Mr. Upjohn, in opening the case, said his clients were the well-known firm of contractors and the defendants were a Board which had been formed in the Colony of Singapore for the purpose of carrying on certain docks and other works. The litigation arose out of a contract made as long ago as February, 1903, for the construction of a wet dock and other works at Singapore. There were three main issues in the case, and these were as follows:—Firstly, the plaintiffs alleged that the contract was induced by misrepresentations of the defendant Board, and that the contract was made in such circumstances that the Board was responsible as for a fraud. If he (Counsel) succeeded upon that issue, away went the contract. If he did not so succeed, the second issue would arise, and the question which arose there was the inquiring and determining whether the contract works were physically impossible of performance. The third issue was the determination of whether the defendants, by their conduct on at least two occasions, repudiated the contract and gave the plaintiffs the opportunity of determining it, of which they availed themselves. Plaintiff case was that the defendants were guilty of such conduct as would amount to repudiation of the contract, and the plaintiffs acted on that footing. Those were the three main issues; but there was also the question of damages. The plaintiffs' claim in the action amounted to about 500,000. The defendants had not counterclaimed in the action, but they had served a notice on the executors of the late Sir John Aird, who in his lifetime was a member of the plaintiffs' firm and a party to the contract, making a claim against his estate of about 1,000,000. His Lordship, however, would not be troubled with the question of damages at the trial, it having been arranged that the determination of the damages, if directed, should stand over for subsequent inquiry. The contract was a very long and complicated one, and abounded in very technical terms in engineering.

It appeared from the statement of the learned Counsel that the plaintiffs received in London from the Crown Agents for the Colonies, acting on behalf of the defendant Board, an invitation to tender for the works to be carried out for the Board at Tanjong Pagar, such invitation being contained in a letter dated July 1, 1907, enclosing a printed book, which contained the conditions of tender, the specimen, alternative forms of

tender, notes for tenderers, and schedule of prices containing detailed items of the works proposed to be executed. The plaintiffs' tender for the works proposed to be executed was accepted on or about October 15, 1907, such works being the construction of a lagoon wet dock, having an area of about 2½ acres, length from east to west of about 2,500 ft., and from south to the north of from 400 ft. to 700 ft., and entered from the open sea by an entrance at the south-west corner; the construction of the main wharf at Tanjong Pagar, and the diversion of a certain road, drainage work, and swamp reclamation. Messrs. Coode, Son, & Matthews and Mr. John Rumney Nicholson were to act as joint engineers under the contract. Plaintiffs' case was that the defendants or other agents had made misrepresentations as to the character of the ground in which the walls of the lagoon wet dock were to be constructed by means of sinking trial pits and boreholes; as to the pressure of the mud experienced in sinking certain trial pits and other matters, plaintiffs said that they did not ascertain the truth of the misrepresentations until they had made considerable progress in the execution of the contract works, and that immediately upon such discovery the plaintiffs avoided the contract and alleged it was no longer binding upon them.

Mr. Upjohn, in the course of his opening address, dealt at great length with the contract specifications and other documents in the case, and referred to the evidence the plaintiffs intended to call.

The learned Counsel upon the construction of the contract said that the first question to be determined was what method of timbering was prescribed. The second was whether there was any provision in the contract requiring the contractors, instead of constructing in trenches, to construct in pockets, or whether this method was not in truth prohibited by the contract. That was the great question raised between the contractors and the engineers in December, 1909. The engineers said, "We require you to do the work, but we do not consider it an extra." He submitted that this work was not within the contract, but that the contract was inconsistent with it. Finding that the ground was of such a nature that the toes of the piles were driven inwards, the work undertaken on the specifications was abandoned.

Counsel then proceeded to deal with the allegations of misrepresentations in the particulars and statements of claim. He said that in the specifications two trial pits were shown—the first 250 ft. east of the entrance to the docks and the other in the narrow part of the entrance to the dock. Both these trial pits were represented as square and as having been sunk through the soft material and down to the hard or shale. In the ordinary practice square trial pits were sunk by means of timbering with runners and settings, and this was what was represented on the drawings. The conditions of tender and prices and specifications contained a representation that the information obtained by the Board and its agents showed that it was practicable to construct the dock walls of concrete with timber trenches in the ordinary way. This, said Counsel, was done for the purpose of inducing the plaintiffs to tender at a much less price than they otherwise would have done, and to commence the work under the ordinary method of runners and settings. As a matter of fact, said Counsel, the trial pits shown were not sunk to the hard bottom shale as represented. Plaintiffs did not find out the truth of these statements until they had actually gone on with the work and just before the commencement of the action. He said that the evidence would show that these facts were within the knowledge of the Board and its agents.

Continuing, the learned Counsel said he would ask His Lordship to say that the Board and their engineers were trying to make the contractors do 2,000,000. worth of work on 1,000,000. contract.

The learned Counsel was still addressing the Court when we went to press.

CORONER'S COURT, SHEFFIELD.

The details of a new coroner's court and mortuary in Sheffield were brought to the notice of Mr. Edgar Dudley, who held a Local Government Board inquiry at Sheffield on the 15th inst. into the application of the Corporation to borrow 5,000. for the purpose. The land is situated in Nursery-street, Wicker-lane, and Nursery-lane. It is proposed that on the new site a central court should be provided for the holding of coroner's inquests. The City Architect (Mr. Edwards) explained the various details of improvement in the plans.

Acton.—At the last meeting of the Urban District Council the following recommendation of the Town Planning Committee was considered:—"That application be made to the Local Government Board for authority to prepare a town-planning scheme under the Housing and Town Planning, etc., Act, 1909," in reference to certain land in Acton, Ealing, Willesden, and Greenford. The following amendment was moved by Councillor Kent:—"That, inasmuch as the Council were assured that the total expenditure connected with the adoption of a town-planning scheme would not exceed 75. (of which 54. has already been expended in preliminaries), but now learn that under such scheme the Council must make binding contracts for the widening of existing railway bridges, the construction of additional ones, the provision of new roads, the stopping-up or diverting of existing roads or ways, the relaying of the high-tension cable of the Metropolitan Electric Supply Company, all of which must involve the ratepayers in expenditure greatly in excess of the balance of the 75. above referred to, but the amount of which the Surveyor is unable to estimate, this Council declines to proceed further with a scheme which must add to the existing large loan debt, and thereby increase the heavy burden now borne by the ratepayers." Councillor Hamilton seconded the amendment. He considered a town-planning scheme unnecessary for Acton, as all the property developed since the new by-laws of 1904 came into force had been developed suitably. Ealing had as much to develop as Acton, and yet it had no town-planning scheme. In reply to a question, Councillor Glen said there was no intention to now commit the Council to any other expenditure beyond the 75. already sanctioned, which, he was told, would amply cover the cost of preparing the maps, etc. Miss Smee: Supposing we apply to the Local Government Board to prepare a scheme, and they give us permission, shall we then be in a position to drop it when it turns out to be expensive or extravagant? Councillor Glen: If the Local Government Board sanctions the scheme and the Council afterwards does not want to go on with it, or any portion of it, then it need not do so, unless it has entered into some contract with a landowner to do something, in which case the ordinary rule of contract applies. Councillor Glen then replied to the amendment. He repeated that if the remaining half of Acton was to be developed on lines satisfactory to Acton, the town-planning scheme was necessary. Development in that part of Acton (north) would probably be extremely rapid. At least two railway-stations were to be put there, and the advent of stations necessarily meant more houses. The Council wished to seize the opportunity now of preventing these houses from being put up anywhere. Under its by-laws the Council had no power to waive certain necessary requirements in regard to particular work. Under the Act power was given to waive the by-laws when they were not found to meet the particular needs of the moment. The estates now being laid out contained three kinds of roads—main arteries, about 60 ft. and 70 ft. wide; secondary roads, which required to be made up to bear a considerable amount of traffic; and residential roads, which required very little depth of construction and very little width. If the Council did not adopt the Committee's Report, the time would come when bridges would have to be widened and roads made at enormous expense to the ratepayers. If the needs of a district required a bridge to be widened, it was the duty of the Council, scheme or no scheme, to widen it. Without the Act the Council might have to widen at enormous cost, without getting a penny for betterment, but under the Act the Council could widen without compulsory powers, and get money paid to it in respect of the betterment of the adjoining property. Councillor Kent expressed the view that Councillor Glen had not read to them Clause 61, subsect. 2, which said that if the Local Government Board were satisfied, on any representation after a local inquiry, that the responsible authority had failed to enforce the observance of the scheme or any provision thereon, or execute any works the authority was required to do, the Board might order that authority to execute the work under the scheme, such order might be enforced by mandamus. So that once they got the thing sanctioned they had to go with it or with the Local Government Board would do so. Mr. Glen had said:—"The Council will make binding contracts with the owners to do certain things," and once these were made they would have to be carried through, or the Local Government Board would force them to do so. A

vision was then taken, with the result that voted for the amendment and fourteen against. Councillor Schulze-Young then moved the following addendum to the Committee's recommendation:—"That no application be made to the Local Government Board prepare a town-planning scheme, except on condition that the Council is not committed to any further expense beyond the 75*l.* already provided, than it would be if the scheme were in existence, but that the Council retains its rights of freedom in the matter." The Chairman: Whether you have a town-planning scheme or not, it is obvious that the bridge at the top of Twyford-avenue will have to be widened. Under the town-planning scheme it would not cost you so much. After their discussion the amendment was defeated on the Chairman's casting vote. Several other motions and amendments were put and rejected. In the result, the Committee's recommendation, including Councillor Schulze-Young's suggestion, that the Council shall have freedom of action in regard to expenditure beyond the 75*l.* (or thereabouts) already allowed, was carried by ten votes to six.

Plans.—Plans, etc., have been approved for making-up the second portion of East Sheen-avenue. The Surveyor has been instructed to prepare the necessary plans, etc., for making Gilpin-avenue, Mortlake, as a new street. At the last meeting of the Council it was decided that the County Council should not agree to the scheme of the Surrey County Council for the treatment of percolation so far as regards the district under the Council's jurisdiction, but to submit a scheme to the Local Government Board. The County Council providing for an isolation block to be erected in the hospital grounds with the necessary nurses' and administrative accommodation, six shelters for venereal cases, and a dispensary. The cost of these buildings is put at 8,000*l.*, 5,000*l.* of which is for the hospital, 120*l.* for shelters, and 180*l.* for the dispensary. Plans have been sent for Mr. George Hunt for four shops and a warehouse, Upper Richmond-road, and E. B. Rowell, for alterations to ten shops White Hart-lane.

General Purposes Committee.—The last meeting of the Council, recommended the adoption of draft instructions to architects for the submission of plans for works and public conveniences, together with required accommodation. Councillor Pearson proposed, as an amendment, that the instructions should be referred back to the Committee for further consideration. He took this course because he considered the plans which had been submitted, and which it was proposed to put before the Council, were both ambitious and extravagant. The sum of 5,000*l.* was mentioned as a limit to be given to the architects. This he considered was more than the Council is justified in calling upon the ratepayers to spend. In his opinion, 3,000*l.* would be a more reasonable limit. He said that he did not bind himself to a sum of 5,000*l.* was arranged to meet the architects to submit the draft instructions to them, and to insist that they should erect offices in the most economical manner possible. The amendment was defeated, and the Committee's recommendation agreed to. Later on, Councillor Pearson proposed:—"That all estimates to cost 5*l.* and over be thrown up to tender upon specifications to be drawn up by the Surveyor or any other person appointed for the purpose." He said that if costing 5*l.* and upwards was thrown open to tender they would get far better value for their money than if carried out by the Surveyor. Councillor Mainland said if the motion was carried they would place themselves in the hands of a ring of builders. Why should they give builders out of ratepayers' money, and then when the work could be done equally well themselves, and better? Councillor Pearson said his intention was to invite tenders from people in the district, not outside. He was absolutely certain that work would be done better and cheaper if thrown open to tender than done by their own men daywork. In the result the motion was defeated. The Surveyor has been instructed to prepare a plan and estimate for improving the road at the bottom Church-hill.

Wokingham.—The Surveyor has submitted estimates for making-up Monahan-avenue, Bedford, at 11*s.* 4*d.* per foot, and Links, Seely, Eastbourne, and Frinton roads, Chesham, at 11*s.* a foot. The tender of the Improved Wood Pavement Company, Ltd., has been accepted at 5,542*l.*, for certain wood-paving works at Mitcham; as has also the tender of Mr. E. H. sen., Katharine-street, Wokingham, at 2,945*l.*, for making-up Florence, Church-street, and St. Mary's roads, Sand-

out to the roadways and footways in eight thoroughfares at a total estimated cost of 1,151*l.* Plans have been passed for Messrs. Greig & Detmar for the erection of a building on the site of Nos. 80-92 High-street.

Basing.—The tender of Mr. M. N. Rose has been accepted, at 486*l.*, for making-up Temple-road with Brooke's adamantine paving. At a recent meeting of the Council a scheme for providing additional accommodation at the Town Hall, at an estimated cost of 500*l.*, fell through.

Enfield.—The tender of Mr. E. J. Betts, Enfield-highway, has been accepted by the Urban District Council, at 395*l.*, for making-up part of Farr-road.

Greenwich.—The Housing Committee have decided to make representations to the Local Government Board to the effect that, in their opinion, the London County Council should provide suitable accommodation for the persons displaced by the acquisition by the County Council of property in the neighbourhood of Randall-place and Billingsgate-street, required for school accommodation. Repair works are to be carried out in four roads at an estimated cost of 380*l.* A plan lodged by Captain Warburton on behalf of the Admiralty has been approved for the erection of fifty-three shops in a new street off Trafalgar and Old Woolwich roads.

Hammer-smith.—The offer of Messrs. W. F. Newcott & Co., Budge-row, Cannon-street, E.C., on behalf of certain clients, has been provisionally accepted by the Borough Council to take a plot of land in the Broadway of 1,069 sq. ft., or thereabouts, on a building lease, subject to the lessees being prepared to spend about 2,500*l.* on a suitable building.

Hendon.—For carrying out improvement works in Lawrence-street and Daws-lane the tenders of Mr. F. G. Brummell, Dudden Hill-lane, Willesden, N.W., has been accepted at 3,347. 13*s.* 6*d.* and 1,168*l.* 14*s.* 8*d.* respectively, as has also the tender of Messrs. W. Gibson & Co., at 2,300*l.*, for the erection of King Edward Hospital.

Islington.—In connexion with the renewal and relaying of wood-paving in several thoroughfares in the Borough the Borough Council have accepted the tender of Messrs. William Griffiths & Co., Ltd., 35-39, Hamilton House, Bishopsgate, E.C., at 653*l.* 4*s.*, for supplying 56,000 jarrah wood blocks required therefor. The sewer in Lyon-street is to be demolished and one constructed of 9-in. stoneware pipe incased in Portland cement concrete and laid to an improved gradient is to be substituted therefor at an estimated cost of 130*l.*

Kensington.—The tender of Messrs. J. Mowlem & Co., Ltd., Westminster, S.W., has been accepted, at 1,410*l.*, for making-up the extension of Highlever-road and a new street. Negotiations are proceeding with Messrs. Derry & Toms, who have under consideration a scheme for rebuilding the front of their premises in Kensington High-street, for effecting a widening of a portion of that road. The quotation of the Improved Wood Pavement Company, Ltd., to relaid the wood-paving of Queen's Gate-place-mews for a distance of some 35 yds. has been accepted at 9*s.* 8*d.* per super. yard.

Lambeth.—The tender of the Improved Wood Pavement Company, Ltd., has been accepted for supplying and laying cross-bedded deal paving blocks on concrete foundations, to be prepared by direct labour, in a portion of Clapham-road, at 7*s.* 6*d.* per super. yard. A plan, lodged by Mr. J. Wilson, has been approved for the drainage of six houses proposed to be erected on the north side of Glennie-road; and have also plans, lodged by Mr. H. B. Mitchell, for the formation of a new street, 40 ft. wide, leading out of Acre-lane.

Lewisham.—The Borough Council have decided to call the attention of the London County Council to the Report of the Departmental Committee on the use of intercepting traps in house drains recently issued, in which the trap is emphatically condemned, requesting them to take the necessary steps to repeal the by-law (6) made by them under the provisions of sect. 202 of the Metropolis Management Act, 1855. This by-law is as follows:—"Every person who shall erect a new building shall provide in every main drain or other drain of such building which may immediately communicate with any sewer a suitable and efficient intercepting trap at a point as distant as may be practicable from such building, and as near as may be practicable to the point at which such drain may be connected with the sewer. He shall, except in cases where the means of access to it are provided in compliance with the preceding by-law, shall give adequate means of access to such trap, provide a separate manhole or other separate means of access to such trap for the purpose of cleansing it." The following plans have been passed:—Messrs. Norfolk & Prior,

four houses, Newquay-road; Messrs. J. W. Heath & Son, five houses, Brockley-grove; Mr. T. G. Arnold, dairy, near 50 and 52, Rushey-green; Messrs. T. O. King & Son, factory, Staplehurst-road; Messrs. G. Baines & Son, church, Torrington-road; Mr. H. H. Dartnall, five houses and shops, High-street. Mr. E. Stewart has lodged plans with the London County Council for houses in Muirkirk road. Tenders are to be invited for paving and forming Perry-rise and Allen-road, in the latter case so soon as 75 per cent. of the estimated cost is received from the frontagers. Artificial stone in lieu of tarpaving is to be laid in portions of two roads at an estimated cost of 168*l.* The tender of Mr. J. T. Gloag has been accepted, at 499*l.*, for kerbing, channelling, and making up the roadway of part of Manor-lane; as has also the tender of Mr. W. Pearce for paving the footways with artificial stone at 5*s.* 7*d.* per yard super. The General Purposes Committee have decided to take the necessary steps for the establishment in the Borough of a tuberculosis dispensary. The cost is estimated at 1,000*l.* The following plans have been passed:—Mr. Percy Roche, ten houses, George-lane and Roxley-road; Mr. A. J. Roddis, six houses, Rushford-road; Messrs. J. W. Heath & Son, eight houses, Chudeleigh-road.

Malden and Coombe.—At the last meeting of the Urban District Council the Surveyor submitted a plan for the widening of a portion (about 450 ft. in length) of Kingston-road, which could be carried out by a widening of the railway bridge from 20 ft. to 50 ft. span, and presented estimate of the cost of roadworks, reconstruction of forecourts, etc. He was instructed to prepare a more comprehensive scheme covering a distance of about 750 ft., so as to lower the level of the roadway on either side of the bridge, thereby reducing the gradient to one in forty-eight.

Marylebone.—The Borough Council have granted an application of Messrs. Bonner & Gibbs, 11, Spring-gardens, S.W., to reconstruct the existing vaults and construct new vaults and sub-basements, and fix pavement lights in Castle-street East, Winsley-street, and Adam and Eve-court; and to form two subways in the last-mentioned thoroughfare, subject to protective conditions.

Romford.—The Guardians have approved a plan and estimate of an isolation hospital, and the work is to be carried out by direct labour at a cost of 434*l.*

St. Pancras.—The Public Health Committee of the Council have received a communication from the Local Government Board referring to Paragraph 9 of the First Schedule of the Housing, Town Planning, etc., Act, 1909, and forwarding copies of an Order which the Board, with the concurrence of the Lord Chancellor, have issued, making rules for the purpose of fixing the scale of costs to be applicable on an arbitration under the schedule. Rule 6 in the Order, the Committee states, which is based upon similar wording to that in the schedule of the Act, deals with the question of representation by counsel or expert witnesses, and is as follows:—"Nothing in these rules shall authorise an arbitrator to hear counsel or expert witnesses except in such cases as the Local Government Board direct, and if counsel or expert witnesses are heard by an arbitrator without such direction no costs shall be allowed in respect thereof." Both counsel and expert witnesses, the Committee continue, are excluded from an inquiry into the taking of land as well as from an arbitration as to the value of the land, unless the Board otherwise direct. The Committee consider that the growing practice of legislating by Acts of Parliament drawn in general terms which leave the duty of settling important points of administration to Government Departments by means of orders, rules, and regulations is a custom strongly to be deprecated, as, although the making of an order may be authorised by statute, no opportunity is afforded, in the absence of discussion in Parliament, for criticism or amendment of what are frequently found to be vital points of detail, and they have accordingly decided to forward a strong protest to the Government on the matter.

Stoke Newington.—Repairs are to be carried out to the carriageway of Blackstock-road at a cost not to exceed 100*l.* The tender of Messrs. William Griffiths & Co., Ltd., has been accepted for renewing the present wood-paving in Lordship Park. The estimated cost of the work is put at 4,400*l.*

Westminster.—The Improvements Committee report that in connexion with the recent purchase by the Royal Geographical Society of Lowther Lodge and the proposed rebuilding of the premises they have had under consideration the desirability of acquiring a strip of the garden to provide for a rounding-off at the corner of Exhibition and Kensington roads. As the result of negotiations it

(Continued on page 491.)

Tuford.—Repair works are to be carried

List of Competitions, Contracts, etc.

For some Contracts still open, but not included in this List, see previous issues. Those with an asterisk (*) are advertised in this number; Competitions, iv. Contracts, iv. vi. viii. x.; Public Appointment, xvii.; Auction Sales, xxii. Certain conditions beyond those given in the following information are imposed in some cases, such as: the advertisers do not bind themselves to accept the lowest or any tender; that a fair wages clause shall be observed; that no allowance will be made for tenders; and that deposits are returned on receipt of a bona-fide tender unless stated to the contrary.

The date given at the commencement of each paragraph is the latest date when the tender, or the names of those willing to submit tenders, may be sent in.

* * It must be understood that the following paragraphs are printed as news, and not as advertisements; and that while every endeavour is made to ensure accuracy, we cannot be responsible for errors that may occur.

Competitions.

OCTOBER 28.—**Blackwood, Mon.**—LIBRARY, ETC.—Cost, 5,000. Particulars from Mr. Lewis Lewis, 8, Aldon-terrace, Blackwood, Mon.

OCTOBER 29.—**Glasgow.**—DESIGNS FOR EXTENSION OF MUNICIPAL BUILDINGS.—The Glasgow Corporation invite architects to submit preliminary sketch designs in competition for the extension of the Municipal buildings. Five will be selected to submit complete drawings in final competition. See advertisement in issue of July 12. Dr. Burnet, assessor. Deposit of 11. 1s.

OCTOBER 31.—**Huddersfield.**—TOWN PLANNING.—The Housing and Town Planning Committee of the Huddersfield Corporation invite designs for the laying-out of certain areas within the county borough and part of an adjacent suburb. Premiums 100gs., 50gs., and 25gs. Deposit of 21. 2s. See advertisement in issue of August 2 for further particulars.

OCTOBER 31.—**Llandudno.**—LANDSCAPE GARDENING.—The Llandudno U.D.C. invite designs for laying-out land adjoining the Happy Valley, about 20 acres in extent. See advertisement in issue of September 6 for further particulars.

NOVEMBER 1.—**Ottawa.**—MONUMENT TO KING EDWARD VII.—Sketch models in plaster to be sent to the Director of National Art Gallery, Ottawa. Particulars from the Public Works Department, Ottawa (see p. 174, August 9).

* NOVEMBER 4.—**London.**—REGENT'S QUADRANT.—The Committee appointed by the Lords of the Treasury to consider the design for completing the above wish to inspect the designs submitted in the Builder Competition, and the authors of those designs are asked to forward them to J. Whitehall, London, S.W., by November 4. See advertisement (page iv.) in this issue for further particulars.

NOVEMBER 25.—**Newcastle-on-Tyne.**—SCHOOLS.—Limited to local architects. Particulars from the Education Office, Northumberland-road, Newcastle-on-Tyne.

NOVEMBER 29.—**Langside, Glasgow.**—BLANCH LIBRARY.—Assessor, Mr. Alex. N. Paterson, A.R.S.A. Premiums, 50l., 30l., and 25l. Particulars from the Town Clerk, City-chambers, Glasgow.

DECEMBER 1.—**Soñia.**—DESIGNS FOR A ROYAL PALACE AND LAW COVERTS.—Particulars from the Commercial Intelligence Branch of the Board of Trade, Basinghall-street, E.C. (see p. 173, August 9, and p. 350, September 27).

DECEMBER 2.—**Carlisle.**—SCHOOL BUILDINGS.—Particulars from the City Surveyor, 88, Fisher-street, Carlisle.

JANUARY 1, 1913.—**Dublin.**—MUNICIPAL BUILDINGS.—Assessor, Mr. Albert E. Murray, A.R.H.A. Conditions from the City Treasurer, Dublin. Deposit, 21. 2s.

MARCH 1, 1913.—**Rangoon.**—MUNICIPAL BUILDINGS.—The Committee of the Municipality of Rangoon invite designs for the new Municipal Buildings. Honoraria of 300l., 200l., and 100l. respectively for first, second, and third. See advertisement in August 2 and 30 for further particulars.

MARCH 1, 1913.—**Winnipeg.**—CITY HALL.—Particulars from Mr. A. Waugh, City Hall, Winnipeg.

* NO DATE.—**Dursley.**—WORKMEN'S DWELLINGS.—The Parochial Committee of the Dursley R.D.C. invite designs for about thirty workmen's dwellings. See advertisement in this issue for further particulars.

NO DATE.—**Jordanhill, Glasgow.**—PROPOSED TRAINING COLLEGE.—Limited to six firms, named in "Competition News," December 1, page 635.

NO DATE.—**Motherwell.**—HIGH SCHOOL.—Dr. Burnet, assessor. Premiums 50l., 30l., and 20l.

Contracts.

BUILDING.

The date given at the commencement of each paragraph is the latest date when the tender, or the names of those willing to submit tenders, may be sent in.

OCTOBER 26.—**Blackpool.**—CONVERSION.—For conversion of single-story workshop into a two-story stores. Specification and quantities from Mr. J. S. Brodie, Borough Engineer and Surveyor, Town Hall, Blackpool.

OCTOBER 26.—**Cheltenham.**—BUILDINGS.—For domestic science buildings at Gloucester-road and Naunton Park schools. Architects, Messrs. Chatters & Smithson, 17, Regent-street.

OCTOBER 28.—**Marrogate.**—ALTERATIONS.—Alterations to the end wings of the Victoria Baths. Plans seen, and particulars from Mr. C. E. Rivers, A.M.Inst.C.E., Borough Engineer.

OCTOBER 28.—**Hollybrook.**—COTTAGE.—Erection of a cottage at Hollybrook, near Skibbereen, Co. Cork. Plans and specification with Mr. James F. M'Mullen, M.R.I.A.S., architect, 30, South-mall, Cork.

OCTOBER 29.—**Senghenydd.**—BAKERY.—Erection of a new bakery at Senghenydd for the Senghenydd and Aber Valley Co-operative Society, Ltd. Plans and specifications with Manager.

OCTOBER 29.—**Shipley.**—EXTENSION.—For the reinstatement and extension of dock mill, Shipley. Names to Messrs. J. G. Thompson & Son, fire-locks, 3, Parkinson's-chambers, Havergate, Bradford.

OCTOBER 29.—**Tynemouth.**—RETAINER.—Construction of a timber retainer on the sea banks at Tynemouth. Drawing and specification seen, and forms of tender from Mr. John F. Smillie, Borough Surveyor, Tynemouth.

OCTOBER 31.—**Barnsley.**—SHOPS, ETC.—Erection of wholesale shops on Midland-street, Barnsley, and providing and fixing of iron fences, hurdles, gates, and other works of paving, draining, etc. Drawings and specifications seen, and quantities from Mr. J. Henry Taylor, M.Inst.C.E., Borough Surveyor, Manor House, Barnsley.

OCTOBER 31.—**Denholme Gate.**—STORES.—Erection of new stores at Denholme Gate. Messrs. John Haggas & Sons, architects, North-street, Keighley.

OCTOBER 31.—**Ramsgate.**—ROOM.—For the erection of a room for fire-alarm fittings and other works. Plan and specification seen, and particulars from Mr. J. G. Taylor, Borough Engineer, Borough Engineer's Office, Albion House, Ramsgate.

NOVEMBER 1.—**Brittas.**—ROOM, ETC.—For the erection of a new day-room and a heating system at the sanatorium, Crookslin, Brittas, Co. Dublin. Plans and specification by Mr. F. F. McNamara, C.E., architect, 132, Great Brunswick-street. Quantities, with forms of tender, on deposit of 11. 1s.

NOVEMBER 1.—**Gledith.**—HOUSE.—For erection of a detached house in Gramere-road, Gledith. Drawings seen, and quantities from Messrs. J. B. Abbey & Son, architects and surveyors, 34A, New-street, Huddersfield.

NOVEMBER 1.—**Mallow.**—COTTAGES.—For the building of thirty-nine single cottages. Plans and specifications at the office of the Council. Deposit of 5l. per cottage.

NOVEMBER 1.—**Queentown.**—HOUSES.—Erection of fifty artisans' and labourers' houses in two blocks of sixteen and two of eight each. Carriganog, and in four blocks of five each at Ballyvolcan. Plans, specification, and general conditions by Mr. Joseph A. McCarthy, R.E., time-surveyor. Form of tender and quantities from the Town Clerk. Deposit of 21.

NOVEMBER 2.—**Maidenhead.**—ADDITIONS.—For additions to the engine-house buildings at electric-light station in Braywick-road. Plans seen, and specification and quantities from Mr. P. Johns, Borough Surveyor, Guildhall, Maidenhead.

NOVEMBER 4.—**Aberdeen.**—ALTERATIONS.—For the alteration of the wharf at Albert Quay, and relative works, on the south side of Albert Quay. Drawings with Mr. R. Gordon Nicol, Engineer, Aberdeen. Specification, conditions, and quantities on deposit of 21. 2s.

* All these applications are in the stage in which opposition to the grant of Patent upon them can be made.

LONDON COUNCILS—continued from page 489.

ears that the Society would be prepared to pay 2,550l. for the land required. The Committee have decided to purchase such property, the Engineer has been instructed to carry out the necessary paving, etc., works in connection with the improvement, estimated to cost 350l. The Committee also report having considered the subject of their recommendation at the last Council meeting, that, in view of the opposition to the scheme of raising the level of Piccadilly by the Junior Engineers' Club, no further action should be taken in the matter at present. They are now of opinion that the rebuilding of the Sutton site Property to the existing elevation would greatly prejudice any future scheme which might be adopted for raising the level of Piccadilly at this point, and they have decided to urge the London County Council to sanction the erection of the building to the existing height of 80 ft. above the proposed level. Macadam repairs are to be carried out in Princes Gardens and Cambridge street at an approximate cost of 235l. Various other repairs are also to be carried out to footways in Chester-street at an estimated cost of 60l.

OBITUARY.

Mr. W. F. Unsworth, F.R.I.B.A.

Mr. T. E. Colclutt, Past-President, R.I.B.A., attributes to the current issue of the *Journal* the Institute some biographical details of the life of the late Mr. William Frederick Unsworth, who died suddenly from heart failure at his residence at Steep, near Petersfield, on the 6th inst., at the age of sixty-one. William Frederick Unsworth was born in 1822, and proceeded to the Fellowship in 1891.

after a year's travel in France was for two years in the office of the late George Edmund Street, and for a year with the late William Burges. He started practice in London in the year 1875, and scored his first success in the competition for the Shakespeare Memorial Theatre and Library at Stratford-on-Avon, which he was commissioned to carry out. The design of this building shows a strong feeling towards French Gothic, and it may be allowed that this feeling was in great measure due to the influences which still dominated one who had worked in the office of William Burges. But Unsworth's sympathies, judging from his later work, were more in accord with the best traditions of English Medievalism, and it was this spirit that influenced him in his later productions. Unsworth brought to the execution of his work an enthusiasm that occasionally was almost feverish in its intensity, and a knowledge of style that gave distinction to all his buildings, whether domestic or ecclesiastical. His detail was especially interesting and charming. Among his architectural works I should like to mention as well worth a visit a small brick-fronted warehouse, built in 1883, which is quite hidden away in Star-yard, at the back of Chancery-lane. Other notable works are his restoration of St. Mary's Church, Horsall, Surrey; Christ Church, Woking, and subsequent enlargement; church at Woodham, Surrey; chapel of the King's School, Warwick; Rossall School Chapel; Zion House, Strabane; houses at Harrogate and Burnham; additions to Selsdon Park, Sandstead, etc. He was formerly in partnership with Mr. Dodgman, in Old Queen-street, Westminster; then practised alone in Old Palace-yard, Westminster, and latterly, in conjunction with his son and Mr. Inigo Triggs, at Petersfield. He was elected an Associate of the Institute in 1892, and proceeded to the Fellowship in 1891.

8,517 of 1912.—William John Swain: Reinforcements for concrete structures.
9,900 of 1912.—Wilson Henry Sturge: Devices for adjustably suspending electric and other lamps, electrolights, gas pendants, and the like.

10,394 of 1912.—Edward Wingfield Brackenbury: Concrete mixers and the like.
10,932 of 1912.—Joseph Schilling and Michael Gierlich: Device for opening and closing fanlights and the like.

13,506 of 1912.—Carl August Gustafsson and Oscar Arvid Hede: Stayed wooden poles.
16,258 of 1912.—Richard Aloysius O'Driscoll: Means for heating water.

SELECTED PATENTS.

12,523 of 1911.—British Reinforced Concrete Engineering Company, Ltd., and Gilbert Stanley Heathcote: Reinforced concrete constructions.

This relates to welded reinforcing frames which can be made in standard lengths or sizes, which comprise a bar or bars and parallel, equidistant, transverse, or shear members, which are welded to the main bars and lie in a common plane when brought to the site, but may be bent up as desired. They may be straight and perpendicular to the main

12,523 of 1911.

bars, or be bent herring-bone fashion; in a modification of the latter form applicable to beams, the shear members being bent up out of the original plane. For columns, the members *b* embrace one or two main bars, or may lie between two main bars. Adjacent ends of the members *b* may be welded or twisted together, the members *b* being parallel with the faces of the column. The main bars may be welded end to end when placed in position.

The provision of ample warmth for comfort and ventilation—in living-rooms, workshops, offices, and factories, as well as in hospitals, infirmaries, etc.—is now generally recognised as an important factor in the maintenance or restoration of health—in the production of the most and best work—in the full enjoyment of leisure.

Our complete catalogue (gratis and post free), besides full particulars of "Ideal" Radiators and "Ideal" Boilers, gives valuable information about the scientific side of heating.

TO CORRESPONDENTS.

NOTE.—All communications with regard to literary and artistic matters should be addressed to "THE EDITOR" (and not to any person by name); those relating to advertisements and other exclusively business matters should be addressed to "THE PUBLISHER," and not to the Editor.

All communications must be authenticated by the name and address of the sender, whether for publication or not. No notice can be taken of anonymous communications.

The responsibility of signed articles, letters, and papers read at meetings rests, of course, with the authors.

We cannot undertake to return rejected communications; and the Editor cannot be responsible for drawings, photographs, manuscripts, or other documents, or for models or samples sent to or left at this office, unless he has specially asked for them.

All drawings sent to or left at this office for consideration should bear the owner's name and address on either the face or back of the drawing. Delay and inconvenience may result from inattention to this.

Any communication to a contributor to write an article, or to execute or lend a drawing for publication, is given subject to the approval of the article or drawing, when received, by the Editor, who retains the right to reject it if unsatisfactory. The receipt by the author of a proof of an article in type does not necessarily imply its acceptance.

N.B.—Illustrations of the First Prize Medal Design in any important architectural competition will always be accepted for publication by the Editor, whether they have been formally asked for or not.

TENDERS.

Communications for insertion under this heading should be addressed to "The Editor," and must reach us not later than 6 p.m. on Wednesday. [N.B.—We cannot publish Tenders unless authenticated either by the architect or the building owner; and we cannot publish announcements of Tenders accepted unless the amount of the Tender is stated, nor any list in which the lowest Tender is under 100l. unless in some exceptional cases and for special reasons.]

* Denotes accepted. † Denotes provisionally accepted.

IS THERE A "NEW SPIRIT" IN ARCHITECTURE?

WE hesitated somewhat before asking ourselves the question which we have put at the head of this article. It carries with it something of the flavour of what is called in journalism the Yellow Press, an element of sensationalism with which we have no sympathy. Some years ago Mr. Havelock Ellis wrote a series of essays under the title of "The New Spirit," in which he spoke of writers, as far as we remember, such as Tolstoy and Ibsen, whose works have passed readily into the ranks of the classic. All phases of art of the last fifty years—philosophy, poetry, romantic literature, music, painting, and the decorative arts—there have been manifestations of what is called a "new spirit," usually confined in its highest and most comprehensible phase by some distinguished man of genius, such as those we have already named and others, such as Wagner, Manet, Rodin, Nietzsche, and William Morris. Architecture has largely escaped these movements of intellectual perturbation. Within the same period has possessed, no doubt, men of as

distinguished talent as have any of the other arts, but they have been less moved by the desires and aspirations of their time than the precursors whom we have named. Architecture has been more content, as it were, to revolve within its own orbit. For, although if we cannot quite point to movements within its sphere of the same importance and extent as have operated elsewhere—movements which have reflected the restless and investigating *Zeitgeist*—architecture has nevertheless not been unresponsive to a certain intellectual restlessness within its own doors. In the middle or so of last century, for instance, we had the historic battle of the styles, a conflict which now seems a little absurd, although precisely the same battle continues to-day, and will no doubt continue until the end of time, only the scene of action has changed. We have recently had the opportunity of making a rapid survey of the architecture of various countries. There remains in our memory, outstanding and formidable, an aspect of architecture which we did not set out to see, at which we scarcely indeed gave more

than a passing glance, but which succeeded in making by the repetition of its effect a sort of cumulative impression which we find impossible to escape. We ask ourselves, "Is architecture coming at last under the influence of the *Zeitgeist*?" It would probably have been more frank to ask, "Is a new style becoming manifest in architecture?" The question of a new style in architecture has occupied the thoughts of more than one generation of architects. It has been discussed in public before our learned societies; it has more often provided a matter of private preoccupation. But no solution has so far been discovered that could secure any sort of unanimous assent. The question of a new style, in fact, has usually resolved itself into some such issue as prevails in certain quarters at the present moment, such as whether we should follow the lines of the French Renaissance or late Georgian. To talk of creating a new style seemed like beating the air. Since the time of the Italian Renaissance—that is, since the art of architecture, emerging out of the period of the Middle Ages, became a self-conscious and

Buckingham Palace : The East Front towards the Mall as existing.

individualised art, instead of an art which represented the general consciousness of the community—it has become more and more a child of tradition and precedent, and therefore less responsive to the world movements which have affected and influenced the expression of the other arts. Apart from this, the conditions governing the practice of the art of architecture are of an extremely restricted and dominant character. The architect is, in fact, the only artist to whom it is forbidden to build castles in the air—that is to say, he cannot construct off-hand the edifices of his imagination as the poet or dramatist, the musician or painter can. All the elements of creative composition—rhythm, colour, proportion, symbolic intention, what you will—have to be arranged and wrought together, often under conditions which he cannot choose for himself, and in any case with a view to a material and practical application to which the other arts are strangers. That is not, however, to say the sister arts do not also possess definite limitations of expression, 'it is only to say that they are different in character and degree. The greater the limitations the greater the art, and in practice they have provided no barrier to the architect of true creative genius, whose works endure through the ages as an ornament to his own country and a centre of pilgrimage for the inhabitants of others. It is, however, probably true that this aspect of architecture has been largely responsible for its apparent irresponsiveness to tendencies and influences, often transitory, to phases of thought which from time to time swept over the world, and which have affected the other arts. The architect, working more or less in a sphere of artistic isolation, has been more content to follow in the lines laid down by one or other aspect of the tradition of his art: here at any rate he was on sure ground. In this connexion another point, which is a little paradoxical, suggests itself. We shall put it as briefly as possible, and it is this: That while works of architecture have not only provided the chief ornaments of their country and are among the most valuable documents of historical record which remain to us from the past, they have until recently found small recognition on the part of the historian (apart from the archaeologist and virtuoso), and formed little or no part in the general teaching of the schools, not even, until recent times, in the art schools. If this has been so, small wonder that the general estimation in regard to architecture has been of an extremely

limited and superficial character, that the gradations which distinguish the builder (we are using the term in its trade and no uncomplimentary sense) from the architect are lost on the man in the street. It is indeed a strange thing that, although architecture in the hierarchy of the arts occupies the most venerable and established position, it should have remained so long outside the appreciation and apprehension of the general mass of mankind. In Great Britain this has been peculiarly the case; the position of the architect has been usurped by the often more trivial and obvious appeal of the painter or the penman. But time this state of things has largely changed. On the Continent certainly, and to some extent in Great Britain, the young architect has found his training among his brother artists, the painter and the sculptor. And this sort of training which necessarily involves interchange of ideas has perhaps assisted each type of artist in a better understanding of each other's aim. There is nothing like a spirit of camaraderie among artists of various *métiers* for opening and refreshing the mind; frank discussion between artists in the making, and even between those of later life, the thrust and parry of ideas, helps to make the imagination more pliable, gives an impetus to creative power. That the public also are beginning to take a more intelligent interest in architecture is reflected in the Press. So that altogether the architect can no longer, even if he would, return to his position of intellectual detachment and isolation. There are also other forces at work; those we have indicated are largely on the surface. There are the requirements of modern planning, the exigencies of a commercial, scientific, and luxurious age, which have no counterpart in history; there is the introduction of new materials, new methods of construction, which cannot perhaps be consistently applied to any preceding style in architecture. And in saying this we are not speaking of the spirit or the aesthetic considerations which guided the formation of the great schools of the past, and which will no doubt always form the grammar and basis for the finest creative efforts; we are speaking merely of the adaptation or imitation of features, of the letter rather than the spirit, contained in the teaching of the older work.

It must not be thought from what we have just said that we are in sympathy with the kind of work which has occasioned our remarks. We are no iconoclasts; we are no strangers to the desire to preserve, if possible, a

scholarly tradition in architecture. If no force of scholarly predilection stop the tide of a universal tendency it once begins to flow. It is, in any case, no good blinking facts. If we desire to change the current of the tide we must first of all realise its direction. In Milan, in Brussels, in Vienna, in Budapest, and to some extent in Paris, but more especially in Austria and Germany, we discovered the same indications of a revolutionary movement expressed with an "insolence of animation" that no one can wholly disregard. The tendency is revolutionary because it aims at upsetting the standards of tradition, if not altogether its canon. It says in effect we must start afresh; we have to deal not with the problem of the past, but with the changed conditions of modern life. Much of the work is experimental, a groping in the dark; much of it is also, in our view, extremely repellent. It is no longer a matter of whirling lines, splashed with forms like the figures of musical notation which we associate with the phase of art known as *l'art nouveau*—a phase which seems happily to have passed away. It is much more serious than that. It would be absurd, for instance, to compare its exponents to the *fauves* of the Independent school in Paris. No doubt it found its origin in Austria and Germany, and that among its earliest protagonists were men of the type of Alfred Messiaen and Otto Wagner—that is, architects of great scholarship and great creative gifts who departed from the school of tradition probably for reasons which we have imperfectly attempted to summarise. It would be premature to say that we are on the eve of the birth of a new style; but there is certainly a great and universal movement in the air which may or may not be the operation of the time spirit, but which cannot be ignored.

BUCKINGHAM PALACE.

THE centralisation of power which in France enabled the monarch to carry out colossal groups of State buildings like those of Fontainebleau, the Louvre, and Versailles ultimately produced the conditions which brought about the Revolution. In this country the only approach to schemes of like magnitude was Inigo Jones's projected Royal Palace, although there are many smaller royal residences of the Tudor period which are delightful in their architectural expression. What the Stuarts might have carried out in the way of monumental architecture had they retained

air power is difficult to conjecture, but for later monarchs have been content with residences of little grandeur or architectural distinction.

And of the royal residences none, with the exception of Balmoral, have as architectural pretensions than Buckingham Palace. The present buildings occupy the site of the Mulberry gardens, a place of fashionable resort during the reigns of Charles I. and II. The ground was originally planted with mulberry-trees by order of James I., who hoped to introduce a silk industry, but the speculation proved a failure. Evelyn and Pepys both refer to the gardens, the former as "the best place about the town for persons of quality," the latter as "a silly place with a wilderness somewhat pretty."

The public recreation grounds were subsequently done away with and a house built on the southern portion of the grounds by Lord Goring, and subsequently occupied by Speaker Lenthall during the Rebellion. The next owner was Lord Arlington, a member of the royal Ministry, who rebuilt the house after its total destruction by fire in 1674, and renamed it Arlington House. This, as shown in old illustrations, was a brick house with slightly projecting wings and a large domed lantern. The house was demolished in 1703, and the site purchased by John Sheffield, Duke of Buckingham, who built a more ambitious residence. This, as shown in old prints, was a square brick house, with projecting wings, in which were

located the laundries, kitchens, and servants' quarters. It was described as "a graceful palace very commodiously situated at the westerly end of St. James' Park, having at one end a prospect of the Mall and other walks, and of a delightful and spacious canal; a seat not to be contemned by the greatest monarch."

Sheffield's only son dying in 1735, the line became extinct, and after the death of his widow, Catherine Darnley, who is referred to by Horace Walpole as "Princess Buckingham," the house was bought by George III. in the second year of his reign for 21,000*l.*, since which time it has been almost continuously used as a royal residence. In 1775 the property was settled on Queen Charlotte in exchange for Somerset House, and was known in West-end society as the "Queen's House." Here it was that the King surprised the great Dr. Johnson, who was allowed the use of the library, and who afterwards said to the King's librarian, "Sir, they may talk of the King as they will, but he is the finest gentleman I have ever seen."

In 1825 the present building was commenced by order of George IV., from the designs of John Nash, but William IV. not liking the situation, the new buildings were not occupied till after Queen Victoria's accession. The original intention had only been to repair and enlarge the buildings then standing, the whole site, heights, and dimensions being adhered to, as it was

considered that Parliament would not grant the funds for a new building.

This partially accounts for the shortcomings of Nash's design, a design unsparingly condemned by Leeds in his work on public buildings of London, for the "utter absence of dignity occasioned by the original idea and the pettiness which marks every individual feature." Leeds further quaintly adds that Nash "appears to have sat down at his drawing-board without any preparation or study further perhaps than his studies for Regent-street."

Nash's buildings are carried out in Bath stone, and, like much of the work of the late Georgian period, are uninspired but simple, refined, and not displeasing, as can be gathered from the west or garden front, which we illustrate.

It is interesting to note that the Marble Arch originally stood in front of the central entrance, being removed to its present position in 1851.

The existing east front occupies the fourth side of Nash's quadrangle, and was added by Blore in the early years of the late Queen's reign at a cost of 150,000*l.*, and represents the nadir of the architectural cycle. It is carried out in Caen stone, a material which quickly decays, and the successive coats of paint with which it has been covered have given it the appearance of stucco, and still further emphasised the unsatisfactory nature of its design. This, which we illustrate on page 496, is now to be replaced by the new front designed by Sir Aston Webb, R.A.

Buckingham Palace: Plan of Ground Floor.

Buckingham Palace: West or Garden Front.

If we consider the general type and simplicity of Nash's design we think it appears obvious that any treatment except the very simplest and quietest would be out of place, and we feel that Sir Aston Webb has been wise in avoiding the temptation to create a *tour de force* by a design of great architectural pretensions to which the remainder of the Palace would be an anti-climax.

The difficult nature of the problem may be understood when it is considered that the height and levels of existing floors had to be adhered to as well as the present window and door openings, a condition which naturally affected the lines of the design. As we have previously stated, the remodelling of the façade is but a unit of the scheme for the improvement of the Mall and has been carefully considered in relation to the Queen's Memorial, to which it forms a background. In a letter to the *Times* Mr. Statham criticises the vertical note of the central feature as contrasting somewhat unfortunately with the lines of the Memorial, but we understand that the attic over the pediment masks two large ventilating shafts which are carried up at either side, as shown on the drawing, so that it is in fact but an ingenious way of masking a difficulty, and it must also be remembered that the building is a Royal Palace and not a background to a memorial only.

The new front will be carried out in Portland stone, one of the only stones which can be safely used in the London atmosphere.

Much as we may regret the fact that the royal residence in the capital of the Empire should be a building whose merits are of a negative character at the best, we do not agree with those who think that all could be put right by adding a magnificent front to the existing buildings. The choice seems to us to really lie between building a new palace on ample and dignified lines and, failing this, to take some such course as Sir Aston Webb has followed.

We may dream dreams and see visions, but unfortunately we cannot translate them into stone without cost, and we are not prepared to commit ourselves to the opinion that in the present state of the national finances it would be wise to undertake the erection of an entirely new palace.

We as architects sometimes fail to recognise that we hold but one position in the body politic, and that there are many other points of view to be considered. In doing so we prove ourselves unpractical advisers, and lessen our influence with the public.

NOTES.

A Committee of Public Art.

THE present time seems opportune—perhaps it is always opportune—for again calling public attention to the proposition for a consultative and advisory committee for the metropolis as one method of ensuring, so far as it is possible, the obtaining of the best artistic and expert criticism and suggestion on all schemes for great public and representative buildings and town planning. Our reason for doing so has no direct reference to any scheme at present on the boards, whether for great building, street, bridge, or city. It is rather that we are fain to believe that there are signs in the public Press and elsewhere of a revival of public consciousness and interest in such matters—the result possibly of the new town-planning movement. In the interest of our art, and of the public good, such incipient tendencies need to be encouraged and fostered in every way. The proposition in no way throws a stigma upon any public official, assessor of competitions, or on any architect fortunate enough to be entrusted with the carrying out of great public works. A representative committee constituted of the best architects, with sculptors and painters, town-planners, engineers, and landscape gardeners, or others as the necessity of each reference might require, would have weight, influence, and authority of a kind not possible in any public official or department, or any single artist, however eminent. A call to public service in such a body would become a coveted distinction. Its concern might be only with designs and schemes of first-class magnitude and importance, national and metropolitan; but, once established, its influence would probably extend downwards, and aid in the solution of the difficult problem of aesthetic as well as practical control over the development of our towns. We have no wish to dogmatise upon its constitution and methods. We wish only to reiterate once again that something must and can be done to take away our reproach among nations—that we who have been a leader among them in all matters of self-government and administration, local and central, and in the development of industry and commerce, have yet been content, under a futile pretence of superior practicality, to lag behind in a proper civic pride in the adornment of our cities with buildings really worthy of the greatness of our institutions and the historical traditions which have grown up round this country.

The Safety of London Buildings.

In the *Morning Post* the 22nd ult. there is an interesting article on the effect of Tube railways in relation to the foundations of buildings and a representative of the paper interviewed Mr. John Belcher, R.E., Mr. Macartney, and Mr. Carde on the subject. An eminent engineer is quoted as saying that, as the Tube railways in the London blue clay at a great depth below the sandy surface, the idea of any possible subsidence was "gammon." Mr. Belcher, on the other hand, contends that "the great increase of tunnels and subways is causing a great deal of disturbance to the older buildings of the metropolis, not to speak of modern structures." He says he has had to do with many buildings in the City of London the foundations of which were often a foot above the soil on which they were originally placed, and which were "hanging suspended as it were" between, and supported by adjoining buildings. He adds that he has never liked St. Paul's Bridge scheme, which, though "well away from the island site of St. Paul's, was nearer than he could conceive to be desirable." Mr. Macartney picturesquely and appositely likens St. Paul's to "a battleship lying in dock." "The building is floating in water that is held in solution by salt. It is all right as long as you do not allow the water to leak away, but if you allow the building may come down and break its back." We think it well that the public should have the opinion of eminent architects as well as engineers, who, as they are, may yet hardly recognise the value we possess in our historical buildings—a value which may not be sufficiently understood by those who are mainly concerned in providing additional means for modern comfort and convenience.

The Preservation of Ancient Monuments.

THE *Times* in its issue of the 24th ult. gives some account of the evidence laid before a Joint Committee of the two Houses of Parliament on three Bills which have been introduced into the House of Lords dealing with the Preservation of Ancient Monuments. The Duke of Rutland, in criticising the proposed enactments, pointed out that "while the order only appeared to mean that the owner must refrain from alterations, or additions, or removal, the owner might have to wait long before he got permission to carry out even urgent repairs." Also that the owner "could not sell unless the Commission of Works refused to buy at a price fixed by the State."

the Board of Inland Revenue." He adds this a "dangerous and arbitrary power," in which contention he is disposed to agree with him, and certainly agrees with his argument that it is impossible for the Board of Inland Revenue to say what the value of an ancient monument is. The Duke of Devonshire asked by Lord Sheffield whether the authorities should not be entrusted with the care of old manor-houses, tithe barns, and portions of abbeys now used as farm buildings, replied that he was suspicious of local experts." Mr. Kersey Turner gave evidence as to damage done to ancient work in the ruins of recent years by so-called restorations. The golden mean between neglect and indifference in these matters is, we think, most difficult to arrive at, while it is the "consummation devoutly to be wished."

AN important Conference has been held at Berlin at which various questions connected with international exhibitions have been discussed. We are glad to hear that, although the report agreed to has not been made public, it is understood that the Convention recommends the limitation of exhibitions held under the auspices of governments, and gives a maximum time which should elapse between them. We think that such a limitation will be a relief to many firms which cannot afford to be unrepresented at exhibitions, and are yet indisposed to meet the continual heavy charges which they involve. It is stated that recent years international exhibitions have been held almost every twelve months, with the result that a permanent display has been laid on trading firms, and at the same time the public have become wearied by their frequent occurrence.

STRENUOUS efforts have been made in Parliament to ascertain the composition and scope of the secret inquiry instituted by the Chancellor of the Exchequer as regards the land, but the sole result has been a series of replies in form and wholly evasive. That has transpired is that, although Mr. Lloyd George is responsible for the formation of some Committee, he is not aware of the numbers, names of the persons employed, or considers it desirable to keep private the sources from which it is being financed, but he states public money is not being expended. Whether the report is to be published and the methods employed to collect evidence the Chancellor declares to be matters within the discretion of the Committee. A secret inquiry countenanced by Ministers, for which they seek to evade responsibility, is such a novel departure from traditions prevailing in this country that it may safely be said it will be condemned by public opinion, and, attention having been drawn to its existence, it might be treated with silent contempt, but it is not for two considerations. The first of these is that a knowledge of its existence tends to hamper dealings in the granting of leases, and business generally, and therefore further devalues this class of property; and the

second is that if and when the information collected by unauthorised and very likely unqualified persons in a secret manner is published it may involve owners of land in considerable expense to rebut evidence collected behind their backs and at random. If public attention be once aroused to this form of espionage it is hardly possible that it should continue or ever be repeated.

The Situation at Norwich.

We are glad to see that the President of the Local Government Board is fully alive to the possibilities of the situation caused by the floods at Norwich. We note that he considers it a good opportunity for the Town Council to take the matter of housing in hand, and promises the assistance of his department. We hope, however, that the influence of the Local Government Board will be exercised in the direction of the larger question of town planning, and that the rebuilding at Norwich will not remain just an isolated improvement, but be properly related to some general scheme for the eventual improvement of the whole city.

Garden City Appeal for Funds.

We trust that the appeal for further financial support which has been issued by the Garden Cities and Town Planning Association will meet with the support it undoubtedly deserves. There can be no question of the value of this movement as a powerful influence tending to the uplift of humanity. Although in essence perhaps a reform which has social rather than artistic ends in view, rightly considered the two things are one. Architects owe much to its efforts, and should do everything in their power to help it. This Society has long carried a heavy financial burden, having been responsible for the propaganda of this movement from the start. This work increases in magnitude day by day, and the Society is now endeavouring to raise a guaranteed subscription for the next five years of at least 1,000*l.* a year. We hope that all those interested in civic design, who must realise how important this movement is, will respond to the appeal, so that the Society's efforts shall not be hampered by a lack of adequate financial support.

Liverpool Custom House.

In a "Note" in our number of May 31 last we adverted to the proposals for building a new Custom House for the port of Liverpool in lieu of the existing structure, which, we may here mention, was built in 1828-9, after John Foster's designs, on the site of the Old Dock (1710-1826), at the joint expense of the Government and the Corporation. We now read that the project to erect a new Custom House at the pier-head is abandoned. It seems that no settlement could be arrived at as to the division of the land in pursuance of an arrangement made between the Corporation and Messrs. Cubitt & Co., of London (who held an option to purchase the entire site of the Old George's Dock not yet utilised), whereby the latter were to retain two-thirds of the land and convey one-third to the Government

for the new building, and that all the site will be now acquired by the Cunard Shipping Company for their new offices. The Treasury had agreed to defray the cost, estimated at 100,000*l.*, of the Custom House upon a site to be provided by the Corporation, and it is understood that the Mersey Docks and Harbour Board would contribute 10,000*l.* The Old Dock, opened in 1710 and closed in 1826, was the first after its kind constructed in England; George's Dock, since enlarged, was made in 1760-1.

Sessional Papers at the Institute.

The programme of the papers to be read at Conduit-street during the session 1912-13 has now been issued, and it is on the whole a fairly interesting programme, if it includes nothing—shall we say?—of sensational interest. We are glad to observe that we are to have some papers on modern work abroad, and that the more or less archaeological type of subject, interesting as it may be, is not represented at all, for Mr. Ball's paper on "Bath and Wells" will no doubt be architectural rather than archaeological. We welcome the papers on modern work abroad, because it is interesting to have brought home to us in a personal way, as a paper at the Institute does, what our confrères in other parts of the world are thinking about. Mr. Baker, of Toronto, is to read a paper on "Canadian Work"; Mr. Thomas Hastings, of the distinguished firm of architects, Carrère & Hastings, of New York, one on "Modern Architecture," which, we presume, will include the architecture of his own country, while to M. Billerey is allocated the subject of "Modern French Architecture"—all interesting subjects. Mr. Cecil Brewer, the Godwin Bursar of last year, and the architect, with Mr. Dunbar Smith, of the new Cardiff Museum, will no doubt in his paper on "American Museum Buildings" throw some additional light on the problem of planning connected with buildings of this type; while the papers on "Modern Steel Construction," by Mr. F. N. Jackson and Mr. Bernard Dicksee, and "Modern Hospitals," by Mr. A. Saxon Snell, will be no less instructive. Mr. Horace Porter's paper on "The Walls of Visby, Gotland," suggests the archaeological view, but it covers new ground, and Mr. Porter is not likely to let the architectural issues of his subject escape him.

MODERN PICTURES AT THE GOUPIL GALLERY.

It is no small praise to say that the seventh exhibition of the Goupil Gallery Salon, which was opened last week, is equal to any of its predecessors; we are not sure that it is not quite the best of the series. It is international—that is to say, that the pictures are either by French or English artists—but the prevailing atmosphere, even where English work is concerned, is French. Although the work represented is modern, the Post-Impressionists' influence is scarcely felt, except in the examples of those determined Post-Impressionists, Mr. Roger Fry and Mr. Peploe. Mr. Fry is Post-Impressionist under the influence of Cézanne (who would be a little surprised if he could see what is being perpetrated to-day), while Mr. Peploe is frankly a cubist, or something

of that sort. As a whole, however, the exhibition is eminently sane. We do not in any case need a manual of new theories to appreciate the quality of the pictures, some of which possess a definite architectural interest. There are some clever sketches of St. Mark's and the Campanile by Mr. Pearce. Skelner shows an admirable study of the Fountain Court at Hampton Court, while Mr. Jamieson continues to discover excellent subjects in the statuary and pleasant waters of the park of Versailles. Time was, before the landscape school dominated the outlook of European painters, when architecture formed one of the chief accessories of pictorial composition. Within recent years Mr. Sargent has shown us that it may provide quite as good material as a portrait for the subject of a picture. If painters were to realise the psychology that may be discovered in fine design in building we should probably find the walls of picture-galleries less burdened by uninteresting repetitions of outworn effects. In the case of portraiture, for instance, the incessant striving for a new pose, for an artificial resemblance of naturalness which deceives no one, would be less apparent. There are two portrait studies of the kind at the present exhibition, which possess considerable technical qualities, but which are not otherwise interesting. M. Jacques Blanche, always an enterprising painter, breaks fresh ground in his studies of still life. They are not merely the detached affairs to which we are accustomed, a group of flowers in a vase, with a glass or two and some cutlery, nicely arranged on a glistening table (for the reflections) for the purpose of being nicely painted. The still-life formula is one of the most rigid in the art of painting. M. Blanche's pictures suggest none of this limitation of imaginative outlook; his flowers and vases and other table furniture provide not only a rich arrangement in colour, but also suggest that they form part of a rich and luxurious habitation, the living character of a room. The tenantless interiors of Mr. Patrick Adam obtain, after a staid fashion, something of the same quality of suggestion; they evoke the type of the absent inhabitants almost as clearly as if they had been portrayed. We must not omit also to mention the still-life studies of Mr. Livens and Mr. Connard. M. Cottet's two pictures of the coast and sea of Brittany (which deserve, by the way, a better position than below the line) are the work of a painter of a more individual temperament than the majority of his companions. His work is as far removed from audacious technical display as it is from purely theoretic artistic expression. We do not know whether M. Cottet is himself a Breton, although he has so closely identified himself in his art with its scenery and people that he would in any case seem to have caught the Celtic spirit. No painter has interpreted the life and natural scenery of Brittany more sympathetically. Above all, a naturalistic painter, and one of the innovators among French artists of this movement of a generation or so ago, the purposes of his art have been put to the service of a profound interpretation of things, not to a superficial parade of technical fireworks. We have scarcely touched the fringe of this most interesting exhibition, which offers so many contrasts in methods of work of first-rate importance, and which is never for a moment dull, while its animation is that of living and serious art.

CASTLE CARROCK SEWERAGE.

The Brampton Rural District Council have now approved and accepted the scheme of sewerage and sewage disposal for Castle Carrock prepared by the Engineers, Messrs. Taylor & Wallin (Mr. Harry W. Taylor, A.M.Inst.C.E.), of Newcastle-upon-Tyne and Birmingham. The sewage will gravitate to the outfall and be disposed of in modern bacterial works. Application for the necessary loan is to be made at once to the Local Government Board.

A COMBINED ordinary meeting and Camera, Sketch, and Debate Club meeting of the Architectural Association was held on Monday at Tufton-street, under the chairmanship of Mr. Gerald Horsley (the President).

Mr. Hall (Hon. Secretary) made the following announcements:—

That the annual Conversazione will be held at 18, Tufton-street on Thursday, November 21, at 8 p.m.; the next meeting of the Camera, Sketch, and Debate Club will be held on November 7, at 8 p.m. (Novices' Night), when papers will be read by Messrs. H. Bart Tunnard and H. E. Moss; and that arrangements have been made for a visit to be paid to the Wesleyan Church House on November 16 (Saturday). Members to meet outside the building at 2 p.m.

The President announced that the following had been elected members:—

F. A. Addey, Wakefield	L. Marnus, W. Ken-
R. Atkinson, West-	bridge-on-Wye
J. Barber, N. Finchley	E. Meredith, New-
G. W. Callender, Queen	J. L. Murgatroyd,
Victoria-street	Pinner
R. D. S. Charles, Stan-	R. J. G. O'Donoghue,
more, Middlessex	Epsom
J. O. Cheadle, Ken-	D. J. Parr, Hampstead
sington	L. Payne, Wyatt-
G. G. Clarke, Stockwell	Brien
L. Clark, Glamorgan	I. B. Pite, Regent's
L. Clayton, Tunbridge	Park

E. Lyne, jun., Street-	gate-street
ham	F. P. M. Woodhouse,
R. H. Maddock, Sutton	Wimbleton

It was announced by the President that Mr. W. G. Newton had been nominated to fill the vacant office of Librarian, and Mr. H. M. Fletcher to fill the vacant seat on the Council. On the motion of Mr. Keen, seconded by Mr. Curtis Green, the Report of the Council for 1912 (printed in the Brown Book) was adopted.

SMALL COUNTRY HOUSES OF TO-DAY.

Mr. Lawrence Weaver gave an address on "Small Country Houses of To-Day," which was profusely illustrated by lantern slides. In his opening remarks he wished to guard himself against any misconception as to the way in which he proposed to treat the subject. He hoped no one would think he was there to instruct architects about their own business, and still less to advance any theories as to the course the design of small country houses ought to take, or was likely to take. It was natural enough that he should have views of his own about the various streams of tendency in modern design, and perhaps

they would allow him to say that he did not think the sun of architecture first rose at Regent's Park. He was also unable to agree that Wren was a foolish old person whose chief function was to pave the way for the final glories of Soane and Nash. That, however, was by the way. His present business in the matter was to act the part of a showman and to try to make clear his excellent and varied was the work which the architects of to-day were doing, and to dispel, as far as might be, some of the misapprehension which clouded the minds of people who are proposing to build, and who endeavour to make people understand the building of their houses was the one branch of modern art in which they were much concerned, and he conceived it his duty to show as many widely differing types of houses as could fairly be said to represent an honest and unaffected outlook on the problem of fitting suitable houses to greatly differing needs and personalities. It was obvious that he must in the pursuit of this idea show many houses which some of them would think poor or even positively bad, but he could claim that he had never written with appreciation about a house which did not seem to him to have some definitely good point, either in its planning or its treatment, and that did not serve as text which enabled him to explain how difficult were the problems which confront the architect. It was, then, in the spirit of the showman that he was going to put on the screen that night a series of houses chosen almost at haphazard from the large number which he had seen as described. As he had very rarely written about a house without first seeing it, he had the advantage, which they would admit was a peculiar one, of learning from clients what they thought about their houses or about the ways of architects, and it might be that he would be able to indicate some point of view of the layman which might not always have made themselves apparent to architects. He would begin the series with one or two houses by Mr. Norman Shaw and Mr. Philip Webb, as they would agree that the great structure of modern architecture had been very largely built on the foundations which he laid, though he did not mean to exclude from that pioneer work such honoured names as Eden Nesfield, Geo. Devey, and others. Mr. Weaver proceeded to show a large number of photographs of houses, and divided the series into the following classes:—(1) XIXth Century Revival; (2) Traditional; (3) Influence of Materials; (4) Direct Historic Influence; (5) Foreign Influences; (6) Restorations; (7) New Ideas; and (8) Gardens. His first view was of the "Red House," built in 1859 by Mr. Philip Webb for Wm. Morris, which he described as the first red-brick house built in the XIXth century with conscious intention to use red brick for artistic design. It contained the first piece of modern furniture in the great press made by Wm. Morris, with paintings by Burne-Jones; "Coneyhurst," at Ewhurst, Surrey, was built by Mr. Philip Webb towards the end of his work, and the plan was much better than with the "Red House." The other two examples shown in the first class was "Dawpool," by Mr. Norman Shaw, and addition at "Chesters," by the same architect. Class (2) the lecturer showed the house near Woking built by Mr. Horace Field for himself, two houses built in Leicestershire and Gloucestershire, by Mr. Ernest Gimson; "Coldcote," at Moreton-in-the-Marsh, by Mr. Guy Dawber a cottage at Llanfairfechan, by Mr. North a cottage by Mr. Curtis Green; "Ardkinglas," built by Sir Robert Lorimer; a house in Scotland built by Mr. Deas for himself "Gilliams Birch," a house of the typical Sussex farmhouse type, by Mr. E. J. May "West Chart," a house by Mr. Turner Powell "Sunnymead," near Wadhurst, by Mr. Frank Chesteron; the "Deanery Garden," Surrey by Mr. Lutyens; "Dyke Nook," Accrington Lancashire, by Mr. Brierley; "Dawstone," Westmorland, by the late Dan Gibson; and "Acres Mead," Kent, by Mr. Brewer. Commenting on the various houses, the lecturer said that before he saw Mr. North's house he had a prejudice against Welsh slates, but after seeing it he appreciated how good the material was if used in the right way in the right country. Mr. North got them to cut the slates of reasonable thickness and reasonably small, and also got a quarry owner to reopen a quarry, from which he got beautiful grey and golden slates. With regard to the late Dan

ibson, he had been struck with the affection in which he was held by his clients. Amongst other houses illustrated were:—"Redlands," Birmingham, by Mr. Bateman; "Four Oaks," Professor Lethaby; "Winterbourne," by Mr. Hall; "Moorecroft," by Mr. Buckland; a house at Norwich, by Mr. Morley Horder; a room in house at Birchington, by Mr. Arthur Bolton; group of cottages at Checkendon, by Mr. Maxwell Ayrton; "The Platts," Petersfield, by the late W. F. Unsworth; an interior, by Mr. Aillie Scott, at Wimbledon; a Norfolk house, Mr. E. S. Prior; and a house at Hertford, Mr. Walter Cave. Mr. Weaver remarked in the important school of architecture at Birmingham, which seemed to have established something like a definite local tradition of building. Messrs. Bateman, Bidlake, Ball, and others, he thought, all followed more or less the footsteps of Mr. Lethaby. Birmingham architects were very fortunate, because Birmingham men liked to build their own houses, and for the size of the city there was a larger number of satisfactory houses than any other place he knew of. Of the Checkendon cottages, the lecturer observed that it was one of the few places where half-timber work had been satisfactorily done. To see half-timber work in a London suburb where one could not imagine there was an adjacent forest was not satisfactory. Of houses in Class (4) Mr. Weaver mentioned work by Mr. Lutyens, R. Bateman ("Castle Bromwich Rectory"), R. Macartney (at Woolhampton, Berks), R. Ernest Newton (at Wokingham), Mr. Albert Oole (at Wimbledon), and Mr. Goodhart Rendle. As examples of houses showing foreign influences, he illustrated the house at Leighton designed by Mr. Lutyens for Lady Weston, showing South African influence; a house at Camberley, by Professor Reginald Lomfield, in which French influence could be seen; a house by Mr. Detmar Blow, near Barnham; the Dormy House of the Walton Heath Golf Club, by Mr. Lutyens; a house by Mr. Ernest Willmott at Totton, near Southampton; and a house designed by Mr. Arthur Bolton in the Italian villa manner at Wharfedale. As instances of good restorations, he referred to Mr. Corlett's work at Garsley, York; Mr. Walter Brierley's work at Whitley Hall; and Mr. Quennell's house, Surrey, by Mr. Basil Stallybrass. In class (7) he illustrated Mr. Edgar Wood's "Upmeads," but said he did not think the architect had made out a case for the abolition of the arched roof. In conclusion, Mr. Weaver showed photographs of the garden at Mr. Inigo Triggs' house at Little Boarhunt; R. Lutyens' garden at Marsh Court; and a garden by Mr. Bidlake at Birmingham.

Mr. Quennell, proposing a vote of thanks to the lecturer, said that, looking at the house designed by Professor Lethaby twenty years ago, one could not help feeling that there had been no marked improvement since then. They were only doing very traditional work. The best part of their work seemed to be the planning. They planned a skeleton which could be roofed, and then they went back to the Jacobean manner, and tried various of putting tiles in gables and having thick mortar joints, and so on. He thought the average client looked very much on a house as he would look on a motor-car. To the client it was a practical thing, and if he got a little bit of art thrown in for the same money he was satisfied. The client had to live in the house, and whilst one felt that the planning of the house was good, yet when they came to the elevations they rather broke down. A thing which had worried him lately was the practical question of heating and cooking, and he thought in the next twenty years they ought to be able to get a kitchen range which would heat the house, cook the food, and give a supply of hot water. In looking at the photographs they also saw a lot of the antiques of which they were somewhat tired. In these days, to ask a person to sit in a chair made for a person in chain armour did not seem to him to be right. The interiors of houses with the old furniture looked quite as long as they kept the lady with the noble skirt out of the picture. In these days people had to be more practical and study hygiene and drains and that sort of thing. Houses were still abominably bad, and Professor Quennell, of Liverpool, in criticising some of the modern city houses, considered that the problem could be solved by much more simple and traditional ideas.

Mr. Jenkins, in seconding the motion, thought that the modern houses were a great deal better than the blue tiles and stock bricks and all the things one saw a few years ago when architects did not try to build rather on the old lines. He would like to hear what Mr. Weaver had to say as to bathrooms. They seemed to be tending towards the time when a bathroom, or at least a fitted lavatory, was required for every bedroom. The open loggia was an excellent thing, as one could breakfast in it during a large portion of the year. He believed there were several economical heating systems on the market which would allow them to keep the coal bill down. In some of the plans shown it appeared that the servants would have to go through the hall every time they had to answer a call at the front door.

Mr. A. T. Bolton remarked that the whole question resolved itself into trying to find some compromise between the ideas of the client and that of the architect as to what the house ought to be. If they had certain qualities they could not have others, and the whole trouble in house building arose from the fact that the public did not understand. The client wanted a Jacobean manor-house and the wife French windows, and so on, and the house became a hideous muddle. In Birmingham the man who could afford it acquired a freehold and built a house, and if that was done in the South it would be much happier for everyone concerned. Now the builder put them up as a financial operation, and the work was credited to architects. With regard to the traditional cottage way of building houses, the old builders knew a lot about economical building, and whilst it was all very well to talk about building classical houses, yet it was a remarkably expensive thing to do.

Mr. Dale agreed with Mr. Quennell in wishing they could build something a little more characteristic of themselves. Perhaps development might be made in the direction of hygiene, and there were no doubt valuable suggestions to be got from hospital planning, although he did not suggest they should make their houses like hospitals.

Mr. Arthur Keen considered it a regrettable thing that they could not arrive at any possible standard in house design. The plans of houses were generally very good and met modern requirements, but there was a degree of affectation and a sense of over-design about most of them which could not fail to be disastrous. Mr. Norman Shaw had designed houses of all kinds which were very admirable, but he never seemed to have arrived at a standard, and he was beginning to despair of ever arriving at a recognised method of building a house.

Mr. C. Brewer failed to see any analogy between a house and a motor-car. A man bought a car for a few years, but with a house it was altogether different. He also thought that if an architect had shown the photographs he would have been a good deal more severe than Mr. Weaver had been with regard to certain points. The motion having been carried,

Mr. Weaver, in reply, said Mr. Quennell was anxious for modern methods of construction, but there were by-laws which prevented anyone indulging in larks. The devising of an ideal kitchen range was not the business of the architect, and people who ran foundries would probably understand more about such things. If two bathrooms could be squeezed in a house it was an enormous advantage, and with the client that was often the test of successful architecture. There never would be a standard of design when they had forty millions of people in a country, most of whom thought they knew all about architecture. Mr. Philip Webb was consistent, but which of them could afford to take up the attitude which he took? He knew several architects who always built in the same spirit and had succeeded in retaining their client's regard, but it was largely a question of personal character.

The President announced the next meeting on November 11, at 8 p.m. Paper by Mr. J. A. Marshall, entitled "Marbles Used in Greek, Roman, and Byzantine Buildings."

THE BRITISH SCHOOL AT ATHENS.

A SPECIAL meeting of the British School at Athens was held on Tuesday evening at the Rooms of the Society of Antiquaries, Burlington House, under the Chairmanship of the Right Hon. Lord Justice Kennedy. A collection of drawings and photographs by members of the School and also the Finlay Memorial were on view.

The Chairman, in his opening address, referred to the pleasure it gave him to be present as one who had a firm belief in the supremacy of classical learning as an educational instrument, and who had found in the classics, and especially in the Greek classics, an endless refreshment in the turmoil of an active life. He heartily congratulated the School on its success, for the work it did was not merely noble in itself, but was productive of real and substantial benefit. The records of the School enlarged their store of knowledge of one of the most interesting regions and one of the most interesting peoples that the world knew. The work was not devoted altogether to what they were apt to call the classic period of Greece, but it was within the purview of the Institution to investigate the later periods through which the region had passed. He wished he knew a great deal more of what was called the Hellenistic period, and still more of the period which, alike in religion and thought, as well as to some extent in the realm of law, was comparatively unknown, viz., the Byzantine period. In spite of the work of Geo. Finlay, he felt far less acquainted in reality with the life lived during the first eight centuries after Christ than of any other period of well-known history. He was inclined to irritability when people divided history into ancient and modern, and spoke of languages as being dead or living according to their proximity to our own era, for it was impossible to separate by inter-compartments that which had contributed to the formation of modern life and character and thought. The Greeks and Romans, through their works of literature, were as alive as any so-called modern nation. He thought the School had fulfilled the prophetic words of Richard Jebb in 1883, when he said it was not to be exclusively a school for specialists of archaeology, but was to be in the most comprehensive sense a school of classical study in Greek lands. This was illustrated by the fact that classical teachers and teachers of the cognate branches of geography and topography who were working in the colleges and schools had availed themselves of the facilities which the School gave at Athens, and he regarded that as of vital interest and important, in the sense that it created a claim not only on the Universities and the schools, but upon the public generally, who cared for the best education to subscribe. There never was a time when the life and the literature of Greece ought to be more studied than the present. We lived in days which, whether they could be called vulgar or not, in many other respects were at least not marked by a want of luxury or absence of advertisement. These were days in which they were not able to say that there was not a great deal which was false and untrue in what was preached as the best art and the coming art and literature. Therefore, he hoped they would have not less but more of that acquaintance with the great Athenian nation which, small in numbers, was great in intelligence and sanity of thought; which developed a humanism which to him, after Christianity, was one of the noblest features of the thought of mankind in any age; and a love of beauty extending to morals and every action of the common life. To quote the words of an able writer whose book he had recently read, "The Greek genius has its lesson, especially for us, in their marvellous directness in the view of life which keeps men from humbug and from false sentiment, which clarifies their thoughts, and teaches them to verify their emotions." And, lastly, he thought the lesson of individualism, the freedom of individual life, and life which was a conspicuous trait in the Athenian in his best days, was something with which the rising generation should be acquainted. They owed to them a great deal of literature of all kinds which they produced in the most perfect form that the world had seen, and it might be that through the efforts of the School, and of other like institutions, some statesman of some modern European country might be able to say to his

St. John's Church, Herne Hill.

Mr. Leonard Martin, F.R.I.B.A., Architect.

people in the future what a great Athenian statesman could say with truth of his countrymen in Athens: "We are lovers of beauty without extravagance and of wisdom without effeminacy."

Mr. R. M. Dawkins, the Director, gave an account of the site of Datcha, the ancient Stadia, on the promontory of Cnidus, on the western coast of Asia Minor. This was to have been the object of the School's excavation this spring, but the outbreak of the Turko-Italian war made it necessary to postpone the work. It is hoped to carry out the excavation in the spring of next year. The part of the site selected has already yielded a number of antiquities to local treasure-hunters, and Mr. Dawkins thinks there is every reason to suppose that below the surface are the remains of an important sanctuary or temple of the archaic period of Greek art. The researches of the Librarian of the School, Mr. F. W. Hasluck, have added considerably to the interest of the site. The story of the Knights of Rhodes searching for building material to repair their Castle of St. Peter at Budrum, the ancient Halicarnassus, and how they found a building covered with

sculptures, which they first admired and then destroyed, is well known. This building has hitherto been supposed to have been the famous Mausoleum of Halicarnassus, one of the seven wonders of the world; the sculptures from which are now in the British Museum. Mr. Hasluck has shown that there is good evidence that this view is incorrect, and that the building found was not at Halicarnassus, and was consequently not the Mausoleum, but some quite different building at the site now known as Datcha, the distance of which from Halicarnassus by sea is inconsiderable. Of so fine a structure some remains must have been left, and it is hoped that an examination of the site will reveal them; in any case, Stadia must have been a place of some importance to have contained so magnificent a structure.

Mr. Wace then briefly described the excavations of the School in Thessaly, and outlined the results of exploring journeys undertaken by Mr. M. S. Thompson and himself in Macedonia on behalf of the Macedonian Exploration Fund. At Halos, in Thessaly, some experimental excavations were made in the Necropolis. The principal results were

obtained from a tumulus, one of a group of ten. This, which is 2 metres high and 17 in diameter, was found to conceal sixteen burnt graves or pyres. The bodies had been burnt on the spot, and then a cairn of huge slabs about 1 metre high, was heaped over them. Later, the tumulus of earth was built over the group of pyres. With the dead were burnt also all their gear, quantities of geometric or Dipylon pottery, iron knives, and iron swords and spears or bronze brooches and bracelets. In the six pyres which contained bronze brooches and bracelets no weapons were found, consequently those are probably the graves of women. While in those which contained the iron weapons, there was no bronze, and these are the graves of warriors. A warrior's equipment consisted of an iron sword, an iron spear, and two or more long iron knives. No traces of helmets or body armour were found. These pyres, which are most interesting in that they recall the Homeric method of burial, belong to the developed iron age, and date probably between 900 and 800 B.C.

In Macedonia many important inscriptions have been found, including an important boundary decree of Trajan settling the frontier between Thessaly and Macedonia, and three letters written by Demetrius II. on behalf of his father, King Antigonus Gonatas, to the city of Berrhœa. The site of Argos Oresticum has been identified, and considerable attention has been paid to the meeting of Byzantine Churches worth further and detailed study.

The explorers have devoted some time and trouble to the study of the Wallachs or Vlachs, the southernmost branch of the Rumanian race. The manners and customs of this little-known but interesting people, which the lecturers proceeded to illustrate, are exceedingly interesting from an anthropological point of view.

CHURCH OF ST. JOHN, GUERNSEY-GROVE, HERNE HILL, S.E.

This building, recently completed, consists on the lower ground floor of large assembly hall with platform and classrooms.

In connexion with the hall is a kitchen with gas coppers for tea and coffee, china and chair store and lavatories. The vestry is also placed on this floor and by means of a special staircase communicates with the church on the upper ground floor. This special staircase would also be used as an emergency exit in case of fire.

Externally the building is of red brick of varied hue with Portland stone dressings to windows and doorways, etc., with red tile roof and bell turret covered with oak shingles.

Internally the walls are plastered and finished pale cream; the pews are stained dark green, and the woodwork of altar, paneling at back of same, choir stalls, pulpit, chancel rail, and joinery generally of Austrian oak slightly fumed.

The paving of the church generally is of pitch-pine wood block "riff sawn"; the steps and paving of chancel are of white and green marble.

The gas fittings were specially designed by the architect and form a pleasing feature of the interior.

In spite of the usual trouble of small funds available, an effective interior has been produced, the design of the whole of the fittings having very wisely been left by the Building Committee to the architect, who has thus been enabled to produce a harmonious whole, simple in character but dignified in proportion.

The general contractors were Messrs. F. & H. F. Higgs, of Station Works, Hinton-road, Herne Hill, S.E., and the architect was Mr. Leonard Martin, F.R.I.B.A., of Seymour House, Waterloo-place, Pall Mall, S.W.

ARCHITECTURAL SOCIETIES.

Liverpool Architectural Society : St. George's Hall.

Mr. Hartwell Grayson, President of the Liverpool Architectural Society, inaugurated the sixty-fifth winter session on the 21st ult. at the Society's Rooms with an address, in the course of which he said:—"The topic of the moment is undoubtedly the fate of the St. George's Hall podium. The controversy, which has now lasted two years, should be

settled during the winter. In the meantime the interest of the public has been most gratifying. Quite a number of people are sincerely trying to understand the points at issue. Unfortunately, many believe that plain walling represents cheapness and shows lack of imagination, and they cannot understand what we mean by epithets such as "repose" and "strength." The difficulty of appreciating the simple is perhaps a heritage from the Gothic revival. The man in the street remembers that one of the most delightful characteristics of Gothic is its adaptability to an irregular site. He forgets that Renaissance architecture is not so elastic and that Greek is infinitely more exacting. The last demands and insists on uniformity in both site and surroundings and ample spaciousness in these surroundings. This truth was obvious enough to Elmes and Cockrell when they designed St. George's Hall, but it is hard to explain to laymen. Elmes did not take the chief entrance at the southern end of the Hall because it was lacking inside and outside fore and aft in vista and in spaciousness, but more especially because on the east front there was a fine level "place" with ample room for a dignified approach. His plan is logical, scholarly in the details, and admirably suited to the plan and to the site. Notice his treatment of the steps to Lime-treet. He gives two flights of ten steps each separated by a 10-ft. landing. These steps have a bare 6-in. rise and 15 in. tread. They are completely in scale with the colonnade, but the actual steps seem fully steep when compared with those at the west and north entrances to St. Paul's Cathedral, which have 4½-in. treads and 5-in. risers; or those at the main entrance to the British Museum, where the treads are also 14½ in., but the risers 4 in. At the south end of St. George's Hall Elmes maintained the same level of the colonnade for the portico; a different level might have introduced element of restlessness. The portico stands less than 40 ft. back from St. John's-lane, and is about 29 ft. above it. For a descent with steps to match those in front of the colonnade at least sixty would have been required. The space necessary for sixty steps with adequate landings is about 120 ft.

It is not surprising, therefore, that Elmes decided that no descent to St. John's-lane was practicable. Instead, he formed a spreading base, composed where seen in perspective of eight blocks of masonry, 15 in. high and 2 ft. 6 in. wide. They, again, are wonderfully in scale with the whole design. Where not seen in perspective, close to the wall east and west of the portico and on the axis, these blocks are divided into two, and

St. John's Church, Herne Hill.

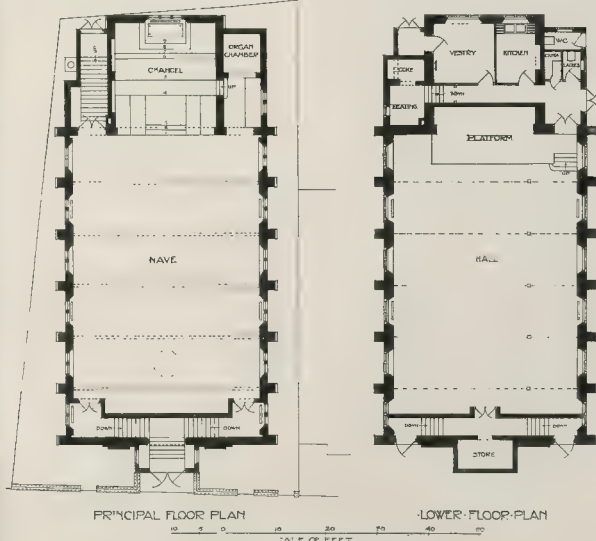

Mr. Leonard Martin, F.R.I.B.A., Architect.

make an uncomfortable and undignified stairway, perhaps just good enough for the few who use them. Below the last step there is a stone terrace 23 ft. wide, ending in the podium—a massive battered wall of masonry, unbroken for its full length of 160 ft. The spreading base, the platform, and the podium

are logically just as much part of the composition as the sculpture in the pediment. They blind the eye to the fall in the ground, they separate the building from the turmoil of a busy thoroughfare, and, above all, they add strength and power to the design. The plan temporarily approved by the City Council destroys all Elmes's carefully-thought-out efforts. The podium becomes two flanks, two pedestals, and a space. The platform is split into three landings. A very dangerous flood of forty-seven unnatural steps flows over on to the sidewalk. The aloofness of the Hall from the tramways and traffic is gone. And why? Who wants to climb forty-seven steep steps? Is there really no other site available for the proposed Royal memorial? Will an equestrian statue, blocking the traffic, placed on one side of the steps, almost on the top of a public convenience, meet with the approval of the Royal Family? No answer has ever been or can be given to these simple questions.

There are only three possible benefits. The first is to the building, for the abruptness of the finish between the podium and the stone-ward will seem less marked. The second is to ourselves, for we have been unofficially informed that in the Local Government Board Inquiry evidence of an architectural character will be admissible. This will form a most valuable precedent. Far too many so-called public improvements have been passed where doubtful utility has been the excuse for unnecessary vandalism. The third benefit is to the citizens of Liverpool. The controversy has opened their eyes to the world-wide fame of St. George's Hall. It is the one art treasure that Liverpool possesses. When Harvey Lonsdale Elmes ended his brief life of thirty-three years he had gained admittance to that select band who have created something to be admired and studied, not merely by their neighbours and contemporaries, but by students of all nations and all times. He was not, of course, one of the world's greatest men; he was not even a pioneer. He was the last of that scholarly

Mr. Leonard Martin, F.R.I.B.A., Architect.

band of English architects who worked steadily on in the footsteps of Inigo Jones until they were snuffed out by the Gothic revival. Elmes carried classical architecture just one definite step forward. He had a very great opportunity, and he stamped it with the hallmark of the "grand manner." No native art-worker since Wren, except possibly Sir Joshua Reynolds, has left such world-wide fame behind him. It is therefore not surprising that the Council of the Royal Institute of British Architects last Monday unanimously resolved to protest against unnecessary meddling with St. George's Hall, that a similar resolution has been passed by the Historic Society of Lancashire and Cheshire, and that individual protests have been received from Europe and America. However, thanks to the generosity of numerous members and friends, there are ample funds for fighting the city plan whenever an opportunity occurs. My own impression is that no opportunity will occur. The scheme is rapidly dying. It was never popular, and its authors will be glad to quietly let it drop. Some lessons, however, have been learnt by both the City Council and the public. No more such schemes for altering our landmarks will be launched at the suggestion of an eminent sculptor. Local advisers, whom in the past the City Council has gaily overlooked, are not likely to be permanently ignored. As defenders of the *status quo* this Society has earned some respect and aroused some local patriotism. When next a big public improvement is projected the ratepayers will expect Liverpool architects to be consulted.

A cordial vote of thanks to the President, coupled with a recognition of the services of a gentleman who had exhibited through a new electric lantern seventy slides of recent and important works by members of the Society, was accompanied by a consensus of opinion in support of the Presidential declaration that St. George's Hall must not be touched.

Mr. A. Thornely (a Past-President) said one could not understand why the original scheme for the proposed alteration was put forward, and though the amended design was a vast improvement upon it, the public would see that the Hall must be let alone, and not touched in any way.

Mr. Eccles endorsed these remarks, agreeing that the podium must not be altered.

Manchester Society of Architects: "Growth in Architecture."

At a meeting of this Society on October 24 Mr. Halsey Ricardo lectured on "Growth in Architecture."

In Professor Lethaby's little book on architecture he said there is that pregnant statement, "No art that is only one man deep is worth much. It should be a thousand men deep." It is much the fashion to accentuate the names of the architects of famous masterpieces and to regard them as the sole creators and originators of their work—to regard such men as Brunelleschi, Michelangelo, and others as creative ends in themselves, as independent phenomena who individually affected and controlled the tendency of their time. Yet from another point of view we may look on them as resultants rather than causes. Their environment has produced them, not they their environment.

The stream of life is immortal and the various mortal shapes in which it is manifested are the outward signs of its current, and owe their characteristics to the composition of the stream at the moment of their appearance. In our tributary of this stream the building instinct is immortal. Its manifestation at any period depends upon the ideals, the structural resources of the time. The dominant determining factor is the main stream of life. The history of the world is shown by its art with faithfulness exceeding all other record, with an eloquence unmediated by the craftsman.

This Mr. Ricardo then proceeded to show by a masterly view of the history of the arts, commencing with a contrast between the Assyrian bas-relief, with their tale of cruelty, strife, and oppression, to the Egyptian hieroglyphs, expressing their belief and hope in a future life, their delight in nature and animal life. Especially loved was the account of the passing of Medievalism and the dawn of the Renaissance, the lecturer emphasising the growing tendency of the craftsman of the

Middle Ages to perfect his own craft, giving it individualistic excellence, losing his view of the whole work, and the characteristic of the mediæval genius.

The emergence of the specialist paved the way for the revival of learning. Coming to modern times, Mr. Ricardo maintained that the impress of our social, religious, and public life on any example of our work is greater than that of the individual architect who designs it. The buildings of our age express its temper; and posterity will look back upon our present period as one of high endeavour, even if we have failed in high achievement.

Nottingham Architectural Society: President's Address.

The opening meeting of the winter session was held at the Society's Room on the 23rd ult., when the President, Mr. Ernest R. Sutton, F.R.I.B.A. and member of the Council of the Royal Institute, delivered his Presidential address, in the course of which he said:—

"The Council have been in communication with the University and School of Art authorities on the question of establishing classes embracing the subjects included in the Intermediate and Final Examinations of the R.I.B.A. It is most gratifying to be able to report that these classes have been instituted, and it is hoped that the students will show their appreciation of the steps taken by the Council by attending the classes, which should be of the greatest assistance to those preparing for the Institute examinations. I hope that ere long all architectural classes for students throughout the country will be linked up with our University centres and the R.I.B.A."

The Council have instituted a special Committee, to undertake all matters connected with the Town Planning Act. I am glad to know that Mr. A. W. Shelton has consented to join this Committee. It is proposed that the Committee shall get in touch with all local authorities at an early stage, and before they have actually prepared the completed scheme, in order that suggestions can be most effectually made both in regard to the planning and regulations comprised in the scheme.

A Trade Question.

There is a question that will, I believe, have to be considered by us in the near future. That is our position with regard to the contractors adding 10 per cent. in all provisional items irrespective of the amount or class of work. In many cases this amount appears to be excessive, and more especially when the contractor does not add anything for his own services in connexion with his subcontractors. Let me just give you an illustration:—You have a block of warehouses; the heating or electric lighting amounts to, say, 500*l*. If we include this in the quantities the client will have to pay an additional 10 per cent. of 50*l*. If it is kept out of the builder's contract, our client will have certainly the trouble of drawing two cheques, but he will be 50*l*. in pocket less the penny stamp for the cheque.

Now, what is our position? If we are instructed by our clients to omit all provisional items and treat them as separate contracts, has the builder any grounds for complaint? On the other hand, if we do not explain the 10 per cent. commission, what is our position with regard to our client?

A Nottingham Street Improvement.

I should be neglecting my duty as your President were I not to make some reference to the finest improvement scheme undertaken by the Corporation for many years—the widening and rebuilding of Carrington-street. The inability to successfully manage our street architecture appears to be almost a national weakness when one considers the prominent examples we have before us. Look, for instance, at the Regent-street rebuilding scheme, the "Piccadilly blunder," and, again, the collection of promiscuous buildings in Kingsway. Now, with regard to Carrington-street, I hope I am not getting on thin ice, but it is foolish to ignore the lessons which past mistakes have taught us. The initial mistake was sacrificing too much to the individual shopkeeper. The architect should have been given a free hand to design a façade of a monumental character, and worthy of one of the finest streets in the

city, and not be hampered by the hundred and one special requirements of a vast number of tradesmen carrying on different trades. It is not very difficult for us to realise what a magnificent street our President would have given us if he had been allowed to carry out the whole of the buildings on some such similar lines to the very successful Carrara terra-cotta façade. The opportunity of obtaining a grand approach to our city, flanked on either side by buildings worthy of such a position, has now unfortunately been lost.

Competitions.

I am introducing the subject of competitions this evening with the object of raising a discussion on the question. I am of opinion that we should use every endeavour to limit the number of competitors in all cases. In almost all open competitions the competitors expend collectively in the preparation of their designs a sum far exceeding the fees that the successful architect receives for the whole of his services. This is a very expensive luxury for the profession to be saddled with, and one which we can ill afford to keep up. I cannot see how the cost of preparing competition drawings is to be reduced. Yet, must, if you are to stand a chance of success, work out your scheme in every detail, and the draughtsmanship must be of a high order.

The conditions as revised by the R.I.B.A. Competition Committee are much improved, but I should like to suggest a further improvement—that the responsibility of nominating an assessor shall be in the hands of the Committee, and that the assessor shall be an architect who has either specialised or is acknowledged authority on the particular subject.

The Royal Academy Exhibition.

I should like to refer to the Royal Academy Exhibition. I think we have a real grievance here with regard to the amount of accommodation allocated for the exhibition of architectural drawings, though I can quite imagine the authorities replying:—

"It is the least popular room in the exhibition, except with the dear old lady, who just goes in to have a quiet little encooee." This I must reluctantly admit, is the case, and I regret to say it is in a great measure due to our own action. If we wish the general public to take an interest in the works exhibited in this much-neglected room we must supply drawings that have some interest to "the man in the street," and I would advocate that in all cases the drawings should be of buildings which have been recently erected or are in course of erection. Many of the drawings which find a place on the walls are of buildings that do not, and never will be in existence; rejected competition drawings and fancy pictures culled from the highly imaginative brain of the artist.

Registration.

The question of Registration is bound to be much in evidence this session owing to the Council of the R.I.B.A. having a large majority of its members pledged to support Registration. It is perhaps worth while to review the question and see just where we stand. Registration has been before the profession more or less prominently for many years, even before the birth of our Society, but no definite plan of action was suggested until the Society of Architects made Registration the keystone of their policy. The R.I.B.A. were urged by a small section of their members to pursue a similar policy; this has been done for some time with varying enthusiasm according to the personnel of the Council. In 1903, I think it was, the Registrationists formed a strong Committee and nominated for the Council a group of men committed to their policy. They were successful at the election, and in 1905 a Bill was drafted and presented to the members of the Institute. The Bill was, however, rejected.

In 1908 the question was again to the fore, but it was obvious to all that if a Bill was to stand the slightest chance of becoming law the scope of the Bill must be considerably widened. With this object in view another class of members was created—the Licentiate. This was the means of attracting to the ranks of the Institute a large number of architects. It was also proposed to join forces with the Society of Architects, and a Bill was drawn up for the Society of

architects to be amalgamated with the I.B.A. The new Bill was prepared, and in January of this year was presented to the members. There was strong opposition to the amalgamation of the Society of Architects, and an amendment was carried, "referred back to the Council for further consideration." At the first Council meeting of this session a strong representative Registration Committee was appointed to consider and report on the question. What conclusions this Committee will arrive at it is impossible to say, but I am of opinion that the Bill will be drafted on such lines that it will be acceptable to all classes within the walls of the Institute.

As I have on several occasions spoken against Registration, I should perhaps state that I am now strongly in favour of Registration, and one of my chief reasons for this change of attitude is that I fail to see how we can set up a high degree of education unless we keep before us the advantages of registration. It is impossible to exaggerate the importance of education. We find on every hand in every walk of life a higher standard of education is demanded, and it is essential that the architect of the future shall be thoroughly trained in his art and have a higher educational standing than in the past, if the status of the architect is to be maintained, so that he may take his proper place in the group of learned professions. I am not convinced that Registration will confer any pecuniary benefit on the average architect. Competition will, I imagine, be keener for this reason.

The boy who enters the profession to-day, as a rule, one who has a desire to design, create; he has a strong natural desire to become an architect. But when we have obtained our Act of Parliament and are a closed profession it is not probable that any will be attracted who have no aptitude for the work? This, I sincerely hope, will not be the case. In conclusion, gentlemen, let me impress upon you that, whatever trials and difficulties we may be called upon to face, we must at all times remember that we are members of a noble profession, and that our career has greater possibilities for influencing the world in which we live. It is an art that perhaps more than any other marks the character and history of nations. Surely the advancement of such an art is both living and working for."

After the address the members adjourned to a refreshment kindly provided by the President, and on returning to the lecture room a hearty vote of thanks was accorded to Mr. Sutton for his address and hospitality. A discussion on the various points mentioned in the address followed. The Nottingham Society celebrate their jubilee this year by a conversation on November 12.

Architectural Association of Ireland.

The first ordinary meeting of the session of the Architectural Association of Ireland was held on the 22nd ult., in the Rooms, 15, South Frederick-lane, Dublin. Mr. George L. Connor, F.R.I.A.A., President, presided.

New University College Buildings.

At the opening of the proceedings the Chairman, on behalf of the Association, tendered his congratulations to Mr. Butler, a fellow member, whose designs for the proposed new buildings of the National University had obtained first place, and also to Mr. Hill, of Cork, and Mr. Cullen, whose designs had been adjudicated second and third respectively.

Presentation.

In connexion with his recent marriage, Mr. George Dickinson was presented by the Chairman, on behalf of the members of the Association, with a silver salver. In making the presentation the Chairman said that Mr. Dickinson, who was lately the President, was held in the highest esteem by them all. Mr. Dickinson returned thanks.

President's Address.

The President then delivered his inaugural address. He said that fortune's wheel was turning for the country was evident by the increased activity in the building trade—a sure sign of general advancement and commercial prosperity. Such a change would be appreciated by the architects. Given the needful opportunity to display his skill, he would say,

without hesitation, that the Irish architect was capable of holding his own with any of his professional brethren throughout the world. Unfortunately, when opportunities did arise the work was handed over to some one across the Channel. He condemned that principle and those responsible for such unworthy actions. Some of the large insurance companies, as well as several of their nobility and gentry, were the chief offenders. He trusted as time progressed such occurrences would cease entirely. In this connexion it was cheering to hear testimony to the spirited action of the governing body of the National University and the Dublin Corporation in throwing open the doors of competition so that all Irish architects might enter and present samples of their originality and skill in the designs submitted for the new buildings. All credit was due to them for their recognition of the Irish architects' work, and there could be no shadow of doubt that when the selection of designs took place the results would amply prove that Irishmen had still the brilliancy of thought and action and cultured refinement for which they have long been famed. He referred to that auspicious event of a few days ago, which was destined to make its mark indelibly on the architectural life of this country—the establishment of a School of Architecture in the National University. The advantages of such a school could not be over-estimated, and he was confident that under the capable tuition of Professor Scott the young architects of Ireland would have afforded them those opportunities for which they had so long waited, and without which they had been seriously handicapped in competition with their more favoured brethren in Great Britain, where such schools existed. Already the signs of improvement were with them, notably the development of town planning. The housing of the working and lower middle classes was one however that required, and was obtaining, immediate and earnest attention. Already they saw schemes in process of construction in the city and in many provincial towns. The much criticised, and sometimes abused, Dublin Corporation had led the way, and they were being quickly followed by the urban bodies, notably the Pembroke Council, in endeavouring to adopt the "garden city" principle as far as possible in the laying-out of the sites. The young man starting business might despair because cathedrals and town halls did not call for a display of his talents. He should remember that a hygienic and comfortable home, not unbecomingly in its external appearance, suitably planned to house the worker, was of really more importance to a nation than magnificent public buildings, and should not be beneath anyone's interest.

Mr. Kaye-Parry proposed a vote of thanks to the President for his address.

Mr. P. J. Lynch, who seconded, said that as the Town Planning Act did not apply to Ireland they should not be wasting time on it, but should concentrate their efforts on the question of the housing of the poor.

GENERAL NEWS.

The Royal Institute of British Architects' Board of Architectural Education.

The Board of Architectural Education of the Royal Institute of British Architects announce that the designs submitted by the following students, who are qualifying for the Final Examination, have been approved:—Subject IV.—Design for a Senate House for a Modern University.—Messrs. B. F. Bothwell, A. D. Clare, H. A. Dod, R. Duckett, E. Gee, E. H. Gibson, K. Glover, E. Prestwich.

King's College, London.

Mr. A. H. Jameson, M.Sc. (Manchester) M.Inst.C.E., formerly Bishop Berkeley Fellow in Engineering, Owens College, and, since 1909, Resident Engineer on the Thirlmere aqueduct, has been appointed to the part-time Professorship in Civil Engineering (London University), tenable at King's College.

Appointment: British School at Athens.

The Craven Committee, Oxford University, have recommended Mr. Stanley Casson, B.A., Senior Scholar of St. John's College, for appointment to the Studentship in the British School at Athens.

Southwark Bridge.

The tender of Sir William Arrol & Co. for the reconstruction of Southwark Bridge has been accepted, and the work will be commenced

as soon as possible. The tender provides for the demolition of the existing bridge and the building of a new structure on the present site as provided by the Act, passed by agreement between the City Corporation and London County Council. The gradients of the new bridge will be eased, and until it is completed the carrying-out of the new St. Paul's Bridge cannot be entered upon.

Visit of Continental Engineers to London.

A deputation of members of the Association Générale des Hygiénistes Techniciens Municipaux, and consisting of about 150 representatives of cities and towns of France, Belgium, Poland, Switzerland, and Luxembourg, have arrived in London. Amongst the places visited by them are the Engineering Exhibition at Olympia, and under the guidance of Mr. W. B. Bryan, Chief Engineer, the Metropolitan Water Board's pumping stations near Hampton Court.

The Riverside Improvements, Millbank.

Progress is made with the construction of the riverside embankment which will extend to Grosvenor-road, at the foot of Lambeth Bridge, which for longer than two years past has been closed to the passage of vehicles. For the new work some 50 ft. in width has been reclaimed from the foreshore between the bridge and Victoria Tower gardens, and the embankment will permit of an extension of the gardens in alignment with the terrace of the Houses of Parliament. It is stated that a site will be assigned to M. Rodin's group in bronze, "The Burghers of Calais."

The Home of Cornille at Rouen.

The birthplace (1606) and home of "Le Grand Cornille," No. 4, Rue de la Pie, Rouen, has been acquired by the Municipal Council for £1,360*l.*, which sum, being the vendor's price, was raised by a committee. The façade of the house will be restored to its pristine condition as it was one hundred years ago, and the ground and first floors will be adapted for purposes of a Cornille Museum.

Safety Appliances Museum.

Mr. Gill asked the Home Secretary whether any steps had yet been taken for the establishment of a Museum of Safety Appliances as recommended by the Accidents Committee.—Mr. McKenna: A museum of safety and health appliances has been under consideration for some time. It has been decided to erect a special building for the purpose, and a site has been secured in a central position in Westminster. Plans have been prepared after consideration of the arrangements in the most important of the museums of this kind on the Continent, and it is hoped that a commencement will be made with the erection of the building at an early date.

A New Theatre in Soho.

Mr. W. G. R. Sprague has been appointed as architect of a new theatre, with 660 sitters, which is to be erected upon the site abutting on West-street, Tower-street, and Lumber-court, recently purchased by Mr. Herbert Jay.

The Late Lord Peel.

Viscount Peel, who died on October 24, aged eighty-three years, was a Trustee of the British Museum, late Chairman of the Trustees of the National Portrait Gallery, Visitor of Balliol College, Oxford, and for a while Chairman of the Council, Toynbee Hall.

The Melton Prior Memorial.

A memorial to Mr. Melton Prior, the war artist and correspondent, was unveiled in the crypt of St. Paul's Cathedral on the 22nd ult. by Field-Marshal Sir Evelyn Wood, V.C. It consists of a bronze medallion of Mr. Prior, in bas-relief, set in a large tablet of onyx, with tints of white, brown, and green; and was designed and gratuitously executed by Mrs. Bennet Burleigh, the wife of the war correspondent.

French Textiles.

The exhibition of French textiles from the Mobilier National, Paris, has proved of so much interest to visitors to the Victoria and Albert Museum that application has been made to the French Government for an extension of the period of the loan. It comprises a series of seven tapestries woven at the Gobelins factory for King Louis XIV. after Raphael's frescoes in the Stanze of the Vatican, four Savonnerie carpets of the same period, and a collection of woven silk fabrics and embroideries of the early part of the

XIXth century. The exhibition was opened to the public on July 18 in the North Court of the Museum for a period of three months, and it has now been arranged, by the courtesy of the French Government, that it shall remain on view until Monday evening, November 11.

The Health of the City Worker.

A conference on "The Health of the City Worker," under the auspices of the Incorporated Institute of Hygiene, has taken place this week at the Guildhall. The Lord Mayor, who opened the proceedings, said that he believed that the principles which applied to the health of the City worker would apply equally to all private houses. During his sixty years' practice of medicine in the City he had seen an almost entire rebuilding of rooms in which clerks worked. It was his experience that the health of the clerk was well looked after, but it was well that with improved ideas the subject should be well ventilated. Referring to the drainage of the City, he said the improvement had been marvellous, and the health of the workers had seen a corresponding change for the better. Many fevers had disappeared from the City. In his youth typhus was no uncommon thing; now it was unknown in London. With improved water supply enteric was very rare.

Westminster Hall.

Mr. King asked the representative of the First Commissioner of Works whether he could give the House any information concerning the statue, supposed to be of a certain monarch, recently erected in Westminster Hall over the door leading to the Members' entrance.—Mr. Wedgwood Benn replied that the attention of the Commissioner of Works had been drawn to three stone statues of kings in the Tufnell-street Museum which had been removed from Westminster Hall. They were well preserved works of the end of the XIVth century, but in the absence of any symbols or accessories, it was not possible to say what kings they represented. The First Commissioner now proposed to bring them back, and he had had one set up experimentally in Westminster Hall.

Improvements to the House of Commons.

Mr. King asked the representative of the First Commissioner of Works whether he could inform the House if it was intended to undertake, in connexion with the Estimates for the next financial year, any alterations or improvements in the building or appointments of this House; if so, what the nature and extent of such works, if any, would be; and what means he proposed to take to consult Hon. Members before altering the building in which they had to spend so much of their existence.—Mr. Wedgwood Benn replied that various proposals were under consideration, but the opinion of Hon. Members would be sought before any considerable changes were decided on. He would welcome suggestions.

BOOKS.

The Blight on the Countryside. By FRANK ALTON MORGAN, author of "Fruit Cities," "The Story of an Essex Farm," etc. (London: The Whitehall Publishing Company. Ltd. 66 pp. 1s.)

THE objects of this small volume are stated in the Preface to be to call the attention of the public "to the misery and suffering caused throughout the country to the thrifty classes of the community by the system adopted of administering the land clauses of the Finance Act 1909-10," to the extraordinary methods of valuing small properties, to the disastrous effects of the Act upon smallholders, the illusory nature of the exemptions to small cultivators, and the general check to land development created by the administration of this measure. The work deals with the question of house property as well as agricultural holdings. Having summarised the objects of the work, we may state that the author is a Welshman and a supporter of the Government, and he approved the Finance Act on its introduction enthusiastically, but he now confesses that he is disillusioned, and readers of these pages will see that his conversion on the subject of the Finance Act is complete, although he is still a supporter of the Government. We fear many persons like the author formed their opinion of the Finance Act, not upon the Bill itself as introduced, but upon the speeches with which

it was introduced, and that this is too often the case nowadays.

The contrast between what was put forward as increment value and what it is in practice is well brought out in these pages. The author describes the system of valuation as the "Mad Hatter" system, and observes that under it private enterprise in connexion with houses and land will be shattered, and he points out that its full effect has still to be experienced. The title of the work is not wholly original, as an article entitled "The Blight of the Land Taxes" appeared in the *Nineteenth Century and After* in September, 1910. The author writes in a very colloquial style, but he appears to have a considerable grasp of his subject, and we commend this very interesting little volume to the attention of our readers.

The Cheap Cottage and Small House: A Manual of Economical Building. By J. GORDON ALLEN, A.R.I.B.A. (Letchworth Garden City Press, Ltd. 1912. Price, in paper 1s. 6d., cloth 2s. 6d.)

NOTHING would so tend to improve the aspect of our villages and the outskirts of our towns as to devise some means whereby the very smallest type of habitation should enjoy the advantages to be derived from the knowledge and skill of the architect.

The difficulty being, we suppose, principally an economic one, it seems to be open to the architect to show that he is not merely a luxury which this type of building cannot afford, but that his special skill can effect such economies or produce such added value as shall more than balance the cost of his employment.

This book, the second edition of which we now welcome, appears to tend in that direction to prove that beautiful buildings are not necessarily expensive nor ugly ones necessarily cheap. As Mr. Allen says:—"It may well be argued that the very qualities that make for cheapness tend towards a pleasing appearance," and his book goes far to prove it. Mr. Allen appears to have made a close study of economical building, and a special feature of the book is the definite information, based on actual experience, of the cost of houses ranging in price from 105s. to 900s., plans and views of which are given. Many of these designs are admirable. The book is full of information and suggestion on every aspect of economical building, and should be useful to all those interested in a subject of such great importance to the welfare of the community.

Nothing Gained by Overcrowding. By RAYMOND UNWIN, F.R.I.B.A. (Garden Cities and Town Planning Association. 1912. Price 3d.)

ALTHOUGH public opinion is always averse from restricting individual industrial activity in any direction, it has lately come to realise that the activity of those who overcrowd the land is detrimental to the public welfare. Proposals for restricting this activity by way of limiting the number of houses to the acre, although generally recognised as necessary and reasonable, may naturally enough be expected to look quite otherwise to those whose profit lies in creating overcrowded areas. It is as well, then, that everyone should be in a position to realise how small is the extra profit to be obtained by overcrowding the land compared with the harm done to the community, and how slight a

restriction to individual enterprise is entailed by reasonable limitations. In this little publication Mr. Raymond Unwin discusses the financial result of the usual by-law system of development compared with that of a method which by limiting the number of houses to the acre establishes a satisfactory proportion between the area built over and that left open for gardens or roads. This he illustrates by diagrams and figures applied to a 10-acre plot, which is shown developed on the two different systems. Attention is drawn to the fact that the limitation of houses to the acre does not by itself achieve the end desired unless it be accompanied by some limitation of their area and cubic contents. The study of the facts and points of view here set forth must, we think, go a long way to convince all those concerned that the hardships entailed on individuals by this necessary measure of public reform are considerably less than is generally supposed.

The small price should help to secure it the wide circulation it deserves.

ST. MARY'S COLLEGE, GALWAY.

ST. MARY'S COLLEGE, Galway, opened on August 25, 1912, is at a considerable elevation above the city, and commands a fine view of Galway Bay on one side and of Lough Corrib on the other. Professor W. A. Scott, of the National University, Dublin, was the architect, and Mr. James Wynne, of Dundalk, the builder, the contract price being 13,000s. The College affords accommodation for over 100 boarders in addition to the resident College staff, but the wings are so designed as to admit of extension. The building is 240 ft. long, with returning wings of 90 ft. The principal entrance is flanked by four subordinate towers supporting a central tower, which forms the chief feature of the front ornamentation. The towers are in Celtic monumental scholastic style, the central one rising above the roof and containing a water tank holding 20,000 gallons. The building is fire-resisting, the floors and roofs being of concrete. The asphalt work was executed by Messrs. Reinhardt, of Dublin, supported on framework by the Expanded Metal Company, of London, the concrete partitions being made with the machines of the Winget Company, of Newcastle-on-Tyne. The College was founded by the Bishop of Galway, Most Rev. Dr. O'Dea, and is intended to train young men of his diocese for the Roman Catholic priesthood.

ILLUSTRATIONS.

Buckingham Palace.

THE illustrations of Buckingham Palace are given in connexion with an article appearing on p. 495, which deals with the history of the fabric and with the design for the new front.

New Congregational Church, Fairhaven.

FAIRHAVEN is a fair place by the sea, lying on the Ribble Estuary between St. Anne's and Lytham. The site of the Church is within a few steps of the bay, at the junction of Clifton-drive and Ansdell-road. The church is faced externally with "Ceramo," from the Middleton Fire Clay Works, Leeds. Many important buildings in recent years have been erected of this material. Having a matt or vellum surface, it presents a very marble-like suggestion. It is also more enduring than stone, and especially so when used near the seaside.

The plan of the church is in the form of a cross, three of the embayments being utilised in the interior space as transepts, and the fourth as choir and Communion. The ceilings of these and the nave are segmental in shape.

The main entrance is from the junction of Clifton-drive and Ansdell-road, and consists of an open octagonal-shaped vestibule, and above this there is a campanile 90 ft. high. At the northern corner of the church there is another entrance from Clifton-drive; this is a similar portico and vestibule as the central one. This is intended to be used as an entrance to church, church-parlour, and school premises (the latter having been erected some few years ago). This entrance is surmounted by a smaller flanking over about 50 ft. high.

The organ-chamber, about 17 ft. by 12 ft., is placed at the Communion end and adjoining the vestibule and entrance to the Church Hall in Ansdell-road. At this angle also of the facade there is a corresponding flanking tower to the same height as the one at the northern corner. The choir vestry is at the opposite side of the Communion, and the size is 17 ft. by 16 ft. The floors throughout are laid in wood blocks, and the Communion, vestibule, and notices marble mosaic. The accommodation is for about 500. The church-parlour is placed on the right-hand side of the entrance from Clifton-drive. From this entrance there is a corridor leading to the minister's and teachers' vestries, and also to the present Church Hall.

The buildings have been designed by Messrs. Briggs, Walsenholme, & Thornely, F.R.I.B.A., of Blackburn and Liverpool, and the estimated cost is about 7,500. The contractors are Messrs. Gerrard & Sons, of Swinton, Manchester.

The Orchestral Association.

The premises we illustrate this week have been designed by Messrs. H. Percy Adams and C. H. Holden, for the Orchestral Association, Ltd., and will be used as a club by the members of the Institution.

In the basement is a large cloakroom fitted with "lock-up" cupboards for the use of members. The ground floor consists of the secretary's offices and a large smoking and refreshment room. The first floor consists of committee-rooms and a large billiard-room; the second over the reading-rooms. The top floor consists of steward's quarters and kitchen and offices, with lift to every floor.

Internally the woodwork generally is of teak and the walls plastered.

Externally the elevation is faced with grey leading bricks, flush-pointed, and Portland cement dressings.

The sculptured panel is by Mr. C. Pibworth. Contractors, Messrs. Sheffield; fireproof floors, Messrs. Homan & Rodgers; electric lighting, General Electric Contracts; heating, Messrs. Perry & Son; locks and fittings, Messrs. Gibbons; casements, Messrs. Hope & Sons.

MEETINGS.

FRIDAY, NOVEMBER 1.

Royal Sanitary Institute.—Mr. Edward Willis, F.S.I., on "Sanitary Appliances." 7 p.m.
University Extension Lectures.—Visit to Westminster Abbey. Meet at the Cloisters. 2 p.m.

MONDAY, NOVEMBER 4.

Royal Institute of British Architects. Opening meeting session. Presidential address by Professor Reginald Lomfield, M.A., A.R.A. 8.30 p.m.
Royal Sanitary Institute. Mr. Edward Willis, F.S.I., on "House Drainage." 7 p.m.

The Society of Engineers.—Mr. William P. Durnall on "The Generation and Electrical Transmission of Power for Marine Transportation." 7.30 p.m.
The London University (Victoria and Albert Museum).—Mr. Banister Fletcher on "Italian Gothic." 5 p.m.

TUESDAY NOVEMBER 5.

The London University (British Museum).—Mr. Kaines Smith on "Homer and His Age." 7 p.m.
Royal Sanitary Institute.—Mr. Henry C. Adams on "Sewerage." 7 p.m.

Institution of Civil Engineers (to be held at the Institution of Mechanical Engineers, Storey'sgate, S.W.).—Address by Mr. E. Elliott-Cooper, the President, and presentation of the medals awarded by the Council.

WEDNESDAY, NOVEMBER 6.

The Royal Archaeological Institute.—Mr. C. H. Bothamley, M.Sc., on "The Walled Town of Aigues Mortes." 4.30 p.m.

Nottingham Architectural Society.—Exhibition and criticism of "Constructional Details and Testimonies of Study" by Mr. W. R. Gleave, A.R.I.B.A.

Institute of Sanitary Engineers.—Mr. William Marriott on "Meteorology and Public Health." 8 p.m.
Edinburgh Architects Association.—Opening meeting. Mr. Francis Bond, M.A., F.G.S., on "French and English Cathedrals." 8 p.m.

THURSDAY, NOVEMBER 7.

The London University (British Museum). Mr. Banister Fletcher on "Creban and Mycenae Architecture." 4.30 p.m.

FRIDAY, NOVEMBER 8.

Royal Sanitary Institute. Mr. Henry C. Adams on "Sewage Disposal." 7 p.m.

COMPETITION NEWS.

A list of current Competitions is printed on page 523.

University Buildings, Dublin.

Twenty-two sets of designs were sent in for the proposed new buildings for University College, Dublin, the competition drawings being adjudicated upon by Mr. Henry T. Hare, F.R.I.B.A. The award is as follows:—First place, Messrs. Doolin & Butler, 27, Dawson-street, Dublin; second place, Messrs. Arthur & H. H. Hill, 22, George's-street, Cork; third place, Mr. T. J. Cullen, 25, Suffolk-street, Dublin. The competition was limited to architects living and practising in Ireland. Mr. R. M. Butler, F.R.I.B.A., was a pupil of and afterwards a partner with the late Mr. W. G. Doolin, F.R.I.B.A., who died in 1902.

Municipal Buildings, Dublin.

The date for sending in designs for this important work is given as January 1, 1913, but it is probable that an extension of time will be arranged. The cost of the proposed buildings is 55,000, and the author of the design placed first will be appointed to carry out the work on a 5 per cent. basis, exclusive of railway and personal expenses. Premiums of 1500 and 1000 are offered also. Mr. Albert E. Murray, F.R.I.B.A., is the Assessor.

Hale Town Planning.

The Town Planning Committee of the Hale (Cheshire) Urban District Council, with their Adviser, Mr. Percy D. Lodge, of 3, Ridgefield, Manchester, have made the awards in this competition. The first premium of 500 was awarded to Mr. R. Dann, of Messrs. J. Cheal & Sons, Ltd., Lowfield Nurseries, Crawley,

Sussex; and the second premium of 250, to Messrs. Robert Bennett, A.R.I.B.A., and Wilson Bidwell, architects, Letchworth Garden City, Herts. The design coming next in order of merit was that of Mr. John C. Thompson, of the Earle Estate Office, Manchester, and 12, Dunham-road, Altrincham. The Committee present were unanimous in their decision. The plans of the two successful competitors will be used as the basis for the town planning scheme which the Council intend to make application to the Local Government Board for permission to prepare, the first step of which is the settling of the area to be included in the scheme. This question will come up at the next meeting of the Committee, which is to be held at an early date.

R.I.B.A. Competitions.

Next month the drawings for the studentships and prizes of the Royal Institute of British Architects must be delivered, and those who are at work on designs must soon put in the finishing touches. This year competitors may choose their own subject for the Essay Medal with 25 guineas, and the result should be interesting. The Soane Medallion with 1000 is offered for the best design for a Terminal Railway Station, and American enterprise in this direction will have influence, we expect, on the schemes submitted. With the Buckingham Palace alterations in mind attention will be directed to the Title Prize design for "The Façade of a Royal Palace in a City."

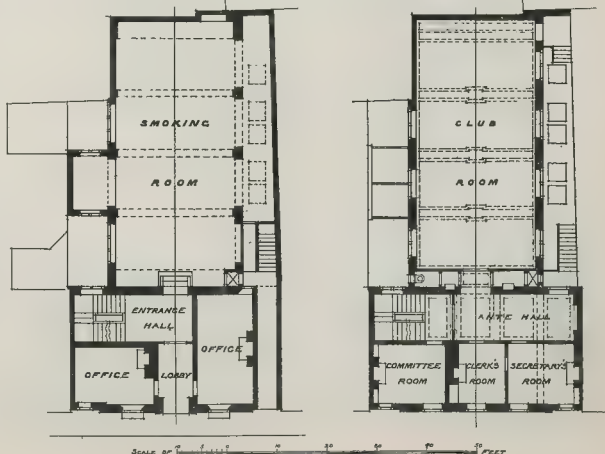

CORRESPONDENCE.

Teachers as Adjudicators.

SIR,—Everyone interested in contemporary architectural education cannot but be delighted with the outstanding success of the system adopted at the Liverpool University School; but is it quite just that studies prepared at this Institution, apparently under the supervision of the Professors, should be accepted as testimonies of study for the R.I.B.A. Final Examination?

For every candidate for the Associateship who comes from the Liverpool School there must be many who are unable to obtain a similar advantage; and it seems to me that it is rather unjust that those other candidates should be handicapped (as they must be) by having to compete with students whose designs are, to all appearances, prepared under the supervision of, if not with the assistance of, such able Professors.

One also notices that Professor Reilly is one of the Committee of Adjudicators appointed for the competitions for the new scholarship at the British School at Rome. Most probably some of Professor Reilly's pupils will be competitors for this valuable scholarship; and, without for one moment attributing the slightest intentional partiality to Professor Reilly, surely it would be more

Premises of the Orchestral Association.
Messrs. H. Percy Adams & C. H. Holden, Architects.

satisfactory to all concerned if this gentleman did not occupy the position of Adjudicator in a competition in which there are, almost of a certainty, many of his own students competing?

If the architectural profession in their own competitions cannot frame arrangements in a manner beyond question, surely it should not complain of outside bodies issuing unsatisfactory conditions.

CRICKET.

[*.* We think there is something to be said for the points raised by our correspondent, especially with regard to the scholarship of the British School at Rome, and we shall be interested to hear the views of our readers upon them.—ED.]

Demolition of the Old G.P.O.

SIR.—It is with regret that I observe another City landmark being demolished, viz., the old G.P.O., which has always rightly been considered a beautiful piece of architecture, and, without question, is far superior as regards façade, to its successor, which shows no particular genius on the part of its designer.

The writer would be pleased to hear what the Government intend doing with the site, and whether it would not have been possible to reconstruct the interior to suit the purpose of whoever requires the site; and, again, could not the Government have adapted the building to have suited their own requirements, and have saved the country the enormous expense they have been put to in securing the old Christ's Hospital site and the erection of the new buildings—especially when one thinks of the amount of money outlaid in additions and alterations, say, during the last twenty years?

Finally, would it not be possible for the Government to re-erect the façade in a convenient place for the benefit of architectural students, memory of days gone by, and a tribute to genius?

ADRIAN C. S. WHEELER.

THE LONDON COUNTY COUNCIL.

THE usual weekly meeting of the London County Council was held on Tuesday, in the County Hall, Spring-gardens, S.W., Lord Cheylesmore, Chairman, presiding.

Loans.—The Finance Committee recommended that loans be made to various local bodies as follows:—Hackney Union Guardians, 15,000*l.* for poor law purposes; Islington Borough Council, 8,486*l.* for electricity undertaking, and 11,500*l.* for repaving works; Lewisham Borough Council, 4,000*l.* towards cost of street improvement; Poplar Borough Council, 10,000*l.* for electricity undertaking; and Stepney Borough Council, 10,250*l.* for electricity mains.

St. Paul's Bridge.—In a joint report of the Highways and Improvements Committee it was recommended that authority be sought in the next session of Parliament for the construction of a tramway over the proposed St. Paul's Bridge. During a discussion on this matter the Chairman of the Special Committee on the allocation of the cost of street improvements along the tramway routes moved that of the proposed contribution by the Council of 350,000*l.* towards the cost of street improvements at St. Paul's Churchyard, 20,000*l.* should be allocated to the tramways account. The Chairman of the Highways Committee also presented a report pointing out that trams would pass through a subway and be constructed at a cost of 86,000*l.*—the whole of this amount being allocated to the tramways' account, and therefore suggested, on behalf of his Committee, that no part of the cost of widening at the Churchyard should be borne by the tramways account.

The recommendation to allocate 20,000*l.* to the tramways account was carried by a majority of one.

Theatres, etc.—The following drawings have been approved by the Theatres and Music Halls Committee:—Aldwych Theatre—Provision of a movable screen in the dress circle; construction of an enclosure for projecting arc lamps. Bear-street, Leicester-square (Cinema de Paris)—Alteration to the seating. 28-32, Denmark-hill Provision of a motor generator enclosure. Hackney Empire, Mare-street—Alterations to the electrical installation. Hamilton Hall, South-road, Forest-hill Arrangement of the new portion of the supper-room and the new block of dressing-rooms. 2, Holloway-road and 4, Highbury-crescent—Ventilating arrangements; amendment of the sanitary arrangements. 44, Mile End-road—Arrangement of the lighting and heating installations. Morley Hall, Mare-street, Hackney—Provision of a motor generator enclosure. Mornington House, Canonbury-lane—Provision of a balcony. Clapton Rink and Cinema, 137-147, Lower Clapton-road Alterations to seating arrangements, etc. 226, Commercial-road (late Yiddish Theatre)—Provision of a cinematograph chamber. 396, Mile End-road Alterations. Rotherhithe Town Hall—New lavatories and alterations to cloakroom. Royalty Theatre—Provision of electric fan. 56 and 58, Rye-lane—Alterations.

Drawings have been submitted for cinematograph theatres as follows:—By Messrs. Deakin & Cameron for a cinema to be erected at the junction of Great Western-road and Hornsea-road, Paddington; by Messrs. J. S. Quilter & Son, for a cinema to be erected at 213, King-street, Hammersmith; and by Mr. F. T. Verity, for a concert hall to be erected at 316-320, Regent-street, W.

FIFTY YEARS AGO.

From the *Builder* of November 1, 1862.

Prevention of Decay in Timber.

MESSRS. YORK & Co. are circulating a translation of an "Essay on the Prevention of Decay in Timber," by a new system of carbonisation, written by Mons. de Lapparent, Inspector General of Timber for the French Navy, and which system, it appears, is extensively adopted at the present moment in the French Government dockyards for their line-of-battle ships, as well as by railway companies both in that country and Spain for the preservation of their sleepers, &c. The advantage of putting the butt of a gate-post, for example, into a fire before placing it in the earth, is perfectly well known in England. The difficulty found in effecting this charring has prevented a more extensive use of the process.

. Any method devised for the preservation of timber must be directed in the first place either towards eliminating the sap or destroying its vitality. Any treatment affecting the surface of timber only offers but a temporary impediment to the action of moisture. The sap may be soaked out by immersion in water, or the spores may be destroyed by a high temperature. It is possible that, in the process referred to, by which the surface was thoroughly charred by a contrivance of Bunsen burners, the heated products of combustion permeated the wood to a greater depth than the portion actually charred, thereby rendering such parts sterile. But it is improbable that any such action went very far, and a later report on M. de Lapparent's system was not satisfactory. The process that has for long now held the field consists in forcing creosote into the pores of the timber at high pressure and at an increased temperature. In fact, nothing less than a complete permeation of the timber by some antiseptic medium can be accepted as a reliable preventive. The application of heat may only result in the drying up of the sap, leaving it eager to absorb moisture again. The mere dipping of the end of a post in some preparation before burying it—a proceeding that is very popular—cannot be trusted to act as a deterrent to decay, unless care has also been taken to ensure the fact that the spores within the timber are dead.—ED.

MONTHLY REVIEW *of* CIVIC DESIGN.

Broadway, Winnipeg, in which the New Parliament Buildings will be placed.

TOWN PLANNING AT WINNIPEG.

THE Town Planning Conference held during the summer in Winnipeg, which was attended by the Governor-General, and by the leading authorities on design in the Dominion, should give considerable impetus to the movement for a general improvement and extension plan for the city itself. We are interested to learn in addition to exhibits lent by the Garden City and Town Planning Association, a special report of this Congress was the scheme presented by the Winnipeg Town Planning Commission.

The citizens of Winnipeg are nothing if not realistic, and they are fully aware of the great future which lies before their city. It may be said that they are, therefore, that any plan they put forward will express their confidence in its ultimate expansion into the central city of Canada, which, if it rivals London in size, will never, we hope, rival it in beauty.

We understand that the plan put forward by the Commission provides for a civic centre, the Parliament buildings, Government buildings, Law Courts, etc., grouped round a new Hall. This scheme, we presume, takes account of the new Parliament buildings to be erected by Mr. Simon on a site on Broadway—a view of which is given—founded on the other side by the Assiniboine

combination of the two in an architectural composition at the same centre will present an extremely interesting architectural problem, and we shall be interested to see how it is treated at Winnipeg.

We publish also a plan of the city in 1909, which gives an idea of its general lay-out and of the manner in which it has developed from the original fort of the Hudson Bay Company at the junction of the Red River and the Assiniboine River. Owing presumably to these rivers and to the presence of old Indian trails to Fort Garry, the main thoroughfares have not been laid out at right angles, so that although the filling in of the plan is on the usual gridiron pattern, the main skeleton suggests some possible adaptation or modification of the radial system in any future developments of the central area.

Anyone who has been confronted with the difficulties and drawbacks entailed by the huge bulk of Greater London will realise that in a city size, beyond a certain limit, is not a thing to strive for and to be proud of.

It is to be hoped that in the case of Winnipeg the garden city idea will be borne in mind, and a green girdle acquired before it is too late.

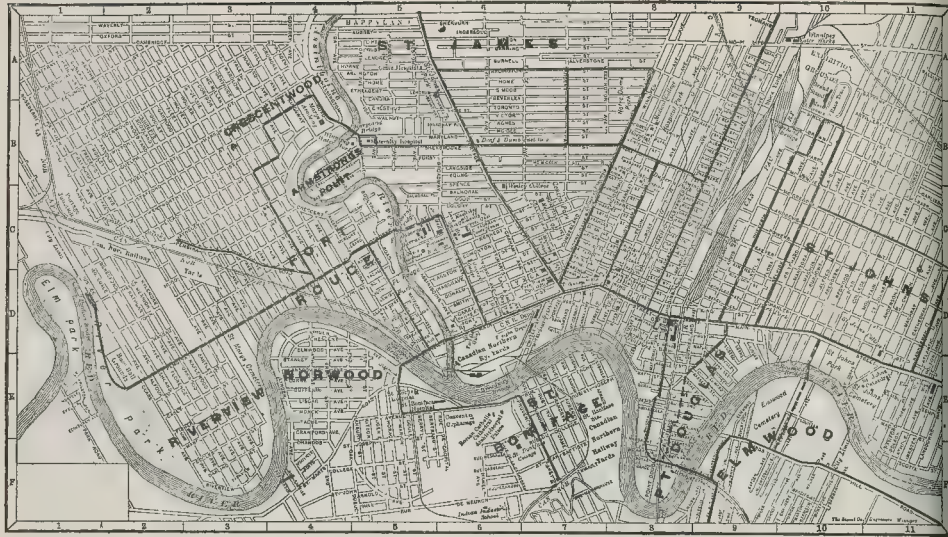

THE CITY DEVELOPMENT PLAN.

LONDON still lacks its city development plan. That there is a growing need for such a plan is shown almost daily as fresh improvements are contemplated, improvements which, to judge from the past, will be left but half completed, lacking the most important part, co-relation to the city as a whole. Examples will

occur to everybody—the Aldwych and Kingsway fiascos, the discreditable petty warfare of the powers that be about the termination of the Processional Way, the St. Paul's Bridge question—there is no need to prolong the list, all these point insistently to the necessity for some carefully co-ordinated plan upon which the city may base its development and growth.

The idea is not by any means new, but in the general apathy which has reigned until recently it has been overlooked and its importance unrecognised. Imperfect appreciation of the purpose and aims of such a plan have caused a regrettable bias against it in some quarters, and an impression, quite unfounded, exists that the idea is visionary and could not be carried out in practice. That this is false the following quotation from the report of the New York City Improvement Commission (1904) will show:—"A comprehensive plan must necessarily anticipate the future growth of the city for many years to come and be so framed as to meet all possible requirements, so far as they can be reasonably foreseen, and be so designed that all its parts shall be consistent the one with the other, and form a homogeneous whole. In order that any improvements hereafter made may be entered upon with reference to the accomplishment of a definite purpose." That is the definition of the city development plan, and emphasis is laid on the gradual nature of the change to be brought about in the city, and also upon the necessary harmony of the projected changes and their relation to the city as a whole.

The majority of the larger American cities have realised the importance of this method and have formed advisory boards, composed

Map of Winnipeg. (See page 509.)

of men of standing in the community, whose interests or attainments fit them for the difficult task, and these boards have gathered materials and information of all kinds bearing on the city—historical, social, and topographical. The result of their deliberations is published (often as a handsome volume, illustrated by the foremost draughtsmen of the day), and forms the base upon which to plan any improvement. The advantages of such a course are obvious.

That such a plan is needed in London today cannot be denied, and the necessary machinery should be easily set up—an advisory board, with a few assistant experts, whose united labours would inspire confidence. The civic authorities, too, with the advantage of a clearly defined line to follow, and would be able to guide the evolution of their city with little, if any, hardship to those most nearly concerned. It is surely time now that something on the lines indicated above was done, as we have been long enough content to muddle through.

THE ESSENTIALS OF A GARDEN CITY.

Owning to the numerous paragraphs that are continually going the round of the daily Press, under the heading of "A New Garden City," whenever a few acres of building land are to be developed, the Secretary of the Garden Cities and Town Planning Association sometime ago asked to be allowed to define the essentials of a garden city as distinct from a garden suburb, or from ordinary development. He states them as follows:

1. That before a sod is cut or a brick is laid the town must in its broad outlines be properly planned with an eye to the convenience of the community as a whole, the preservation of natural beauties, the securing of the utmost degree of healthfulness, and proper regard to communication with the surrounding district.

2. That in the town area the number of houses should be strictly limited, so that every dwelling should have ample light and air, with a suitable garden, and that public recreation ground and open space should be provided generously.

3. That the town area should for ever be surrounded by a belt of agricultural and park land, so that while in the centre the urban problem is being dealt with, the rural portion, which should be the larger part of the estate, may be available for farms and small holdings, in order that the smallholder and market gardener may have a new market direct to hand for the sale of produce.

4. That the return on capital should be limited to, say, 5 per cent., any profit above that amount being applied to the estate itself for the benefit of the community.

5. That the town should be not merely residential, but also commercial and industrial, that provision should exist for taking the worker and his work away from the crowded centres into the fresh air of the country district, where not only should the land be cheaply obtainable for the employer, but the worker should have a comfortable cottage at a convenient distance from his labour.

"It is therefore," he continues, "essential that the land should be of considerable area, and its development should be in the hands of one controlling body, which, in Mr. Howard's scheme, should have for its ultimate object, not the making of huge profits, but the improvement of the conditions of life for all who live on the area. The estate should be somewhere from six to ten square miles in area, and in order to give effect to the desire for the combination of town and country about two-thirds should be reserved for the rural area."

As he further points out, neither a "garden suburb" nor a garden village, such as Bournville, fulfils these conditions, for they make no attempt to deal with the root evil of rural depopulation, towards which the garden city acts as a preventive not as a palliative.

It certainly is most desirable that terms should be accurately defined, and that the fundamental principles underlying the garden city movement should not be forgotten. Although it is no doubt annoying to those who have been propagating this idea for the past thirteen years to find the name used by every speculator who is anxious to draw attention to his building scheme, yet there should be some comfort in the proof it affords of the growing popularity of the movement.

The same difficulty has arisen in other countries, notably in France, where, if we may believe the speculators' announcements, garden cities are to be found in profusion on the outskirts of all the large towns.

It is difficult to see how the abuse of the term is to be prevented, but at any rate the public can be kept informed as to the salient features of a garden city, and not be left under any misapprehension.

MONTREAL.

In a previous number (August 4, 1911), in the course of some notes on recent work in the city of Montreal, attention was called to the extensive additions to the equipment of the city as regards schools, and in the present issue we give some further illustration of these. The census of 1911 pretty clearly reveals some of the pressing necessities which have been at the back of recent building activity. The city proper numbered a population of 267,730 in 1901, whilst the census

of the current year places it at 466,197, showing a larger increase than in any other city of the Dominion. With its suburbs Montreal has now a total population of over 520,000. The province of Quebec also shows a larger increase than that of any other of the older provinces due no doubt to the steady development of great natural water powers in various industries and this increasing industrial development with corresponding mercantile organisation is what has called into being the Ecole des Hautes Etudes Commerciales de Montreal, Commercial High School.

The building is advantageously placed on the side of one of the city squares, the Place Viger, opposite the terminal of the eastern system of the Canadian Pacific Railway. Limestone only is employed in the facade. Internally the woodwork in doors and dado is chiefly oak and the floor is birch. The chief feature internally from an architectural point of view is the entrance hall, with four Roman Doric pillars and a wide staircase oak with wrought-iron railing of scroll-work. Besides classrooms and laboratories the building contains a commercial and industrial museum the exhibits in which are in process of acquisition. The architects are Messrs. Gauthier, Daoust, of Montreal. The courses in the institution are in the French language, about two-thirds of the population of the city being of French descent.

On the other hand, the Montreal Technical and Commercial High School in Sherbrooke street is under the direction of the Protestant Board of School Commissioners, and education is here given in English. The building is of red brick and yellow limestone. There is a large assembly hall in the rear. The architect is Mr. A. F. Dunlop, of Montreal, who has been successful in one of the most important open competitions held in the city in recent years that for the Sir William Dawson School on the St. Joseph Boulevard. The general practice of American schools is here very rigidly observed as regards type of classrooms and their relation to adjoining cloak-rooms in every case. A large combined assembly-room and playroom is provided in the basement. Fire escapes stairs are provided within the building, ought to be more commonly practised in Canada when snow and ice are apt to render external stairs dangerous, especially for children in winter. The classroom windows are of the type which is now almost absolutely demanded—the continuous mullioned window. The new health by-law for the city of Montreal runs:—"The windows of class and study room dormitories, and infirmaries shall be so arranged that the rays of the sun may penetrate direct into the interior of the room. The glass area of the windows in each class and study

Ecole des Hautes Etudes Commerciales, Place Viger, Montreal.

Messrs. Gauthier & Droust, Architects, Montreal.

Technical and Commercial High School, Sherbrooke Street, Montreal.

Mr. A. F. Dunlop, Architect, Montreal.

room shall be equal to at least one-fourth the area of the floor of the room." In the exceptionally clear atmosphere of Montreal, almost immune from fogs and blessed with high percentage of bright sunshine, which in winter is still further intensified by the reflection from the snow, one-fourth of the floor area is equivalent to a much larger area in England. When it is remembered, too, that the thermometer in Montreal often stands below zero for days and even weeks at a time it will be realised that such lighting conditions entail considerable expenditure in heating. The new health by-law is not yet finally adjusted, but in the present connexion it may be of interest to quote the requirements for ventilation:—"The number of pupils to be admitted to a study or class room shall be so limited that each of them and the teacher or master shall have a minimum of 150 cubic ft. of air, and the total area of the floor space shall be 15 sq. ft. at least per head." Mechanical devices must be provided capable of supplying 1,800 cubic ft. of fresh air per hour per person during occupation of the rooms; air not to be introduced at a speed of more than 200 ft. per minute at not less than 65 deg. Fahrenheit. It is also usual to aim at a certain percentage of humidity—in the neighbourhood of 40 per cent., the necessity for this arising from the circumstance that air at zero can only sustain a small percentage of humidity; when, therefore, its temperature is raised its extreme dryness has the effect of drawing off the moisture from all substances in the rooms, doors shrink, flooring boards open, furniture is injured, and the influence on human health is made apparent in injury to the membranes of the breathing passages and lungs.

The Académie Marchand has been recently built under the care of the Catholic Board of School Commissioners for French-speaking children in Berri-street in a fairly closely-built and old quarter. The architects are Messrs. Marchand & Hawcoll, of Montreal. The lower stories and dressings are in limestone, the three upper stories are in pale buff brick.

ETCHINGS OF NEW YORK.

MESSRS. ACKERMANN & SON, now of New Bond-street as well as of Regent-street, have inaugurated their season by publishing four etchings of New York subjects by Mr. W. Monk, R.E. We have obtained permission to illustrate two of them, namely, "Wall Street" and "New York from the River."

The other two are "Fifth Avenue" and "St. Patrick's Cathedral." It may be said at once that Mr. Monk, whose work is well known to readers of the *Builder*, has represented the various buildings with due consideration to architectural exactitude and scale. The scenes are not shown in reverse, as is the case with so many original etchings of the present day, and the artist has avoided the modern tendency to blur over or leave out altogether the difficult features of the chosen subjects. The etchings, however, are neither microscopical in detail nor hard in general effect; enough has been put in to satisfy the architectural critic,

yet the treatment is sufficiently broad to attract those who expect an artist to realise the pictorial possibilities of groups of buildings.

It is obvious from these etchings that Mr. Monk was impressed with the architecture of New York, and the series ranks among the artist's best achievements in black and white. The effective and descriptive plate of "New York from the River" is a masterpiece of drawing and lighting. The buildings on the island, "down town," are seen from the Brooklyn side, the Singer Tower rising highest, with its forty stories. The dock scenes give movement to the composition, and the foreground "occurs" happily.

The other small illustration represents Wall-street, with Trinity Church in the distance. The Bankers' Trust building, with its pyramid-shaped roof, is skilfully rendered, and the ravine-like effect of the street, with the scale indicated by the human element, is suggested without undue emphasis on the perspective.

WHOSE WORK IS TOWN PLANNING?

OUR contemporary, the *Surveyor and Municipal and County Engineer*, publishes a letter calling attention to the alleged "danger of architects usurping the legitimate functions of municipal engineers in regard to town planning." An editorial note which accompanies this letter points out that the municipal engineer's "special knowledge of existing evils, his practical experience with the design, construction, and maintenance of roads and sewers, and his knowledge of building gained through his duty of supervising the plans and works of architects, alike specially qualify him to deal with questions of town planning." The opinion is then expressed that "town planning is eminently a matter in which those who are by their daily work experienced in town development are well qualified to take a leading part."

With this opinion, as a general statement, we cordially agree, and if this is all our contemporary is concerned about it is only forcing an open door. Architects themselves admit it, and have pointed out that, as under present conditions the first work to be done is generally the lay-out of new roads, the municipal engineer is bound to take a leading part in all practical work under the present Act.

But to gladly concede to the municipal engineer his "leading part" in his own sphere of activity is a very different thing to conceding him what our contemporary's correspondent calls "his true work of town planning, construction and maintenance." For this seems to concede him everything—which is, we imagine, more than any reasonable municipal engineer would wish to claim.

Town planning is a wide and complicated subject which has only recently entered the field of practical politics in this country. At present there is no one man, or class of men, competent to deal with every aspect of it.

Wall-street.

From the Etching by Mr. W. Monk, R.E.

It requires combined effort. Naturally enough we do not yet see our way clear in this respect. We have not yet discovered how each of us may best contribute his mite of knowledge and skill to the common stock. It is all to the good, therefore, that the matter should be discussed in a spirit of mutual respect; but it seems to us unnecessary to press the claim of the architect as it is to deny that of the engineer. We possess the special knowledge of the one to supplement the special skill of the other.

But whatever claims may in the near future be put forward by one or another to play a "leading part"—and everyone, whether architect or engineer, has a natural weakness for this—one thing is certain: the question settles itself regardless of the feelings of either. Those who lead who are the most competent, and we imagine that, by whatever name they may be called in the future, they will possess the gift of design and be able to approach the subject from an architectural standpoint.

CIVIC DESIGN NOTES.

City Tramway Projects. The London County Council will renew in the next Parliamentary Session their application for powers to extend

existing tramways from Charles-street, Farringdon-road, as far as (but not beyond) Ludgate-circus, and, if consent is given them by the Corporation of the City and Holy Trinity Corporation, they will seek for statutory authority to widen Charterhouse-street and Farringdon-road. The new double line, 2 furlongs 8 chains long, will cost about 18,000. The Council have also prepared plans of the proposed system of electrical traction and mode of construction in regard to the extension of the tramways from the City boundary through Bishopsgate to Liverpool-street. This short line, 2 furlongs 1 chain in length, from North Folgate to near Liverpool-street, has been agreed upon between the Council and the Corporation, and when the latter resolved last year to widen Bishopsgate between the City boundary and Brushfield-street, the Council consented to pay one-half of the cost conditionally upon the Corporation not opposing the contemplated running of the tramway-cars on Middlesex-street. The estimated cost for construction and equipment upon the underground conduit system for this double line is near 10,000.

County or Borough Improvement? The dispute between the London County Council and the Stepney Borough Council as to who should widen Cable-street is another instance of the muddle into which London administration has fallen. Stepney contends that this improvement should be treated as a county improvement, as, Cable-street being really a main

New York, from the River.

From the Etching by Mr. W. Monk, R.E.

reach to Tower Bridge and also to the roads, most of its traffic is through traffic, local. Also it claims that a widening would relieve the through traffic in main arterial routes outside its jurisdiction. We do not yet send the reply to these representations, but if a properly constituted authority, with a properly thought out general scheme, such discussions, we imagine, would be of no need to arise. The differences between London County Council and the Road Board as to the value of a western approach road to London illustrate the same point.

The Model Village Criticised. A CORRESPONDENT of the *Daily News* in visiting model villages in Yorkshire, where open spaces and large backyards in common have been provided instead of the usual back and front garden to each house, was struck by their neat appearance, and concludes that, owing to the lack of privacy, in actual working systems seem to have proved a disadvantage to the dweller who wishes to show a proper pride in his residence.

If you plant a few flowers," a housewife explained to me, "as likely as not the children in the other houses come and spoil them. I do wish I had my own backyard! What's the use of trying to be tidy if you've got untidy neighbours sharing the yard?" It is also found that some dull-looking red brick and slate cottages were preferred to those of the model village. They're better than these in some ways," as told. "Their baths are in the scullery." It, it appears, is a real recommendation to collier, whose wife doesn't approve of his living through the house before he can remove dust from his body.

A Boston Improvement. THE plan for the improvement of Copley-square, Boston, prepared for the city by Mr. Frank A. Bourne, does away with that part of Huntington-avenue which diagonally crosses Copley-square. This will provide a quadrangle nearly 400 ft. square between the Public Library, Trinity Church, and the City Plaza Hotel, and extend the line of City Church out to Boylston-street, so that the line by the obliteration of Huntington-avenue could be converted into a garden park. One would then have a public square worthy of comparison with the great squares of other cities. It is intended to place a large column like the Nelson monument in London in the centre of the square.

Western Approach. THE Road Board have signified their approval of a proposal preferred by the London County Council, Heston and Isleworth Urban District Council to divert the line of the contemplated road near Osterley by turning it southwards to effect a junction with the present main road at Spring-ridge, and continuing it thence northwards along the track originally intended. It is also proposed to turn the new route away from the main road at Chiswick, so as to pass round Kew Station and then to enter the main road at Pears' Fountain. The Improvements Committee of the London County Council have decided to recommend the Council not to proceed with the undertaking having regard to the conditions attached to the Road Board to their offer of a grant, £1000, amounting to half the computed cost of the improvement.

Traffic Authority for London. WE are interested to note that the General Purposes Committee of the London County Council reports in favour of the establishment of a London Traffic Board, but that an amendment is to be moved declaring that such a board would be opposed to all principles of local government, and that the County Council should have the duties and powers of traffic authority now performed by other authorities. Motion is also to be moved in favour of restrictive proposals which will secure for the local authorities of London and Greater London the control of street traffic corresponding to the control possessed by the City of London and by other municipalities in England, including powers to determine what roads should be reserved for private residences. These proposals and counter-proposals involve, no doubt, questions of policy which we are not

directly concerned, but we are concerned to obtain for London, however it may be brought about, such simplification and unity of administration as seems necessary if any adherent general plan is to be evolved. That a town should be competent to control its own traffic seems at first glance a self-evident proposition—how much more therefore a county? But at the same time there may be reasons connected with the National or Imperial aspect of London as the capital city which, at the moment, escape us. This seems to be the inherent difficulty with London. As the capital city she is not mistress in her own house from the civic point of view.

Planning of Delhi. MR. KING asked the Under Secretary of State for India whether the report of the Committee appointed to advise on the site planning of the new Delhi will be published shortly; what steps will be taken to carry out the promise that the planning and designing of the public buildings of the new Delhi will be considered with the greatest deliberation and care; and what means are being taken to consult the best Native Indian opinion and those practically experienced in Indian building as to the style and character of the proposed new buildings in Delhi. Mr. Montague replies that the Committee have not submitted any report that could be conveniently published. When their inquiries are completed and their final recommendations submitted the Secretary of State will consult the Government of India as to publication. No decision has yet been come to with regard to the matters mentioned in the second and third parts of the question, but they are engaging the closest attention of the Government of India and of the Secretary of State.

National Housing and Town Planning Council's Irish Report. We have received the Report of a deputation sent by the Housing and National Housing and Town Planning Council to investigate the working of the Irish Labourers' Acts. This Report is stated to have removed all doubts which the members of the Committee may have had as to the economic wisdom of asking for State help for the housing of the poorest classes. We hope to deal with this Report at greater length in a future issue.

Royal Housing Commission for Scotland. THE vital importance of the housing question is again recognised by the appointment of a Royal Commission to inquire into the housing of the industrial population of Scotland, with special reference to the rural districts and the housing of miners and agricultural labourers. This Commission will, no doubt, advise legislative action in due course, but in the meanwhile there is much that might be done by administrative action under the existing law. In such matters as housing it is the energetic and whole-hearted administration of the law by local authorities which seems to be the important thing.

The Scapa Society. FROM the annual report of the Scapa Society, hitherto known for much useful work as the National Society for Checking the Abuses of Public Advertising, we gather that the most important event of the year has been the framing of the Hampshire By-law, under the Advertisement Regulation Act, 1907. The terms of this by-law enact that "no advertisement shall be exhibited on any hoarding, stand, or other erection visible from any public highway (whether carriage-way, bridle-way, or footway), and so placed as to disfigure the natural beauty of the landscape." The important point is that the Secretary of State has approved a by-law whose terms are of general application, not requiring the scheduling of each particular place that it is desired to protect. Five other County Councils, we learn, have followed this example with by-laws of equal or even greater scope. Although it is generally held that the words "visible from any highway" would apply to railways, rivers, and public spaces, the by-laws of Gloucester, Surrey, and Somerset specifically include them. The Scapa Society is to be congratulated on good work well done and may be wished that increase of membership it desires to enable it to extend its sphere of usefulness.

Totterdown Fields Estate. THE development of the Totterdown Fields Estate, Tooting, has been practically completed. The estate, which was purchased in 1900 for £4,238, now comprises 1,261 dwellings. The expenditure on the estate has amounted to £95,931, and the financial prospects are considered satisfactory. Not only does the accommodation provided supply a real need, but the action of the County Council in purchasing and developing the estate has done much to promote the development of a district where additional suburban housing was urgently needed.

Edinburgh as the Seat of a Parliament. WITH reference to the Government Offices that will take the place of the prison erected in 1808 on Carlton Hill, Edinburgh, the Secretary for Scotland was asked whether provision should be made for the housing of a Scottish Parliament in Edinburgh, whether he had considered the propriety of utilising Carlton Hill for that purpose? The reply was made that this site would be fully occupied by the permanent offices. If the present political trend towards federation and devolution is to result in a Parliament for Scotland it is as well that the possibility should be foreseen and provided for however remote it may seem at the moment. The *Builder*, in view of the possibility of Imperial Federation, has already put forward a suggestion for the development of Central London as the capital of the Empire, and it would be interesting to see something of the same sort attempted for Edinburgh as the seat of a national Parliament for Scotland. In any event, the inhabitants of Edinburgh need not scrutinise too closely all proposals for dealing with such an outstanding site as Carlton Hill. Any buildings erected there should be entrusted to the most capable designer available and not left to the ordinary routine of a Government Department.

Railways and Town Planning. AT the Local Government Board inquiry, held to consider a town-planning scheme for East Birmingham, an important question of principle was raised by the railway companies, who contend that the scheme should not apply to any land vested in them for the purposes of their railways. The land in question, some 1,400 acres, has good communication with the central area, but no communication from north to south, the railway line forming a barrier. This defect is proposed to be remedied by the construction of new roads. The position taken up by the Birmingham Council is that so long as the use of the railway land is confined to the purposes of permanent way they have no wish to interfere; but if the companies begin to erect buildings upon it, such as engine-sheds, goods yards, or workmen's dwellings, they ought to come within the provision of the scheme. It is understood that the companies were disposed to consider the position as far as the dwelling-houses are concerned. We are not aware that the property of railway companies, like that of the Government, is expressly excluded from the provisions of the Act. The position needs to be carefully watched, as the railways are not exactly famous for their consideration for the amenities, and there is little doubt that, in the future, the alteration or removal of their permanent way will be the crucial point of many a town-planning scheme.

Regent-street Rebuilding. MR. FELL asked the representative of the First Commissioner of Works if he would state what are the questions submitted to the Committee appointed to consider the proposed rebuilding of Regent-street and the Quadrant; and if it was made a condition of the rebuilding that the height of buildings to be erected shall not exceed that of the present structures, so that the sunshine and light and air of the street shall not be interfered with. Mr. Benn said the terms of reference were as follows:—"To consider the design to be adopted for completing the rebuilding of the Quadrant, Regent-street, due regard being had to aesthetic considerations, commercial requirements, and the interests of the land revenues of the Crown." The point raised in the last part of the question would no doubt be considered by the Committee.

THE BUILDING TRADE.

LAND VALUATION: THE FINANCE ACT.

ON June 20 it was announced by the Chancellor of the Exchequer that an inquiry was to be instituted into the administration of the Finance Act, and it was understood that this was to be proceeded with at once. We are not aware that any steps have so far been taken to appoint a Committee, but on the 16th ult. a question was put to the Chancellor of the Exchequer in the House as to whether under the terms of the reference it would be competent for the Commission to inquire whether the true site value of agricultural land was being ascertained and credit being given for all improvements by owners and their predecessors. The building trade are especially interested in very similar points in connexion with building estates, but on July 5 we pointed out that under the terms of reference—"To inquire into the working of the valuation prescribed by sect. 26, subsect. 1, of the Finance Act, 1910, and to report whether any modifications of the machinery carrying out the valuation are necessary, and, if so, what modifications"—it seemed that questions such as the above would not be the subject for inquiry. In his answer to the above question the Chancellor is in agreement with the view we expressed, as he stated that a Committee of experts such as has been proposed would be confined to considering questions of administration—i.e., whether the Act had been fairly administered; but that if questions of policy were involved, such as the above, the Committee would have to be differently constituted. It is important to note that Mr. Lloyd George made the further statement that he had never stated that the Government were opposed to an inquiry which would embrace questions of policy involving an amendment of the Act, but that the Opposition ought to make up their minds as to the kind of inquiry they desired.

There can be no doubt that an inquiry of the widest kind is that which is required, and that the terms of reference as originally framed were far too narrow to serve any useful purpose, and therefore we trust that the offer now made by the Chancellor of the Exchequer will at once be accepted.

The Act has now been sufficiently long in force for any defects in its working to have been fully grasped and any unexpected results affecting injustice to be considered. We may add that where new principles are applied, as was the case in the Finance Act, it is almost inevitable that defects in their practical application should be disclosed and call for amendment, and we trust that the former reference may now be cancelled and that a full inquiry into the working of the clauses affecting land, both as regards principles and administration, may be instituted without delay.

DISPUTES IN THE BUILDING TRADE.

THE Industrial Council resumed its sittings at Winchester House, St. James's-square, on the 29th ult., to hear evidence upon the settlement of disputes in the building trades of London, Lancashire, Cheshire, and North Wales. Sir George Askwith (Chief Industrial Commissioner) presided.

Mr. Frederick Higgs, Vice-President of the National Federation of Building Trades Employers and ex-President of the London Master Builders' Association, was the first witness. With regard to the scope of the Association in London, he said that they numbered 137 members, who were the chief contractors of London. During 1910 their members paid 1,692,000*l.* in wages to their operatives. They had agreements with their workers as to wages, conditions, demarcation, and the settlement of disputes. Recently they made a fresh agreement with stonemasons and carpenters. Bricklayers were also awaiting a settlement. The agreements embodied a conciliation clause. There were Conciliation Boards and various arrangements for settlements. In case of failure there was a right of appeal to the

Board of Trade to appoint an arbitrator. He thought the decision of the arbitrator should be final. His general experience was that the agreements had been observed by both sides. The conciliation rule which was brought into force was the result of negotiations after long periods of squabbling from 1890 to 1900. The rule came into active operation about 1905. He had heard representatives of the workmen saying that Conciliation Boards were not much used in cases where the decisions were against the workmen, or where they could not agree. There had been several cases of breaches of agreement by employers, and he had generally found that a censure from the Association had been effective. He favoured financial penalties for the enforcement of agreements. If these were imposed on the organisation it would fall on the individual offender.

By Mr. J. M. White: He did not object to compulsion if it could be properly applied to make non-associated competitors pay the same rate of wage as members.

Replying to Sir T. Ratcliffe Ellis, witness said the position ought not to be that a workman should be labelled by being asked, when seeking work, whether he was a unionist or a non-unionist. "My view," he added, "is, ask him if he can lay a brick, and if he can, give him a job."

Mr. Clynes, M.P.: As the result of agreements come to, one effect has been an improvement generally in the quality of work done, and in value and durability?—Possibly; I think it might be so.

Witness said some big firms of contractors in London were not members of the Association. He had suggested that architects should agree to give orders only to builders in the Association for the purpose of inducing employers outside to come in.

In the course of further examination witness stated that he was not in favour of the non-unionist escaping penalties which would fall upon organised workmen of the same trade. He would like to see them organised, just as in his own Association he should like to see more power exercised over outside employers.

Sir Hugh Bell: Do you favour adopting the course of not employing a man unless he produces a union ticket?—I could not prevent it. I can see the man's point of view.

The question is, whether you would be willing to take the same course in regard to men as you suggest architects should take in regard to yourselves—that is to say, to give work only to builders belonging to your Association?—I could not see that.

Mr. Thomas Arthur Locan, of the Lancashire, Cheshire, and North Wales Master Builders' Association, complained of the way in which the Manchester trade had been affected by sectional sympathetic strikes, and favoured the national agreement being more absolute. He would attach monetary penalties to any breach of agreements. Agreements should be arrived at voluntarily between the parties concerned, and when they desired that they should be enforced by law they should be sanctioned by law.

Mr. George Dew, London County Council (Secretary of the London Building Industries Federation), was of the opinion that once an agreement defining wages, conditions, and hours had been arrived at mutually between employers and the trade unions, all employers in the particular industry should pay those rates and observe those conditions. He was strongly in favour wherever possible of adjusting all disputes by amicable means. His Federation was in favour of the enforcement of industrial agreements in regard to rates of wages and conditions of labour. When an agreement had been arrived at between the representatives of the workmen and the employers in any given district it should be an offence for any employer to enforce conditions that were less favourable than those agreed to. Much harm was often done by contractors from low-wage districts, who brought cheap labour into London and took an unfair advantage of the trade. The law should help to enforce agreements mutually arrived at, either by process of recovery of wages from the employers in the wrong or by withholding support from the workman or workmen in default.

The Council adjourned. The results of the ballot on the question of amalgamation of existing trade unions in the building trade has been a disappointment to the promoters of the scheme. Twenty unions were at first committed to the principle, but

the final returns show that only ten seem prepared to go forward with the project, even here the support accorded is not, as stated, calculated to inspire much hope of success. The detailed results of the vote are:—

	Membership.	Votes.
Amalgamated Carpenters and Joiners	77,000	18,600
Operative Bricklayers	24,000	4,371
United Operative Plumbers	12,000	1,606
Stonemasons	9,000	1,249
National Operative Plasterers	8,000	1,778
National Builders' Labourers	5,000	756
United Builders' Labourers	3,000	2,369
Manchester Unity of Bricklayers	2,000	427
Street Masons and Paviers	2,000	152
London and Provincial Painters and Decorators	1,000	223
Totals	143,000	31,541

It will be seen that the statutory two-thirds majority of the total membership has only been obtained in the case of the United Builders' Labourers, one of the smaller unions. A further Conference of the unions set out above will be held in London on December 4, to further consider the scheme, and the promoters are hopeful that other unions will agree to join before that date.

BRICKLAYERS' WAGES, MANCHESTER DISTRICT.

THE agreement arrived at between the Master Builders' Association and the Operative Bricklayers' Society as to rates of pay, etc., Manchester, Salford, and District, will come into operation on November 1. Under the agreement, the workmen receive an advance of 1*d.* per hour, bringing the rate up to 1*s.* 10*d.* an hour. During the summer months the hour will be reduced by five, making forty-nine and a half hours a working week, but the winter week of forty-one and a half hours remains unchanged. There will be advanced rates for men engaged in chimney building, and for sewer-work the new minimum is 1*s.* per hour. There are revised rates for travelling expenses to jobs; all apprentices are to be legally bound; provision is made for the admission of representatives of the union to jobs; and the demarcation of work is defined.

The agreement also provides for improved accommodation for men engaged on jobs, and for the giving of notice to men about to be discharged. It applies to a radius of 5 miles from Albert-square, and will remain in operation until May 1, 1915.

The reduction of hours during the summer months will increase employment by 5 per cent.—*Manchester Evening News.*

GENERAL BUILDING NEWS.

ALL SAINTS' CHURCH, GOODMAYES.
This church is being erected at a cost of 10,065*l.* from the designs of Mr. P. E. Allen, architect, of Tunbridge Wells. The external facings of the buildings are in grey brick with Portland stone dressings, and the contractors are Messrs. Dove Brothers, of Islington.

WESLEYAN HALL, BRADFORD.
Messrs. W. J. Morley & Son are the architects for the new Prospect Wesleyan Mission Hall, which is to be erected to provide accommodation for about 1,000 people. In addition to the large hall there will be several small rooms and a kitchen, and the estimated cost of the work is 6,000*l.* The contractors are Messrs. Brown & Son (masons), Messrs. Wilkinson & Dawson (joiners), Mr. H. Wilkin (plumber), Messrs. Hill & Nelson (slaters), and Mr. T. C. Calvert (painter).

TOWN HALL, CLARE.
A new Town Hall is to be erected on the site of the old Corn Exchange at a cost of about 1,050*l.* From designs submitted in competition that of Mr. Beaumont, architect, has been chosen, which provides for a hall 46 ft. by 32 ft., with a gallery, and a large room below the hall. The contract has been secured by Messrs. Grimwood & Son.

THE SOUTHWARK BRIDGE CONTRACT.
At the last meeting of the Corporation of London an agreement was sealed between the Bridge House Estates Committee and William Arrol & Co., Ltd., for the execution by the company of works in connexion with the removal of Southwark Bridge and erection of a new bridge for the sum of 278,148*l.*

MANCHESTER MUSEUM EXTENSION.

extension of the Manchester Museum in connexion with Manchester University has just opened. Accommodation is provided in extension for the collection of Egyptian antiquities and also for geological and zoological specimens. The architect is Mr. Waterhouse.

TRADE NEWS.

Under the direction of Mr. Arthur J. Stedman, Lic.R.I.B.A., Farnham, the "Boyle" system of ventilation (natural), embracing the latest patent "air-pump" ventilators, air-inlets, has been applied to Old Bourne, Bourne, Farnham, Surrey. The new, new Infectious Diseases Hospital, Milton, Fife, is being supplied with Shor's warm-air ventilating patent Manchester and patent Manchester grates by Messrs. J. Shorland & Brother, Ltd., of Fallowfield, Manchester.

WATER SUPPLY, ABERTILLY.

A new reservoir is to be built for the Abertilly and District Water Board at a cost of £100,000 from the plans of Messrs. Baldwin, Lam, engineers, and the work is to be carried out by Messrs. Underwood Brothers. The reservoir will hold 376,000,000 gallons of water, and will serve a population of 80,000. The height of the dam will be 146 ft., with foundations of 26 ft., and the length will be 1,200 ft. The water will be carried in 12 in. pipes, of which there will be 30 miles. Mr. Latham is the resident engineer.

NATIONAL BUILDING EXHIBITION, LEIPZIG, 1913. The Directors of the Exhibition inform that the date for exhibitors to be finally fixed for October 1, 1912) has been decided to January 1, 1913. Thus firms who wished to participate, but who hitherto have not sent in their application, still have opportunity of securing the space they require. Space has already been booked to amount of a million marks.

LEGISLATION IN THE BUILDING TRADE.

A meeting of Glasgow Technical College Architectural Craftsmen's Society, held in the evening on the 25th ult., Mr. A. H. Purdie, president, an address was delivered by Mr. J. H. Baxter on "The Effect of Recent Legislation in the Building Trade." In order to aid, to understand how steadily oncosts of building and legislative burdens were increasing it was necessary to go back and examine the more troublesome Acts of Parliament and the effect of such as the Factory Acts, Workmen's Compensation Acts, and the Insurance Act. The stringency of the last two had been steadily increasing, and it was no doubt, the National Insurance Act had long become more burdensome, as clear that employers had not realised the effect of such legislation in piling up oncosts, and the percentage of these was increasing, and also methods whereby definite oncosts could be allowed for in ordinary contracts. Discussion followed.

APPLICATIONS UNDER LONDON BUILDING ACTS, 1894 to 1909.

Tuesday's meeting of the London County Council, for the following applications under the Building Acts were dealt with. (The names of the applicants are given in parentheses):—

Lines of Frontage and Projections.

Camdenwell.—Erection of a shop front at 90, Camberwell-road, Camberwell (Messrs. J. & Sons for Messrs. H. & C. Davis, Ltd.).—Consent.

Camberwell, North.—Building on the western side of Wells-street, Camberwell, to abut also on the southern side of Blackbridge-street (Messrs. Hichison & Co., Ltd.).—Consent.

Hampstead.—Projecting wooden entrance to the use of the northern side of St. Cuthbert's-lane, Hampstead, next to Shoot-up-hill (Messrs. Rix & Wilkins).—Consent.

Islington, East.—Illuminated sign in front of No. 292, Holloway-road, Islington (Mr. C. E. R. Consent).

Lewisham.—Erection of shops on the western side of High-street, Lewisham (Mr. H. H. Hall).—Consent.

Wandsworth.—Erection of a one-story building No. 264, Burdett-road, Wandsworth (Mr. J. Hayworth for the Bow-common Estate).—Consent.

Wandsworth, West.—Erection of an oriel window and two balconies at No. 394, Oxford-st. St. Marylebone (Mr. G. Thrale Jeffs for Mr. F. Dixon).—Consent.

Wokingham.—Erection of a building on the eastern side of High-street, Peckham (Mr. Wetherell).—Consent.

St. George, Hanover-square.—Erection of a projecting shop front and balcony at No. 23, New Bond-street (Mr. M. E. Collins for Messrs. A. C. F. & W. M. Hill).—Consent.

Strand.—Iron and glass shelter at the entrance to Nos. 1 and 2, Coventry-street and No. 1, Wardour-street (Messrs. Emden, Egan, & Co.).—Refused.

Wandsworth.—Erection of bay-windows and porches at a proposed building on the northern side of Becmead-avenue, Streatham, abutting also upon the eastern side of Garrads-road (Messrs. Marsh & Wiles for Mr. C. N. Murphy).—Consent.

Width of Way.

Limchouse.—Erection of a building at Hough's Wharf, on the northern side of Narrow-street, Limchouse (Mr. W. M. Knight for Mr. R. Hough).—Consent.

Mill End.—Erection of additions at No. 381, Mile End-road, at less than the prescribed distance from the centre of the roadway of Lewton-road (Mr. F. E. Harris for Mr. I. Zeligman).—Consent.

Rotherhithe.—Erection of a stable building and an open shed upon a site on the eastern side of Braddon-road, Rotherhithe, abutting also upon Seven Step-alley (Mr. J. M. Kennard for Mr. A. H. Foster).—Consent.

Width of Way, Lines of Frontage, and Projections.

Kensington, South.—Erection of a circular iron staircase and a balcony at No. 35, Queen's-terrace mews, Kensington (Messrs. Hayward Brothers & Eckstein, Ltd.).—Consent.

Lewisham.—Erection of a building upon a site at the rear of No. 60, Loampit-hill, Lewisham, to abut upon the southern side of Beaufort-gardens (Mr. H. G. Fennell).—Consent.

Lines of Frontage and Construction.

Hackney, Central.—Retention of wooden fowlhouses of a temporary character at the rear of No. 21, De Beauvoir-square, Hackney, next to Mortimer-road (Mr. E. J. Shelly).—Consent.

Paddington, South.—Temporary shed in front of No. 10, Craven-hill, Paddington (Messrs. T. W. Heath & Son).—Consent.

Width of Way, Projections, and Construction.

Kensington, North.—Erection of an iron and glass covered way at Nos. 3, 5, and 7, Chestow-place, over the public way of Chestow-mews, Paddington (Mr. E. J. Stubbs for Messrs. Bradley & Sons).—Consent.

Line of Fronts, Space at Rear, and Projections.

Deptford.—Water-closets and wooden staircases at the rear of Nos. 58 to 78, even numbers only, inclusive, Whitechapel-street, Deptford (Mr. W. J. Clayton for the South-Eastern Railway Company).—Consent.

Lewisham.—Buildings on the northern side of Georgelane, and the eastern side of Roxley-road, Lewisham (Mr. P. Roche).—Consent.

Frontage and Space at Rear.

St. Pancras, South.—Erection of projections to a building to abut upon Hunter-street and Handel-street, St. Pancras (Mr. A. Davis for the London Housing Society, Ltd.).—Refused.

Width of Way and Construction.

Dulwich.—Lean-to shed at the premises of Messrs. J. F. Chiverrall & Co., at the rear of Nos. 87 and 89, Camberwell-grove, Camberwell (Mr. J. F. Chiverrall).—Consent.

Width of Way and Space at Rear.

Poplar.—Erection of four cottages on the southern side of Morant-street, Poplar (Mr. T. J. Bee for Mr. W. J. Kemp).—Consent.

Width of Way, Space at Rear, and Height of Buildings.

Battersea.—Buildings on the northern and southern sides of a street for foot traffic only leading from St. John's-hill, Clapham Junction, to Clapham Junction Station (Messrs. Trehearne & Norman for Mr. W. J. Fryer).—Consent.

Space at Rear and Alteration of Building.

Maylebone, West.—Erection of an addition at the rear of No. 83, Gloucester-place, St. Marylebone (Mr. J. Hudson for Mr. W. Gadd).—Consent.

Alteration of Buildings.

Chelsea.—Erection of an additional story to the back addition of No. 17, Moore-street, Lennox-gardens, Chelsea (Messrs. Douglas Young & Co. for Miss M. L. Talbot).—Consent.

Hampstead.—Erection of a bathroom addition at the first-floor level of No. 2, Harley-road, Hampstead (Mr. A. W. Moore for Mr. C. E. Marshall).—Consent.

Islington.—War-closet addition at the rear of No. 159, Hornsey-road, Islington, at the

second floor level (Messrs. W. J. Smith & Co.).—Consent.

Wandsworth.—Enclosing walls of less thickness than required by the said Act to cellars at Nos. 6 and 64, Waldron-road, Wandsworth (Messrs. Holloway Brothers (London), Ltd.).—Refused.

Cubical Extent.

City of London.—Additional cubical extent in connexion with the erection of a printing office and factory building abutting upon Shoe-lane and Plum Tree-court, City (Messrs. J. W. Beaumont & Son).—Consent.

Kensington, North.—Erection of a building upon the site of Nos. 3, 5, and 7, Chestow-place, Kensington, exceeding 250,000 cubic ft. in extent (Mr. E. J. Stubbs for Messrs. Bradley & Sons).—Consent.

Cubical Extent and Construction.

Paddington, South.—Erection of iron and glass roofs over loading-platforms, external iron staircases and galleries, and iron enclosures to lifts at the premises of Messrs. W. Whiteley & Co., Ltd., Queen's-road, Bayswater (Messrs. John Belcher, R.A., and J. J. Joass for Messrs. W. Whiteley & Co., Ltd.).—Consent.

Uniting of Buildings and Construction.

St. George, Hanover-square.—Erection of an iron staircase at No. 7, Dover-yard, and the uniting of No. 43, Dover-street with Nos. 5 to 7, Dover-yard, Piccadilly (Mr. F. Newman for Messrs. A. Webster & Co.).—Consent.

Cubical Extent, Uniting of Buildings, and Construction.

Mill End.—Additional cubical extent in respect of a proposed division to be used for cask washing and drying at the Anchor Brewery, Mile End-road; the formation of openings, fitted with steel rolling shutters; and the erection of the cask washing shed in reinforced concrete (Messrs. W. Bradford & Sons for Messrs. Charrington & Co., Ltd.).—Consent.

The recommendations marked * are contrary to the views of the Metropolitan Borough Councils concerned.

PROJECTED NEW BUILDINGS IN THE PROVINCES.*

ABERNANT.—Houses for the Aberdare Urban District Council (Messrs. John Morgan & Son, Ltd., builders, Pendarren-street, Aberdare).

Ayr.—Diphtheria block at Heathfield Hospital (2,700); Mr. J. Young, Surveyor, Town Hall, Ayr.

Banbury.—Proposed rebuilding of Britannia Works for Messrs. Samuelson & Co., agricultural and milling engineers.

Bangor (Ireland).—Baths and convenience, Pickie (3,000); Surveyor, Council Offices, Bangor.

Barry.—Shelters on Promenade (1,200); Mr. J. C. Pardoe, Surveyor, Council Offices, Barry.

Basingstoke.—Fire-station, Brook street (700); Mr. E. Reginald Phipps, Surveyor, Town Hall, Basingstoke.

Beverley.—Proposed school (3,500); Vicar, St. Mary's Church, Beverley.

Birkenhead.—School, Pilgrim-street (800 places); Mr. Robert T. Jones, Town Hall, Birkenhead.

Birmingham.—Tramway depot, Highgate-road (30,000); Mr. A. Baker, Tramways Manager, Town Hall, Birmingham.

Birmm.—Rebuilding Birmm Hotel; Messrs. Henry & Maclellan, architects, 7, South Charlotte-street, Edinburgh.

Blackburn.—Weesleyan Mission-buildings (20,000); Messrs. Bradshaw, Gass, & Hope architects, 19, Silverwell-street, Bolton.

Blackpool.—Picture theatre, Dickson-road; Mr. H. Wade, architect, Birley-street, Blackpool. Rebuilding Sunday-school for Trustees, Wesleyan Church, Adelaide-street, Blackpool.

Booker.—Administrative block at isolation hospital (527); Messrs. C. H. Hunt & Son, builders, Station Works, High Wycombe.

Bury.—Alterations and additions to Holy Trinity Church (1,500) for the Vicar.

Bury St. Edmund's.—Six houses, near Northgate-street, for the Guildhall Tenement Trustees; Mr. Sidney Naish, architect, The Croft, Bury St. Edmund's.

Cardiff.—Offices, Cardiff Dock; Mr. H. Bugden, architect, 95, St. Mary's-street, Cardiff. Cawood (Selby).—Alterations to chapel (1,000) for the Trustees.

Cheadle.—Additions to Harthill. The Crescent, for Dr. John H. Godson; extensions to works of Messrs. William Mosley, Ltd., bleachers, for the Bleachers' Association, Ltd., 4, Norfolk-street, Manchester.

* See also our list of Competitions, Contracts, etc., on another page.

Cockermouth.—Proposed new building for the Board of Management, Cockermouth Nursing Home.

Crompton.—Warehouse at Higher Clough Mills for the executors of Mr. J. Milne, cotton spinner.

Cullompton.—Unitarian chapel (900*l.*); Mr. R. M. Challice, architect, 14, Bedford-circus, Exeter; Messrs. E. Labdon & Sons, builders, 1, Fore-street, Cullompton.

Denbeath.—Residence adjoining hospital for the Wemyss Coal Company, Ltd., East Wemyss, Fife-shire.

Doncaster.—Proposed addition to Yorkshire Institute for the Deaf and Dumb (4,900*l.*) for the Governors.

Dundee.—Additions to buildings, Dens-road and Main-street, for Messrs. Harry Walkers & Sons, Ltd., jute goods, etc., manufacturers, Caldrum Works, St. Salvador-street; additions to Lilybank Foundry for the Caledon Shipbuilding and Engineering Company, Ltd., Kembach-street, Dundee.

Dunston-on-Tyne.—Proposed large steelworks for the Stobie Steel Company of Sheffield; works for the Team By-Products Coke Company, Ltd., Milburn House, Newcastle-on-Tyne.

Eastbourne.—Plans have been passed as follows:—Garage, Prideaux-road, for Mr. O. Bradford; Mr. A. Ford, architect; Messrs. Miller & Selmes, builders. Four houses, Station-road; Mr. A. Chandler, architect; Mr. E. Merchant, builder. Addition to Palgrave-mansions, Devonshire-place; Messrs. Peerless, Dennis, & Co., builders. A plan has been lodged for alterations to the Club Hotel for Messrs. Young & Rawley; Mr. T. Woodbridge Biggs, architect.

Elvington (near Eyrthorpe).—Houses; Mr. W. Bromley, builder, Maison Dieu-road, Dover.

Foleshill.—Addition to school, Windmill-lane (4,052*l.*); Mr. I. Langley, builder, Tyburn, Chester-road, Erdington, Birmingham.

Freckleton.—Alterations and improvements to Holy Trinity Church for the Vicar.

Gorseinon.—Two hundred and sixty-four houses for the Gorseinon Co-partnership Housing Society.

Halstead.—Baths, Parsonage-street; Mr. W. A. Nicholson, Surveyor, Council Offices, Halstead.

Hinckley.—Proposed workmen's dwellings (1,850*l.*); Mr. E. H. Crump, Surveyor, Council Offices, Hinckley.

Holmfrith.—Hippodrome, Eldon-yard, for Messrs. Hawthorne & King, Milfield; Mr. P. N. Brown, architect, Hawthorn Bank, Holmfrith.

Horton.—Alterations to Bolton and Horton car depôts (500*l.*); Mr. C. J. Sydenham, Tramways Manager, Town Hall, Bradford.

Huddersfield.—Mill, Acre-street, Lindley, for Messrs. Joseph Sykes Brothers, branch of the British Card Clothing Company, Ltd., Acre Mills, Lindley, Huddersfield.

Huntingdon.—Children's quarters for Guardians; Mr. R. A. Fordham, architect, Peterborough.

Kilmarnock.—Reconstruction of infirmary (12,000*l.*); Dr. Burnett, architect, Glasgow.

Lancaster.—Church; Rev. A. S. Andrew, Pastor of Trinity Presbyterian Church, 2, Westbourne-terrace, Lancaster.

Larne.—Store, filter shed, Circular-road, for the North of Ireland Paper Mill Company, Ltd., Inver Mill, Larne.

Leigh (Lancashire).—Picture palace (3,000*l.*); Messrs. J. C. Prestwich & Son, architects, Bradshawgate-chambers, Leigh.

Lincoln.—Adaptation of premises, Bank-street, as tuberculosis dispensary, also probable sanatorium (10,050*l.*); Mr. R. A. MacBair, Engineer, Town Hall, Lincoln.

Lincolnshire.—Six houses, Deeping St. James; four houses, Market Deeping; and four houses, Carly; Mr. J. H. Roberts, builder, 3, North-street, Bourne.

Linslade.—School (1,638*l.*); Messrs. Webster & Cannon, builders, 42, Cambridge-street, Aylesbury.

Luton.—Workshops, Biscot-road, for Commercial Cars, Ltd., motor-car manufacturers, Biscot-road, Luton; additions to premises, Upper George-street, for Mr. W. M. Skelton, Master, Cottage hospital; Mr. Joseph Humphries, architect, Maesteg.

Manchester.—Proposed baths, Chorlton; Mr. Henry Price, Architect, Town Hall, Manchester.

Matlock.—Pavilion in the Park (4,000*l.*); Mr. Joseph Turner, Surveyor, Council Offices, Matlock.

Menai Bridge.—School (4,731*l.*); Messrs. R. & J. Williams, builders, Park-street, Upper Bangor.

Mountcorrel.—Conservative Club; Mr. F. Sleath, builder, Rothley, Loughborough.

Nelson.—Tan houses and shop, Carr Hall Estate, for the Co-operative Society.

Newcastle-under-Lyne.—Six houses, Brampton Farm, Garden Suburb; Mr. R. T. Longden, architect, York-chambers, Stoke-on-Trent; Mr. J. Cooke, builder, Wolstanton.

New Malden West.—School (4,700*l.*); Messrs. Grace & Marsh, builders, 79, Tamworth-road, Croydon.

Northampton.—Creosoting works, Cotton End; Mr. Edward Mackie, Estate Agent, London and North Western Railway Company, Ltd., Euston Station, N.W.

Nuneaton.—Cookery and manual instruction centres, Canon-road (3,642*l.*); Mr. S. Smith, builder, care of the Town Clerk, Town Hall, Nuneaton.

Rotherham.—Congregational church, Kimberworth-road; Mr. J. Totty, architect, 20, Moorgate-street, Rotherham.

Selby.—Proposed thirty to fifty houses; Mr. R. G. McG. Gray, Surveyor, Council Offices, Selby.

Sandwich.—Sanatorium, Holly-lane (11,200*l.*); Mr. A. Hoskens, Surveyor, Town Hall.

Southend.—Pumping-station and destructor buildings, two houses, etc. (13,195*l.*); Messrs. E. & B. H. Davey, builders, Southend. Theatre, Leigh-road, for the Raymond Animated Picture Company.

Swansea.—Extensions to warehouse at Prince of Wales' Dock (about 3,000*l.*) for the Swansea Harbour Trust. Buildings, Castle-street; Messrs. Phillips & Vaughan, architects, 39, Commercial-street, Newport, Mon. Buildings, Castle-street, Sea View-terrace, and alterations to premises, Carmarthen-road; Mr. Marcus Hoskins, Estate Agent, Town Hall, Swansea. The following plans have been passed:—Warehouse, Paxton-street, for Mr. E. Holwitt; four houses, Sketty-road, for Mr. T. Spragg; eleven houses, Glangydran-avenue, for Mr. J. B. Jenkins; three houses, De Breos-avenue, for Mr. Jonah Roberts; four houses and garages, Eversley-road, for Mr. Henry Billings; four houses, De Breos-avenue, for Messrs. Munday, Hayes, Griffiths, & Pugh. A plan has been lodged for four houses, Florestfach, for Messrs. Fogler & Allen.

Towcester.—Seventeen houses (2,700*l.*); Mr. Robert Marriott, builder, High-road, Rushden.

Wallasey.—Workmen's dwellings (4,110*l.*); Mr. W. H. Travers, Engineer, Town Hall, Wallasey.

Warwickshire.—Schools at Glascoote, Hillman-ton, and Studley; Mr. Bolton King, Secretary, County Education Offices, Warwick.

Wealdstone.—Additions to works for Messrs. Kodak, Ltd., Kingsway, W.C.

West Molesey.—School (4,595*l.*); Mr. E. Potterton, builder, East Molesey.

Wigan.—Proposed rebuilding of factory, Solo-street, for Mr. H. King, furniture manufacturer.

Willington.—Additional premises for the Co-operative Society.

Yorks (East Riding).—Adaptation of Armeley House as boarding-house (500*l.*); school, North Newbold (1,500*l.*); and addition to school, Great Driffield; Mr. J. J. Bickersteth, Secretary, Education Offices, Beverley.

THE HYGIENE OF BUILDING.

At a meeting of the Institute of Sanitary Engineers on October 21 Mr. T. W. Aldwinckle, F.R.I.B.A., in the chair, a paper on "The Hygiene of Building" was read by Mr. Percy L. Marks. After some general remarks the author said, in speaking of ventilation:—"An important hygienic consideration is the provision of thorough ventilation. Can anything more detrimental to health be conceived than the old discredited arrangement of back-to-back houses, an arrangement of held in conjunction though it did not connote side-to-side houses as well. I say "discredited"; and yet it is not so long since I read in a North-British paper that one of the burghs had, though finally voting against their continuance, a fair-sized minority in favour of back-to-back houses—and that in the twentieth century! And in a provincial paper (of last April) I read that "Flint R.D.C. has ordered the closing of a house at Dyerdy, which has no water supply, no drainage, no light, no ventilation, and no bedroom, the only living-room being used for sleeping."

Buildings should be well lighted; dark spaces connote disregarded collections of undesirable matter; and, if they do not connote, yet dark spaces certainly invite eye-

strain and nervous breakdown. Scientifically-based proportions for lighting have been tabulated, but it is difficult to credit the value of these proportions, except as a "Guide to the Perplexed." It has, for instance, been recommended that for each 70 cubic ft. of air space in an apartment there should be 1 sq. ft. of glass; and other proportions on different bases of calculation have been advocated. But these are, to an extent, rule-of-thumb methods that do not need to be regarded too rigorously. What ought to be borne in mind is that, whilst it is proper to ensure against unlighted spaces, an excess of light is also detrimental. But of the two extremes excess of light is preferable to deficiency of light.

Strictly regarded, ventilation and warming should not be dissociated, under which circumstances the intimate relation between warming and hygiene would be at once made manifest. And it must be remembered that warming should be warming, not scorching, or drying the air or in any way rendering the effect enervating. It may almost be said that correct heating, when effected by mechanical means, is the result of empiricism, though it assumes the form of a scientifically-based tabulation. But science is itself based upon practical purposes upon an empirical basis, though fundamentally it is independent of and superior to the latter. Accepting matters as they stand, however, we are furnished with a plenitude of tables to indicate the quantity of 2-in., 3-in., or 4-in. pipe that should be provided under given conditions and doubtless in a majority of cases the answers satisfactorily.

The avoidance of draughts is an important point for consideration, and, to this end, doors and windows *vis-à-vis* to each other should to one another are undesirable. Nor is it well for a door to be placed in the wall contiguous to and overlooking the length of the fireplace; when the door is opened it produces a draught by the hearth more pronounced than in any other position, and ought to be obviated by the interposition of screen.

The best relative positions for door, window, and fireplace are probably as here detailed, if we start with an assumed writing-table placed more or less centrally; the fireplace to face the writer, the door to be to the right and opening against, not towards, the fireplace; the window area to be treated (at a moderate-sized room) as two separate openings to the writer's left, a solid wall confronting the more or less centrally placed door in the opposite wall. Where writing facilities may be disregarded a left-hand light is not of importance, as, for instance, in a drawing-room, where such a lighting scheme would never be considered. In a small room an angle fireplace has distinct advantages, though this is not a hygienic point.

But the others just mentioned are assured hygienic points to be borne in mind, even though the reference to door-hanging is hygienic only so far as the promotion of a sudden draught between the fireplace and the open door is concerned, and is of effect only when the former is being used as a focus of attraction.

Another point is to obviate draught between the front or other entrance door and any of the rooms. This satisfaction may be most frequently secured by interposition of only a small vestibule, or by so deflecting the currents of air as to produce the happy result. This deflection may be obtained by the use of a projecting porch with the opening set at one side.

A staircase-well is a fruitful source of draughts, but this feature is so commingled with the desire of possessing spacious and artistic or picturesque staircase treatment that it is difficult to effect a cure, except by using the well for a lift-run.

The inter-relation of the living-rooms to the kitchen is of importance so far as non-transportation of odours is concerned, for with people who are in any degree neurotic the insidious attack of such odours has an irritant effect upon the olfactory organs and the nervous system. A dinner service hatch giving direct communication between the kitchen and the dining-room very trying in this connexion.

Similarly with the inter-relation in regard to the water-closet, which is frequently in properly ventilated and improperly placed.

w often in the average-sized town house we find it situated halfway up the principal staircase—perhaps the worst possible position for selection. But if it were solely from the standpoint of want of space I would not deal with it here; it is a hygienic objection that justifies—nay, demands—its condemnation in this place. Its inter-relation with the bedrooms could be likewise carefully considered. Making generally, if it can be kept entirely detached from every room, other than a bathroom, it will be best so arranged. And it should be also entire detachment from places where food is stored or cooked, but it is too frequently disregarded, though the Public Health Acts are gradually effecting improvements.

Hygienically it is a mistake for habitable rooms to be unduly high in proportion to their area; it tends to a stagnation of air, which is the negation of good ventilation. How are we to find out what is the proper height, either absolute or relative? We may take with a minimum height of 8 ft. 6 in., and with any lesser height the ceiling would tend to press down upon the heads of the people in the room. But having fixed a minimum, can we find a maximum? I fear not. We may, of course, say that we cannot have of any room in an ordinary house more than 30 ft. high, but how much nearer can we approximate a maximum? We can say that a cube room would perhaps be a desirable maximum, but further we cannot go, for then it then a matter of hypothesis as to a matter of proportion, not of dimensions.

Respecting hospital-ward capacity I will make a slight difference respecting data; by means of accumulated experiments which result in experience it is perhaps possible to say that such and such a minimum of space is requisite in order to promote valences under average conditions, and such and such a lineal wall-space between patient and patient is desirable. This is so, and allowing for the necessary lateral gangway in a multiple ward, the ideal height is thus obtained. But when we are considering the spacing for barracks, for workhouses and school dormitories, for other and smaller apartments unassociated with people in an abnormal pathological condition we are confronted at once with the empirical bases. For though scientists may say that all is properly based upon the fact that a certain small fractional amount of CO₂ per 1,000 cubic ft. of air is admissible maximum, yet we must bear in mind that other conditions are allowed prevail outside hospitals and infirmaries, not disturbing (not to say disastrous) effects.

We must therefore be careful to distinguish between scientific formulae and tables affecting people abnormally conditioned in regard to health and between all others. The Public Health Acts, Building Acts, Health Acts, and others may, it is true, lay down instructions on such points, but I must emphasise the fact that there is no scientific accuracy in such instructions, though it may be added that they are far more than merely lenient.

It is, of course, most desirable that bathrooms, lavatories, water-closets, housemaids' rooms, and sculleries should be placed not external walls and, as a natural consequence, be lighted and ventilated in an external wall.

Even as the relative horizontal grouping of the living-rooms and the kitchen is to be regarded as hygienically important, so, too, their relative vertical grouping. If a service lift is installed with its intake in the kitchen, then its outlet should be in the dining-room, but in a lobby; otherwise the penetration of odours will be pronounced, which would be trying and perhaps injurious to delicate nervous systems.

When considering hygienic construction it is fitting to consider simultaneously the use of hygienic materials; otherwise there is bound to be overlapping. Firstly, thin walls detrimental to health in such samples of houses as the British Isles possess. Combricks are naturally porous, though of course there has been an increasing manufacture of denser stuff. Habitually, however, atmospheric moisture penetrates readily,

with the result of a general tendency to levelling of the internal and external temperatures, causing rooms to be hot or cold in sympathy with the rise or fall of the mercury. This is, of course, a mistake; the internal temperature should be able to be maintained easily some 10 deg. higher or lower than the external. In the good old days, when defensive building was in vogue, walls were built perhaps 10 ft. or more in thickness, so thick, indeed, at times that they would contain hidden rooms, tortuous corridors, and winding staircases—houses such as Woodstock, on whose site Blenheim now stands. Whatever defects they may have had, from a sanitary standpoint, they were certainly not subject to sudden and unwelcome changes of temperature—except such as might be provided by a conflagration. I do not forget that the houses of the commonality in general were not so constructed; but even the latter were structurally superior to many, very many, of our modern edifices.

It is well where a wall-face is exposed to very humid influences that it should be protected either by weather-tiling or stucco; if it be a driving damp, stucco is preferable. Slate—the ordinary slate—makes a pervious roofing material. In fact, for the ordinary urban and suburban house all possible means seem to be taken so as to ensure comfortable conditions of existence. Again I must interpolate that I do not forget the numerous tile-hung roofed houses that are to be seen, but I have in mind the general treatment of the long-suffering public.

Lime-and-hair plaster is not a notably sanitary material to employ—it is too apt to harbour vermin; and the super-hanging of wall-paper upon wall-paper is a prime factor in similar harborage. Let me tell you of an experience of my own with some small shop property in South London with which I had to deal in the way of repairs under a schedule of dilapidations served on my client. When the workmen commenced stripping the walls of the bedrooms they were able to count as many as eighteen separate papers, besides which there was a massed thickness that represented half a dozen or so more; that is to say, there were some twenty-four or more papers in all, and the inference is that in the whole course of the life of these premises not a single paper had ever been stripped off before hanging a fresh one.

Lead and copper should, by preference, not be used for storage cisterns connected with table service; in fact, galvanised iron is now customarily employed. Thatched roofing is very pleasing in appearance, but, besides the fire risks attaching to its use, it is also apt to harbour vermin. Its good quality is the maintenance of an equable temperature. Oxide of lead paints should be avoided, as they are of a poisonous nature. Oxide of zinc and some of the many varieties of water paints may be safely employed. Arsenical wall-papers are a source of danger, particularly in bedrooms; poisonous particles may become detached and enter into the organs of those using the rooms. It is a popular mistake to think that only green tones contain arsenic. But the use of these papers is easily avoided at the present day.

There is great merit in choosing good lavatory-basins, baths, and closet apparatus. The basin should be self-cleansing, and should have an accessible overflow—in so many lavatory-basins may be observed soap that has clung to the sides, even after a flush, and so often do we become unpleasantly cognisant of the odour of stale soap that has collected out of sight by the overflow.

Of course, there are other good overflows, but the weir principle, with the facility of removing the plate and exposing the overflow, appeals to my sense of cleanliness. The old-established shell-screened overflow is an abomination, harbouring collections of dried scapods which may easily prove injurious to health. Of course, the lavatory-basin waste should be provided with screw-capped cleansing traps in an accessible position, and should also have a puff-pipe (that is anti-siphonage pipe). Stack waste-pipes should also be supplemented by anti-siphonage pipes, so as to prevent the standing water from the traps being drawn out by the action of momentary anti-siphonage.

Baths should be trapped and should have

accessible overflow and puff pipe. There should also be a dribble-pipe from the safe beneath the bath. Water waste-preventing (commonly called flushing) cisterns should be of good construction, and, where permitted, they should be of 3-gallon, instead of merely 2-gallon, capacity; nor should the inlet-pipe be contracted in bore, as is not infrequently the case.

Closet-pans should be self-cleaning, and should not only have a sufficient water-seal, but a fair standing water area also. Good valve-apparatus closets are very commendable, but still I prefer the "wash-down" variety of pedestal closet. Of course, the "wash-out" variety is adjacently unnameable, and is discredited in London, though not infrequently still to be met with in unmodernised systems.

And with all or any of these systems wooden enclosures are to be avoided, for even with the valve variety it is possible to obtain "pedestal" treatment. Baths and lavatories should also be unenclosed; let the fittings stand exposed to light and air.

As regards drainage, the lines should be straight and laid to a moderate fall only; too slight a gradient means the possibility of inefficient clearance, leaving deposits, which will gradually silt more and more and eventually choke the drain, and too steep a gradient also, curiously enough, may have a similar effect. It has been found that for 4-in. and 6-in. drainage a fall of 2 in. in 10 ft. (1 in 60 gradient) is generally effective; an increase in the pipe diameter should be met by a decrease in gradient, but an increased diameter should only be provided where the mass of discharge justifies it. In a house where I was concerned a few years ago I found that a system of 9-in. drainage throughout was installed, and this, too, by a firm of London engineers for a property dating only thirty years back even now. I had the whole of this cleared away, substituting 4 in. and 6 in. There was also not very far from the house a large choked-up cesspool, not habitually used; for by means of a sluice-valve inserted in a Y-junction pipe the discharge could be directed either to the cesspool or to the main sewer. This cesspool, too, I had cleaned out and filled in with brick rubbish and plenty of lime disinfectant.

Where curves or changes of direction become necessary in a drainage system, man-holes or inspection-chambers should be provided. Good pipes and good jointing are necessary. I have a preference for unsocketed pipes, such as those in Lowe's patent; the latter system admits, too, of quicker laying down, ensures a more satisfactory bedding, and is, in my opinion, likely to prove more lastingly satisfactory. Of course, all drains should be bedded on and partially in shallow concrete. Porous pipes and open joints are inadmissible, except for agricultural drainage and unconscientious landlords.

Defective drains might be a matter of less urgency for replacement were they running in an open channel exposed to the free air of heaven, for they would then be aerated. But confined underground, noxious gases are generated, which gradually permeate the surrounding soil by way of defective work and materials, and thus promote a breakdown of health. Recently I had a case of this nature, where the tenant complained of the smell and also of the rats. Despite the fact that on inspection my plumber saw a rat poking his head up from the sewer through the cleaning-eye of the disconnection trap (which was no disconnection trap, as the eye lacked a sealing-off cap); despite the fact that my plumber and I saw plentiful marks of the claws and presence of the rats; despite the fact that we could not fill the drains with water (for the latter lodged the surrounding soil and poured out in the disconnection-chamber at all points and places, except by way of the channel pipes); despite the fact that we saw the smoke pouring in volumes through the open joints of the soil-vent pipes—despite all those facts, the sanitary inspector (declining to use the hydraulic test as being "unfair") calmly reported that there was nothing wrong anywhere under a smoke test, merely graciously conceding that it would be well to put a sealing-off cap to the eye of the disconnection trap. It was red-tape rampant.

The specimens for testing as beams were prepared in a similar manner, and the columns were prepared with the ends in parallel planes at right angles to the axis of

TABLE IV.—SHEARING TESTS: NEW SOUTH WALES HARDWOODS.

Local Name.	Size of Test Piece.		Moisture.	Shearing Stress.

White stringybark	3	2.83	15.1	693

neutral length of 40 in. by the formula: $120 W/bd^2$; and the horizontal shearing stress S_h has been calculated by the formula: $= 0.75 W/bd$.

It will be observed that in Table II. the values of the modulus of elasticity as determined from the loads and deflections are ways greater than those obtained from the measured extension of the extreme fibres in tension. This is due to the fact that the deflection is produced by the direct and bending stresses combined, whereas the extreme fibre stresses and extensions are not affected by the shearing stresses, as the shearing stress is of zero value over the central portion of the beam. The values of the moment of resistance given in the table denote the work done in producing the deflections, and have been calculated by the equation: $M. R_1 = 0.432 \Delta/bd$.

The Report gives details of the tests conducted on the smaller beams mentioned, but, limits of space will not permit us to enter these, the reader is referred to the report for particulars.

3. Tests of Columns.

These tests were made on short, medium, and long columns. The short columns were 8 in. long and the long columns 8 ft. long, the kinds being of square and circular cross-section. The medium columns were 3 ft. long, and of square cross-section only. In every case the cross-section was either 4 in. square or 4 in. in diameter.

The results are given in several voluminous tables, for details of which the reader is referred to the Report itself; but we give in Table III. a summary of the average breaking loads for the three types of columns as computed for the uniform proportion of per cent. of moisture, which was exceeded only a few of the test columns. The average ratio l/d , denoting the ratio of the length to the diameter or side of the square, is included as an additional index to the proportions of the various columns tested. The complete tables in the Report are of such practical value, clearly indicating the percentage of moisture, the degree of seasoning, and other conditions affecting strength, stiffness, and affording guidance of a kind that cannot be furnished by formulae.

4. Shearing Tests.

The difficulty of making accurate tests of the shearing strength of any material is generally acknowledged. It is usually considered more satisfactory to subject the test specimens to shearing stress on one plane only, causing "single shear," than to apply stress on two planes, resulting in "double shear."

In the previous tests by Professor Warren, the results of which were published in 1892, the method adopted did not ensure determination of the true shearing stress, as bending moment was necessarily developed, though the ultimate shear was confined to one plane.

The method in question was devised for finding the strength of timber used as keys compound timber beams, and, while representing accurately the behaviour of timber so

applied, is not suitable for general employment.

For the purpose of the tests described in the present Report a new method was adopted by Professor Warren, the shear being confined to one plane and the bending moment developed being very small.

It was originally intended to cut the test pieces so that shearing would take place only tangentially or normally to the direction of the annual rings, but this was not done with all the specimens, and in some cases the plane of shear was more or less inclined to the tangent.

In the case of all the test pieces for which results are summarised in Table IV. failure occurred in the plane of shear irrespective of its position relative to the plane of the annual rings.

The results in this table are considerably lower than those afforded by the method of testing described in the 1892 Report, the difference being due mainly to the practical elimination of bending moment by the new method.

5. Tensile Tests.

From a practical standpoint data on the tensile resistance of timber are of secondary importance, as in structures the members in tension are jointed at their ends to other members, and the weakest point is at the joint and its connexions, where shearing stress is the governing factor.

Nevertheless, reliable information as to the tensile strength of timber is of general utility, and tests bearing upon this property have been included in every comprehensive

TABLE V.—TENSILE TESTS: NEW SOUTH WALES HARDWOODS. (SPECIMENS 8 IN. LONG, 1.23 SQ. IN. SECTIONAL AREA.)

investigation of timber conducted in Europe and in America.

Comparison of the tables accompanying this article illustrate the fact that timber is stronger in tension than in compression, and very greatly stronger in tension than in shear.

For these reasons it is somewhat difficult to make tension tests, as the head and shoulders of the test specimen must be stronger than the portion subjected to pure tensile stress, and because the stress must be applied accurately along the axis of the test piece, so as to avoid the effect of transverse stress.

Table V. summarises the principal results obtained by Professor Warren from specimens 8 in. long with a middle parallel portion having the sectional area of 1.23 sq. in.

6. Tests of the Holding Power of Nails and Spikes.

Comparatively little attention has been given in this country to experiments on the holding power of nails, the most complete data hitherto available having been those furnished by investigations at Watertown Arsenal, in America.

These data are now supplemented by the results furnished by Mr. H. A. Roberts, B.E., and Professor Warren in the Russell Engineering Laboratory.

As our readers are aware, the holding power of a nail in timber depends upon the friction developed between the fibres and the surface of the driven nail, the pressure of the fibres on the nail being governed by the elastic properties and strength of the timber.

In soft woods a nail can be driven without first boring a hole, and, as demonstrated by the Watertown Arsenal tests, the wrought-iron cut nail possesses greater holding power than the steel-wire nail.

In Australian hardwoods the resistance to driving is so great that it is necessary first to bore a hole slightly smaller than the nail in order to obviate the risk of buckling the latter, or in the case of stout nails to avoid the risk of splitting the timber.

Professor Warren gives numerous tables and diagrams bearing upon this part of his investigation, and from them the following notes are based:—

The holding power of a 6-in. nail of No. 1 S.W.G. first driven to the depth of $3\frac{1}{2}$ in. and withdrawn by stages varied from 1,331 lb. to 790 lb. per square inch of bearing surface, while the holding power for nails of the same size driven to depths ranging from $1\frac{1}{2}$ in. up to $3\frac{1}{2}$ in. varied from 1,438 lb. to 3,529 lb. per square inch of bearing surface.

Other experiments indicated that there is no definite relation between the size of the nail and the holding power per unit of surface, the results for nails of from No. 1 to No. 8 S.W.G. driven to the depth of 3 in. into ironbark varying only from 1,260 lb. to 1,320 lb. per square inch. The mean of 1,290 lb. per square inch is approximately three times the average holding power of nails in American softwoods.

An interesting point was the determination of the effect of the size of the holes on holding power. From the results quoted by Professor Warren we may cite as an example the fact that a 6-in. No. 1 S.W.G. nail driven 3 in. into a hole of 9.32 in. diameter developed the holding power of 1,130 lb. per square inch, while a similar nail driven direct into the wood showed the holding power of 1,400 lb. per square inch. For the reasons stated above it is desirable that the holes in hardwood should not be too small.

For purposes of comparison and reference we give in Tables VI. and VII. some of the results furnished by the tests of Professor Warren on Australian hardwoods, and by those conducted at Watertown Arsenal on American timber.

The effect of time and moisture on holding power are shown by other tables, the influence of time being somewhat variable, and that of moisture being always to reduce the holding power.

Finally, we may point out that the experiments of Professor Warren indicate the holding power of nails driven parallel to the layers of fibre to be slightly greater than that of similar nails driven perpendicular to the layers.

The holding power of spikes such as are used in railway and tramway practice is also discussed at some length in the Report, but as the results are generally similar to those for nails, and as most of our readers are less

White Stringybark	20.5	33.5	1	1.1	2.6

interested in spikes of the kind than with ordinary nails, we need scarcely devote space to consideration of the tests.

7. Hardness Tests.

This part of the investigation was carried out by Mr. G. E. Cowdery, B.E., under the supervision of Professor Warren, with the object of ascertaining not only the relative hardness of the different varieties of timber under examination, but also of comparing the different methods of determining hardness.

Comparison was also made of the hardness of three planes relative to the directions of the fibre and the annual rings.

The tests applied were:—(1) The cross-compression test on a 100,000-lb. machine, (2) the Brinell-ball test with an apparatus forcing a ball of 0·78 in. diameter into the wood under a pressure of about 1 ton, and (3) the cone-pressure test with an appliance forcing a steel cone into the timber under a pressure of about 880 lb.

For detailed results our readers are referred to the complete Report.

8. Torsion Tests

As the stress of the surface of a specimen subjected to pure torsion is a shearing stress, it was considered desirable to conduct tests of this kind for examination of the results with those furnished by the tests for direct shear.

While the relative shearing resistances of various timbers tested in this manner by torsion are probably more accurate than those given by direct shear tests, owing to the absence of bending moment, the values are higher in all cases, and are not applicable as data for ordinary structural computations.

9. Abrasion Tests.

These interesting tests, conducted by Mr. J. M. Royle, B.E., under the supervision of Professor Warren, were undertaken for the purpose of gauging the resistance of timber to wear when employed in flooring and paving.

10. Impact Tests.

The machine used for these tests was of the falling-weight type, comprising hammers of various weights arranged so as to fall from an height up to 13 ft.

The tests were conducted on beams 2 in. square in cross-section with a 24-in. span, their object being to determine the capacity of the various kinds of wood for resisting sudden shocks in practical construction.

Table IX gives the principal results of nearly 150 tests, and includes a column where the order of merit of the various timbers is indicated by numbers. It will be noticed that stringy wood, such as mountain ash, gives high results, while brittle varieties, such as turpentine and colonial teak, show low average values.

**APPLIANCE FOR CLEARING
OBSTRUCTIONS FROM
SINKS, LAVATORIES, ETC.**

THE Little Giant Lift and Force Pump, patented by Hector Macfarlane, of 317, High Holborn, London, W.C., is a cheap and simple appliance for clearing obstructions from sinks, lavatories, water-closets, etc. Its weight is less than 2 lb., and it measures about 14 in. over all; the barrel is 9 in. long by 1½ in. diameter. With it are supplied two rubber washers, the smaller having a stepped conical face to fit various sizes of lavatory and sink

wastes, and the larger being a force cup for use in water-closet and similar larger outgoings. The barrel is of brass and the piston is fitted with cup leathers, the whole construction being strong and easy to keep in order. Full printed instructions are supplied with each pump, and

The Little Giant Lift and Force Pump.

CERESIT.

THIS is a waterproofing material in cement, etc., much used by the German State and other authorities. It is a light-coloured paste, about the consistency of butter, and may be made into a milky emulsion with ten to twelve parts of water. With the milky fluid, instead of with water, the dry mixture of cement and sand is worked into a plastic state.

The proportions run about one sack of 50 kg. (= 110 lb. of cement) and three of sand to 2½ kg. of the cersit. Four cubic metres (141·2 cubic ft.) of wet mortar to about 25 kg. (55 lb.) of cersit are needed or, reckoning on the amount required to cover a given surface to a given thickness we have:—

Per square metre, 2 cm. thick,	0.5 kg.
" 3 "	0.75 "
" 4 "	1 "
Per square yard, 0.5 in. thick,	1.1 lb. av.
" 0.75 "	1.65 "
" 1 "	2.2 "

The mortar is handled and applied just like any other of the same consistency and for the same purpose.

When it is required to keep out ground water the sole—i.e., the concrete or other surface covering of the whole area—must be strong enough not to be displaced by the weight of the building. The best material is a concrete of gravel or coarse pebbles; but where the water pressure and volume are not very great rolled broken brick will do as well. It is laid in the centre, and several layers of brick-breaking joint may be used.

The bricks should be laid in cement mortar or, if there is much water, in cessit mortar being thoroughly wetted down just before laying. The requisite thickness of sole depends on the pressure and volume of water, and on the size of the cellar, say, on an average for a compartment 4 x 5 metres, and 1 metre water pressure, a concrete sole 20 cm. thick made of one part cement, two of sand, four to five of gravel or fine broken stone.

the foundation walls must be thick enough to take cracking impossible.

Waterproofing the walls for average pressure 25 cm. to 3 cm. (1 in. to 1 1/2 in.) thick of plaster is sufficient. The plaster should be thoroughly cleaned before plastering (any old plaster should be removed), the mortar joints scratched out and wetted. The plaster is then applied in several layers, well trowelled together, and finished by dusting with dry cement or

Fig. 1.

being with very thin cement mixed in milk. When the water pressure is considerable then the plaster may be 1 1/2 in. thick below and thinned as it goes upwards. This plaster should extend about 20 in. above the highest possible water level (Fig. 1).

The floor is to be treated with ceresit, 3 cm. to 5 cm. (1 1/2 in. to 2 in.) thick, and, as the wall plaster was, in several trowelled layers. Before applying the ceresit the sole should be thoroughly cleaned, wetted, and then swabbed with cement milk. All corners and joining places of wall floor should be rounded.

During the work of waterproofing, and for six days after (day and night), may be flowing must be kept. As a rule, a hole in the concrete sole, which the water can collect, and from

Fig. 2.

it may be pumped, will suffice. When an important building it is best to have a regular drainage (Fig. 2).

boiler-rooms, smoke passages, etc., the sole should be protected from the heat. It is best done by two layers of tiles (Fig. 3).

The insulating layer should not be penetrated by any iron parts, as hooks, hinges,

Fig. 3.

Solid stairways should not be built until the floors and walls below them have been treated with the ceresit mortar. The steps should not go through the insulating layer.

Where the ground water is very slight in quantity, and it is only a matter of protection against dampness from the earth and air, it will be sufficient to give the sole only about 3 cm. (1 1/2 in.) and the walls about 2 cm. (0 8 in.) of insulating plaster. When it is an old building the old mortar coat must be removed (or at least roughened) to give the new one a good hold; and the wall should be well cleaned before the insulating layer is applied.

On the weather side the walls should be protected inside and out, else there will be danger of fungus, mildewed wallpaper, scaling off of the plaster, etc. A thickness of 1 1/2 cm. to 2 cm. (0 6 in. to 0 8 in.) of 1 : 3 concrete mixed up with ceresit suffices. The plaster should be laid on in several layers and well worked in.

The ceresit permits the use of colouring materials, and even oil paint, after a very short time.

Where exterior plaster is out of the question, as in ornamental brickwork, etc., of course, the waterproof layer must be internal only, of the same thickness as for the outer side, but with a fat lime plaster layer about 3 mm. to 5 mm. (0 12 in. to 0 2 in.) thick to take up any moisture of condensation. Old lime plaster should be first removed.

When there is filled-in wooden framing the

Fig. 4.

wooden portions should be covered with woven wire (Fig. 4).

For insulation of horizontal surfaces from moisture it is claimed for ceresit that, in the first place, ordinary masons can make and apply the protecting material without calling in the help of workmen skilled in asphalt work, with their special plant; and, in the second, that the insulation can be effected, if necessary, a little at a time, just as fast as the masonry is completed; and, in the third place, that the ceresit, in contrast to asphalt slabs, etc., makes a firm bond with the masonry, and the strength of the latter is in no way lessened, as is the case where the foundation and the upper work are separated by asphalt paper. It suffices to use 2 cm. to 3 cm. (0 8 in. to 1 2 in.) of the ceresit mortar in the proportion of one volume of cement and three of sand, mixed up with the ceresit "milk."

For terraces and balconies there must be sufficient provision for allowing the water to flow away. This can be done by giving the concrete surface itself slope, or by making the layer of ceresit mortar thicker at that side from which it is desired that the water shall flow; 3 cm. (1 1/2 in.) is the proper thickness to be applied to roughened and cleaned surfaces and well smoothed. The mix can be 1 : 3 with ceresit "milk." Meeting points of floor and wall are to be well rounded out; and it is better to carry the cement up about 8 in. from the floor. As soon as the laid layer is to be covered hand high with sand, which is to be let stand a week and damped down every day, then removed. This is to prevent too rapid drying and consequent cracking.

LABOUR IN THE COLONIES.

FROM the *Supplement to Circulars* issued from the Emigrants' Information Office, 34, Broadway, Westminster, S.W., we learn that in Sydney and suburbs, *New South Wales*, the furniture and iron trades have been fairly well employed, and competent men in these trades and strong railway labourers can get work. There is a good demand at Orange and Young for carpenters, bricklayers, painters, and plumbers. In *Victoria* competent mechanics will have little difficulty in securing employment. In *South Australia* work of nearly all kinds is plentiful, and a large amount of money is being spent in public works. There is a good demand for plasterers, cabinet makers, masons, galvanised iron-workers, carpenters, joiners, brickmakers, cooper-smiths, sheet-metal workers, brass-finishers, and boiler-makers. In *New Zealand* the engineering, wood-working, building, and unskilled labour have been fairly busy, and are likely to improve at this season. The building trades of *Johannesburg* continue to be active in most branches, but the supply of labour is quite sufficient; there is no improvement in the engineering trades. There is no demand for more labour at *Pretoria*. At *Cape Town* there is no demand except for a few skilled plumbers, cement workers, and furniture makers. At *Durban* the only demand is for a few good plasterers, tilers, and plumbers.

THE TRADES DISPUTES ACT.

THE annual general meeting of the Glasgow Building Trades Exchange, Ltd., was held in the office, 37, Hope-street, on the 25th ult. Colonel Robert J. Bennett presided.

The Executive Council's nineteenth annual Report—for the year ending September 30—stated that the Council had continued to afford the Employers' Parliamentary Council every assistance in their power in their endeavour to force legislation in the direction of suppressing or limiting picketing, subjecting all unions to the ordinary law of the land, and suppressing as unlawful combinations federations of unions for the purpose of "paralysing the country" by means of a general strike. To this end the Executive, having with other associations signed the memorial to the Prime Minister, thereafter addressed a communication to him urging him to receive a deputation on the subject. The Prime Minister up till now had declined on account of pressure of business, and it was undoubted that the Government have sufficient business on hand to occupy them for some time. The Council had been approached urging that items should be introduced into schedules to cover the increased cost of workmen's compensation, insurance and insurance under the National Insurance Bill. The matter was fully discussed in connexion with the revision of the regulations for measurement of mason-work, and it was resolved that these charges must be treated as oncost in the same way as office rent, wages, etc., that they must be taken into account by the contractor in quoting, and that no special item should be introduced into schedules to cover same. The following members of Council who retire at this time were re-elected:—Messrs. Robert J. Bennett, Matthew Henderson, William Howatt, John Keppie, James Goldie, James A. Ferguson, and R. A. MacGillivray.

On the motion of the Chairman, seconded by Mr. Matthew Henderson, the Report was adopted.

ACCIDENT AT KINGSWOOD.

A builder's scaffolding in front of a new picture palace, which is being erected at Kingswood, near Bristol, suddenly collapsed and threw fourteen workmen on to the ground. Some of the men had limbs broken and others were found suffering from internal injuries.

Fig. 1. Balustrade in Wrought-iron and Bronze, New Wesleyan Hall.

THE WESLEYAN HALL, WESTMINSTER.

THESE illustrations depict typical details of interest. Nos. 1 and 3 show examples of the ornamental metalwork in the interior of the building, the last-named representing one of the handsome lamp standards which occur in the entrance hall. These are executed in iron and bronze, and are placed on shaped Roman marble bases attached to the wall, and they are extremely effective. The above illustration shows a portion of balustrading occurring on the staircase landing, and this is executed in iron with bronze enrichments. The detail is exceptionally good, and the execution exhibits workmanship of the first class, which will bear very close inspection.

The illustration in Fig. No. 2 shows one of the four large trophies which occur at the base of the dome, these measuring 24 ft. 6 in. by 13 ft. 6 in. They were executed in lead, and cast from models prepared by Mr. H. Poole from the architects' designs, and carried out by Messrs. J. W. Singer & Sons, of Frome, who also executed the ornamental ironwork mentioned above. The lead trophies are very happily placed on the dome, and must be considered very successful both as regards general composition and also as regards detail.

TRIBUNAL OF APPEAL UNDER THE LONDON BUILDING ACT.

Allen & Norris v. London County Council.

On October 24 the Tribunal of Appeal under the London Building Act sat at the Surveyors' Institution, Westminster, to give their decision in the appeal of Messrs. W. G. Allen & H. G. Norris, builders, against the certificate of the Superintending Architect of Metropolitan buildings defining the general line of buildings on the western side of the street known as Fulham Palace-road, between Queensmill-road, for the building known as 205, Fulham Palace-road. Mr. Courthope Munroe appeared for the appellants, and Mr. Daldy for the London County Council.

The facts of the case, as reported in the *Builder* of October 11, showed that the appellants are developing a building estate on the western side of Fulham Palace-road, and first erected four shops, of which one is No. 205.

The Superintending Architect defined the general line of buildings in such a way that it would have cut off a portion of these shops, and thereupon the builders appealed, and the Tribunal found there was no general line of buildings in that portion of the street, but said that the presence of the four shops might possibly form the building line in the future. The appellants, without applying to the Superintending Architect to fix a general line, proceeded to build a number of other shops, which were the same distance from the edge of the curb as the four shops, but owing to the contour of the road they were set some 2 ft. behind the first shops. The Superintending Architect subsequently fixed the general line of buildings by taking a certain length of

the road, the effect of which would be to cut off a portion of the last terrace of shops.

Mr. Hudson (Chairman of the Tribunal) now said the Tribunal felt it desirable to call the parties together, not merely to listen to their decision, but to see if they could indicate for the future what ought to be the general line of buildings with regard to the road, so as to avoid those constant appeals to them which did not seem to be worthy of the time and trouble they involved. With regard to the present appeal they had come to the decision that there was no general line at all. They had tried in every way to fix a general line, and had failed to come to any general conclusion. The Superintending Architect made a very good try, but the Tribunal did not like it, and they had come to the conclusion that there was no general line with regard to this particular part of the road. They made no order as to costs. What they desired to indicate as to the future was that the general line of buildings should be the continuation of the line from the south-eastern end of the new buildings. This in effect would mean a line parallel with the Fulham Palace-road to Silverton-road. They were not prepared, however, to say that was the general line. Having indicated that much, they thought that Messrs. Allen & Norris ought to apply to the Superintending Architect to define the line. The Tribunal could only indicate what would be the probable line they would find, and, having done that, the parties ought to be able to settle what the general line was without difficulty. Mr. Daldy would say that it was undesirable to have these constant appeals. The Superintending Architect had shown a perfectly conscientious desire to fix a line, but it was not a general line, and the Tribunal could not find it so. The new buildings could be made the basis on which a general line might now be fixed by the prolongation of the south-eastern end up to

Silverton-road. They recognised there was some difficulty in settling the general line of buildings between Silverton-road and Crabtree lane, because the church stood further back from the road.

Mr. Courthope Munroe said he took it the Tribunal meant the prolongation of the existing buildings as such—taking what the appellants said was the front.

The Chairman said a block of buildings was at present shown on the plan of the Superintending Architect, and if they took from the south-east end they would find there was a straight line.

Mr. Courthope Munroe: You are taking your straight line from the front of the shop windows.

The Chairman: We have nothing here to indicate what is the front.

Mr. Courthope Munroe said there was a question as to whether the front of the shop windows or the main wall was to be the front, and he did not want any misapprehension.

Mr. Daldy said he hoped the Tribunal would not decide that the shop window was the effective front.

The Chairman said it cut both for and against Mr. Daldy. If he took the front of the window it cut the main building, back.

After further discussion the Chairman said what the Tribunal meant was that no brick and mortar should be put beyond the line that had marked on the plan as indicating what they thought might be the general line of buildings.

WESTMINSTER CITY COUNCIL.

At the fortnightly sitting of the Westminster City Council on October 24 the following matters were dealt with:—

Engineer's Estimate.—It was decided that in future, as far as practicable, estimates by the Council's officers of the cost of supplies and works to be supplied or executed for the Council by contractors be not made public before tenders have been obtained.

Poland-street Workhouse Site.—The Housing Committee reported that they were engaged in the preparation of a scheme, pending the result of an inquiry by the Local Government Board, for the erection of working-class dwellings on this site.

Housing Scheme.—The same Committee reported that their attention having been drawn to a possibly available site in the vicinity of the City of Westminster dwellings, Regency street, suitable for a housing scheme, they had directed that preliminary negotiations be entered into with the owner.

Exhibition-road.—In connexion with the recent purchase by the Royal Geographical Society of Leinster Lodge and the proposed rebuilding of the premises, the Improvement Committee recommended the expenditure of £2,350, for the acquisition of land to round off the corner of Exhibition and Kensington roads.—Agreed.

Piccadilly "Dip."—In regard to the proposal for doing away with the "dip" in Piccadilly, which was before the Council at its last sitting, it was agreed to urge the London County Council to sanction the rebuilding of the Sutton Estate property to a height of 81 ft., as had been suggested, so that any further scheme for raising the roadway should not be prejudiced.

LAW REPORTS.

COURT OF APPEAL.

(Before the MASTER OF THE ROLLS and Lords JUSTICES FARWELL and HAMILTON.)

Eastbourne Right of Way and Trespass Action: White and Another against the Grand Hotel, Eastbourne, Ltd.

THE hearing of this case upon the plaintiffs' appeal from a judgment of Mr. Justice Joyce was concluded on October 28.

The plaintiffs, Mr. F. A. White, J.P., and Mr. Thomas Fenn, brought the action to restrain by injunction the defendant company from permitting any part of a private road (the soil of which belonged to Mr. White) leading from Southcliffe-mews to Silverdale road, Eastbourne, to be used as a means of access to and from the defendants' motor garage, St. Vincent's Lodge, and for an order upon the company to reinstate a wall dividing the property of the parties, which the defendants had interfered with, into its former condition, the plaintiffs alleging that it was a party wall, which, however, the defendants denied. Mr. White, as the owner, and Mr. Fenn, as the tenant of Nos. 1, 4, 5, 6, and 7, Southcliffe-mews, complained that the defendants were using the road in question in such a way as to constitute a nuisance, but this the defendants denied. Mr. Justice Joyce held that, by reason of an agreement made between the predecessors in title and the parties, a general right of way was granted to the defendants for their vehicles along the road, and that there was no express restriction or limitation of that right of way. He also held that upon the other issues in the case the plaintiffs had failed to substantiate their claim, and dismissed the action with costs, and from this decision the plaintiffs now appealed.

At the conclusion of the arguments of Counsel, their Lordships held that the defendants had a right of way over the road in question without restriction or limitation, and dismissed the appeal on that part of the case. They, however, held that the wall, being a party wall, which was owned by the parties as tenants in common, the defendants had no right to pull it down or to alter the position and size of the gateway, and they accordingly

made an order upon the defendants to reinstate the wall to its former condition. Upon this part of the case, therefore, the appeal was allowed. Plaintiffs were awarded the costs of the trial, except so far as they had been increased by the claim upon which they had failed and half the costs of the appeal.

KING'S BENCH DIVISION: DIVISIONAL COURT. (Before the LORD CHIEF JUSTICE and Justices CHANNELL and AVORY.)

A Sea Wall Dispute.

THE Court on the 24th ult. heard an interesting dispute about the liability of the Holme Cultram (Cumberland) Urban District Council to pay Mr. John Dawson, a builder and contractor, for "extras" in connexion with his contract to build a sea wall at Silloth.

The matter came before the Court on a case stated by an arbitrator, and it appeared that in 1908 Mr. Dawson, who carries on business at Whitehaven, secured a contract to build the sea wall for 4,695*l*. The work was commenced on August 10, 1908, and it was a clause of the contract that no extras were to be done without the order, in writing, of the Council. In September, 1908, unusually high tides caused damage to part of the wall which was completed, and this necessitated the carrying out of extra work to protect the wall. In consequence of a decision arrived at by the contractor and Mr. Bell, of Carlisle, who at that time was nominated as arbitrator, and Mr. Armstrong, of Carlisle, the surveyor, Mr. Dawson was empowered to lay down a large quantity of bags of cement to prevent the sea washing more of the soil away. These bags formed an "apron," and the cost of the work was 540*l*. for materials and 75*l*. for labour. Later in the month further high tides caused more damage, and soil from the wall to the extent of 200 yds. was washed away, and the foundations of the wall were laid bare in some places. A lot of stones and cobbles were placed at the foot of the wall, the cost of that being 120*l*. Both these jobs were done at the order of the surveyor. Later, Mr. Armstrong verbally ordered a new road, for which he gave a certificate for 60*l*. That sum had been paid, together with the contract price of 4,695*l*., but the claim for extra work had been disputed by the Council, who raised the defence that the contractor had received no written order for them to carry out the work, and also that, each item costing over 50*l*., a written order should have borne the seal of the Council as stipulated by the Public Health Act.

After hearing Counsel for both parties, the Lord Chief Justice said the case raised an important point, and the case would go back to the arbitrator with instructions to reconsider it. If the work carried out extra to the contract was, in the opinion of the arbitrator, in the nature of alterations or additions to the contract, then the absence of a written order was fatal to the claim, but if they were not alterations and additions the absence of a written agreement would be no bar to the claim; but then the second question arose, viz. the absence of the seal of the Council. If when the orders were given it was in the contemplation of the parties that the extras would cost more than 50*l*., then the seal should have been affixed to a written order of the Council. If, on the other hand, the work was given out as day work, it would not come within the section which required the seal of the Council.

Justices Channell and Avory concurred, and the case was sent back to the arbitrator.

Contractor's Claim against Corporation: A Sewage Undertaking.

MR. JUSTICE PHILLIMORE, in the King's Bench Division, sitting without a jury, heard on Saturday, October 26, and on Wednesday, October 30, an action brought by Mr. J. Riley, contractor, of Rose Cottage, Gloucestershire-road, Cheltenham, against the Corporation of Sutton Coldfield, claiming about 5,000*l*. in respect to work done and damages for alleged breach of contract in connexion with a sewage undertaking at Sutton Coldfield. The defendants denied that the plaintiff was entitled to the amount claimed.

For the plaintiff Mr. Hudson, K.C., appeared, and Mr. Sankey, K.C., represented the defendants.

Mr. Hudson, in opening the plaintiff's case, said that Mr. Riley's contract with the Corporation in regard to the sewage works was dated August 16, 1909. The work comprised the building of a sewer about 6½ miles in length. In March, 1911, Mr. Riley was proceeding with the work, and was engaged on the last section.

During the progress of the work an immense number of alterations were made, in respect to which the plaintiff contended that he should

Heavy Claim by and against Contractors: J. Aird & Co. v. the Tanjong Pagar Dock Board.

THE hearing was resumed of this case last week in which the plaintiffs claim from the defendants 500,000*l*. as damages for alleged such of contract in connexion with the construction of a wet dock at Singapore. Plaintiffs, who are the well-known contractors, allege that the defendants misrepresented the conditions under which the contract was to be carried out, and therefore that they were entitled in repudiating the contract. Defendants denied these allegations, and served notice on the executors of the late Sir John Aird, who in his lifetime was a member of a plaintiff firm and a party to the contract, asking a claim against his estate of about 100,000*l*. as damages for breach of contract.

Mr. Upjohn, K.C., Mr. Macassey, K.C., and Mr. Schwann appeared for the plaintiffs; and Mr. Finlay, K.C., Mr. Gerson, K.C., Mr. Bomer, K.C., Sir Hugh Fort, K.C., Mr. Atcheson, and Mr. Hull for the defendants.

Mr. Upjohn, continuing his opening address on behalf of the plaintiffs, having dealt with the issue of alleged misrepresentation by the defendants, so as to induce the plaintiffs to enter into the contract, said that the engineers had wholly miscalculated the quality of the mud to be dealt with, and its effect upon the piers they had designed. Every part of the piers they had designed were really impossible performance, because they estimated that the mud was stable—a more or less solid mass—whereas it was admitted that where the mud was one and a half to one, they must consider it as having at least an angle of three to one, and in some places an angle of six to one, and even in parts twelve to one at the greater depths. They had admitted the correspondence that several walls were unstable, and what was true of the walls was *a fortiori* true of getting through this mud in operation of sinking a timber trench. When they admitted that the walls were not stable they really admitted that the whole design was not capable of performance. If the plaintiffs were right in their submission to the contract, on its true construction, was to sink a trench timbered in runners and stringers, there could not be the slightest dispute that the work would be impracticable.

The question of the impossibility of the construction of the walls under the contract was very important. The contractors found that places where the contract walls were to be it was impossible to get down to the "hard" even by employing the heaviest timber known to engineers. Plaintiffs did not think from incurring enormous expense, trust implicitly to the reputation of the engineers as a fair and honourable firm, and that they would see that the contractors were paid and honourably paid for the work done. Having explained in great detail the difficulties the plaintiffs experienced owing to action of the mud and the impracticability of constructing the walls of the dock under the terms and conditions imposed by the contract, and the impossibility of doing the work except at an enormously increased expense, learned Counsel referred to other issues raised in the action, and said that the plaintiffs' case, broadly speaking, was that the contract was so different in character as to be wholly outside the contract. The plaintiffs were rather disappointed that the defendants had not put in a counterclaim, as they would have liked to have threshed out the matter altogether.

Mr. R. Finlay said that the counterclaim was not framed yet, but he thought there did not be another action, as the result of the present case would probably decide the matter.

Mr. William H. J. Stacey, the engineer of the plaintiff firm, was the first witness. He gave evidence that he had received instructions to prepare drawings for submission to Mr. Aird, the resident engineer, showing the method of timbering it was proposed to adopt for the trenches. He said there was no defect in the timbering or workmanship, and no error on the part of the contractors. All the work used was suitable for the sheet piling, and the frames were put in directly as excavations were made. So far as he knew, the work did not suffer from want of proper supervision. The case had not concluded as we went to see.

Fig. 3. Standard in Iron and Bronze, New Wesleyan Hall.

receive written orders. Plaintiff said that in February and March, 1911, he was still pressing for these written orders, and ultimately he informed the Corporation that he would not proceed with the work until he received those orders. The Corporation said they would carry out the remainder of the work themselves, and the plaintiff issued a writ asking for an injunction to prevent them from doing this. The Court ordered that the plant, etc., belonging to the plaintiff should be valued by Mr. Wilcox, of Birmingham, before the Corporation took the work over. In an affidavit by the plaintiff, read by Counsel, plaintiff said that all through the work the specifications were altered by the Corporation's Engineer, Mr. Clarry, this leading to much extra work being done. Plaintiff also said he had evasive replies when he applied for written orders for the work, and he said he had always been ready to carry out the contract, but he was not bound to carry out extra work without the written order of the Corporation.

Mr. Hudson went on to say that there was an affidavit by Mr. Clarry, in which he maintained that any extra work executed by the plaintiff had been measured and paid for by the Corporation. He also said that the alterations and additions were of a simple character, that they had been made for the plaintiff's convenience, and he denied that when asked for orders in writing he gave evasive replies, as alleged. Counsel further stated that there was a counterclaim by the defendant Corporation for alleged breach of contract by the plaintiff. The plaintiff was entitled to 10,145*s.* as affecting the contract work completed. A sum of 8,865*s.* had been paid, and the Corporation had kept 1,000*s.* retention money, and plaintiff's claim was for extras done.

The plaintiff complained (said Counsel) that owing to the alteration of the specifications he had to contend with extra difficulties, and when he asked for written instructions the answer was sent to him: "Keep to your contract."

At this point the Court adjourned, and when the hearing was resumed on Wednesday Mr. Justice Phillimore asked Mr. Hudson to explain exactly what relief he (plaintiff) wanted, pointing out the fact that the case was one of complexity.

Mr. Hudson said that plaintiff asked for damages in respect to the wrongful taking possession of the works by the Corporation, and such damages should cover the payment for work done.

Mr. Sankey, K.C., then submitted that the plaintiff could not recover for alleged breach of contract, as this was committed on March 25, and the writ was dated March 6.

Counsel's contention led to a long discussion, and eventually a consultation took place between the parties, which resulted in the case being settled. The terms were judgment for the defendants, who withdrew their counterclaim, each party to pay its own costs, the defendants, "as a matter of grace," to pay the plaintiff 500*s.* out of the retention money, the settlement to be in mutual and final satisfaction of all claims between the parties, the plaintiff withdraws all imputations against the defendant and Mr. Clarry, and the defendants make no charges against the plaintiff.

His Lordship signified consent.

CHANCERY DIVISION.

(Before Mr. Justice NEVILLE.)

Pumping Operations and the Stability of the Hôtel Métropole:

The Attorney-General against the London Electric Railway Company.

THIS case came before the learned Judge on Friday, October 25, upon a motion which had previously come before the Vacation Judge, in which the Attorney-General, at the relation of the Gordon Hotels, Ltd., asked for an interim injunction to restrain the defendant company or its contractors, etc., from pumping or making use of similar modes of removing water from the works of the defendants at the present time being carried on in connexion with the defendants' undertaking situated in the Parish of St. Martin-in-the-Fields, in alleged contravention of the provisions of the London Electric Railway Act, 1911, which gave the defendant company power to construct an underground tube railway to extend and connect their Charing Cross and Hampstead Railway, and their Bakerloo Railway at Charing Cross, with the underground station at Charing Cross of the Metropolitan District Railway. The plaintiffs' case was that the continuous pumping of the water, which the defendants met with under the ground, if allowed to proceed would prejudicially affect the stability of the Hôtel Métropole in Northumberland-avenue, which belonged to the relators, and

that what the defendants were doing was expressly forbidden by the Act of 1911.

Mr. Felix Cassel, K.C., and Mr. B. B. Pensonby appeared in support of the motion; and Mr. Bramwell Davis, K.C., and Mr. L. Mossop for the defendant company.

During the course of the discussion it transpired that the defendant company had done no pumping at the point in question since October 21, and that any pumping that had been done since that date was done by the Metropolitan District Railway, under, as it was alleged, their statutory powers.

In the result it was arranged that the motion should stand over till the trial, the defendants giving an undertaking not to resume pumping operations without giving seven days' previous notice in writing to the plaintiffs.

OBITUARY.

Mr. W. J. Laidlay, LL.M., R.B.A.

MR. William James Laidlay, F.R.G.S., of Circus-road, St. John's Wood, Drumore, and the Oxford and Cambridge Club, who died at Freshwater, Isle of Wight, on October 25, aged sixty-six years, was a son of the late J. W. Laidlay, of Seaciff, Co. Haddington, and Drumore, N.B. He was educated at Loretto and Peterhouse, Cambridge. He was called to the Bar by the Middle Temple, and after six years' practice as a member of the Faculty of Advocates, Scotland, he went, in 1879, to Paris, where he studied in the École des Beaux-Arts, and was a pupil of Bouguereau and Carolus Duran. He was a frequent exhibitor, 1881-86, at the Royal Academy and the Salon, and, 1888-1904, at the New Gallery; in 1888 he took a prominent part in the founding of the New English Art Club, and in 1902, became a member of the Royal Society of British Artists. He was the author of "The Royal Academy: Its Uses and Abuses," 1898; "Lena Laird," 1901; "The Origin and First Two Years of the New English Art Club"; and "Art, Artists, and Landscape Painting."

LONDON COUNCILS.

Acton.—It has been decided to take under consideration the prevention of flooding other than by the construction of a northern relief sewer. The Council is to press for a by-law to provide for 500 ft. super. air space at the rear of buildings.

Barking.—The tender of Messrs. Parsons & Parsons, Ilford, has been accepted at 62*s.* for constructing roads at the Ripple School. The Surveyor has been instructed to proceed with the making-up a trial section of Wilmington-gardens with tarred slag macadam, subject to the owner giving an undertaking to bear the cost. The following plans have been passed:—Mr. George Clark, six houses and one shop, Suffolk-road; Mr. W. Stewart, cinematograph theatre, Broadway; Messrs. Gross, Sherwood, & Heald, Ltd., offices and laboratory, Jenkins-lane.

Chiswick.—For making-up Grantham-road the tender of Mr. J. Ball, Chiswick, has been accepted at 1,237*s.*

Greenford.—The open-air bath at South Norwood is to be lengthened to 75 ft. and roofed in by the County Council at an estimated cost of 4,000*s.* The scheme also provides for additional dressing-boxes, clubrooms, lavatories, first-class slipper-baths, and a new laundry. Land is to be purchased in Grange Park-road, Thornton Heath, and plans, specifications, and estimates prepared for the erection of baths thereon. This scheme provides for a bath 75 ft. in length, with galleries, lavatories, and laundry. A new road is to be constructed connecting Crowther and Richanger roads, at an estimated cost of 620*s.* The following plans have been passed:—Mr. A. Bagge, Galford, four houses, Melfort-road, Norbury; Mr. W. B. Coomber, 65, Pemdevon-road, eleven houses, Leander-road; Mr. A. W. Dawson, Teevan, three houses, Zernatt-road; Mr. E. Bates, London, E.C., four houses, Highbarrow-combe-avenue, and fifteen houses, Addiscombe-road; Mr. D. Waightman, 78, North-end, two houses, Christchurch-road East, and five houses, Godstone-road; Mr. P. Richardson, 20, Addiscombe-avenue, seven houses, Pollard's-hill North, one house, Pollard's-hill East, also mission hall, Suffolk-road, South Norwood.

Finchley.—The Local Government Board is to hold an inquiry on November 5 into the application of the Council for authority to prepare a town-planning scheme. The following plans have been passed:—Mr. J. Stonnell, four shops, ten houses, and one orchard, Squires-lane; Mr. T. Osborne, six houses, Woodlands-avenue; Mr. S. W. Tod, motor garage, Nether-

land, Holly Park-gardens; Mr. C. W. Scott, four houses, Arden-road; Messrs. Hamilton, four houses, junction of Holly Park and Widdowes-avenue; Mr. F. W. Walker, four houses, Finchley-way. Plans have been lodged as follows:—The Co-partnership Tenants, Ltd., twelve houses, Addison-way; twenty-eight houses, Denman-drive; the Manor Farm Dairy, Ltd., dairy and offices, High-road, East Finchley; Mr. W. T. Howard, nine houses, Finchley Park; Mr. A. P. Joyce, additions to factory, King-street, East Finchley; Mr. E. J. Abrahams, buildings, rear Cambridge and Wisbech Houses, Great North-road, East Finchley.

Finbury.—Portions of Lever-street and Dingley-road, St. Luke's, are to be improved and widened at respective estimated costs of 495*s.* and 109*s.*

Ham.—Estimates are to be prepared by the Surveyor for the erection of artisans' dwellings.

Hanwell.—Instructions have been given to the Surveyor to prepare plans and estimates for kerbering and paving with artificial stone a portion of the footway on the south side of Uxbridge-road. The tender of Messrs. Heene & Proude, Ltd., has been accepted, at 1,333*s.* for the erection of a two-cell dust-distributor.

Hemel Hempstead.—Plans submitted by Messrs. John Dickinson & Co. have been passed by the Rural District Council for the erection of an addition to their mills at Apsley.

Heston and Isleworth.—The General Purposes Committee report that the plan prepared by the Surveyor, showing a suggested route through Heston and Isleworth for the proposed new western approach road to London, was submitted to the Road Board for their consideration at a recent interview with representatives of the Council. At this interview it was intimated that the Board had come to the conclusion that the construction of a by-pass road through Brentford would be inadvisable, preferable to the widening of the existing road, and that in those circumstances the Board would not be prepared to contribute towards the widening of the Brentford High-street. Generally the Council's scheme was approved, and it was agreed that the route suggested would not be detrimental to the Board's original proposals, though the advisability of adopting the proposed entry to the new road from the Chiswick High-road was questioned. If the scheme is adopted, the Committee state the Board will not contribute more than one-half of the cost of carrying it out, which cost is estimated by the Surveyor at 250,000*s.* It was resolved to urge the Middlesex County Council and other influential bodies and owners of land on the route to support the scheme. The following plans have been passed:—Messrs. A. & P. Baars, Ltd., building at Orchard Works, Isleworth; Mr. W. Hogbin, six houses, Standard-road, Hounslow; Messrs. H. Somerford & Son, entertainers' hall, Gumley House, Isleworth; Mr. H. W. Nicholls, four houses, Church-road, Isleworth.

Ilford.—The following plans have been passed:—Mr. E. T. Dunn, cinema theatre, Ilford-lane; Messrs. Rawlins, Culver, & Co., motor garage, Eversley-terrace; Mr. C. W. Duly, eleven houses, Haslemere-road; Mr. G. S. Valentin, cinematograph theatre, Cameron-road, Seven Kings.

Shoreditch.—The tender of the Improved Wood Pavement Company, Ltd., has been accepted for laying wood-paving in Baring-street and New-street, between New North-road and Rosemary Branch Bridge, at 7*s.* 9*d.* per yard. The approximate area to be paved is 1,400 yds. super.

Walthamstow.—A portion of Greenleaf-road is to be coated with bituminous material, and the tender of Messrs. H. V. Smith & Co., Ltd., has been accepted for supplying same, at 27*s.* 6*d.* per ton. Directions have been given to the Engineer to prepare plans, specifications, and estimate for making-up Sylvan-road and completing the making-up of Beech Hall-road; also for the erection of conveniences in Higham-hill Recreation Ground and St. James Park. A scheme prepared by the Engineer has been approved for providing a large artificial island in Beech Hall-road, and six houses to be passed for Messrs. Allen Brothers for the erection of three houses in Malvern-avenue; also for Mr. A. G. Barton for a warehouse in Hale End-road. Plans have been lodged by Mr. A. J. Robinson and Mr. T. D. Baker, for seventy-nine houses in Beech Hall-road, and six houses in Shakespeare-road, respectively.

West Ham.—The Public Health Committee report that they are of opinion that it is desirable that a separate sanatorium should be provided for the Borough, and they have directed the Borough Engineer and the Medical Officer of Health to make inquiries as to a suitable site for a permanent building. Plans and estimates by the Borough

(Continued on page 525.)

List of Competitions, Contracts, etc.

For some Contracts still open, but not included in this List, see previous issues. Those with an asterisk (*) are advertised in this number: Competitions, iv.; Contracts, iv. vii. viii. x.; Public Appointments, xviii.; Auction Sales, xxiv. Certain conditions beyond those given in the following information are imposed in some cases, such as: the advertisers do not and themselves to accept the lowest or any tender; that a fair wages clause shall be observed; that no allowance will be made for tenders; and that deposits are returned on receipt of a bona-fide tender unless stated to the contrary.

The date given at the commencement of each paragraph is the latest date when the tender, or the names of those willing to submit tenders, may be sent in.

* It must be understood that the following paragraphs are printed as news, and not as advertisements; and that while every endeavour is made to ensure accuracy, we cannot be responsible for errors that may occur.

Competitions.

NOVEMBER 1.—**Ottawa.**—MONUMENT TO KING EDWARD VII.—Sketch models in plaster to be sent to the Director of National Art Gallery, Ottawa, by November 1. Particulars from the Public Works Department, Ottawa, p. 174, August 9.

NOVEMBER 4.—**London.**—REGENT'S QUADRANT.—Committee appointed by the Lords of the Treasury to consider the design for completing the Regent's Quadrant, and the authors of the designs are asked to forward them to the Architect, London, S.W., by November 4. See advertisement (page iv.) in issue of October 25 for other particulars.

NOVEMBER 25.—**Newcastle-on-Tyne.**—SCHOOLS.—Assessor, Mr. Alex. N. Paterson, A. Premises, 601, 304, and 254. Particulars from the Town Clerk, City Chambers, Newcastle-on-Tyne.

NOVEMBER 30.—**Batham.**—SWIMMING-BATH.—Wandsworth B.C. invite designs. See advertisement in issue of August 16. Particulars from the Batham High-road, S.W.

NOVEMBER 1.—**Sofia.**—DESIGNS FOR A ROYAL COURT AND LAW COURTS.—Particulars from the Central Intelligence Branch of the Board of Education, Sofia, see p. 173, August 9, and p. 250, September 27.

NOVEMBER 2.—**Carlisle.**—SCHOOL BUILDINGS.—Particulars from the City Surveyor, 26, Market-street, Carlisle.

NOVEMBER 20.—**R.I.B.A. Competitions.**—All for the Studentship and Prizes, 1913, must be sent before 5 p.m. on November 9. Conducted by the R.I.B.A.

MAY 1, 1913.—**Dublin.**—MUNICIPAL BUILDINGS.—Assessor, Mr. Albert E. Murray, A.R.H.A. Particulars from the City Treasurer, Dublin, 21, St. James's-street.

MAY 20, 1913.—**Rome.**—BRITISH SCHOOL AT SCARLEIGH IN ARCHITECTURE.—2000, per cent for three years. Particulars from Mr. J. H. Shaw, 54, Victoria-street, S.W.

NOVEMBER 3.—**Eastcote.**—SCHOOL.—The Regate Education Committee invite designs for a Council school in Slipston-road. See advertisement in this issue for further particulars.

NOVEMBER 1, 1913.—**Rangoon.**—MUNICIPAL BUILDINGS.—The Committee of the Municipality of Rangoon invite designs for the new Municipal Buildings, Honoraria of 3000, 3000, and 1000, respectively for first, second, and third. See advertisement in August 2 and 30 for further particulars.

NOVEMBER 1, 1913.—**Winnipeg.**—CITY HALL.—Particulars from Mr. A. Waugh, City Hall, Winnipeg, see page 509.

DATE.—**Dursley.**—WORKMEN'S DWELLINGS.—The Parochial Committee of the Dursley Parish invite designs for about thirty workmen's houses. See advertisement in issue of October 25 for further particulars.

DATE.—**Jordanhill.**—GLASGOW.—PROPOSED COMPETITION NEWS.—December 1, page 635.

DATE.—**Motherwell.**—HIGH SCHOOL.—Dr. J. H. Motherwell, 601, 304, and 254.

NOVEMBER 5.—**Swindon.**—ALTERATIONS, ETC.—For alterations and additions to Olive House, Swindon. Plans by Mr. K. J. Boswick, M.S.A., Swindon.

NOVEMBER 6.—**London.**—DEMOLITION.—For demolishing 155 and 157, Peckham-rd., London, S.E., for the Metropolitan Asylums Board. Drawing and specification by Mr. W. T. Hatch, M.Inst.C.E., M.Inst.M.E., Engineer-in-Chief, Office of the Board, Embankment, E.C. Deposit of 11.

NOVEMBER 6.—**Slough.**—BUILDINGS, ETC.—For erection of buildings, furnaces, boilers, and chimneys, etc., at the Council's pumping-station at Chalvey. Plans, specification, quantities, and form of tender at the Town Surveyor's Office, Wilton, Slough. Deposit of 11.

NOVEMBER 6.—**Winchester.**—ADDITIONS.—For alterations and additions to the Soldiers' Home, Hyde Close, Winchester. Drawings and specifications with the architect, Mr. B. D. Cancellor, 12, Jewry-street, Winchester.

NOVEMBER 7.—**Sheffield.**—EXTENSION. Alterations and extension of the Technical School of Art, Arundel-lane. Drawings and conditions of contract seen, and quantities and forms of tender from the City Architect, Town Hall, Sheffield. Deposit of 11.

NOVEMBER 8.—**Holmfirth.**—ADDITIONS, ETC.—For alterations and additions to Holmfirth Hinchliffe Mill Council School, Plane seen, and specifications, with quantities, from the Education Architect, Council School, Wakefield. Deposit of 11.

NOVEMBER 8.—**Hoyle.**—ADDITIONS.—For additions to Hoyleland Elsecar Council School. Plans seen, and specifications, with quantities, from the Education Architect, Council School, Wakefield. Deposit of 11.

NOVEMBER 9.—**Bolton.**—COTTAGE. Erection of the park-keeper's cottage at the New Park, Green-lane, Great Lever, Bolton. Drawings seen, and quantities from Mr. E. L. Morgan, M.Inst.C.E., Borough Engineer and Surveyor, Town Hall, Bolton, on deposit of 11.

NOVEMBER 9.—**Bolton.**—PAVILION, ETC.—Erection of a consumption pavilion and an extension to the administrative block, at the Eastern Fever Hospital, Bolton. Drawings seen, and quantities from Mr. E. L. Morgan, M.Inst.C.E., Borough Engineer and Surveyor, Town Hall, Bolton, on deposit of 31.

NOVEMBER 9.—**Goole.**—ADDITIONS, ETC.—For the additions and alterations to Workhouse Hospital and other buildings. Plans and specifications seen, and quantities from the architect, Messrs. Thorp & Turner, Carlisle-street, Goole.

NOVEMBER 11.—**Ardrara.**—HOUSE.—For erection of a market-house at Ardrara, Co. Donegal. Plans and specifications from the Board's Office, 23, Rutland-square, Dublin.

NOVEMBER 11.—**Birmingham.**—STARTLING.—For the erection of a factory, etc., at the destructor works, Nethills, and also stabling, foreman's house, loose boxes, smithy, etc., at the destructor works, Lifford-lane, King's Norton. Drawings seen, and quantities from Mr. W. E. Ballard, M.Inst.C.E., District Office of the Department, Council House, Sparkhill, on deposit of 11.

NOVEMBER 11.—**Margate.**—WATER-TOWER.—For repairs to the water-tower at Woodlands, near Wingham. Specification seen, and particulars from the Borough Engineer, 18, Grosvenor-place, Margate. Deposit of 21.

NOVEMBER 11.—**Richmond.**—EXTENSIONS.—For extensions to the Public Baths, Parkhill, Richmond. Plans, specifications, and conditions of contract with Mr. J. H. Brierley, Borough Surveyor, Town Hall, Richmond, on deposit of 11.

NOVEMBER 12.—**Bridlington.**—VILLA.—For erection of a villa residence on the Belvedere Cliff-terrace, Bridlington. Messrs. W. S. Walker, F.R.I.B.A., Son, architects and surveyors, 77, Longgate, Hull.

NOVEMBER 12.—**Dublin.**—GALLERY, ETC.—For erection of a gallery and circular staircase at the National Library, Dublin. Plans and specification at the Office of Public Works, Dublin.

NOVEMBER 12.—**Hull.**—OFFICES, ETC.—For erection of a dockmaster's house, and offices for Customs Surveyor at the Hull Joint Dock. Plans and specification seen, and quantities from Mr. William Bell, architect, North-Eastern Railway, York.

NOVEMBER 12.—**York.**—COTTAGES.—Erection of thirty cottages in Alma-terrace, Fulford-road, York. Plans and specifications from Mr. F. W. Spurr, City Engineer, Guildhall, York. Deposit of 21.

NOVEMBER 13.—**Woolwich.**—CONVENIENCES.—For erection of sanitary conveniences in the Royal Victoria Gardens, and fronting High-street, North Woolwich. Drawing, specification, and form of tender from Mr. J. Rush Dixon, M.Inst.C.E., Borough Engineer, Town Hall, Woolwich. Deposit of 11.

NOVEMBER 14.—**Eastbourne.**—WALL.—For the construction of a coal bunker retaining wall at the electricity works. Specification and plan from the Borough Electrical Engineer, Electricity Works.

NOVEMBER 14.—**Haileybury.**—SCHOOL.—The Committee of Haileybury College, Herts, invite tenders for New Big School, etc. See advertisement in this issue for further particulars.

NOVEMBER 14.—**Rugby.**—BLOCK.—Erection of a discharge block at Infectious Diseases Hospital, Harborough Magna. Plans, specifications, and quantities from Mr. T. W. Willard, architect, Market-place, Rugby.

NOVEMBER 14.—**Wandsworth.**—EXTENSION OF THE WANDSWORTH GUARDIAN.—The Wandsworth Guardians invite tenders for alteration and extension of boiler-house at Workhouse, Swaffield-road. See advertisement in this issue for further particulars.

NOVEMBER 15.—**Chartham.**—STORE.—Erection of a new store in connexion with the farm buildings and other works at the Asylum. Drawings and specifications from the architect, Mr. W. J. Jennings, 4, St. Margaret's-street, Canterbury.

NOVEMBER 18.—**Birmingham.**—SCHOOL.—Erection of a Council school in Brook-lane, Wedgate, Bartley Green. Forms of tender and quantities, on deposit of 21, at the office of the architect, Messrs. Crouch, Butler, & Savage, of 39, Newhall-street, Birmingham.

NOVEMBER 21.—**Cleethorpes.**—SCHOOL.—Erection of a new Council school at Cleethorpes. Quantities and form of tender from Messrs. Scorer & Gamble, architects, Bank-street-chambers, Lincoln. Deposit of 21.

NOVEMBER 21.—**Thornton-le-Fen.**—ALTERATIONS.—For alterations to the Council school at Thornton-le-Fen. Quantities and form of tender from the Secretary, 286, High-street, Lincoln. Deposit of 11.

NOVEMBER 21.—**Upper Clapton.**—BRANCH LIBRARY.—The Hackney B.C. invite tenders for the erection of a Branch Library. See advertisement in this issue for further particulars.

NOVEMBER 25.—**Chorley Wood.**—SCHOOL.—The Herts C.C. Education Committee invite tenders for new County Council school. See advertisement in this issue for further particulars.

NOVEMBER 25.—**Newmarket.**—WATER-TOWER.—For carting, excavating, and laying of about 5 miles of 8-in. cast-iron pipes, including fixing of valves, hydrants, etc., and the erection of brick water-tower. Plans and specifications seen, and quantities and form of tender from the engineers, Messrs. Sands & Walker, Milton-chambers, Milton-street, Nottingham. Deposit of 31.

LONDON COUNCILS—continued from page 524.

Engineer, amounting to 270l., 350l., and 1,200l., have been approved for improvement works in West Ham-lane and Church-street, and making up Densham-road respectively. Plans have been passed for Messrs. C. Watkins and E. Bothwell for alterations and additions to the Y.M.C.A. buildings in Woodgrange-road, Forest Gate; also for Mr. R. C. T. Gordon for alterations to Nos. 348 and 350, Green-street, Upton Park. The following plans have been lodged:—Mr. F. W. Waggett, conversion of hall, Roshet-road, Upton Manor, into cinematograph theatre; Messrs. J. & P. J. Groom, cinematograph theatre, Forest-lane, Forest Gate.

Wood Green.—The Surveyor has been authorised to confer with a firm of consulting engineers with respect to the preparation of a scheme for extending the heating apparatus, hot-water supply, and electric lighting plant in connexion with the proposed additions to the slipper-baths. A Committee has been appointed for the purpose of considering all matters required to be done in connexion with the Council's application to the Local Government Board for the preparation of a town-planning scheme. Tenders are to be invited for laying sewers in three roads at an estimated cost of 885l. A plan has been passed for Mr. H. Jones for the erection of six houses in Clifton-road; as has also a plan submitted by Mr. J. Farrer on behalf of Mr. J. Ives, for seventeen houses in Woodside-road.

Woodwich.—For foundation steelwork required in connexion with extensions now in progress at the Globe-lane Electricity Works the tender of Messrs. Dorman & Long, Ltd., Middlesbrough, has been accepted at 257l. 8s. 7d. The following plans have been passed:—Mr. F. H. Baen, 12, Woodlands-Hutchings, six houses. Blunts-road, Eltham; Messrs. Lovegrove & Papworth, 574-576, Old-

street, E.C., on behalf of West's Brewery Company, Ltd., rebuilding Three Crowns public-house, High-street, North Woolwich, E.; Mr. L. A. Stanton, 110, High-road, Lee, S.E., on behalf of Mr. F. Hare, five houses, Blunts-road, Eltham.

PATENTS.

TO CORRESPONDENTS.

NOTE.—All communications with respect to literary and artistic matters should be addressed to "THE EDITOR" (and not to any person by name); those relating to advertisements and other exclusively business matters should be addressed to "THE PUBLISHER," and not to the Editor.

All communications must be authenticated by the name and address of the sender, whether for publication or not. No notice can be taken of anonymous communications.

The responsibility of signed articles, letters, and papers read at meetings rests, of course, with the author.

We cannot undertake to return rejected communications; and the Editor cannot be responsible for drawings, photographs, manuscripts, or other documents, or for models or samples sent to or left at this office, unless he has specially asked for them.

All drawings sent to or left at this office for consideration should bear the owner's name and address on either the face or back of the drawing. Delay and inconvenience may result from inattention to this.

Any communication to a contributor to write an article, or to execute or lend a drawing for publication, is given subject to the approval of the article or drawing, when received, by the Editor, who retains the right to reject it if unsatisfactory. The receipt by the author of a proof of an article in type does not necessarily imply its acceptance.

N.B.—Illustrations of the First Premiered Design in any important architectural competition will always be accepted for publication by the Editor, whether they have been formally asked for or not.

TENDERS.

Communications for insertion under this heading should be addressed to "The Editor," and must reach us not later than 6 p.m. on Wednesday. T.N.B.—We cannot publish Tenders unless authenticated either by the architect or the building owner; and we cannot publish announcements of Tenders accepted unless the amount of the Tender is stated, nor any list in which the lowest Tender is under 100l., unless in some exceptional cases and for special reasons.]

SCHOLARLY ARCHITECTURE.

THE frequent and somewhat indiscriminate use of the word scholarly in architectural criticism is suggestive of questions not without importance in the development of a consistent modern architecture, and in professional education to that end. It is a mere question of a pedantic purism; the constant use of the word is, in other things, significant of a certain kind of feeling with regard to architecture, common at present both amongst architects and others capable of bringing unduly appreciated to the criticism their work. To say that it is clearly an academic term indicative of an academic phase of architecture may be true, but it is not enough, for unfortunately the word academic also is ordinarily used in a loose, indeterminate sort of way, suggestive of what appears to some as a highly desirable state of architectural and to others, whose opinions are equally worthy of consideration, as the reverse.

It might be said that any high degree of attainment in the varied knowledge necessary to the modern architect competent

to deal successfully with all branches of professional work in itself amounts to scholarship; but we must use words in their ordinary sense. In that sense it applies to distinguished learning, literary—especially in the ancient or classical literatures—historical, archaeological. Scholarship is one thing, art is another, and architecture is art. The profession contains men for whom, without doubt, the qualification scholarly has a sound and well-deserved application: men who are scholars as well as artists capable of producing good architecture. But it is an open question how far their work owes its high quality to their scholarship or to something else. As the handmaiden of art, scholarship may render excellent service; yet it would not be difficult to instance buildings of high merit that come short of the highest, as architecture, by reason in part of this very scholarship.

Without in any way detracting from whatever of real suggestive value for architecture such words as scholarly and academic may contain, their want of appropriateness as critical terms of a creative executive art is perhaps more clearly felt in their application to other

arts. Take a few instances at random: The "Ode to the West Wind"; the "Ode to a Grecian Urn"; "Abt Vogler"; a sonnet of Wordsworth or of Michelangelo; the works of Shakespeare, or even of Milton; and beyond mere irrelevance is there not even a faint sense of derogation in saying of either, or of the poet's work in general, that it is scholarly? The same is also true of the painter's art, and in a painting of Botticelli or Raphael, of Turner or Watts, or Millais, it is not scholarliness we appraise or that appeals, however it may be implicit. We might, as high praise, call Lessing's critical treatise on the Laocoön scholarly, but who would use it of that famous group itself? Returning now to architecture, would it not be mere pedantry to say of the masterpieces of Athens and her colonies or of the great Mediaeval period that they were scholarly? We do not call the men who thus could build scholars, but masters. These were the great original styles, in that, after the universal law of creative life, they were evolved from what went before them by a long series of natural and logical changes, and the introduction of new elements

true to the threefold expression of structure, purpose, and of the soul of the peoples who made them. Works of art they were in the noblest and truest sense of that sadly-abused word, but not of scholarship in our present sense of that term.

But with the Renaissance we come to something essentially different. That great spontaneous resurgence of joyous vitality and energy in all departments of human life did not arise in the conscious application of definite guiding principles. No academic rules could contain or confine it. Its animating spirit of criticism, emancipation, and individualism, unexhausted and indeterminate even now, was fraught with many inconsistencies and contradictions.

In the land of its birth its passion for beauty and art, its enthusiasm for learning, especially for the ancient literatures of Rome and Athens, were naturally linked with a revived interest in their archaeological remains. In architecture this showed itself in two ways: first, in a revulsion of feeling against the long neglect and reckless destruction of the ruins of Imperial Rome, their use as quarries and the burning of their statuary for lime; and secondly, in the study and adaptation of the antique styles to their modern buildings; and from this time the motive spirit in architecture was changed, it became imitative in a way it had never been before. If the change was more swift and complete in Italy than elsewhere it was also more natural, in being the revival of a native style that long ago had been developed in the same geographical and climatic, and, if not in the same social, political, and religious, at all events in the same racial conditions. Its broad defect as architecture, shared with humanism, its contemporary scholarship, was that grace and beauty were aimed at independently of character, that the thing to be expressed, the structure, the purpose, the emancipated modern spirit became of less importance than that the manner of expressing it should be a correct imitation of the antique. The counter reflection may be noted that even so architecture was but expressing what was taking place as the result of the movement in religion, politics, philosophy, science, the extravagance of reactions, and the spirit of experiment and adventure in all things.

Yet even in Italy it is interesting, *à propos* of our subject, to note how the adaptation of the antique architecture to their modern uses was carried out from the first in two quite different spirits with divergent aims and results. The works of Filippo Brunelleschi and Leon Battista Alberti, two of the most distinguished of the earlier architects of the movement, may be compared in illustration of this. Both studied the antique with enthusiasm and patient carefulness, and both applied what they learned in their after work: the first applied the main principles and copied the details of Roman construction and architecture, adapting them with originality and freedom, according to his own ideas in solving the modern problems he was faced with. But Alberti had in his buildings and details far more scholarly regard for the precedent of his Roman models; and, beautiful though his works

are, he laid the foundation of that school in which architecture appears to aim at abstract beauty with a freedom of expression detached from construction and fitness for purpose, and applies the classic orders and details as ornament even where they can have no structural meaning. Alberti may be said to have been the first of the scholarly architects. A distinguished humanist—*i.e.*, a scholar as we still understand the term, he was, beyond that, one of the most versatile and many-sided men of an age prolific of such, with distinguished natural gifts and attainments ranging from music and poetry over a wide field to mathematics and mechanics. A writer on many subjects, his great book on "Building" was the first of a series of great works such as those by Vignola and Palladio and others, which, based upon an assumption that the absolute canons of architectural art had been revealed to Athens once and for all, have had so powerful an influence—such is the inconsistency of the Renaissance—in subjecting architecture to academic rules and formulas, encouraging the fatal idea that all that is required in the architect is an artistic faculty to copy and adapt from recognised original types and standards.

Our modern schools may be free from the pedantic extravagances of the later Renaissance Academies, but they share with the latter the common error of ignoring the true limitations of architectural art, of aiming at beauty detached from the proper character of the subject dealt with, and of assuming that architectural beauty has reached its zenith for all time in the classic styles. They produce men who are certainly often accomplished artists, exhibiting a wonderful beauty and facility of draughtsmanship, gifted with a fancy prolific, versatile, and scholarly, within the limits of a memory stored and trained in all the accomplishments of classic art; but less distinguished for that broader creative imagination which, trained not only in the principles and forms of the great architecture of the past, but also in all the science and industry and requirements of the present, is thus able not only to deal originally and characteristically with its special problems, but to foresee and prepare for future possibilities.

Evolution, as is recognised in Biology, is not necessarily progressive. While in Italy the Renaissance was a return, more or less, to the purity of an ancient native style, to the more Northern nations in which, as especially in France and England, the Romanesque—itsself derived from the Roman as that had been from the Greek—had passed up by a long process of orderly and logical development into the pure style so wrongly named Gothic, the Renaissance came at first simply as a new element and influence gradually assimilated; but proving later, and especially through the publication of the writings and drawings of Palladio and others, to be a transition and reversion to the classical type.

It would appear that, as men's minds became more and more occupied with the immense and ultimately beneficent advance of the physical and mechanical sciences and of their utilitarian applications, itself one of the deeper results of the Renaissance, they lost the instinct

and faculty for creative art. They looked to knowledge and scholarship of the ancients to supply them with consistent modern architecture. The antique and Renaissance authors were searched, new books and measured drawings were published and studied with the idea that the old styles, that owed their greatness, as architecture, to the fact that they so perfectly expressed the life of their own time and place, could be fitted upon a civilisation quite different and without precedent in history, that architecture can, in fact, be studied, understood, or developed apart from the rest of contemporary life.

We do not think we express unfairly the limitations of and the danger of futility that is implicit in academic and scholarly architecture.

The words, however, undoubtedly do also imply a purpose that is both desirable and quite practicable.

The architecture of the future will be in a broad sense, academic in that it will be subject to certain clear principles, universally recognised, but which are not as yet completely formulated nor accepted. It will be scholarly in a living progressive sense, expressing both practical efficiency and character. For anything like a complete realisation of such a consistency in the architecture of the past, of the ideal aimed at by the terms we discuss, we must go back to what is the chief source of all subsequent Western architecture. We must go back to the antique Greek, not by any means assuming it to be the best possible, a pattern to be copied literally; not because, as is so often said in justification of the prevailing classic fashion, our present life is more like that of old Greek or Roman than to that of our mediæval ancestors, for indeed its ruling ideas—religious, social, political, industrial, scientific, etc.—are very different from all these; but simply that we may, if possible, realise the causes of that complete unity of Greek life, its perfect correspondence with and expression in their art.

Scholarly we may say their architecture certainly was, but with a scholarship showing little of that concern with past cultures which forms so large a part of ours, and much more with their own actual busy competitive life. It was a living progressive scholarship, a knowledge of life in all its living aspects, which, combined with high instinct and faculty for fitness and beauty, found expression in the most perfect sensual and intellectual art yet achieved. Compared with those of Roman, mediæval, and modern times, their buildings were but simple structures; but their simplicity was an epitome of practical precision of line and form, logically worked out in every detail with the utmost subtlety of æsthetic refinements. It was in complete unity with, an exact expression of Greek life whose atmosphere of keen emulation and competition and breezy public criticism in all arts and activities tended to the highest efficiency and the most complete development of personalities. This it is which gives it such value for us, and not as so many have, perhaps pardonably, assumed, that the intrinsic beauty of its forms justifies the use of a Greek temple as a model indifferently for church, town hall, summer-house, etc., or

a Greek column in all or every position which it can be applied in use or ornament.

To repeat what we said at the outset, do not discuss these terms in a pedantic or pedantic spirit, but, as we think, solely in the twin interests of literary and critical English and art.

The old Greek language, itself as beautiful and perfect an instrument of expression as any created by their plastic genius, gave us our title architect. Here also we find ancestors both of "cholar" and of "art"; of the first suggesting the leisure and quiet breathing, that was yet far from idleness, of the lives of the Academia, or later in the crowded cloisters of monastery and university; of the second more suggestive of the busier activities of the life of towns and the country outside; the ranging, contriving, preparing, and doing together.

Of great and enduring value is the gift Athens to the world! In the slow upward progress of our race her name descended from a Sanskrit ancestor, which survives to-day less altered in form, more like in sound, and identical in meaning in our word dawn:—

"Let there be light!" said Liberty.
And, like sunrise from the sea,
Athens arose!"

She was one of the cities of the dawn. But, while we bear in mind the freshness and beauties of the dawn, should we not look forward with confidence, and work on the full noonday which is yet to be?

NOTES.

The Temple Church. CERTAIN works of restoration have recently been carried out at the Temple Church, and the usual psalm of praise is gone up from the daily Press voicing the ideas of that large section of the public which likes to see its old buildings made as good as new. The parts affected appear to have undergone a very drastic process of renovation, and how far this was necessary for their preservation is certainly questionable. The turret, for instance, which stands at the junction of the rotunda with the choir on the north side, has been entirely refaced, if not rebuilt, and the southern and the two free-standing piers which carry the porch is now, including its capitals, a mere replica of what stood there before. The northern one appears to have been renovated at an earlier but still recent date, and the same stone is not been used in both cases. The beautiful Transitional doorway, which the porch shelters, with its receding orders variously enriched shafts and architraves, has been thoroughly tidied up, before the work began, this elaborate structure had all the appearance of ancient masonry long subjected to the influences of the London atmosphere. Its surface was crumbling in places and stained, white on the exposed faces and black in the hollows. It was supposed that it was in danger of perishing altogether, and it was thoroughly cleaned. In the course of this process the curious discovery was made that the whole surface had at some unknown

period been thickly coated with an alien substance. This has been for the most part removed by the application of a chemical preparation, and the stone now appears in its original colour, except for the places where the black substance has refused to part company with it. The doorway now looks new, but spotty, and has lost all its agreeable bloom of age. The beauty of the carved ornament, which is of extraordinary refinement for its period, was appreciable before, while the lack of the broken portions which have now in some cases been replaced was not noticed. In one point, however, there is distinct gain. The quaint realistic little half-length figures of monks and royalty which crown the enriched members of the jambs and shelter under the spreading capitals of the intervening shafts are now more clearly discernible and attest the humorous outlook and remarkable technical accomplishment of the unknown XIIIth-century sculptor whose work they are.

Lift Fatalities.

ON Monday, the 28th ult., an inquest was held by Dr. Waldo, the City Coroner, upon the death of a clerk who was killed by falling down a lift well. The verdict was "Accidental death," but Dr. Waldo, in mentioning that this was the forty-ninth case of this kind during his experience of eleven and a half years as Coroner, expressed the view that many of these deaths were preventable. In the case under consideration the well was protected by collapsible gates, and two of the five attendants who alone were authorised to work the lift stated that the lift could not be moved if a single gate happened to be open. It was also against the rules to use this lift for passenger service. But it appeared that the deceased had opened the gate with a lift key in his own possession and had, in the darkness, stepped into the well, believing that he was stepping into the lift. A similar recent case was mentioned by the Coroner, in which a barmaid opened a lift gate with a hairpin and was killed by falling down the well. A considerable proportion of the lift fatalities coming before the Coroner are due to falling down the lift wells, and in many cases the "accidents" arise from such tampering with safety gear as is above mentioned. The difficulty of protecting people of certain classes against themselves is very great. Workmen will clean running shafting and put belts on to revolving pulleys by hand at the imminent risk of death, although their employers may put up conspicuous warnings against such recklessness and may also provide proper and safe means of doing the work. We cannot help feeling that "accidental death" is scarcely an accurate way of describing such incidents as we refer to. It is eminently desirable that lifts should be, whenever possible, arranged with gates that can only be opened when the cage is at rest at the level of the particular gate operated, but at the same time we think it should be made an offence punishable by fine or otherwise to tamper with gate locks or in any similar way to contravene rules made by owners of lifts to prevent

injury to persons. Many people are in the habit of expecting to be looked after in these matters like children, and it would seem desirable, in addition to taking all reasonable mechanical precautions, to endeavour also to instil some sense of responsibility into people who from ignorance or carelessness, or both, are only too often a danger to others as well as to themselves.

The Fatal Fire at Kensington.

THE disastrous fire at Messrs. John Barker & Co.'s premises on the 3rd inst., when four young women were killed and several others injured (one of whom is since dead), has again shown that even with carefully considered means of escape some risk often remains. The external iron staircase was not used, as the girls were cut off from it before they knew their danger, and the modern fire appliances in the building were also not brought into play. Happily this was the occasion of another demonstration of the promptness and efficiency of our Fire Brigade, and it seems certain that all the dead women but one would be alive now had they not jumped to the ground from the cornice 60 ft. above. In doing this one missed the jumping sheet and struck the pavement directly, and two others most unfortunately jumped simultaneously, and therefore, though they fell into the sheet, the impact of the two bodies together was too violent to be safely met. We see with regret that a member of the Brigade, Fireman A. G. Ayres, had to be taken to hospital suffering from severe burns to face and hands after most gallantly saving one of the women.

Flood Protection in Paris.

UP to the present nearly a million sterling has been expended in making good the damage caused by the disastrous floods of January, 1910, but very little has been done in the way of works for the prevention of floods and the protection of the city. The scheme which has been agreed upon by the Paris Municipal Council and the French Government includes the general raising of quays and parapets along the Seine within the city boundaries, the widening of the river at the Monnaie, and the deepening of the river between Suresnes and Bougival in order to facilitate the passage of flood waters. After these works have been executed the river will be dredged between Paris and Rouen as a further aid to the flow of water. It is satisfactory to learn that the two authorities concerned are about to vote the sum of nearly two and a half millions on account of the first instalment of the works, the execution of which ought to be no longer delayed in view of the serious risks to which the city is exposed in its present unprotected state.

Richmond Bridge.

THE Richmond Council have applied for the imposition of a five-mile speed limit for heavy motor traffic over the bridge, and we learn that there will be an inquiry by the Local Government Board in respect of the application. We fear, however, that any such method of dealing with the present difficulty

will be of very doubtful value. As we pointed out in our issue of July 26, the bridge owes its situation entirely to the interests of a few people of a century ago, and the present generation is paying for the errors of those preceding it. Lest, therefore, we leave a similar debt, it would be well for the Council to face the facts squarely and to seek for some lasting solution of the difficulty. In our opinion the only really satisfactory way is the construction of another bridge and the widening of the lane at the foot of George-street. This would avoid the existing dangerous corners and the awkward series of varying gradients which are responsible for the present state of affairs. In any case, to do any lasting good a considerable sum of money must be expended, and the Council, realising this, would be wise to seek the best means of doing so to obtain a satisfactory return in the shape of a fitting continuation of one of the highways of Greater London.

Reinforced Concrete and the L.G.B.

A LONG-STANDING grievance of reinforced concrete specialists against the conservative action of the Local Government Board is once again being ventilated, this time by correspondence in the *Times Engineering Supplement*. Although in some isolated cases the Board have allowed terms of twenty and thirty years for the repayment of loans in respect of works to be executed in reinforced concrete, their general policy is restrictive, and has the effect of imposing a needless obstacle in the way of an important and perfectly reliable branch of architectural construction. Some time ago Mr. John Burns was urged by a deputation to remove the embargo placed by his Department upon reinforced concrete, but after consultation with his professional staff decided against such a course. The fact is that some of the engineering inspectors of the Board still retain the prejudice formerly felt by many British engineers against a comparatively new structural method. Prejudice of the same kind has now virtually disappeared. The Institution of Civil Engineers, who declined to appoint representatives on the R.I.B.A. Committee because the Council thought that such action would imply the support of the Institution to an "untried" method of construction, have long ago changed their attitude, and it is to be hoped that the old-fashioned engineers who seem to control the policy of the Local Government Board will not be allowed to continue a course of action that is not only unfair to an important branch of industry, but is in many instances opposed to the public interest.

The New President of the Institute.

THE R.I.B.A. session opened on Monday evening last with an address by the new President, Mr. Reginald Blomfield, M.A.Oxon., A.R.A., F.S.A., F.R.I.B.A. As was to be expected, the address took the form of an able and well-reasoned exposition of principles affecting the policy and well-being of the profession, but dealing primarily with the position of the Institute, the position of the architect, Registration, and last, but by no means

least, with education. The address is printed *in extenso* elsewhere in our columns, and will be read by all with interest and welcomed for the ideals it fosters. Mr. Blomfield was elected A.R.A. in 1904 and Professor of Architecture shortly afterwards. He is Chairman of the Board of Architectural Education, R.I.B.A., and, as a representative of the Institute, is a member of Council of the new British School at Rome. Our issue of July 28, last year, contains an illustrated article upon his chief architectural and literary works, while a review of his latest book will be found in this issue. Of his most recent designs we may mention the Carnegie Free Library, Lincoln, to which we devote a Plate this week. Mr. Blomfield has more than once acted as assessor in important competitions, and he is on the Committee appointed to consider the question of the rebuilding of the Regent's Quadrant.

ARCHITECTURAL DRAWINGS AT THE ROYAL INSTITUTE OF BRITISH ARCHITECTS.

THE opening meeting at the Royal Institute of British Architects on Monday evening provided occasion for an exhibition of drawings from the Institute collection. The occasion was, however, altogether too brief for the purpose, as the time allowed for viewing the drawings after Mr. Blomfield's speech was scarcely sufficient for more than a glance at the subjects on the walls, which had to be removed immediately subsequent to the meeting, as the gallery was required for other purposes.

The exhibition in question was not formed from a vicarious selection of the Institute's considerable collection of original drawings—it represented an individual and independent collection, only second in interest to the Burlington-Devonshire group of drawings in the possession of the Institute. Regarded from the point of view of architectural draughtsmanship and not architectural history, they possess even a greater variety of interest. Like the Burlington-Devonshire collection, the drawings had been gathered together by a distinguished amateur collector, in this case, Sir James Drummond Stewart, of Grandtully, Dunkeld, who died shortly after their presentation in 1838. The President read a letter from Sir Charles Barry to Professor Donaldson, in which he makes the presentation, on behalf of the Scottish baronet, of certain of the drawings to the Institute, and refers to earlier gifts from the same hand. Until recently the drawings were pasted in a folio album, which no doubt formed part of the original gift, to which those received later were added and attached after the same manner. This inference is borne out by the fact that several pages of the album carried drawings pasted on each side of the sheet, not precisely an ideal way of preserving them, but which no doubt seemed to the librarian of that day as the best method of providing for their security and for retaining the unity of the collection, and, as it happens, they have survived the ordeal remarkably well.

The collection, therefore, on view on Monday night forms one of the earliest gifts to the Institute after its foundation, and one of the most interesting in its history so far as its collections in this respect are concerned. The album, however, provided neither adequate means for the inspection or for the proper verification of the drawings. It has, therefore, been thought well to have them detached and placed in sunk mounts, and they appeared in their new dress for the first time at the inaugural

meeting. The collection consists altogether of 119 examples, which are largely the work of Italian and French masters of the late XVIIIth or early XVIIIth century, representing names of the first importance so far as architectural draughtsmanship is concerned, if not so far as architecture itself is concerned. Many of the drawings are signed, and are of undoubted authenticity. There are others whose authorship can be placed by connoisseurs beyond any reasonable doubt; there are a few of conjectural attribution, and there are still others—not the least interesting part of the collection—to which as yet no artist's name has been assigned. In the course of time no doubt the authorship of all the drawings will be identified or approximately identified. The President of the Institute has published several of them in his recent book, and has cleared up some doubtful points. But their individual character makes, perhaps, subsequent verification only a matter of intelligent interest and time.

Sir Charles Barry, in the letter already referred to, alludes to the drawings as being the work of Bibiena and others, and certainly those by Giuseppe Galli da Bibiena (there are also two drawings by his father, Francesca Galli) form the largest number of drawings by one artist in the collection. The scope of the Bibiena talent suggests in a measure the general artistic atmosphere, both from the point of view of draughtsmanship and architecture of the collection as a whole. There are, of course, some exceptions. Many of the drawings, apart from those by Giuseppe Galli, were designed for the scenic purposes of the theatre, elaborated with something of the delight in the problems of perspective which was characteristic of the Bibiena family, or, if they deal with the invention of architectural subjects for other purposes than the theatre, the style employed is that of the rococo. The numerous members of the Bibiena family devoted themselves with remarkable consistency to the same artistic tradition, and their influence extended outside their own country. It might not be uninteresting to attempt to trace the extent of this influence (chiefly perhaps that of Giuseppe) on the development of the rococo style in the various centres which they visited for the exercise of their artistic and decorative skill in the production of theatrical scenery or in the arrangement of spectacle for Court festivals, or even at times in actual building. Architecture and the stage were more nearly allied in those days than they are now. It is recorded that Brunelleschi provided the scenery for a masque; Palladio's setting in the theatre at Vicenza still remains, and many other instances could be cited. The Bibiena drawings are of undoubted authenticity. So are those of Panini, of which a few bear his signature, the two drawings of his pupil, Jean Nicholas Servandoni, and the four by Mauro Tesi.

Other examples by Italian artists of the late XVIIIth or early XVIIIth century remain unidentified; among these we should be inclined to include the drawing of a candelabrum attributed to Cellini. Next in importance to the drawings of the Italian school are those of the French artists. The sketch of the decorated prows for barges, ascribed to Nicholas Poussin, requires further verification. But there can be no doubt about the veracity of the pen-and-ink drawing signed by Puget, or of the scene of an interior by Delafosse, which is characteristic of the somewhat wild compositions of this famous ornamentist. A pen-and-ink drawing for the decoration of the return angle of a ceiling is ascribed to Le Brun, and certainly its bold design and turbulent grouping suggests his manner, although it was probably not the final working out of his composition. Oppenordt, a French architect, and of the same period as Le Brun, who studied for some years in

ne, is represented by a vigorous pen-
wing of a fountain, with rococo archi-
tural features, figures, vases, etc., in the
inner of architectural arrangement then
wing into vogue. A restrained and
fully-elaborated design of a public
ding, by Henri Marlet, is of con-
rably later date (the drawing is
tently wrought for the purposes of
aving), and, according to its inscription,
emporté le prix à l'Académie de Peinture,
pture et d'Architecture de Dijon, en
1777). Paul Decker's florid interior of a hall
ides an example of German draughts-
ship (the artist was born at Nuremberg
1677); while Isaac Moucheron (who was
the same period as Decker), in two charm-
pen-and-ink drawings, represents with
nelius Schut, an earlier artist, said to be
upil of Rubens, the art of drawing of
pays bas. Not the least interesting
of the collection is a set of tiny
ettes depicted with a light and sure
ph, and with a charming feeling for
position.

For the first time, probably, since its
entation by Sir Charles Barry, a President
the Institute has associated the donor
to the collection which will no doubt in
be definitely connected with his name.
James Drummond Stewart's taste and
ollections as a collector are sufficiently
eated by his choice of subject, and we
e no doubt that the desire which he
ressed through Sir Charles Barry, that
new possessors of the drawings should
e as great a care for them as he would
self, will be fulfilled to the letter.

UNIVERSITY COLLEGE BUILDINGS, DUBLIN.

HE designs submitted in competition for
proposed new Dublin College, to be
ected in connexion with the National
iversity, are, on the whole, of a high
dard, the planning being perhaps more
ormally successful than the elevations.
is result is no doubt partly due to the
racter and restricted area of the site and
carefully-detailed conditions published by
governing body, which tended respec-
ely towards the evolution of plans on set
s, and prevented serious errors of judg-
nt in the allocation of the rooms and
ions. It must not be understood, how-
er, that the problem before the competitors
is an easy one. The sections for which
vision had to be made were scheduled
the conditions as:—Administration;
ents' general accommodation; arts;
sciences, chemistry, physiology, and pathol-
ogy; heating apparatus; examination-
hall, library, large theatre, and seven rooms;
atomy, biology, geology, and architect-
ure; public health, materia medica, and
cellaneous; the required total floor area
which amounts to well over 100,000 sq. ft.
but one-third of this accommodation,
bracing the fifth and a large proportion
the seventh sections, is not for the present
to be erected, the existing buildings on the
being utilised until funds are available
for the completion of the scheme. This
dition, while it was not permitted to
igh with the assessor in considering the
ns on their general merits, must neces-
sarily have hampered the competitors in
their work. The site was, as already stated,
severely restricted in area, being quadri-
lateral in shape, with a frontage of 260 ft. to
Earlsfort-terrace, on the east, and of 250 ft.
Hatch-street, on the south. The possi-
bilities of future building on the northern and
western boundaries necessitated a consid-
erable recession on these sides to obtain un-
interrupted light and air, while a further
wing back of the street frontages was
desirable to gain entrance forecourts and to
avoid the inconveniences arising from the
traffic. The cost of the entire scheme is
fixed at 160,000*l.*, excluding fittings, furni-
ture, and equipment, and of this inadequate
sum 95,000*l.* is to be expended on the first

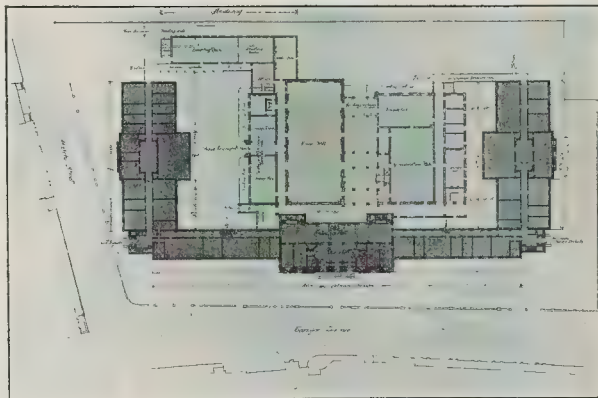

portion. These serious limitations are to be
regretted in a project for collegiate buildings,
destined to be a centre for national education,
and also one of the few examples of early
XXth-century architecture which Dublin is
likely to possess.

A design submitted by Messrs. Doolin &
Butler (No. 10), of which firm Mr. R. M.
Butler, F.R.I.B.A., is the surviving partner,
has been placed first by the assessor, Mr.
H. T. Hare, F.R.I.B.A. Recognising doubt-
less the difficulties to be faced in providing
one large central quadrangle, a method
adopted by many competitors, the author of
this design has grouped his buildings around
two courtyards, each of which will be about
half an acre in extent. The simplicity of the
lay-out is immediately discernible from the
axial arrangement of the plans. The main
entrance is situated in the centre of the
Earlsfort-terrace wing, which is devoted to
arts and administration. From this entrance
access is obtained to a large central hall,
with staircases on either side, and from the
western side of the hall one enters the
examination-hall, which, with the library to
the north and the lecture theatre to the
south, forms the division between the two
quadrangles, and is the central feature of the
plan. The corridors on either side of the
examination-hall afford the necessary exits,
and also give direct communication between
the eastern and western wings. The northern
wing is devoted to chemistry and physics, the
southern wing to anatomy, physiology, and
kindred subjects, while in the rear, or
western, block accommodation is found for
those sections, for which provision is for the
present to be postponed. This arrangement
allows the whole of the main enclosing
frontages to be at once proceeded with,
forming three sides of a rectangle, within
which a large proportion of the existing
buildings will be retained. When the scheme
is being completed the operations will be
entirely shielded from public view. The
winning plan alone embodies this disposition,
which has much to be said in its favour. The
entrances for male and female students are
situated at the ends of the Earlsfort-terrace
wing, with cloak-rooms and conveniences on
the ground floor and on the basement
respectively, while the common dining-room,
with the necessary kitchen and offices, are also
situated in the basement. The anatomical
section is somewhat awkwardly placed on
the ground floor, where the absence of roof
light will prove inconvenient. The position
of the mortuary and the heating chamber,
the latter being placed in the worst position
possible on the plan in point of view of the
prevailing winds, leave much to be desired.
The entrance-hall and parts of the main
corridors are rather deficient in light. With

these exceptions the plans fulfil the main
requirements of grouping and lighting, while
the absence of a basement, except in the
eastern wing, is a satisfactory feature of the
design. The author has, moreover, set back
his buildings some 40 ft. from the western
boundary—a safeguard which no other
competitor has fully managed to achieve.
The elevations to the public thoroughfares
are strikingly simple. The order adopted
only appears fully developed in the colon-
nade forming the central feature, with
slightly projecting wings surmounted by
twin pediments, and in the treatment of the
angle pavilions, which contain subsidiary
staircases. The remainder of the façades,
two stories in height, with main cornice and
attic story over, is of plain ashlar, the
ground-floor windows alone being accen-
tuated. This conception results in a digni-
fied, well-proportioned, and comparatively
inexpensive elevation, in keeping with the
XVIIIth-century style of architecture which
is traditional in Dublin, and escaping the
museum or municipal building-like appear-
ance noticeable in some of the other com-
petitors' work. The central feature over the
main entrance is not an integral part of
design, and opinions may differ as to its
necessity. Economy has dominated all else
in the treatment of the elevations to the
courtyards, which are being finished in
strictly utilitarian manner in cement. The
author doubtless regrets this necessity as
keenly as will any critic.

There is no question that, of all the schemes
submitted, Mr. Butler's is the one which can
be carried out with the closest approximation
to the funds available, and that he has
achieved this without prejudice to the
directness and roominess of the plan and the
dignity of the design. His appointment as
architect by the governing body has been
officially announced, and his sense of grati-
fication at his success can but be enhanced
by the general appreciation of the fairness
of the award which is expressed by his
professional brethren in Dublin.

The assessor has placed second a design
(No. 3) by Messrs. Arthur & H. H. Hill, of
Cork, which, while not so compact in plan
as the winning design, has much to commend
it. The two-court principle is adopted, a
main quadrangle some 208 ft. by 144 ft.
and a smaller medical court, around which
are situated accommodation for the sciences
cognate to surgery and medicine, a segrega-
tion which is one of the salient features of
the plan. The allocation of the various
sections is satisfactory, although a more
reposeful situation might have been found
for the library, which is placed in the
Earlsfort-terrace wing directly over the main
entrance. A feature has been made of the

Proposed University College, Dublin: Block Plan.

Design placed first, by Messrs. Doolin & Butler.

examination-hall by placing it in the centre of the northern wing, and effectively treating the elevation abutting on the large quadrangle. With the exception of a few chambers in the basement, and the attic stories over the dominant features of the design, the accommodation is confined to two floors, which greatly extends and elaborates the plan. The elevations to Hatch-street and Earlsfort-terrace are typically Neo-Greek, the entrance portico, with its Ionic columnar treatment, losing something in refinement by exaggerations of the style and a wealth of ornament which, in hard Irish limestone, would be costly to execute. The façades are flanked by pavilions, impressive mainly by their heaviness. Wings two stories in height are advanced 40 ft. to the pavement line on the south front to form an entrance courtyard. The façades to the quadrangles were intended to be treated with bricks 2 in. in thickness and dressings of cut stone, of which the effect, by its simplicity, would doubtless be very pleasing. A raised terrace with stone balustrade is shown around the main quadrangle, adding much to the dignity of the building, but the expense would be prohibitive, a factor which has been rather neglected elsewhere in this design.

Mr. T. J. Cullen, M.R.I.A., a young Dublin architect, whose design has been placed third, adopted the basic principle of one large quadrangle, entered from Earlsfort-terrace by a triple archway for vehicular traffic. The entrance to the administration block, which is also the main entrance to the buildings, is situated on the side of the quadrangle most remote from the street, while the somewhat meagre entrances for the students are also from this courtyard. The result is that some seclusion is obtained appropriate to collegiate conditions.

Unfortunately this principle on the confined site involves either wings two rooms in depth and an ill-lit central corridor, or a four-story building. The author has chosen the latter plan, and placed one-fourth of the total accommodation, including some laboratories in the basement, 12 ft. below street level. With this grave exception, the plans possess considerable merits, the corridors, entrance-hall, and the rooms generally being adequately lighted and conveniently planned, particularly in regard to the physics section. The position of the assembly, or examination hall, with its longer side on the Hatch-street façade, enables the latter to be effectively treated. The elevation to Earlsfort-terrace is rather impaired by the elaborate central feature which, with an Ionic colonnade, defines the main entrance. The additional story over this entrance tends further to destroy the harmony of the whole conception.

Although no official announcements have been made, it is generally understood that two designs have been highly commended by the assessor. No. 12, submitted by Messrs. O'Callaghan & Webb, bears a great similarity to the winning design in plan and in the broad treatment of the elevations, and highly deserves its commendation. The grouping around two quadrangles, the allocations of the sections, the central position of the examination-hall and library, the entrances for the students, the situation and amount of the basement accommodation are almost, in the narrowest sense of the word, identical, except that the anatomical section in this design is better placed for lighting purposes. The elevation to Earlsfort-terrace is very effective, the main entrance being marked by a Roman Doric portico, with the bases of the finely-proportioned columns placed at first-floor level. The façade terminates in projecting pavilions, with distyle treatment of detached columns deeply recessed. The detail is decidedly Neo-Greek, and elaboration is carefully avoided. The elevations to the quadrangles are shown in ashlar, and this fact, combined with the general internal and external design, may have militated against the success of this scheme on the score of expense. Architect-

turally, it is probably one of the finest conceptions submitted.

The second commended design, No. 18, by Messrs. Batchelor & Hicks, F.F.R.I.B.A., of Dublin, is a departure from the prevalent classical treatment, and consists of buildings in the Tudor style grouped round one large and four subsidiary quadrangles. A collegiate atmosphere has thus been attained by the authors, which is emphasised by the well-conceived entrance-gateway and tower marking the arched entrance to the main quadrangle, and utterly marred by a somewhat meaningless tower and spire placed at the junction of the Hatch-street and Earlsfort-terrace façades, which, by its height and character, overpowers the whole building. The planning is occasionally devious, although the grouping of the sections is in many respects excellent, and the setting back of the main frontage to form an entrance courtyard gives great depth to the building. The style adopted affords opportunities for design which have been fully seized by the authors, the assembly-hall being noteworthy in this respect.

Another Gothic design possessing many excellent characteristics has been submitted in No. 16, the elevation to Earlsfort-terrace, with a tower 100 ft. in height as central feature, being well conceived. The entrance is well defined and possesses a porte-cochère, while the main hall gives access to a block of buildings on the central axis, which affords a means of intercommunication between the front and rear wings on two floors, a convenience which has not been obtained in other plans, even where the two-quadrangle principle has been adopted. The author of this design has utilised the examination-hall to form a bold projection on the southern front, of which elevation it forms a prominent feature.

In design No. 20 may be found several features of interest, including two excellent elevations in the classic manner. The central entrance is emphasised by a flatish dome placed over the main hall, which, with the vigorous columnar treatment of the portico, gives an appearance of stateliness to the whole design. The examination-hall has been boldly thrown athwart the centre of the southern wing—these plans being based on the single-quadrangle principle—and the tetrastyle portico to this hall is made the chief feature of the Hatch-street elevation, balanced by the pavilions forming the termination of the eastern and western wings. The planning, otherwise good, has the serious defect of central corridors, lit for the major portion of their length by glazed screens in the walls of the rooms on either side. Such an imperfection is too weighty for even this, otherwise most-carefully designed building to overcome.

In design No. 15 the buildings are grouped around four rectangular courts, with their main axis running from east to west. This arrangement permits of excellent lighting to and intercommunication between the various sections, but the plans lose something in dignity. The elevations are not particularly striking.

One is curious to learn why the author of design No. 7 spoiled the uniformity of the large quadrangle by setting down in its midst the common dining-hall. The exterior of the hall is, without exaggeration, a charming conception in the Georgian style, but its presence is rather disturbing. This design embodies some original features which add greatly to its collegiate atmosphere, and in this connexion may be noted the almost isolated position of the examination-hall, marking, as it were, its importance in University life, and at the same time giving vigorous architectural character to the southern façade. The Georgian style, with its possibilities of combination of brick and stone, makes a powerful appeal when treated, as in this instance, by a master-hand, which has, however, fallen rather short of perfection in the external elevation to Earlsfort-terrace, by the introduction of some lumpy terminal pavilions of doubtful origin.

Design No. 9 is singular in the provision of the accommodation in six independent blocks, a treatment scarcely suited to the conditions appertaining to this competition and requiring more judicious architectural clothing than is discernible in this set of plans.

In this brief review it has naturally been impossible to deal with each of the twenty-one designs submitted, or even with all of the best of them. As far as possible those selected are typical of a class or of a principle. One feature of the competition, however, calls for remark, having regard to the fact that, with few exceptions, a new generation of architects is in practice in Ireland since the last opportunity of an equally important competition was afforded the profession. It is the influence of the Neo-Greek element which permeates so much of the work under review. It is quite clear that young Irish architects are again turning their attention to the careful study of classical examples, and are abandoning to a large extent the Gothic tradition which was followed for a large portion of the XIXth century, and which was caused doubtless by the era of church building in that period.

MISSOURI STATE CAPITOL COMPETITION.

JEFFERSON CITY, the Capitol of Missouri, located on the Missouri River between St. Louis and Kansas City, and the site of the new Capitol lies on a promontory visible for miles up and down the river and 100 ft. above its level.

A domed building with one axis on the main street of the city was called for, but the orientation was left to the competitor. The winning design, by Messrs. Tracy & Swartwout, architects, of New York City, takes the long axis of the building parallel to the river and fulfils the requirements of the programme in a thoroughly practical manner. In describing his plan, Mr. Swartwout emphasised three elements: (1) Complete circuit of offices on the outside; (2) uninterrupted circulation; (3) the relation of Senate and House and the vestibule and library. Furthermore, "the secondary stairs and elevators are in the four corners of the building, just off the circulation, and placed that members of the Legislature can get from either side directly to their coatrooms without passing through the lobbies."

A feature of the design not found in other State Capitols is the splendid opening up of the plan and section from the entrance portico and steps through a high vaulted stair hall to the dome.

We may mention that other buildings by the same firm include the Post Office, Denver, Colorado; Connecticut Savings Bank, New Haven, Conn.; Yale University Club Building, New York City; Home Club Building, New York City; Metropolitan Bank, Washington, D.C. We are indebted to our contemporary, the *American Architect*, for permission to reproduce the winning design, which we shall further illustrate next week.

HOUSING SCHEME, CHELMSFORD.

As the first instalment of their extensive scheme the Town Council have just completed the erection of thirty-eight workmen's dwellings. The Corporation bought the site of 6 acres ± 27½ per acre, and will build 140 cottages with gardens, to be let at rents of 6s., 5s., and 4s., according to the accommodation. The thirty-eight now built are of red brick with tiled roofs; they cost 5,310s., and the rental amount to 455s. per annum; there were ninety-six applicants for the first two that were built.

RE-INAUGURATION OF THE CHAPEL OF THE ORDER OF THE BATH.

Mr. Lionel Earle, C.B., C.M.G., the newly appointed Secretary to H.M.S. Office of Works, is nominated as a member of a committee who are charged with arranging for an installation ceremony in King Henry VII's Chapel, Westminster Abbey, in the autumn of next year. It is proposed to revive, as far as modern conditions will allow, the connexion of the Order of the Bath with the chapel wherein the last installation of Knights of the Order was held in June, 1812.

OPENING MEETING OF SESSION AND
PRESIDENTIAL ADDRESS.

THE first general meeting (ordinary) of session 1912-13 of the Royal Institute of British Architects was held on Monday, at 9, Conduit-street, W., the President, Mr. Reginald Blomfield, A.R.A., presiding. The minutes of the last meeting having been taken as read, and the announcement that the Council had admitted the Hampshire and Isle of Wight Association of Architects to alliance having been made, The President delivered the following address:—

It has become the custom of this Institute to look to its Presidential addresses for announcements on matters of serious interest to the profession, for the foreshadowings of policy, sometimes for sanguine anticipations of ideals that we should all like to see realised. You will collect the frankness of my predecessor in this chair, and the zeal with which he attacked the difficult problems which confronted him during his term of office. Many circumstances continually full of arduous situations. I who have to honour to succeed him do not look for a series of alarms and excursions. Rather, so far as I can see, the time has come for a steady consideration of our position and for a period of serious, if less brilliant, development on practicable lines. I hope I shall not disappoint you if I say that I have no heroic policy to offer you, no infallible panacea for the many difficulties that lie before us; but I shall ask you to follow me in the suggestions which I shall put before you as to the present position, and to help me on your part with your clear, unprejudiced, and close attention.

The Position of the Institute.

The points which I would ask you to consider with me to-night are: the position of this Institute, the position of the architect, Registration, and education. I will deal first with the position of the Institute.

We have in the last two or three years incurred a large expenditure, and this has induced some anxiety among our members in regard to the future. I think I can safely reassure any member who has an uncomfortable feeling of insecurity. As a body this Institute has never been so strong as it is to-day. The total of its membership, including Licentiates, amounts to some 4,700, in addition to the numerous class of probationers and students from whom the members of the future will be drawn: and I would remind those of the latter class to whom the Insurance Act applies that an Architects' and Surveyors' Approved Society under the Act has lately been formed by the Architectural Association, with the approval of this Institute and of the Surveyors' Institution. The net-work of allied societies, working in close relation with the central body, now covers not only the United Kingdom, but practically the whole of the English-speaking Dominions, and your Council has recently taken in hand the consideration of the relations of the allied societies *inter se* and to this Institute, in order that no district shall be without a representative body to assist the architects practising within its boundaries. The constant reference to the Institute in matters of public importance I need not touch on, because it is a matter of common knowledge to all of you. In regard to our financial position, as freeholders of these fine premises which have recently been enlarged and improved, the Institute is in a more secure position than it was two years ago, when it was merely the holder of a lease of half these premises with some fifty years to run. Such a serious undertaking has necessarily put a temporary strain on our finances. In the years 1909, 1910, and 1911 the Institute spent about 31,000*l.* on the purchase of these premises and their repairs and rearrangement, skilfully carried out by our Hon. Secretary, Mr. Hare. In addition to this, the Town-Planning Conference involved a capital expenditure of 2,235*l.* To meet these liabilities the Institute had in hand 21,095*l.* capital. The result was that during these years we had to borrow from our bankers the sum of 12,144*l.* But the soundness of our finances is shown by the fact that by the end of last year our indebtedness was reduced to some 9,000*l.*, and we have reason to believe that in this and following years an annual surplus of income over expenditure will enable us to reduce our debt by

at least 1,000*l.* a year. I need hardly say that the sooner the whole of this debt is wiped off the better, and this is the more necessary as there still remains to be dealt with the mortgage of 4,000*l.* which we took over with these premises from the Architectural Union Company. There is much that the Institute would like to do, and yet hopes to do in the future, which your Council do not feel justified in undertaking till this debt is cleared: our splendid architectural library, for example, perhaps the finest in this country, should be kept up-to-date by the purchase of the best contemporary publications, both in this country and abroad, but at present your Council is not always able to follow the legitimate representations of the Literature Committee for financial reasons. Then there is the pressing question of the payment of our examiners, long ago recommended by the Board of Architectural Education, but as yet unrealised for the same reason, and all that the Institute can offer to these gentlemen who place at its disposal their highly-skilled and valuable services is its platonism, if very genuine gratitude. I would remind you also that the promotion of Registration, whatever form it may take, must in any case mean the expenditure of money, possibly of a good deal of it. I venture to suggest one obvious means of adding to the sinews of war, and that is that those Associates who are qualified for the Fellowship should take up their Fellowship without further to-do. The status of a Fellow of the Royal Institute of British Architects is assuredly a distinction, and I suggest to you that all our Associates ought in due course to proceed to the Fellowship, and that the senior Associates should give a lead to their juniors by taking up their Fellowships at once. I appeal to you as good sportsmen to lend a hand in this very practical way, having regard to the facts that I have now laid before you. I would say again that our position is perfectly sound, but it is only common sense to deal with our existing liabilities before we embark on large enterprises, whose end, however desirable, must be to some extent problematical.

The Position of the Architect.

The position of the architect as a professional man has given ground for a good deal of anxious consideration in the last year or two. Adverse verdicts have been given in the Courts, which appear to saddle us with unfair and impossible responsibilities, and there can be no doubt that the position of a practising architect to-day is more difficult than it was forty years ago. He is expected to know a great deal more, and to do a great deal more for his money, than was expected of his predecessors in the halcyon days of the 'seventies. Applied science has developed

Missouri State Capitol: Rear Elevation. Winning Design, by Messrs. Tracy & Swartwout.

so fast and in so many directions that it is impossible for an architect to keep pace with every branch of it; and beside all this, he has his own art to master. For when all is said and done, the first business of an architect, that which differentiates him from other men, is his power and knowledge of design; and that, in the chaos of modern styles and the kaleidoscope of fashion, is not less but more difficult to acquire now than it was 150 years ago when everybody worked in one manner as a matter of course and every village builder knew the Orders. And it is more difficult than it was fifty or sixty years ago when hygiene was a negligible quantity, electricity as a commercial power unknown, and the builder was a man who really knew something of the practice of building. At the same time, I think there has been an unnecessary scare in this matter. We architects have, and have always had, our responsibilities to our clients, and, provided an architect knows his business, watches his work, and takes due care of his clients' interests, I do not think his position is one of greater danger than that of other professional men. The pressure of competition is keener than it used to be, and the standard of attainment is higher, but this is due in the one case to causes beyond our control, in the other to our own efforts; and what we have to do is, on our part, to qualify ourselves for our responsibilities, and to stimulate in the public a more intelligent appreciation of the services that an architect can and ought to render. If the public understood that an architect is an individual with the necessary limits of an individual, and not merely a wholesale *entrepreneur* on the one hand, or a building policeman on the other, there would be less of the regrettable misunderstandings that sometimes occur in the practice of architecture—but architects should not forget that the only effective passport to the appreciation of the public is the merit of their own personal work, and that if the profession of architecture is to receive a higher recognition in the State than it obtains at present it can only do so by ensuring a high standard of education and attainment among its individual members.

Registration.

This brings me to the thorny question of Registration. In this matter, if you will bear with me, I wish to explain certain developments that have formed part of the history of this Institute. Over twenty years ago I had the honour to be an Associate Member of Council, and about that time a move was made in the direction of Registration, which appeared to some of us, old as well as young, to be heading off architecture into a *cul-de-sac* of unmitigated professionalism. But since those days much water has flowed under the bridge. Free discussion has cleared away the misapprehensions of earlier days, the Institute has taken a very active and, if I may say so, in regard to its members, self-sacrificing part in the reorganisation of education, and there has grown up a fairly general consensus of opinion that Registration, in some shape or another, is desirable, not only in the interests of architects, but in the interests of the public. So far this Institute is pledged to the policy stated in the Report of the Committee of 1907, and your Council has for some years endeavoured to give effect to that policy. Your Council can hardly hope to produce a scheme that will at once satisfy all, or nearly all, shades of opinion, and also be within the range of practical politics—this last is important—for I think you will agree with me that, if you run a horse, you should run him for all he is worth, and that it is unworthy of serious men of affairs to waste time and money on mere *ballons d'essai*. We are after a practical scheme, one that will protect both the public and architects. Various solutions have been proposed. So far none of them have met with general acceptance, but it must not be supposed that the labours of the last few years have been wholly in vain. They have at least shown us some of the difficulties in the way, and have brought it home to thoughtful men that this is a very difficult and intricate problem not to be settled off-hand, and that if a real and satisfactory solution is to be found for it, that solution will have to be built up by careful and exhaustive consideration of the case in all its aspects; of what is required by the public, of what is due to the architect, and of the effect of any such scheme on other professional bodies whose interests may be affected. And if after this careful consideration it is found to be impossible to go quite so far as some of the more ardent of our Registrationists might desire, I would remind

them that half a loaf is better than no bread, and I would appeal to them, and indeed to all of our critics, to have patience and not to take the bit in their mouths and bolt. It is no use striking before the iron is hot, and it has become clear that there are many issues to this question, all of which must be dealt with before it will be possible to reach the psychological moment of solution. The conditions of modern society are so complex that it is impossible to deal with any of its problems in watertight compartments. What may appear to us as very clearly in the public interest may seem less convincing to our neighbours on the other side of the fence; and the experience of history is conclusive that drastic changes are not to be made *ad idem*. If such changes are to take their permanent place in the social organisation, they will only do so as the result of much previous effort, of anxious thought, of the slow attrition of those awkward angles which have split up many a well-meant scheme of reform. One of the first acts of your new Council has been to appoint a large and carefully-selected Committee to consider the whole question of Registration, and it has strengthened it by the addition of a number of representative members from the provinces. I would ask you to give this Committee time to deal with the question in all its bearings, and, before you, not to look for impossibilities, but to give it your careful consideration as practical men of affairs, and with an anxious regard to the future of architecture. For, after all, whether members of the Council or not, we are but trustees for the next generation, and it should be our business to hand on our inheritance, not tarnished or diminished, but greater and more splendid, because it is held on the terms of a higher standard of attainment. On one point I feel sure we shall all agree. The object of a Registration scheme should not be to make architecture a close profession, regardless of professional skill. We do not want to repeat the history of the Trade Guilds in their later days, when their object was to surround their members with a jealously-guarded ring-fence of monopoly. Our object is to put a stop to incompetence, and to establish and maintain a reasonable level of accomplishment, and to see that that level is reached by those who undertake the very responsible work of an architect. There is not a man in this room who would not say "*la carrière ouverte aux talents*," but what we insist on is that the "talent" should really be there, and that is the substantial issue to which Registration should be directed. It should be really and effectually the hall-mark of professional competence.

Education.

So, by this roundabout way, we come back to the vital question of education, or rather, as I should prefer to put it, a sound and thorough professional and artistic training as the basis on which any form of Registration must be founded. If we are to obtain public and formal recognition of the fact that architecture is not an art that can be practised by Dick, Tom, and Harry with advantage to the community, and that there is a difference in kind between the work of the trained designer and the architectural efforts of the gentleman who combines the practice of architect, auctioneer, and estate agent, we shall see to it, not only that our present standard is maintained by all who enter our ranks, but also that it is slowly and surely raised, so that there can be no question as to who is and who is not qualified to undertake the work that legitimately falls to an architect.

It is to this object that the Institute, through its Board of Architectural Education, has steadily applied itself during the last few years. Sir Aston Webb was the first and most admirable Chairman of that Board. I had the honour of succeeding him, and we can both testify to the unwavering sympathy and support which the Institute, through its Council, gave to that Board, and thereby enabled it to carry out the important and far-reaching reorganisation of the architectural training, which has been quietly going on for the last few years. The syllabus of training for architectural students has been thoroughly overhauled, and quite recently a serious attempt has been made to render our examination a more effective and intelligent test of architectural capacity, and also a real stimulus to the artistic enthusiasm of our students. Design, the adequate invention of buildings which are good to live in and to look at, is, after all, the essential object of our training. Many studies are necessary as subsidiary to this, but the aim of our training must always be to

make our students competent architects, artists to whom the methods and materials of building are as his canvas and colours to the painter, or his bronze and marble to the sculptor. The institution of a test in design, which is to some extent competitive, is an important step forward and a further development of that reorganisation of our methods of training which has been one of the most valuable constructive works carried out by the Institute during the last few years. And by design I do not mean scene-painting. Under modern conditions it is more than ever imperative that power of design and knowledge of construction should go hand-in-hand—that the architect should have the technical knowledge of building necessary to realise the flights of his imagination. Where the engineer stops at construction, the architect, as an artist, sees further possibilities of beautiful form and its combinations, and he should possess sufficient knowledge at any rate to start the realisation of these possibilities.

Architecture and Science.

At the meeting of the British Association in September last Professor Archibald Barr gave a very able address on the duty of the engineer to the community, and in the course of it called attention to the unfortunate severance of engineering from artistic design. The engineer, he said, takes a too exclusively utilitarian view of his calling, and architects have not sufficiently mastered the science of steel construction to be able to design in it freely. I think there can be little doubt that Professor Barr is right in this contention; and the conclusion to be drawn from it is that in the modern practice of architecture the necessity of the study of scientific construction becomes more and more urgent. That is a point that will not be lost sight of in our scheme of architectural training, and I may assure you that on this point our examiners are adamant. Yet there are one or two considerations which I venture to offer, to reassure the old-fashioned lover of bricks and mortar. I do not believe that the whole future of architecture rests with steel construction or reinforced concrete, any more than I can believe that the whole future of painting lies with the Post-Impressionists or the Cubists. Brickwork and masonry must always hold their place in building, and, though architects will do well to avail themselves of all the resources of applied science, that is no reason for throwing up their familiar tools and rushing headlong into methods, however brilliant their promise, which have not yet stood the test of time.

We artists have to live in an age of science, and science is steadily invading the territory of the arts; not content with brushing us aside as people of no account, it has stolen our one ewe lamb, it has annexed the term "beauty" for its own purposes, and misled the public by using it in a sense of its own. In consequence of this insidious misuse of the middle term, we artists wake up to find our work judged by irrelevant standards, and condemned accordingly. One hears the term "beauty" applied to subjects so diverse as St. Paul's or Westminster Abbey, to the steelwork of the Gare d'Orléans or to some complicated piece of machinery. Now, it is obvious that the same thing cannot be meant in each of these instances. In the case of the buildings, we mean that our sense of rhythm and proportion, our enjoyment of light and shade and the like are gratified; in the two latter cases that we derive intellectual satisfaction from the exact solution of a problem of construction or mechanical function; and it is only because we are lazy or careless of speech that we talk of "beauty" in the case of the steel roof or the steam engine. There is, of course, a borderland, where our pleasure is partly aesthetic and partly intellectual, such as the scale of a great dam or the lines in perspective of an ironclad. But from the point of view dealt with by Professor Barr I suggest that the term "beauty" as applied to steel construction means technical beauty—that is, that its appeal will be to the intellectual satisfaction given by perfectly efficient work, rather than to the aesthetic enjoyment to be derived from the "ordnance" of noble architecture. One is therefore, the less daunted, and I do not think that architecture is going to be stranded high and dry by the engineer; but I heartily endorse Professor Barr's appeal for more thorough study of construction and for closer co-operation between the engineer and the architect. The two should pull together and should do so from the first. It is no use asking an engineer to design a bridge, or even a shopfront as was recently suggested, and afterwards calling on an

architect to invest it with "artistic merit." Both architect and engineer will have their views on the main form and distribution, but they will have studied the problem from different points of view, and it is only by laying their different points of view together, before the treatment of the problem as a whole is decided on, that it will be possible to attain the unity of effect essential to monumental architecture.

The Universities and the Institute.

I would take this opportunity of expressing our appreciation of the admirable spirit in which several of the Universities have endeavoured to give effect to the Institute scheme in their schools of architecture. The control of the Institute over the training of architectural students has been placed on an efficient basis by the organisation of the system of external examiners. The Institute has been brought into satisfactory relations with the Universities, and is now recognised by them as the official centre of reference for questions concerned with the training of architectural students. We have our representatives in the schools of London University, the Architectural Association, Cambridge, Manchester, Liverpool, Sheffield, Glasgow, and Edinburgh; and finally, at the invitation of the Board of Education at Whitehall, the Institute has undertaken to conduct, next year, the examinations in architecture of candidates in the National Competition of Art Students. The horizon of the work of this Institute is steadily widening, and the part that it is called on to play in the training of architects becomes each year of greater importance, of vital importance, to the next generation of architects, and scarcely less so to the public and to our own members, because, as I have ventured to assert already, trained technical ability must be the basis of statutory recognition.

The New School at Rome.

In this branch of the work of the Institute prospects are very much brighter than they have been hitherto. The Jarvis Bequest has placed at the disposal of the Institute annually a scholarship of 200*l.* a year tenable for two years; and within the present year, through the generosity of the Commissioners of the 1851 Exhibition, the new School at Rome, long dreamt of by this Institute, has been established by Royal Charter; the first instalment of the building is already in hand, and a scholarship of 200*l.* a year tenable at this school for three years is to be awarded annually. The Institute has offered its hospitality to the Commissioners in regard to the examination for this scholarship, which will be the blue ribbon of the year. The jury will be the Faculty of Architecture, all of whom are members of this Institute. In these scholarships, and in the gold and silver medals of the Royal Academy, not to mention other scholarships and prizes, there are solid inducements to tempt the young man of genius out of his hiding. The importance of the scholarships tenable in the School at Rome will be obvious to all who recall their own days of studentship, those aimless and often solitary wanderings on the Continent, pleasant enough as a sketcher's pilgrimage in search of the picturesque, but of little value as artistic training, owing to the absence of intellectual discipline and authoritative guidance. Indeed, as a student of the development of architecture, I am sometimes tempted to attribute the weak points of the architecture of the last fifty years to the habit of indiscriminate and undisciplined sketching. I regret to admit that we have all of us done it—sometimes, it is but fair to say in self-defence, from the sheer pleasure of drawing some very drawable object—the sheer joy of draughtsmanship—more often I fear from a certain laziness and disinclination for the hard thought involved in the critical analysis of architecture. The results, alas, have too often been an unlicensed orgy of details snatched from every land and every style! But the sketching and measuring of actual buildings with a clearly realised object, and carried out with the aim of artistic analysis, becomes of inestimable value to the student, especially when checked by the free discussion of students working together. For the first time students will have the chance of working together, and in touch with their brethren the painters and sculptors, in that city which must always be the mother of the arts. The School at Rome may take years of patient effort to perfect, but we may look for great things from it in the next generation. One of the most serious difficulties in the modern practice of architecture is the absence of

tradition, the want of a common method and of a recognised standard of attainment. It is not too much to hope that in lapse of time it may be the privilege of the students at our School at Rome to restore this method and standard. That ideal is still far distant, and to complete our programme we must go further afield and enlist the help of all who care for our progress in the arts. I think the time has come when closer attention than it has hitherto received is due to the organisation of training in the arts in this country. Excellent work is done in our schools, but the schools are not sufficiently organised *inter se*, and there is need for further development both in regard to this and also in regard to the advanced stages of training in the arts. Our schools bring the students up to a certain point, and far ahead for the brilliant few there will be the artistic paradise of the School at Rome, but there is an interval between these stages to be bridged over, so that others, not among the brilliant few, yet good men too, may have the benefit of the most advanced training in design, with all the resources of a great establishment and the benefit of the skill and experience of the most competent artists. I believe that the want can be met by the development of existing institutions, but it is one that will require very serious and anxious consideration, in co-operation with such educational establishments as the Royal Academy.

Training.

In this short survey of the present situation of what I may call architectural politics I have endeavoured to indicate a certain unity of idea, and even of fact, that underlies the whole position. If the architect is faced by graver responsibilities than heretofore he must meet them by mastering his business and attending to it. This means more thorough training. If as a profession we are to succeed in effecting such further official organisation as will protect both the public and ourselves from the depredations of poachers, the foundation-stone of that organisation must be systematic professional training, and it is, and will always be, one of the most responsible duties of the Institute to see that that training is really sufficient and its standard steadily maintained. In saying this I do not for one moment imply that our present methods of training are not efficient. They are efficient, whenever they are properly applied. The mischief is that they are not universally applied, or, to put it another way, that they are not insisted on in the case of all who set out to practise architecture. The strength of a chain is its weakest link, and, however strong a profession may be in individuals, it is the minimum of excellence that determines its position with the public. Thus it is that, by insistence on this training, with its corollary of a widespread level of accomplishment, we may hope to build up in the mind of the public a real understanding of architecture. I fear that until that is done we shall continue to suffer from the unfortunate vicissitudes of art in this country, those failures of method and intelligence which result in constant disappointments, only relieved at rare intervals by some effort of individual genius or patriotism. I will not dwell here on the alarming architectural results that may arise from the bureaucratic instinct, that growing centripetal tendency in our State and municipal departments which deprives the public of the use of the best ability in the country, and so far hinders it from getting the best value for its money.

National Monuments.

Nor need I enlarge on such matters as the lack of organised protection for our national monuments. A Bill for their protection is now being considered by a Committee of both Houses, and you will have fresh in your memory an astonishing piece of vandalism which was only rectified at the last moment through the munificence of a distinguished Statesman. Mistakes which are afterwards a source of the keenest regret seem to slip through by accident. In those far-distant days, when real ability and solid attainment will be the condition precedent to the practice of architecture, one may hope to see these evils remedied, because a sense of the place and value of architecture will be widespread among educated people. The serious importance of this art in the State will be realised, and with this keener sense of the gravity of the problems of architecture fuller trust will be given to those whose high calling it is to practise the art.

The Relation of the Architect to Himself.

Lastly—and this time it really is lastly—there is the relation of the architect to himself. So far I have been discussing his position in regard to the public. But more important than this is his own attitude to his career, the point of view from which he regards the work of his life. There is a real danger, in all this whirl of architectural politics, of our forgetting that first of all we are artists, and that the art which we practise is a very great and a very old one. The cares of business, the keenness of competition, the feverish haste of modern work are apt to reduce the lamp of art to the merest flicker if they do not put it out altogether. Those of us who have wide experience of practice know how difficult it is to keep that lamp alight, but here I am addressing myself not to my seniors and contemporaries, but to our younger members—to those who will take our places and carry on our work. Scholarship and research have always been among the best traditions of this Institute. I need only recall such names as Donaldson, Cockerell, and Penrose, and remind you that, whatever view one may take of the historical justness of the Gothic Revival, there can be no question of the intense enthusiasm that inspired the labours of such men as the younger Pugin, Street, Burgess, and Nesfield. If you turn over the pages of the earlier volumes of our *Transactions* you will find papers on matters of serious interest, marked by a learning and ability that give them a permanent value in architectural literature. I hope, and I do not doubt, that that tradition will be worthily maintained by the rising generation. Current politics may be fascinating, but they are the outside of the cup and platter, they are a very poor substitute for that patient forging and perfecting of your artistic armament which will enable you later to practise your art with the enjoyment that comes of real mastery. And to those that have enthusiasm this labour will be a perennial delight, the joy that is to be won from the study of past art. Who of us, after all, does not look back with vivid pleasure to those wrestlings with the mysteries of some great cathedral, quiet hours with pencil, note-book, and 2*ft.* rule spent in some exquisite chapter-house, long autumn rambles among the time-worn buildings of historic cities? These things are the privilege of the architectural student, and it is this touch with the past that gives to our work its abiding interest. You may recollect the old Greek game of the *Lampadephoria*, where runners took torches lit at the altars of Prometheus, Athens, and Hephaistos, and passed them from hand to hand till they reached the winning-post. That, gentlemen, is our position. It is our business to hand on the torch of architecture. Some of us may be getting old and stiff in the joints, and may have to content ourselves with painfully nursing the flame. It is for you of the younger generation so to train yourselves in your calling that, when the torch is passed into your hands, you may fan it to more vigorous life, and enable it to shine again with all the splendid brilliancy of the great ages of architecture."

The Earl of Plymouth,

in proposing a vote of thanks to the President for his address, said there was one subject on which he could say a few words—*i.e.*, ancient monuments. The President had reminded them that the Government had introduced a Bill into Parliament with the object of dealing with the preservation of ancient monuments, and a Committee was now sitting which had not yet reported, and so he could not say much on that occasion. But he could remind them that there were one or two difficulties which confronted them in dealing with the question. There were two extreme points of view in dealing with the question; one, the method that had rather been practised in this country hitherto of leaving alone those responsible for the protection of ancient monuments, whether they be trustees of more or less public bodies connected with such buildings, or private owners—leaving them alone in the hope that they would be alive to their responsibilities and would do their best to preserve these buildings in a proper way. Although there were interested bodies dealing with the preservation of ancient buildings, in this country they exercised such a limited control that it might be not unfairly said that we had hitherto gone to the extreme he had mentioned and had left matters alone. On the other hand, we had constantly quoted to us the practice of

Archway, Lincoln's Inn-fields. (Demolished.)

other nations in Europe in the matter, but he thought we ought to be very careful of taking such a practice as a guide to ourselves. He very much doubted whether in all cases the power which had been placed in the hands of Government departments or bodies appointed for the purpose had been so very successful in the treatment of ancient buildings in European countries. At any rate, let us profit by their experience, and let us not hurriedly adopt methods which we might find not only did not suit us in this country, but had not been completely successful elsewhere. He hoped and believed that the Government were approaching the question with care. There were a good many who desired to constitute some organisation which should assist those who had the responsibility and care of ancient monuments to get expert advice from those who had a real knowledge of the proper way to preserve and restore old buildings. One of the greatest difficulties was to set up an Advisory Ancient Monuments Board which should have the complete confidence of the country, and whose advice and decision would carry weight with those who were interested. Although there were representatives of archaeological societies and artistic bodies in this country who might well belong to such an advisory board, after all, it was to architects who had studied the construction and methods of buildings of ancient work to whom they had to look finally for the preservation of old buildings. Taste and knowledge had changed in the architectural profession, and in the whole country during the last half-century, and there was a general feeling that we had a duty to perform, and that we must take what means we could to preserve our ancient buildings, and it was to the Royal Institute of British Architects and its allied societies that one must finally turn for expert advice. We must proceed with care and caution and not be faddists in the matter.

Sir Aston Webb, C.B., R.A., seconded the motion, and said they congratulated themselves in having Mr. Reginald Blomfield as their President. They knew him as an architect of distinction; who had great literary gift, and who had written in a most useful and interesting way on English and French Renaissance. Their President had also taken a high University degree, and there was another side of his character which would appeal to the younger members of the profession, and that was that he was a good all-round sportsman; in short, he was a good all-round man. It was said that the practice of architecture made a man very one-sided, but in the case of their President they had a many-sided man, and if he had to describe him in technical language he would call him a "polygonal" President. He was glad to see Mr. Blomfield as their President, for he regarded him as a symbol of reconciliation and unity between the members of the profession; and the Institute would say "this our son was dead and is alive again, was lost and

is found"; and, having found him, they intended to keep him and make the most of him. The members of the profession were more or less united now, and he believed there was a determination on the part of those who had the welfare of the Institute at heart, whether they believed in Registration or did not, to try and put their heads together and hit upon some means which would satisfy those who did not desire Registration, and also the undoubtedly large number who desired to see some form of Registration introduced. They were all determined if they could to hit upon some scheme and talk it out and submit it to the Institute, and thus to stop a troublesome business which had gone on from year to year and which they were getting heartily tired of, and would like to see finished off, so as to leave the Institute free to take up those matters which would be of more advantage to architecture and the Institute. The President must look upon the education of architects as the principal object with which he was interested, and it was an object which he, the speaker, thought that the Institute could do untold good to architecture as well as to its members by attending to. They knew their President had largely helped to mould the scheme of education that was now gradually coming to a definite and organised form, and which, he believed, as it developed and was improved, would be of great use and advantage. The President had also adumbrated some advanced training which might take more or less the form of a diploma course; and he, the speaker, also hoped that something of the kind might be done, and he hoped that when the President retired after his period of office that that would be one of the things which had been accomplished. He did not think it was an impossible thing to do, and he thought it would be of very great use if the President could carry it out. The President mentioned the Royal Academy. He, the speaker, had no right to speak for that body, but he thought he knew enough of it to say that he believed that if it were approached it would give a very sympathetic hearing to the proposal, and would do what it could. The Royal Academy were far more ready to assist in schemes of the sort than some people seemed to suppose, and he was sure they would do all they could to assist. The work of the Institute divided itself into two divisions, and Lord Plymouth had indicated one when he referred to the case of ancient buildings. Another branch of the same division was the Architects' Benevolent Society, or the care of those who had fallen by the way, and in that connexion he might mention that the Society would be extremely glad to receive more help from members of the profession, as there were many more applications than there were funds adequately to deal with. The other division of the work of the Institute was education, about which there was reason to feel great hope—hope that they might be able by taking young men in hand to ensure that in the future there would be better trained architects than

there were at present. Our art was different from all others, for it meant what Ruskin called "the fraternity of toil," and they must work together and help each other. No great buildings ever were built, or ever would be built, except by men who helped and assisted each other, and so it was they must all try and help young architects to get a better equipment in their career than the generation of present-day practising architects had had.

The vote of thanks was then heartily agreed to, and

The President,

in reply, called attention to the interesting collection of drawings on exhibition that evening—i.e., the Drummond Stewart drawings—which had been the property of the Institute since the year 1838. He should like to read the following letter which their excellent Librarian, Mr. Dicks, had unearthed—a letter written by Sir Charles Barry to Professor Donaldson—

14th May, 1838.
Dear Donaldson,—I have the pleasure to forward to you another collection of original drawings and designs by Bibbeni and others, as a further donation to the Institute on the part of Sir James Drummond Stewart, who assures me that on account of their value in his estimation he should part with them with much regret if he were not persuaded that they will be fully appreciated by their new possessors.

The President announced that the next meeting will be held on the 18th inst., when Mr. J. L. Ball will read a paper on "Bath and Wells."

The meeting then concluded.

OLD HOUSES ON WEST SIDE OF LINCOLN'S INN-FIELDS.

It is interesting to note that history has a curious habit of repeating itself, especially in matters concerning architecture, and that early in the XVIIth century the need for controlling the development of streets and buildings was desired, just as it is required to-day. The gentlemen of the Inns of Court and Chancery and from the four parishes adjoining Lincoln's Inn-fields presented a petition early in the year 1617 to James I. asking "that the feildes commonly called Lincolnes Inn Feildes, being parcell of His Maties inheritance, might for their general Commoditie and health be converted into walkes after the same manner as Morefeildes are now made to the great pleasure and benefit of that City." The King, we are told, graciously approved of the matter, and the Privy Council in the same year issued a circular letter to the Lord Mayor and Aldermen, the Justices of the Peace for Middlesex, and the Benchers of Gray's Inn, Lincoln's Inn, Middle Temple, and "Inward" Temple, urging them to solicit subscriptions to meet the cost of "so worthe and commendable a worke." In 1618 a Commission was granted, and the Commissioners, among whom was the then Surveyor-General, Inigo Jones, were ordered to survey the Fields and obtain information concerning various nuisances then existing. An extract from the Patent Roll, James I., 16, reads:—"to inquire accordinglye of all other nuisances, inconveniences, and annoyances whatsoever whereby the ayre in those parts now is or in tyme may be corrupted or made unwholesome, and the same to demolishe, pull downe, and reforme," according to their discretion, and to take such order that "the said closes and grounds commonly called Lincolnes Inn Feildes according to [their] wisdomes and discretions may be framed and reduced both for sweetness and uniformitie and comelines into such walkes, partitions, or other plottes and in such sorte, manner, and forme both for publike health and pleasure as by the said Inago Jones is or shalbe accordinglye drawne by way of map or ground plott exhibited plained and sett out and approved by us."

The above information, culled from the London County Council's "Survey of London," Vol. III., clearly shows the connexion Inigo Jones had with the early arrangement of the Fields, but it is extremely doubtful if he were responsible for the design of the buildings. In other words, the Commission failed of its purpose, and by the year 1629 one William Newton, of Bedfordshire, acquired the lease of a portion of the ground, and in 1636 purchased from Lady Cornwallis another portion. By February 14, 1636, a licence had been granted

to Newton to build thirty-two houses. He appears to have been very successful in this enterprise, and by 1641 some of the houses on the west side of the Fields had been built, together with others in Great Queen-street (two of the latter are still in existence). The style and character of the buildings shown on the "Prospect of Lincoln's Inn Fields," probably by Hollar, and the picture at Wilton House, *circa* 1683, suggest the architectural influence of one well versed in the style exploited by Inigo Jones, and, although no direct documentary evidence exists to prove the authorship, it is more than probable that John Webb was the architect.

The houses forming the southern portion of Arch-row, and including Nos. 54 and 55, shown in the illustrations reproduced herewith, so called on account of the arches opening to Sardinian-square, formed part of William Newton's speculation, but they underwent considerable change and alteration during the years subsequent to their erection in 1639-41. The main portion of the basement stories and portions of the pilasters and bases can be taken to be part of the original work, but in the case of No. 55 the upper portion of the building suffered partial destruction by the fire which destroyed the Sardinian Chapel in 1759. If proof were required of this important fact, the absence of the bands decorating the pilasters of the other houses would confirm the partial rebuilding. The rate-books from the year 1700 to 1810 give the following list of occupiers for No. 54:—

1700. "Don Lewis Du Cunha."
1705 and 1708. Portuguese Ambassador.
Before 1723 to 1728. Sardinian Ambassador.
1739 to 1807. The Rev. Charles Julian.
1808-9. Dr. Rigby.
1810. The Rev. R. Broderick.

And to this list can be added from other sources of information:—

1641-1654. The fifth Earl of Bath.
1654-1690. Countess of Bath.
1693. Lord Holmes.
1687-8. The Order of Franciscans.

The occupiers of No. 55, from the same authority, were:—

1700. The Hon. Mary, Lady Dowager of Abercromby.
1702-1705. Richard Snow.
1715-1739. W. Guidot.
1740. Julius Beckford.
1742-1749. Jas. Walker.
1745-1767. Sir Thos. Denjaon.
1768-1779. Sir William Blackstone.
1780-1782. — Foulter.
1783-1794. Mrs. Adair.
1795-1807. J. R. Baker.
1808. Robinson John.

To the above list may be added the following:—

From date of erection to some time before July 1, 1667. Lancelot Leake, Henage, Fetherston, Humphrey Weld.
From some time before July 1, 1667, to at least 1675. Henry, Lord Arundell of Wardour.
1683. Lady Rider.

From a study of the picture of Lincoln's Inn-fields in the Wilton House Collection it is clear that the uniformity aimed at was not completely attained. Ralph drew attention to this in his "Critical View of the Public Buildings" (1739 edition), and he points out the discrepancy between the heights of the buildings at the centre of the west side.

Newcastle House, erected in 1636, further violated the uniform height of the buildings, and from this date until the closing years of the XVIIIth century, when many houses on the west side and practically the whole of those on the north side were in the process of rebuilding, uniformity in design was neglected. It is a matter for regret that new buildings have recently been erected, on each of the four sides of the square, without due regard to the harmony of the whole place. Even supposing that the exigencies of modern commerce need to receive first consideration, it should be possible to express such conditions in a quiet and dignified manner. To preserve the refined aspect of the west side of the Fields, it has been suggested that the existing façades to Nos. 57 and 58 and 59 and 60 be taken as a theme for the rebuilding. The extra height could unobtrusively rise behind such façades at a higher level than the existing cornice-line, and with the erection of new brick piers to correspond with the two now fronting the courtyards the grand character of the old work could be blended with the new.

GENERAL NEWS.

Professional Announcement.

Mr. Frank Lishman, A.R.I.B.A., of 12, Gray's Inn-square, London, W.C., has taken up the appointment of Consulting Architect to the Government of the United Provinces of Agra and Oudh, India, and his address will in future be "P.W.D., Allahabad."

Appointments: British Museum.

Mr. Arthur William Kaye Miller has been appointed by the Principal Trustees as Keeper of Printed Books, in succession to the late Dr. G. K. Fortescue, and Mr. William Barclay Squire as Assistant-Keeper, *vice* Mr. Miller, promoted.

The Elections.

In the recent Borough Council elections have been returned Mr. Doll (Holborn, unopposed), Mr. Pilditch (Westminster, unopposed), and Mr. Lorden (Wandsworth). For the City Guilds Mr. Charles Gasquet and Mr. Ernest Hepburn have been elected Masters of the Painters' and the Founders' Companies, respectively.

Ghent Exhibition, 1913.

The International Exhibition at Ghent next year will be notable for the general scheme of decoration. A rich ivory colour picked out with gold has been adopted for the buildings, and contrast will be obtained by the presence of leaded glasswork. Many of the larger windows will be as large as those of a cathedral, and all the windows will be of a size to make them play an essential part in the design of the buildings. The same colouring and design—that of the laurel-tree—runs through all this glass. It is interesting to know that the Palais des Fêtes, a permanent building, has been built partly upon the foundations of the fort constructed by Wellington at the time of the Waterloo campaign.

No. 34, Grove End-road, N.W.

The house in St. John's Wood of the late Sir Lawrence Alma Tadema, O.M., R.A., will, by order of his executrix, be offered for sale at the Mart in the course of next month. The house, designed and beautified by the artist for his own occupation, is freehold, and has two studios—one in the garden and the other, known as the Byzantine Studio, with a gallery, indoors. There are also an atrium, Dutch-room, palm-house, billiard-room, etc.

Two New Books.

Mr. B. T. Batsford will publish in a few days Mr. L. A. Shuffrey's long-promised work on "The English Fireplace and Its Accessories from the Earliest Times to the Nineteenth Century." He will also issue "Old Houses and Village Buildings in East Anglia," by Mr. Basil Oliver, A.R.I.B.A., forming the fifth volume of his "Old Cottage" series. Both volumes will be fully illustrated by collotype reproductions of photographs of the most interesting examples, accompanied by numerous sketches and measured drawings.

Open Spaces.

A project is opened to acquire Ganton House and grounds, the late Sir Robert Hensley's residence, which Lady Hensley is willing to sell for 3,000*l.* as an extension of Wandsworth Park.—For the extension of Wandsworth Common, with the inclusion of the farm, Trinity-road, and the 20 acres which the Commissioners of the Royal Patriotic Asylum are about to sell, the Wandsworth Borough Council have agreed, conditionally, to contribute 3,000*l.*, and Sir Edward Davis Stern is prepared, when the local subscription is closed, to make up the whole amount required, 12,000*l.*—reckoning 6,000*l.* from the London County Council and 1,500*l.* from Battersea Borough Council—with a donation of about 500*l.*—Mr. Edgar Dudley, Local Government Board Inspector, has held an inquiry at New Malden

[Photo. by Whiffin.]

55, Lincoln's Inn-fields. (To be demolished.)

into an application by the Malden and Coombe District Council for leave to borrow 3,600*l.* for purchasing a strip of about 18 acres as part of the scheme for the preservation of Wimbledon Common.—In various Ward meetings, held during the last two weeks, the ratepayers of Brighton have carried resolutions in support of the proposed purchase of about 1,000 acres of the Downs to the east of the borough boundary; the land has been valued at 32,000*l.*, and the general feeling seems to be in favour of securing the land as an open space conditionally upon its not being appropriated for a large scheme of development—in the shape of, for instance, a garden suburb.—Lord Tredegar has given the Jews' Wood to Newport, provided that it be maintained in its present timbered condition, as a public recreation ground.—Lord Howard de Walden has presented an extensive piece of land for purposes of recreation to Chirk Village, Denbighshire, where the Castle is being repaired for his residence. Chirk Castle, originally built in 1011-3 and formerly the seat of the Myddeltons, was considerably altered and improved internally by Pugin.

BOOKS.

Architectural Drawing and Draughtsmen. By REGINALD BLOMFIELD, A.R.A. With 103 illustrations. (London: Cassell & Co., Ltd. Price 10*s.* 6*d.* net.)

WE are not surprised that a subject so attractive as architectural drawing should appeal to the author and illustrator of "A History of the English Renaissance," a book displaying an exceptionally masculine grasp of a great period of architectural development. The XVIIth century, and the XVIIIth, until nigh upon its close, when the Romantic revival burst upon it, was not characterised by evidences of imaginative power. It was an age of philosophies and of scholarly acquirements, and architecture, despite its notable achievements, attained these without that exuberance which accompanied the Renaissance in Italy and found relief in pictorial expression.

Mr. Reginald Blomfield makes it clear that, in his opinion, draughtsmanship and design must or should go hand in hand, and in this respect the present volume may be considered as a supplement to his former work.

Three kinds of architectural drawings are defined. Briefly they may be said to be: (1) geometrical drawings set out to scale; (2) drawings which are intended to suggest, rather than formulate, an idea, or those which present some purely abstract conception of the artist's mind; (3) drawings which have taken architecture as their subject in distinction to figure, scenic, or still life. It is not quite apparent what other division could have been made. Yet it presents its immediate difficulties. Geometrical drawing is heavily handicapped when put into comparison with the others. It is purely literary and documentary. Again, supposing the drawing to be a reproduction by an engraver, or even when the original draughtsman has employed the burin instead of pen or pencil, the result must be judged subject to the limitations and qualifications of engraving. A drawing possessing spirit may become a tame affair under the engraver's ruler, or one that is skilful hands. Whose shall be the praise or dispraise? A great many of the illustrations in the book arouse this question. The whole subject indeed might be treated, or subdivided at least, from the standpoint of methods of production or of reproduction. Engraving alone includes so many processes that it would be a matter of difficulty to distinguish a particular hand when translated by one and the other. An engraving is made upon a wood block or a copperplate. As the first, it may be confined to the display of little more than outline as in its earlier stages of development, or it may show the wealth of resource possessed by the engravers of the commencement of the last century. Copperplate engraving includes line engraving, etching, mezzotint, and aquatint; and lithography is yet another medium. All these methods have been employed in architectural draughtsmanship, and the success of achievement depends on the progressive conditions of these particular arts.

From lack of material, there is little to be said regarding architectural drawings previous to the Renaissance. The author cites Villand de

Honnecourt, and gives also an interesting drawing of German origin, belonging to the end of the XVth century. "It might," as he says, "be an interesting speculation to consider how far some of the qualities of mediæval architecture were due to the absence of organised working drawings: its informality, its habit of improvisation in detail, its irregularities and neglect of symmetry of design." Not until we reach the long line of Italian architects of the XVth and XVIth centuries do we find the examples we seek. Yet these have often to be judged as prints. Antonio San Gallo, Peruzzi, and Bramante were certainly draughtsmen. Bramante's fine engraving in the British Museum is evidence in his case that he was that, and skilled engraver besides. The frontispiece of the "Architettura" is given in support of Palladio. The illustrations in that volume are in the best style of wood block printing of the period—soft in quality yet firm in line, in every way an attractive instance of simple architectural demonstration. In the following century we meet with veritable masters in the art of portraying abstract conceptions. Mauro Tesi, Giuseppe Galli, and finally, Piranesi. We have here reached the "rarer qualities of selection, insight, and imaginative power" which the author demands. Yet neither one nor other of these Italians was an architect. Tesi and Piranesi were engravers, and Galli was a scene-painter.

Upon these, however, too much praise cannot be bestowed, and the work is of their own hands, executed in line and wash or upon the copperplate. In one regard, viz., by the range of his imagination, Piranesi stands alone. Yet he had, as we venture to think, a prototype in, and of, another century, although the author does not refer to him when dealing with the later topographical draughtsmen. We mean Meryon, who, beyond his unassailable prestige as an etcher, was an accurate and refined draughtsman of architectural detail, qualities which he at times illuminated with curiosities of imagination that rivalled those of Piranesi.

The chapter upon "French Draughtsmen of the XVIIIth Century" is not so successful in its claim upon our enthusiasm. Jean Lepautre was unquestionably a most accomplished engraver of architectural subjects, while to Della Bella we must feel gratitude for the relief he has afforded the mechanical productions of Marcot, by the addition of his inimitable figures. France suffered from philosophers and encyclopedists in a greater degree than ourselves at that time. Yet from the great school of French engraving inspired by Callot and ending with Wille, we expected to find further examples, besides Perelle, which would have appealed to the author. The Flemish engravers ran Italy very close in the early days of the art, but reference is made to these only in order that the style of examples selected may be avoided. Isaac de Moucheron was, at least, a topographical artist of note.

When we come to the consideration of our own contribution to the cause of architectural draughtsmanship we do not hesitate to say that Mr. Blomfield's outlook and estimate produce on us a sense of depression that we do not think the true facts of the case can justify. As he points out, towards the close of the XVIIIth century architectural draughtsmanship, *per se*, and topography, each went off on their own lines. Was not this in itself evidence that the desirability of the first-named of these was anxious to recognise its responsibilities, and, as events proved, was on the road towards creating a level of work that certainly had not hitherto been reached? It is admitted that "Blond drew his Gothic very well, and both the Cockercills were accomplished draughtsmen." This is a great stride from Robert Adam, "bad at the figure and inaccurate in perspective," while "of architecture, its aims and possible merits, he was blandly unconscious." Folios of architectural detail were produced, from Stuart's "Athens" to Pugin's "Examples" that were accurate and explicit. Mere documents if you will, but documents of importance. Information too readily acquired from such sources may or may not have been prejudicial to natural architectural development. We gather that in the author's opinion they were. Nevertheless, they were the inevitable creations of the taste of the times. In topographical representation the school of English engraving was destined to reach the highest order. Following upon the meritorious Hollar and the worthy Logan came, by the middle of the last century,

a whole army of expert engravers. Their work—varying in excellence, though some at least was of the highest—may be found in the numerous books that were published. Turner got together an expert group of engravers to translate his drawings. Berwick, Clennell, Brandard, and the two Cookes were doing remarkable illustrations upon wood. The list of folio publications is too numerous to name. "Picturesque Tours Through the Cities of London and Westminster," a series of fine aquatints, may perhaps be cited as an example, while the engraved work of the brothers Le Keux should not be passed by without adequate recognition.

We have recognised the many difficulties that of necessity beset an author in dealing with a subject of this kind. The available examples by draughtsmen who are at the same time architects are small in number, the types at least represented by the drawings of Tesi and Galli. Yet it is the architects to whom we should naturally look, and in their place we have to follow the ups and downs of a reproductive art, or enroll the assistance of the topographical painter. Robert Adam hoped much from the attainment of "vistas." It is rather in the relationship of masses and great architectural conceptions as achieved, a quality allied to pictorial composition. This is the appeal that is made to us by great draughtsmen, and it is one that "Architectural Drawing and Draughtsmen" will do much to further. Though necessarily limited in its scope it is a book which commands attention, and will be received with a generous appreciation.

Portfolio of Measured Drawings issued by the School of Architecture in Connection with the Victoria University of Manchester, the Manchester School of Technology, and the Manchester Municipal School of Art. Part I. (Published by the Municipal School of Art, Manchester. 1912. 3*s.* net.)

THIS portfolio contains but four plates—three consisting of measured drawings and one a perspective sketch—of Hall i'th Wood, near Bolton, all the work of Mr. W. J. Roberts, a former student of the School under Professor S. H. Capper. These plates are prefaced by a short historical account of the house, and we welcome such a monograph, brief though it is, and realise the incentive to students of having their work recorded in some such permanent form. The drawings are very good of their kind, but we should have liked a few more. The constructive detail in such a house as this, erected at different periods, and presenting in the earlier part genuine timber construction with walls of "wattle and daub," and in the later solid masonry with deep-set mullioned windows in the manner of the North Country, has much to tell of the influence of material upon detail, and a plate might well have been devoted to details, which doubtless the student has drawn out. The plan of the house, by reason of the whims of successive building owners, has become curiously irregular, and it would have been an advantage if the several building dates—which seem to be fairly well determined—had been differentiated on the plan by hatching or other means at the discretion of the draughtsman. Such a practice makes clear the history of the fabric at a glance, and we hope it will be adopted wherever feasible in the forthcoming portfolios of the series. We also note the omission of any north point on the plan. It is gratifying to know that such an interesting house, native to the soil on which it stands, is being taken care of and used as a museum, for, owing to the generosity of Sir W. H. Lever, it has been acquired by the Corporation of Bolton. The drawings have been excellently reproduced and printed, together with the text, by the Photography and Printing Crafts Department of the Municipal School of Technology.

English and Welsh Cathedrals. By T. D. ATKINSON. (London: Methuen & Co., Ltd. Price 10*s.* 6*d.*)

MR. ATKINSON has written something better than a popular handbook on this subject. We are far from saying that a demand for a popular handbook is not desirable. It establishes the fact that there is an interest appealing to the average intelligence, which should be met and fostered to the best of a publisher's ability. An appreciation of our monuments of architecture is, and may reasonably be, a welcome addition to the possible interests that belong to the holiday, or opportunities for sight-seeing, that come to the average person. But these

guides are, for the most part, written by the professional *cicerone*, or by one who can pretend to little or no training, whose eye cannot grasp the salient points presented by a building, and is therefore content to point out item by item, such features as every observant beholder may see for himself. Mr. Atkinson brings the trained mind to bear upon his subject, and in doing so he does not make it in any way the less interesting or the less capable of comprehension. Indeed these qualities are strengthened by his judicious and reticent handling. We could wish perhaps that the "three-colour process" illustrations had been less obviously pretty, since they seem to us at variance with the restrained style of the author. One must view them as independent conceptions of a capable water-colour artist.

THE LONDON COUNTY COUNCIL.

THE usual weekly meeting of the London County Council was held on Tuesday, in the County Hall, Spring-gardens, S.W., Lord Chelmsford, Chairman, presiding.

Loans.—The Finance Committee recommended, and it was agreed, to make a loan of 3,800l. to the Islington Guardians for poor law purposes, and a loan of 600l. to the North Surrey School District Managers for poor law purposes.

New Chief Engineer.—On a recommendation of the General Purposes Committee it was unanimously agreed to appoint Mr. George William Humphreys, M.Inst.C.E., as Chief Engineer to the Council, at a salary of 2,000l., in succession to Sir M. Fitzmaurice, who is retiring at the end of the year. Mr. Humphreys has hitherto been the Deputy Chief Engineer to the Council.

Strand Improvement.—The Improvements Committee recommended, and it was agreed, that, subject to the Westminster City Council agreeing to contribute one-sixth of the net cost, powers should be sought in the next session of Parliament to widen the Strand between Adam-street and Durham House-street.

CORRESPONDENCE.

Rebuilding Piccadilly-circus.

SIR,—The accompanying plan indicates a scheme for the rebuilding of Piccadilly-circus. The existing leases of the Crown lands are now about to fall in, which circumstance, if taken advantage of, renders the commencement of the scheme such as is indicated possible.

The small scale plan, which is a tracing from the Ordnance Survey, shows the existing buildings and the position of the circles, which indicate the amount of land now vacant which would be utilised for buildings, and also the sites of existing buildings that would be thrown into the roadways. It will be seen that these are about equal in area, so that what building space is lost in one position is gained in another.

Most street improvements entail a tremendous outlay, and the benefit accruing thereby is very seldom of a monetary nature. By continuing the buildings right round the Circus, not only would the architectural design be emphasised, but a considerable annual income would also be gained. Assuming only four floors over the archways are built, this would give, approximately, an increased floor space as indicated of about 51,000 ft. super., suitable for restaurants,

offices, business, and other premises. This area could be increased by additional floors and by building the archways and the superstructure of larger dimensions in the length of the streets. The scheme lends itself to the control of street traffic, and the main lines of traffic are direct. "Islands" for pedestrians would be formed where shown, and also at both ends of the central piers carrying the arches at the entrance to each of the main streets.

The plan is only intended to indicate the scheme, and possibly by the planning of moving stairways at several convenient intervals, a colonnade of shops at a higher level could be worked in with an increased rental advantage. Provided the access is easy and the colonnade is of sufficient length to ensure a good variety of shops, it is submitted that there is no reason that such a plan should not be as successful in London as in the "Rovs" of Chester. The Shaftesbury Memorial could be refixed in the central position, or the centre feature could be a memorial to King Edward VII., with a statue of the late King on a base of suitable design surrounded by sculpture.

G. F. M. MERRIMAN.

LEGAL COLUMN.

Intimidation.

THE decision in the case, *Young and others v. Peck*, recently given in a Divisional Court, is one of some importance in view of disturbances arising out of labour disputes. Some thirteen persons were prosecuted by the police under the Conspiracy and Protection of Property Act, 1875, sect. 7, for intimidation.

The facts were that when a man in charge of a motor-wagon was leaving certain works the thirteen appellants, who at one time had been employed at the same works and were wearing white ribbons, were present when eggs were thrown at the carman, and there were cries of "Blacklegs!" "Dirty scabs!" Someone also struck the carman. The justices convicted, and on this appeal two points were raised by the defendants:—1. That the information could only be laid by the person intimidated and not by the police; 2. That the evidence showed that only two persons actually threw eggs, and the presence of the other eleven persons was not sufficient to render them liable to conviction for intimidation. The Court overruled both objections, and the convictions were confirmed.

Damages for Death of an Apprentice:

Taff Vale Railway Company v. Jenkins.

A case which has necessitated considerable litigation and given rise to a divergence in judicial opinion has now been set at rest by a unanimous decision in the House of Lords.

A young woman, near the end of her apprenticeship as a dressmaker, was killed by the admitted negligence of the railway company. Her father, suing on behalf of himself and her mother, obtained a verdict for 75l. In the Court of Appeal one Lord Justice was in favour of dismissing the railway company's appeal, another for allowing it, whilst the third considered there should be a new trial. The evidence was that, at the termination of the

articles of apprenticeship the deceased would have become able to earn wages in the same employ, and there was also evidence that she assisted her mother in the shop, and also made small sums in her spare time. The important point in the case, as it would apply to nearly all apprentices, was whether prospective earnings could be taken into consideration or whether damages could alone be given where actual earnings were proved, and the House of Lords unanimously held that the reasonable expectation of pecuniary benefit could be taken into consideration.

OBITUARY.

Dr. G. K. Fortescue.

WE regret to announce the death on October 26, in his sixty-fifth year, of Dr. George Knottfort Fortescue, Keeper of the Printed Books, British Museum, who, as we stated in our issue of October 11, was about to retire, as on October 31, after forty-two years' service. Mr. Fortescue (LL.D., Aberdeen) was a son of the Very Rev. E. B. K. Fortescue, Provost of Perth Cathedral. He was educated at Harlow College; when twenty-three years old he left the Royal Navy for the post of Assistant in the Library, British Museum, where in 1884 he was appointed Superintendent of the Reading-room, and in 1890 Assistant-Keeper, and in 1899 Keeper of the Printed Books. In 1901 he was elected President of the Library Association, and in 1909 President of the Bibliographical Society. Whilst the general course of Dr. Fortescue's official career does not come within our province, we may aptly recall that to him the public are indebted for the means by which he has greatly reduced the labour of research. Thirty-two years ago he originated the current subject-index of European books, including fresh editions of older works, received in the library. His first volume, for January, 1880—August, 1885, though not intended at first for publication, was printed with the Trustees' sanction in 1886. Other volumes have appeared from time to time; the complete series so far containing more than 417,000 references, with titles and press-marks, to modern works in the Museum. Dr. Fortescue was the author of "Napoleon and the Consulate," 1908, and a co-editor of "Romances of Royalty," thirteen volumes, 8vo—a personal history of France in the XVIIIth century as told by six of her most famous memoir-writers.

Mr. C. D. Szlumper, C.E.

THE death, on October 27, is announced of Mr. Charles David Szlumper, C.E., aged forty years. Mr. Szlumper, the eldest son of Sir James Weeke Szlumper, C.E., ex-Mayor of Richmond, was educated under Professor Grimley, of Aberystwith, and at University College, London. When in the service of the Great Western Railway he was employed in the conversion of the broad to the narrow gauge, and was resident engineer for the Rheidal Railway, and, in succession to his father, was engineer to the Manchester and Milford line. He was also employed as a railway engineer in South Wales, and, with Messrs. Szlumper & Szlumper, upon projected schemes to relieve, by means of tube-lines, the congested road traffic of London.

Sketch Plan for Rebuilding Piccadilly-circus.

ILLUSTRATIONS.

University Buildings, Dublin.

ESSRS. DOOLIN & BUTLER'S design for the proposed new buildings to University College, Dublin, was placed first by the Assessor, Mr. Henry T. Hare, F.R.I.B.A., in the recent competition, the result of which we announced last week. Reference is made elsewhere (p. 533) to the competition as a whole.

Carnegie Library, Lincoln.

This building, of which we give an illustration, reproduced from the drawing which appeared in the Royal Academy this year, will be built of Ancaster stone with local brick backing and Westmorland green slates. The dome and cupola will be covered with lead. The accommodation will consist of an entrance hall with news-room and reference library to right and left of the same, and lending library straight ahead, with librarian's room and staffroom on either side of the same; a ladies' reading-room, committee or students' room, book store, lavatories, etc., on ground floor, and a printroom on first floor over the entrance hall.

The architect is Mr. Reginald Blomfield, A.R.A., P.R.I.B.A.

Birmingham Council House Extension.

These illustrations are in connexion with the article beginning on p. 543, describing the construction of the building.

MEETINGS.

FRIDAY, NOVEMBER 8.

Royal Sanitary Institute.—Mr. Henry C. Adams on "Sewage Disposal." 7 p.m.
Glasgow Technical Club and Architectural Craftsmen's Society.—Debate: "Single v. Separate Contracting." Opened by Mr. A. Davidson, architect, and Mr. A. Smith, contractor. 7.45 p.m.

SATURDAY, NOVEMBER 9.

Aberdeen Architectural Association.—Mr. D. T. Byres, A.M. Inst.C.E., on "House Drainage." Illustrated. 7.30 p.m.

MONDAY, NOVEMBER 11.

Architectural Association.—Mr. J. A. Marshall on "Marbles used in Greek, Roman, and Byzantine Buildings." 8 p.m.

Bristol Society of Architects.—Paper by Mr. Graham C. Awbery, entitled "Some Practical Remarks to Pupils, Assistants, and Young Architects." 8 p.m.
Surveyors' Institution.—The President, the Hon. Edward Gerald Strutt, will deliver an opening address. 8 p.m.

Royal Sanitary Institute (Lectures for Sanitary Officers).—Mr. Henry C. Adams on "Water Supply, Sources of Supply and Distribution." 7 p.m.
University of London (Victoria and Albert Museum).—Mr. Banister Fletcher on "Gothic Architecture in Central Italy and Sicily." 5 p.m.
The Incorporated Clerks of Works' Association (Carpenters' Hall, London-only).—Monthly meeting. 7 p.m.

TUESDAY, NOVEMBER 12.

University of London (British Museum).—Mr. Kaines Smith on "The Age of the Dorians: Greece in the Making." 4.30 p.m.

Nottingham Architectural Society.—Fiftieth anniversary of the Society. Conversazione at the Exchange Hall.

Royal Sanitary Institute (Lectures for Sanitary Officers).—Mr. Henry C. Adams on "Scavenging, Disposal of House Refuse." 7 p.m.

The Royal Sanitary Institute.—Discussion on "The Report of the Departmental Committee on Intercepting Traps and House Drains." To be opened by Mr. H. Percy Boulnois, M.Inst.C.E. 8 p.m.

The Institution of Civil Engineers (To be held at the Institution of Mechanical Engineers, Storey's-gate, S.W.).—(1) Mr. E. Hall Blyth, jun., on "The Construction of the New Dock at Melhill"; (2) Mr. W. Cleaver, M.Inst.C.E., on "Alterations and Improvements of the Port Talbot Docks and Railway During the Last Decade." 8 p.m.

WEDNESDAY, NOVEMBER 13.

Edinburgh Architectural Association.—Associates' paper: "Town Planner." by Mr. A. Lorne Campbell, F.R.I.B.A., lantern slides. 8 p.m.

Northern Architectural Association.—The opening meeting of the session. Mr. Wm. Milburn, F.R.I.B.A., the President, will deliver the opening address. 7.30 p.m.

Manchester Society of Architects.—A paper will be read by Mr. J. H. Worthington, M.A., A.R.I.B.A. 6.30 p.m.

THURSDAY, NOVEMBER 14.

University of London (British Museum).—Mr. Banister Fletcher on "The Architecture of the Greeks." 4.30 p.m.

Builders' Benevolent Institution.—Sixty-fifth annual dinner, Whitehall Rooms. Hotel Métropole, W.C. Mr. F. G. Minter presiding. 6.30 p.m.

University of London (Victoria and Albert Museum).—Mr. Kaines Smith, M.A., on "Decoration of Buildings: Woodwork." 3.30 p.m.

The Concrete Institute.—Presidential address, by Mr. E. P. Wells, J.E. 7.30 p.m.

SHEFFIELD SOCIETY OF ARCHITECTS AND SURVEYORS.—Paper by Mr. F. H. Wrench, A.M. Inst.C.E., entitled "Some Notes on Surveying." A.M. Inst.C.E., entitled "Institution of Electrical Engineers." Address by the President, Mr. W. Duddell, F.R.S. Presentation of premiums. 8 p.m.

FRIDAY, NOVEMBER 15.

University Extension.—Visit to the Soane Museum, Lincoln's Inn-fields (Greek and Roman Antiquities). 3 p.m.

SATURDAY, NOVEMBER 16.

Edinburgh Architectural Association.—Forenoon visit of Associate Section to Messrs. Redpath, Brown, & Co., Ltd.'s works, Easter-road, (2) Afternoon visit of whole Association to (1) New Masonic Hall, (2) New Hall of United Free Church of Scotland, 121, George-street.

COMPETITION NEWS.

A list of current Competitions is printed on page 539.

Church at Winton, near Manchester.

A competition has taken place recently for a new church (to hold 600) at Winton, in the parish of Worsley, near Manchester. The Assessor was Mr. W. D. Caröe, F.R.I.B.A., and the conditions were drawn up by him. The award is as follows:—First premium (15*l.*), Mr. R. T. Beckett, A.R.I.B.A., of Chester; second premium (10*l.*), Mr. F. R. Freeman, of Bolton; third premium (5*l.*), Mr. F. P. Oakley, A.R.I.B.A., of Manchester.

Folkestone Band Pavilion.

At the last meeting of the Folkestone Town Council it was decided to erect a band pavilion on the less and cliff, and to invite competitive designs for the structure, the maximum cost not to exceed 20,000*l.* Premiums of 100 guineas, 50 guineas, and 25 guineas, are to be offered for the designs placed first, second, and third by the assessor; but if any one of these three designs be adopted, the premium is to be merged into the architect's fees. Instructions were also given the Town Clerk to draw up the conditions of the competition. The appointment of a suitable Assessor has been left to the Mayor, the Deputy Mayor, and the Mayor-Elect.

Society of Architects' Studentship.

The Travelling Studentship of the Society of Architects (25*l.* and Silver Medal) will be awarded in 1913 for the best design for a group of almshouses. The conditions and a plan of the site are published in the November issue of the *Journal of the Society*.

BRITISH SCHOOL AT ROME.

THE following is the scheme of competition for the Scholarship in Decorative Painting at the British School at Rome, offered by the Commissioners for the Exhibition of 1881:—

The scholarship will be of the value of 200*l.* per annum, and will be ordinarily tenable for three years. Candidates must be British subjects, and less than thirty years of age on July 1, 1913.

The competition, which will be conducted by the Faculty of Painting of the British School at Rome, will be in two stages:—A. An open examination. B. A final competition, open to not more than four candidates selected from those competing in the open examination.

A. The Open Examination.—Competitors in this examination must submit the following works:—1. Not less than four drawings of the nude figure from the life. 2. One painting of a head and one painting of a figure from the life in oil or tempera. 3. Two figure compositions in colour suitable for wall decoration (not larger than 30 in. by 22 in.). 4. Sketches of designs for decorative purposes, which should include some architectural studies.

B. The Final Competition.—This competition will be held in London from June 30 to August 23, 1913, and will be open to not more than four candidates selected from those competing in the open examination. The subject will consist of a design for a wall decoration, to fill a given space for a given purpose, and to a given scale. Eight weeks will be allowed for the execution of the design, and during that time candidates will be provided with studio accommodation and given an allowance of 2*l.* per week for models. The successful candidate in this competition will be recommended for appointment to the Commissioners' Scholarship.

The office of the British School at Rome is at 54, Victoria-street, London, S.W.

ARCHITECTURAL SOCIETIES.

Manchester Society of Architects.

At a meeting of the students of the Manchester Society of Architects, on November 6, Mr. Francis Jones, junr., in the chair, an interesting paper was read by Mr. Thomas Stott on "Tradition in Architecture." Mr. Stott traced the development of architecture on traditional lines, and strongly emphasised the necessity of a school free from all taint of passing fashions. During his remarks the lecturer pointed out that, apart from ecclesiastical architecture, the line of development was absolutely unbroken from the Greek, through the Roman and Italian Renaissance to the work of Jones and his immediate successors, and that it is desirable to continue this tradition in modern work. The conclusions of Mr. Stott, after a much animated discussion, were unanimously approved and carried by the meeting.

Royal Institute of the Architects of Ireland.

An ordinary meeting of the Council of this Institute was held at 31, South Frederick-street, Dublin, on Monday. The President, Mr. A. F. Murray, R.H.A., F.R.I.B.A., occupied the chair. There were also present Messrs. R. Caulfield Orpen, J. H. Webb, F. Batchelor, C. H. Ashworth, L. O'Callaghan, G. P. Sheridan, A. G. C. Millar, F. Hicks, F. Hayes, H. Allberry, W. Kaye-Parry, Professor Scott, and C. A. Owen, Hon. Secretary.

A great deal of correspondence was read and the House List of Officers and Council for the coming session was considered.

FIFTY YEARS AGO.

From the *Builder* of November 8, 1862.

Comfort for Pedestrians in Wet Weather.

Is It Utopian?

It has been asked, "Why not lay on hot air to warm our dwellings as well as gas to light them?" On my road to the City this week I could not but envy the dryness of the pavement in front of the bakers' shops, owing to the heat generated by their ovens. Pondering upon this, the thought struck me, if iron pipes could be laid down beneath the pavement, and supplied with heated air from furnaces erected at convenient distances, what a great comfort it would be during the winter months to pedestrians of all classes to have a dry pavement to walk on; what a saving in the wear and tear of boots, shoes, clothes, etc. How many doctors' bills would be saved, as well as the many valuable lives that are lost solely through disease brought on by damp feet. Last, though perhaps not least in this money-making age, what an enormous increase of custom our tradesmen would derive from the circumstance of the ladies—the "spending power" in the community—being enabled to go out "shopping" every day in the week, instead of, as now, only once or twice a week. Surely for all the advantages I have pointed out—comfort, health, and increase of trade—our householders would not object to being rated to pay the expense incurred. There is nothing impossible in sanitary reform, provided man will but use his inventive faculties properly and for the benefit of his fellows; and I am in hopes some of your readers may be able to reduce my "theory" into some practical utility, if you will kindly grant space in your columns for it. Is it Utopian, or have I found the germ of a sanitary truth, requiring only practical heads to bring it out?

* * * We have been tempted to reprint this very human letter, since it gives such able expression to the sentiments of those who walk abroad take them over pavements greasy with a compound of fog and moisture peculiar to this season of the year. The appeal elicited no response, and we have by this time ceased to hope. Our correspondent of fifty years since is virtually pleading the cause of the street colonnade.—ED.

An engraving of the interior of St. Peter's Basilica, viewed from the entrance towards the altar. The large dome is the central feature, with its ribs clearly visible. The floor is covered with a pattern of light and dark tiles. On the right side, there is a long, low structure, possibly a tomb or a base for a statue. The background shows the distant altar area with a large cross. The entire scene is framed by a simple rectangular border.

UNIVERSITY COLLEGE, DUBLIN. PROPOSED NEW BUILDINGS.—ACCEPTED DESIGN BY MESSRS DOOLIN & BUTLER.

MONTHLY REVIEW · *of* · CONSTRUCTION.

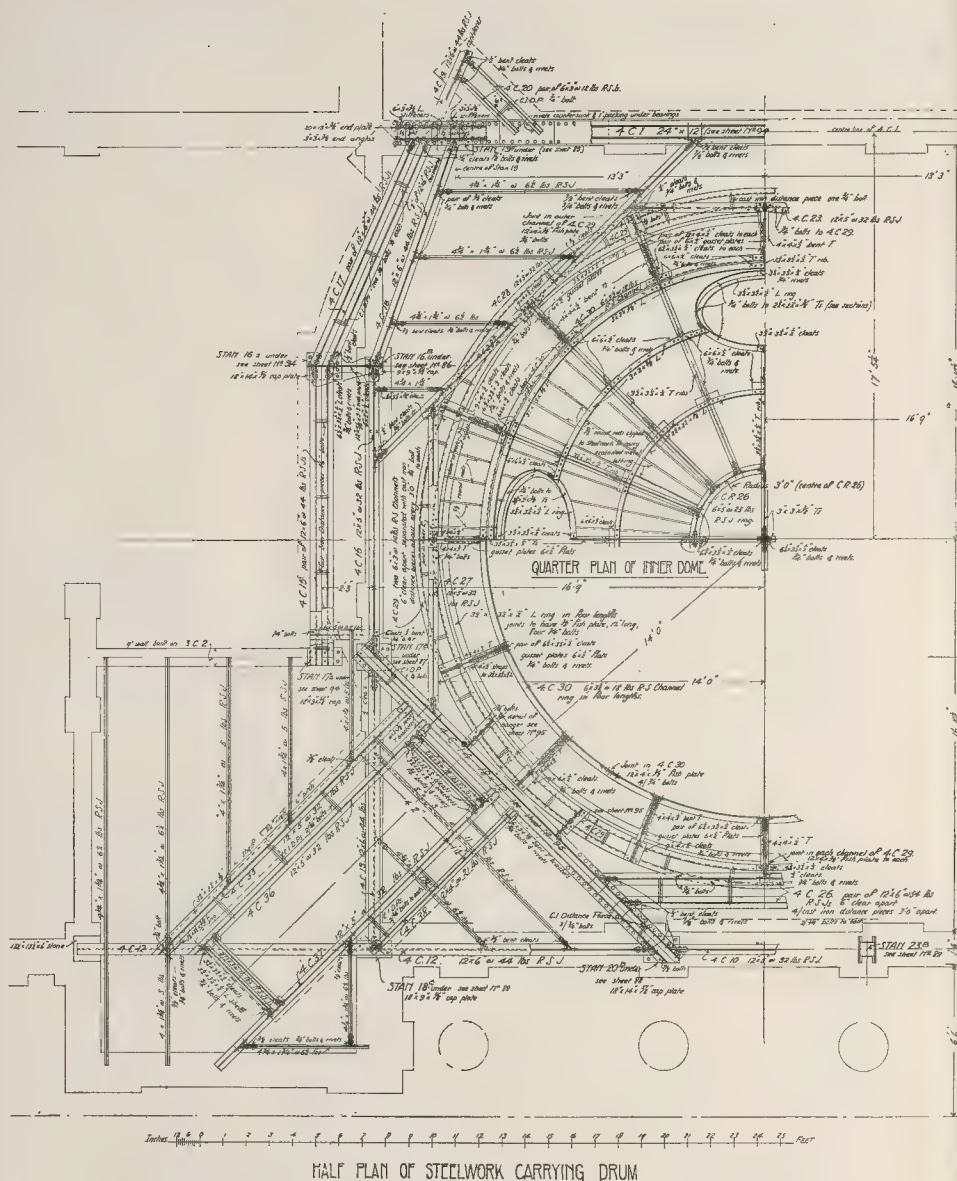

Fig. 1. Section of Steelwork in Dome over Central Museum.

BIRMINGHAM COUNCIL HOUSE EXTENSIONS.

Accommodation had to be provided in the building for four municipal departments and a series of art galleries and museums, the cost of the latter having been covered by a bequest of the late Mr. John Feeney. In the disposition of the plan the art galleries and the large rates office in the Gas Department were the governing factors. The former were required at the level of the art galleries in the old building, with a connecting bridge across Edmund-street of sufficient width and

HALF PLAN OF STEELWORK CARRYING DRUM

Birmingham Council House Extension.

Fig. 2. Details of Steelwork in Dome over Central Museum.

internal size to form a gallery in itself, while the large rates office had of necessity to be easily accessible from the street. These two conditions had been met by placing the rates office toward the centre of the block and grouping the galleries around and partially over it, lighting the office from internal courtyards some 40 ft. wide, and by a large top light in addition. This, in execution, has worked out most satisfactorily. Another factor of considerable influence on the plan was the fall in the site from west to east. This necessitated very careful consideration of floor levels, a solution having been found by taking the old art gallery floor as the datum for the new galleries, and also for the first floor level throughout the building, and taking the centre of Margaret-street front as the

datum of the lower ground floor, and dividing the height between these two levels into two floors, thus obtaining a lower ground and an upper ground floor. The level of the upper ground floor on the Congreve-street side finishes about 6 ft. above pavement level on account of the fall in the site, and consequently the entrance porches on that front come at the half-landing level.

Minor influences on the plan have been the disposition of future extensions and the planning of departments as complete in themselves; that is to say, each department has its own entrance from the street, and its only access to other departments is by means of pass doors in the corridors, which are kept locked, and are only used by head officials holding master-keys.

The municipal departments accommodation in the building are, in addition to the art galleries and Gas Department already mentioned, the Education Department, which occupies the whole of the Margaret-street frontage on all four floors; the Tramways Department, which occupies three floors on the northern half of the Congreve-street frontage; and the Health Department, which occupies three floors on the southern half of the same frontage. The remainder of the building is occupied by the art galleries and museums on the first and second floors, and by the Gas Department on the upper and lower ground floors.

In addition, there is a second extension now about to be commenced, which provides for the completion of the series of art galleries

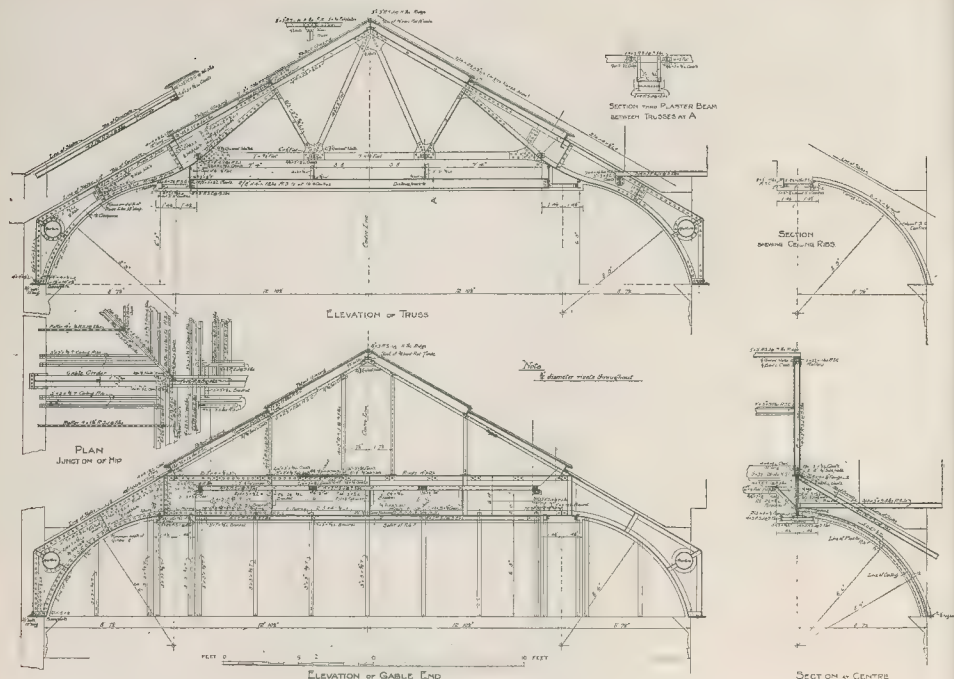

shown on the plans, with a connecting
at the northern end in the form of
for casts, with balconies around, and
principal staircase and entrance from Great
Charles-street; otherwise the only entrance to
the galleries at present is by the staircase on
the other side of Edmund-street, through the
galleries, and over the new bridge. Cast
also connect at the north-west end with
the series of natural history museums
which will extend the whole length of the
Congreve-street frontage on the second floor.
The southern end of these museums is
connected by a marble staircase with the new
gallery hall.
The second extension also provides additional
accommodation (rendered necessary by the
water Birmingham scheme) for the Trans-
ports, Health, and Gas Departments on the
lower and upper ground floors, as well as
a patent library at the northern end with
access to the various courtyards within the
building is obtained through one large gate-
in Margaret-street, under close supervision
of the gate-keeper's office adjoining.
In the general construction of the building
special reinforced concrete methods have
been adopted, but the steel joists and stan-
cions throughout are encased in concrete.
The walling has been built with Black
country bricks in cement, with Birmingham
bricks internally where plastering occurs,
the whole of the internal courtyards
have been faced with white glazed bricks,
covered with salt-glazed dado and dressings
in green bands. The external frontages to
the streets have been finished with a heavily-
carved base of Aberdeen granite to the

level of the upper ground floor, and above
this level in Darley Dale stone. This stone
was used in the present Council House, and
in selecting the same material the architects
worked under definite instructions.
It may be mentioned that no great diffi-
culties were encountered with the founda-
tions, which are taken down to below the
level of the foundations of the old houses
that originally occupied the site. Numerous
disused wells were discovered, which neces-
sitated in many cases steel grillages and
concrete, but otherwise the concrete founda-
tions rest upon a good gravelly loam.
The first extension now completed in-
cludes some interesting steelwork, the most
important items being in the dome over the
central museum on the Congreve-street
frontage, the roofing for the loan and art
galleries, and the new bridge over Edmund-
street.
We give in Fig. 1 a sectional elevation of
the steelwork in the dome, which includes
an outer dome of 31 ft. 3 in. diameter, and
an inner dome of 24 ft. 3 in. diameter. This
drawing shows the steel ribs of the domes
and the manner in which the latter are sup-
ported by stanchions and girders. It also
indicates in outline the masonry drum and
sheathing of the outer dome.
The steelwork carrying the masonry drum
is further illustrated by the half plan in
Fig. 2, where also will be found a quarter
plan of the inner dome.
The outer dome is carried by steel framing,
of which a half plan is given in Fig. 3, this
drawing also including a half plan of the
dome from the top. As these illustrations are
fully lettered and figured it is unnecessary

to enter into detailed particulars of the
construction, which is very clearly shown by
the drawings themselves.
The roofing of the art galleries is illustrated
by the photograph reproduced as one of our
Plates, typical sections of the steelwork being
given in Figs. 4 and 5.
The loan art gallery roof has a clear span
of 43 ft., and is carried by trusses, of which
details are reproduced in Fig. 4, the lower
drawing in the same illustration being an
elevation of the steelwork in the gable end.
The central portion of the roof is provided
with patent glazing, giving ample light to the
interior of the gallery, and the side portions
are covered with concrete, over which slates
are laid.
The modern art gallery measures 33 ft.
from wall to wall, and the roof is carried by
two types of trusses, A and B respectively,
as represented by the elevation in Fig. 5.
The bridge connecting the new and old
buildings, and passing over Edmund-street,
as represented by one of the photographs
reproduced in our Plate, is a steel-framed
structure sheathed in masonry.
The bridge has a span of 64 ft. 9 in., and
is 22 ft. 6 in. wide over all. It is essentially
a bridge of the tubular type, formed by two
longitudinal main girders, connected at the
bottom by transverse girders and other
members of the floor framing, and connected
at the top by steel roof trusses and framing.
Camps are attached to the two main
girders for supporting the masonry sheathing,
and the masonry arch ribs on the undersides
are carried by steel ribs.
The interior of the structure is 18 ft. 9 in.
wide by 17 ft. 6 in. high, and forms one of

Birmingham Council House Extension.

Fig. 4. Steelwork in Loan Art Gallery Roof.

the series of art galleries, the walls being unbroken by windows, and the roof suitably glazed.

Fig. 6 includes a half plan of the floor framing, a half plan of the roof framing showing the wind bracing, and a half plan of the framing for support of the ceiling.

Section line A-A in the plan serves as an index to the sectional elevation of the main girder in Fig. 7. The two members of this type are 16 ft. 6 in. deep, and beneath them are the inner ribs, one, denoted by section line B-B in Fig. 6, carrying the masonry arches added for architectural effect. The

steel ribs were fixed simultaneously with the arch stone, as may be seen by reference to the general view of the steel framing in Fig. 8.

Fig. 9 is a cross-section of the bridge on line D-D (Fig. 6) representing one of the connecting roof trusses of type A, and showing in outline the masonry sheathing and interior architectural treatment. The ribs and stonework of the arches beneath are also indicated in detail. The two remaining roof trusses are of type B, these being on either side of the centreline, and generally similar to those of type A, but of lighter construction.

The heating of the building is effected by means of ventilating radiators and low pressure hot water (accelerated by motor-driven pumps) supplied from two large boilers. The boiler-house is situated below the ground level in the centre of the site, occupying the greater portion of the courtyard at the northern end of the large rates office, and accommodation has been provided for a third boiler required for the second extension. Ventilation is effected by means of exhaust ducts above the barrel ceilings of the corridors, with connections to the various rooms and upstairs exhaust fans in the rooms that discharge above the roof level. The art galleries have separate fans in the gable-ends above the inner lights, and the large rates office also has a separate system of vertical and horizontal exhaust ducts connecting with a central fan, which drives the foul air up the shaft surrounding the smoke stack from the boilers. The art galleries are heated by radiators placed in the centre between the seats, fresh air being brought to them by means of horizontal ducts in the floors.

As to the interior finishings and fittings apart from the art galleries and approaches to the departmental entrance-hall and staircase, the large rates office, and various committee rooms, the building is made up of a series of large and small offices requiring nothing more than plain and simple finishings. Naturally the art galleries have received very careful attention, particularly as regards lighting, both natural and artificial. In the present case the method adopted comprises an outer roof light of as large an area as possible, and an inner glazed light, both of

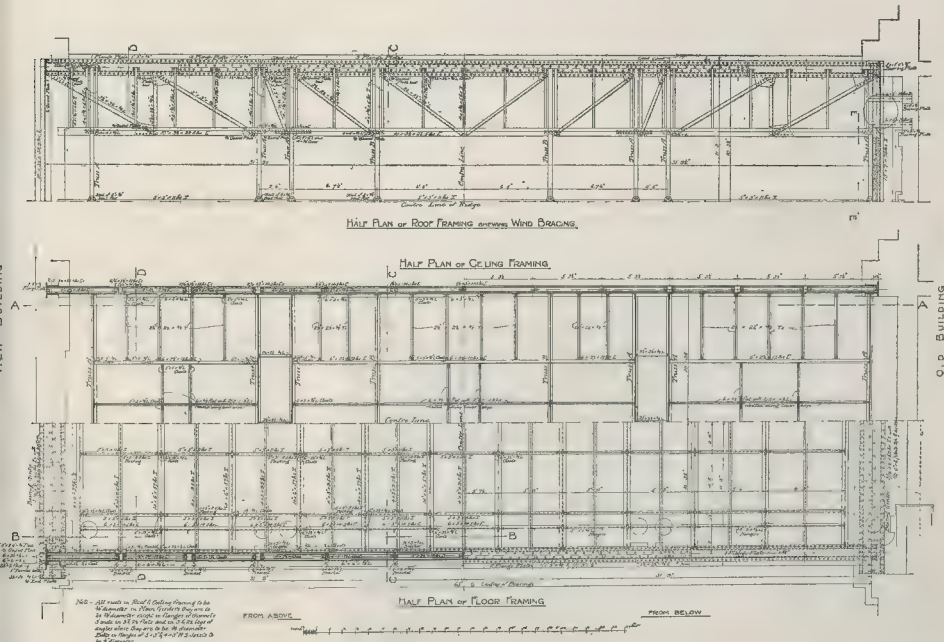

Birmingham Council House Extension.

Fig. 5. Steelwork in Modern Art Gallery Roof.

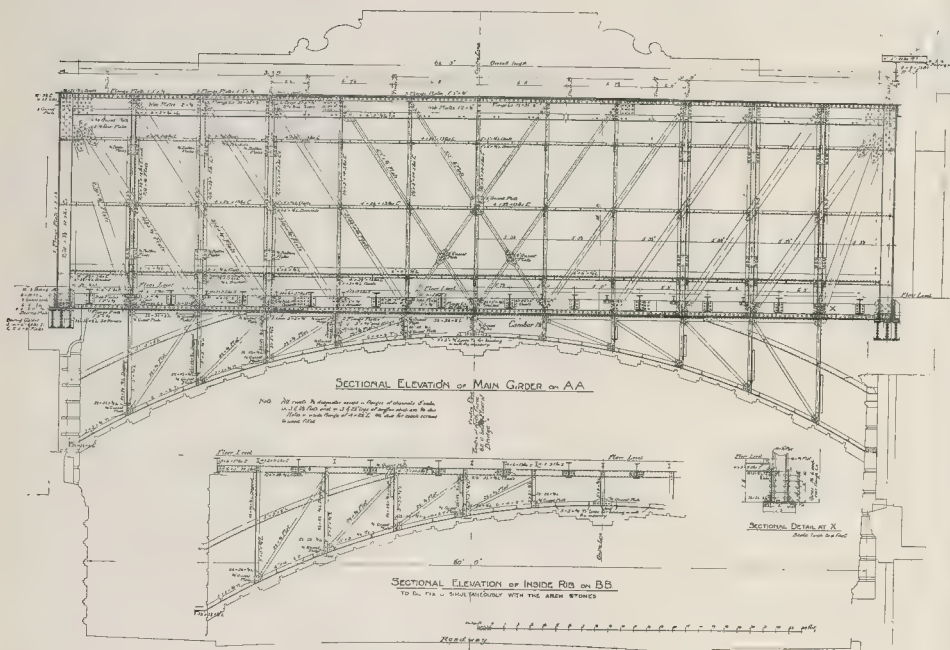

er and scientific relation to one another the picture plane. The ceiling is and all round, finishing at the walls with ice, frieze, and architrave, and horizontal blinds are fitted above the inner grids. or the artificial electric lighting of the series a system of metallic filament lamps need in ground-glass bowls with mirror ctors over, contained and carried by a ze rim and chains, has been adopted, the resulting illumination is most ing and satisfactory. This system was ved at after many different experiments n expensive nature. the gallery floors are of oak, with ways around in brown linoleum, 4 ft. e and about 5 ft. away from the walls. s method of deadening the sound of the tant traffic has been found most success- at the Glasgow Galleries, and is of special in the present instance on account of the as below being used as offices; it also s visitors a guide as to the position for uly examining pictures of ordinary size at about eye level. he galleries have been finished in as rained a manner as possible, with little itectural treatment beyond the cove and ice, etc., already mentioned, a low agony dado all round, and Ashburton le architraves to the doorways, thus ining the interest to the pictures and ing them to provide a general decorative ct. he new bridge and the art gallery-hall e been treated with rather more freedom. e floors are finished in marble, Hopton ed stone, and mosaic, and Swedish green e columns support the ceiling of the , while an alabaster staircase leads to natural history museums on the top floor. e columns and entablature and the ceiling e bridge are all finished white, provid- an excellent foil to the Burne-Jones etries between the columns. he natural history museums are carried ery simply in white and grey, with a ved top-lighted ceiling over the main . The central museum beneath the e on the Congreve-street frontage has e treated as a domed room, with support- Ionic columns, all in creamy-white. It e noted that this series of museums

has been constructed so as to be easily converted into additional departmental offices should they be ultimately required. Apart from the art galleries, the department providing most scope for effect has been the Gas Department, with its entrance-hall, large rates office, and committee-rooms. The entrance-hall has been finished in Hopton Wood stone and marble, with plaster panels and columns and enriched plaster cornices and ceiling panels. Leading direct out of the entrance-hall to the right is the private corridor with its suites of private rooms; to the left is the large fitting showroom; and straight ahead is the main rates office. The last named has been panelled and fitted in oak throughout, with wall surfaces above in plaster, and a decorative plaster treatment for the ceiling panels and the large barrel top-light in the centre of the office, the floor of the public space being laid with marble and mosaic. The principal rooms leading out of the private corridor are the committee-room, chairman's room, and secretary's room, all of which have been finished with oak panelling, marble fireplaces, and decorative plaster ceilings. The floor areas below these offices are occupied by stores and additional offices in connexion with the departments, access to the stores-yard being obtained from the cart-way entrance in Margaret-street already mentioned. The whole of the lighting of the Gas Department is by low-pressure gas, with the exception of the large pendants in the rates office and the entrance-hall, for which high-pressure gas has been adopted. All the fittings are executed in bronze from designs by the architects in conjunction with the Gas Department, and some measure of success has been obtained in embodying the latest methods of lighting control by pneumatic tube, etc., without the unsightliness usually associated with such fittings. The external lighting of the building on the street frontages is also by means of high-pressure gas burners; otherwise the building internally is electrically lighted. The rooms of the remaining departments do not call for special notice beyond the statement that the committee-rooms in

connexion with them have been finished with oak dados and plaster panels and decorative plaster ceilings. The principal staircases have Echailon treads and risers, marble dados with large panels over, and wrought-iron balustrades. It is worth noting that the floors of the main corridors throughout the building have been finished with linoleum panels with Echailon marble surrounds, in order to deaden the noise and reverberation usually so noticeable in a building of this character. The majority of the ordinary offices are also finished with linoleum laid on a cement screed direct on the concrete. The whole of the fittings and furniture, including the chairs, have been executed in Austrian oak, with the exception of the plainer fittings in the stores and similar rooms, where deal has been employed, and in special cases in the Gas Department stores, where wrought-iron racks and hangers have been rendered necessary by reason of the heavy materials to be accommodated. These fittings have all been executed from designs by the architects to the special requirements of the departments concerned, and in this way an effect of fitness and uniformity has been secured throughout the building. The general contractors were Mr. Thomas Rowbotham, Birmingham, for the first portion of the contract, and the Building Construction Company, Ltd., London, for the remainder. The steelwork engineers were Messrs. Whitaker, Hall, & Owen, and the consulting engineer was Mr. W. M. Binney. The plaster-work was executed by Mr. G. P. Bankart, Mr. L. A. Turner, and Messrs. A. & S. Wheeler, and the stone-carving by Mr. W. B. Fagan and the Broms-grove Guild. Wall and floor tiling was supplied by Messrs. Carter & Co., Ltd.; sanitary fittings by Messrs. Doulton & Co. and Messrs. Shanks & Co.; exterior iron balconies, standard and bracket lamps, interior iron balustrading, bronze window-grilles and door furniture, and bronze electric-light fittings by the Birmingham Guild, Ltd.; and permanent furniture by Messrs. Cubitt & Co. and Messrs. John Barnsley & Son. The stone for the Council House was supplied by the Stancliffe Estates Company, Ltd.,

Birmingham Council House Extension.
Fig. 6. Steelwork in Bridge over Edmund-street.

Birmingham Council House Extension.

Fig. 7. Steelwork in Bridge over Edmund-street.

of Darley Dale, who are the proprietors of the original Darley Dale quarries. The total quantity of Stancliffe Darley Dale stone used in the construction of the old Council House and art gallery was about 80,000 cubic ft., and for the extensions the quantity supplied was approximately 90,000 cubic ft., delivered over a period of eighteen months. We may add that St. George's Hall, Liverpool, was built out of this stone.

Messrs. Chance Brothers & Co., Ltd., specially manufactured the glass for the skylights, which is extra white, double-rolled cast glass, and about 30,000 super. ft. of this was glazed by Messrs. Mellows & Co., Ltd., on their "Eclipse" patent system, which ensures the roof being absolutely

water-tight. The particular feature of this glass is the clearness and brightness of the light obtained, owing to the special ingredients used to make the glass as far as possible colourless. This renders it suitable for such positions as the one under notice.

The contract for the foundations, which also included the structural work up to the first-floor level, and including steel and concrete suspended floor and beams, was, as already mentioned, entrusted to Mr. Thos. Rowbotham, of Coventry-road. The foundations, which were carried out to the plans and instructions of the architects, are of Portland cement concrete, and brickwork of Staffordshire brindled bricks in cement mortar, steel

grillages being provided where considered necessary, and steel stanchions fixed of concrete and stone bases placed in position for carrying the floors above. The foundation scheme included the formation of necessary subways for the conveyance of H.W. and other pipes, etc. The foundation portion of the work was completed by June 1909, and handed over to the contractors for the superstructure, the Building Construction Company, Ltd., of London.

The whole of the electric light fittings for the art gallery corridor and portion of the fittings for the bridge leading out of the old gallery into the new were supplied by Messrs. Peyton & Peyton, Ltd., Birmingham and London. To obtain the best results for the lighting of the art gallery a variety of experiments were tried from suggestion made by Sir Whitworth Wallis, the Committee, and others. The architects tried to aim at a diffused light which would light up the various pictures without altering the various tints, and by experiments Messrs. Peyton & Peyton found that the best result obtained was from a series of electric lights contained in a frosted globe with a metal cover. The lights were arranged at a scientific angle, and to increase the volume of light a silver-plated mirror was employed, which reflected the light at different angles into the bowl of the fitting, and which then gave practically a concentrated diffused light which did not affect the colours in the pictures. The net result of the whole of the experiment is that a brilliant light is achieved without glare.

Messrs. H. T. Jenkins & Son, marble merchants, Torquay, carried out the marble work, Hopton Wood and Echaillon stone work to the interior.

Messrs. Arthur Lee & Bros. Ltd., carried out work at three entrances—two in Congreve-street and one in Edmund-street. These portions consisted entirely of Hopton Wood stone, with the exception of the columns, which were of Greek Cippolino with bronze caps and bases. The whole of this work was British throughout, and was carried out by the firm at their works at Hayes, Middlesex.

The lifts were supplied by Messrs. B. Waygood & Co., Ltd., of Falmouth-road.

CONSTRUCTION NOTES.

The Fire at the Equitable Building, New York.

THE destruction of the Equitable Building, New York, by fire, on January 9, 1912, involved the loss of six lives. The building was valued at about 700,000, while the contents were of great value. Technically, the fire brought out a number of important features, and the Executive of the British Fire Prevention Committee considered it advisable that a reliable record of the disaster should be presented, and they have issued a Red Book on the subject.

As to the fire from the English point of view, the enormous cubic extent of the risk at stake, comprising a single block of some 45,000 ft. super., with a height equivalent to that of a ten-story building, is the prominent feature on the structural and legislative side. The absence of proper subdivision, both vertically and horizontally, and the promiscuous distribution of unprotected lift shafts are conspicuous points, whilst the dearth of exit facilities is another feature among the many defects that cannot be excused either by the age or structural evolution of the building. Had the fire occurred during office hours instead of in the early morning, the loss of life would probably have been terrible.

An interesting chapter in the report is devoted to vaults and safes, a subject all too frequently ignored, having regard to the unsuitability of most vaults, and the inadequacy of the ordinary office safe to meet fire conditions of a serious character. This chapter is the more interesting as the temperatures which were reached at this fire were not excessive, no fused cast-iron, for instance, being observable. The average maximum temperature of the fire was probably about 1,800 deg. Fahr.—i.e., under 1,000 deg. C., with only exceptional spurts or moments at, say, 2,000 deg. Fahr. (under 1,100 deg. C.).

The New Woolwich Tunnel.

THE new foot tunnel which has been built to connect North and South Woolwich has just been opened. The tunnel, which was designed by and the work executed under the supervision of Sir Maurice Fitzmaurice, consists of a cast-iron tube of 12 ft. 8 in. outside diameter, connecting two vertical shafts of 25 ft. inside diameter and about 60 ft. deep. The length between the shafts is 1,635 ft. The thickness of the river bed between the top of the tunnel and the river is about 10 ft. at the deepest place. The shafts consist of steel caissons formed of two skins of steel plating, the annular space between them being filled with concrete. Both shafts were sunk by excavating inside them under compressed air. They are lined with brickwork, and in each there is a spiral steel staircase giving access to the tunnel from the street above. In the well of each staircase there is an electric lift capable of carrying forty passengers. The tunnel was constructed by the shield method under compressed air. After it was completed from shaft to shaft it was lined throughout with concrete, upon which white glazed tiles are fixed. The footway is paved with York stone flags. The tender of the contractors, Messrs. Walter Scott & Middleton, amounted to 78,860. 7s. 1d., but the original scheme did not include the provision of lifts, which were after wards added at an extra cost of 5,000. Some excellent tiling in the subway has been executed by the Newellite Glass Tile Company, Old Kent-road, S.E.

Disintegration of Concrete in Drains.

AN investigation conducted in Germany by Dr. E. Neumann leads to the conclusion that the disintegration of concrete in drains is always due to the action of some acid. The decomposition of pyrites in the soil and the oxidation of sulphuretted hydrogen in the drains have both been found as a source of sulphuric acid which decomposes the aluminium and calcium compounds in cement and forms sulphates. The formation by the acid of insoluble salt breaks up the concrete by increasing its volume, and the formation of soluble salts causes more rapid destruction by permitting part of the concrete to be dissolved away. Dr. Neumann suggests as a remedy that the cement for concrete to be employed in drains should be made of dense clinker containing little lime. He also recommends that asphalt be used to protect all exposed parts, and that the interior of the drains should be efficiently ventilated.

Warming Buildings by Exhaust Steam.

THE new premises of the Calico Printers' Association, in Manchester, are warmed through-out by means of exhaust steam supplied from the Dickinson-street electricity generating-station of the Manchester Corporation, the steam being employed in calorifiers for heating water, which is circulated in the ordinary manner throughout the buildings. We understand that the Refuge Insurance Company, of Manchester, have also decided to utilise exhaust steam for a similar purpose from the Dickinson-street station.

How to Ebonyise Oak.

A RECIPE given by a French contemporary for imparting to oak the appearance of ebony is as follows:—After having been cut up the wood is immersed for forty-eight hours in a hot saturated solution of alum, and then sprayed repeatedly with a decoction of logwood. Small pieces can be immersed in the decoction instead of being sprinkled. The decoction is thus prepared:—Boil 1 part of the best quality of logwood in 10 parts of water, filter through cloth, evaporate gently until the volume of the liquid is reduced to one-half the original amount, and add for each litre from ten to fifteen drops of a saturated solution of indigo, perfectly neutral. After having treated the pieces of wood with the logwood decoction rub them with a hot saturated solution of verdigris (hydrated dibasic cupric carbonate) in concentrated acetic acid, and repeat the process until the required depth of tint is obtained. It is stated that oak thus treated presents an appearance very similar to that of true ebony.

Architecture and Utility.

At a recent meeting of the Builders' and Clerks of Works' Association, held in the Temperance Institute, Newcastle, Mr. J. Wightman Douglas, F.S.I., delivered a lecture on "Construction." In the course of his remarks Mr. Douglas referred to construction in Newcastle and to the conflict between architecture and utility in the street architecture of to-day. The present serious question in architectural construction was "Will it pay?" The constructors of a past generation either had a different class of clients or they deserved credit for their courage. How many designers to-day dared suggest that a company should expend, say, 20,000, to provide a cab-stand like that of the Central Station, or, say, 7,000, to provide a portico like the Royal Theatre? A hideous glass and iron structure would probably be demanded. This was an age when good appearances had to be maintained as cheaply as possible, and sometimes the care required to achieve this was beyond the understanding of the average citizen, who failed to realise the subtle difference between "cheap and nasty" and "cheap and nice," which was so clear to the trained eye. This demand for cheapness by some thing to be said for it. Methods of trade and manufacture, ideas of comfort, etc., changed as rapidly as a cinematograph, so that buildings quickly got out of date as regarded utility. Ten years ago schools were arranged with a central hall; to-day it was admitted to be noisy or useless, and a hall was provided detached from the classrooms. Country houses had their old brew houses with expansive cellars standing practically empty, and extensive stables little used. There was therefore considerable justification for erecting many of these buildings in a less substantial manner, so that they could more easily be abolished and replaced when their utility depreciated.

Injury to Cement Work by Oil.

ENGINEERS are in this country familiar with the mischief caused to concrete engine beds by spilling thereon certain kinds of oil. In 1892 the Association of Portland Cement Makers in Germany investigated the subject, and came to the conclusion that while porous cement work was always attacked by petroleum, vulcan oil, or rape-seed oil it was possible with a very non-porous surface, formed of one cement to one of sand, and very carefully hardened before use, to employ concrete which would perfectly resist any oil. These conclusions now require further revision, for it has been found that if an animal or a vegetable oil be spilled upon the concrete the oil goes rancid; glycerine separates out, forming lime soaps, so that the cement work crumbles. A fluoride

of calcium paint is of service in this case, a plate of glass may be used to receive the oil, and periodically cleansed. An asphalt coating is of no use, as the oil dissolves it.

With mineral lubricating oils—members of the paraffin series of carbon compounds—there is rarely if ever this disintegrating effect. Tar, which is by contrast made up of the aromatic series of carbon compounds, seems never to give any trouble through attacking cement concrete or render. These are the results of the recent investigation of the German Cement Association into the effect of different classes of oils upon cement.

Steel-Lead Coated.

A NEW form of roof covering in the form of steel coated with pure lead has recently appeared on the market, and is claimed for this material that it is superior to galvanised sheets or sheet steel zinc coated that it is not liable to crack or flake, and unlike zinc, takes a coating of paint. It is coated with zinc is susceptible to electrical influences, and chemical action is liable to take place with a resulting decomposition, but with this new material this chemical action is much less likely to take place, the necessary relationship between iron and zinc being much closer than in the case of Terneplate. Terneplate is said to be inferior to this material. Terneplate has a coating which is composed of 30 per cent. tin and 70 per cent. lead, but the tin has the effect of inducing rusting to take place. This new material as has already been stated, can be painted and can also be easily soldered. Soft water causes a discoloration of the surface, but does not injure it, but this can be prevented by painting the exposed surface.

A Large Pressure Filter Installation.

OWING to complaints of lead poisoning in the part of the area supplied by the Ashford Waterworks, Dunkfield Joint Waterworks Board a special system of filtration and purification has been adopted by that body. The necessary work has been completed at a cost of 30,000, and on September 16 the new filtration stations at Greenfield, Saddleworth, and Salford were officially opened. The installations comprise thirty-six pressure filters, designed to purify the total of 5,352,000 gallons of water daily, the filters and chemical plant having been supplied and erected by Messrs. Mather & Platt, Ltd., of Manchester.

Hydraulic Lime.

HEER B. KRIEGER, in the *Toninder Zeitung* of 18 draws attention to H. Hardenbrook's statements that hydraulic lime should not be used for the manufacture of sand-lime bricks, and that pressed raw bricks should not be allowed to set out before being introduced into the autoclave. He also mentions the report of the Dutch Commission for the investigation of Dutch bricks and sand-lime bricks, with special reference to the work of MM. Ledue and De Roche that appeared in the *Toninder Zeitung* of 1909. It was found that bricks made of hydraulic lime were more readily destroyed by frost than ordinary sand-lime bricks, and that the surface of the former began to harden in raw state before the bricks were brought in the autoclave, the resulting products in consequence being deficient in uniformity. The lime used in a large number of sand-lime brickworks was analysed, and a correction factor derived from such analyses was designated the hydraulic coefficient.

This factor is obtained by adding together the percentages present of the following oxides and dividing that total by the percentage calcium oxide (lime) present. The oxides referred to are aluminium oxide (Al_2O_3), ferric oxide Fe_2O_3 , and silicon dioxide SiO_2 , in the form of soluble silica.

An attempt was made to correlate decrease in strength and increasing damage by frost with various bricks with increase of the hydraulic coefficient. No such general relationship was found to hold good, though in the products one brickworks where two classes of lime were used not one of the bricks made with lime having the unusually high hydraulic coefficient of 0.143 withstood the freezing test, whereas the bricks made with lime of a lower hydraulic coefficient remained undamaged.

THE BUILDING TRADE.

THE TRADE UNION BILL.

WHEN all the agitation and excitement created by the Osborne judgment is recalled it is somewhat curious to find the Trade Union (No. 2) Bill so overshadowed by other legislation that it was considered sufficient to refer it to a Standing Committee of the House of Commons, who have recently commenced their deliberations on its provisions. Yet during the current year no questions have been of such importance to this country as those concerning the Trade Union Bill. Early in the year the country was in the throes of labour convulsions, and a record number of working days have been lost through labour disputes. The Bill was before the Standing Committee is one of enormous importance. Whatever may be said to the contrary, until a comparatively recent date the functions of trade unions were solely that in this Bill are described as "statutory objects," namely, "the regulation of the relations between workmen and masters, or between masters and masters, or the imposing of restrictive conditions on the conduct of any trade or business, and also the provision of benefits to members." The very fact that these objects are described in this Bill as "statutory objects" is as far as possible to prove that these are the objects recognised by the Legislature, and that it is the exercise of these functions that certain privileges and immunities have been granted to the trade unions, as, for instance, by the Trade Disputes Act. As such trade societies have been allowed to exercise considerable control over their members, the Courts have been deprived of jurisdiction over the exercise of their discretion in domestic matters, and even over certain actions committed against a public in contemplation or furtherance of trade disputes. In considering the provisions of the proposed legislation too much stress must not be laid upon this privileged position of the trade unions as trade societies, because powers have been given to them which in effect compel workmen to join them in order to pursue their avocation and to dispose of their capital—their labour—it becomes at once apparent that an extension of these objects imperils the freedom of the working classes in other spheres and fetter their political or civil liberty. A man who joins a trade union regards its objects as furthering his interests in his trade, but to obtain advantages in his business he does not wish to fetter his freedom in other matters, and he should not be compelled to forego his liberty in joining a trade society than he should in joining an approved society under the Insurance Act in order to obtain the full benefits provided by that Act. The litigation on the powers of trade unions to make a levy for Parliamentary purposes may be said to have commenced with the case of *South Wales Miners' Federation v. The Union of Employers*, January 26, 1907, which is decided by a Divisional Court in the miners' favour. This decision, and that of the Minority Division in the Osborne case, was reversed in the Court of Appeal (see the *Builder*, November 5, 1908) in the latter case, and the House of Lords affirmed that decision. The Government, in the present Bill, propose to override the principle of that decision, but this is not to satisfy the Labour Party, because, though the Bill empowers the unions to engage in political objects, it to some extent safeguards the right of the minority to decline to subscribe to political objects with which they are not in sympathy. The above observations may assist our readers in considering the questions now before the Committee, but the proceedings in Committee are very briefly reported. The Bill is very curiously drafted. In clause 3 (2) certain political objects are defined, and unions can only expend their funds on these objects subject to certain conditions laid down in the first part of the clause. If there be political objects outside those defined by this clause, this Bill does not prohibit them so long as the principal objects of the union are statutory objects." To obtain registration, principal objects of the union have to be statutory objects. It will be seen that if the

unions engage in political objects outside those specified in the Bill—the specified objects, shortly stated, being the payment of the election expenses of any candidate for any public office (an expression which includes even an election to a Board of Guardians), his maintenance in office, expenditure on meetings, and the distribution of literature in connexion with such elections, or generally, unless they be for statutory objects—then in connexion with those objects not thus defined the powers of unions are by this Bill left at large, and it is possible that questions similar to those raised in the Osborne case may again come before the Courts for decision. In Committee an amendment was moved limiting the powers of trade unions to "statutory objects," and the political objects as defined by the Bill, a course which would have obviated the uncertainty indicated above, but this amendment was negatived by 22 votes to 18.

Mr. Ramsay Macdonald moved an amendment which would have taken away the protection, such as it is, which the Bill affords to members who do not desire to subscribe to the political objects, arguing that the minority should not be regarded. The Attorney-General pointed out that if the unions were confined to labour questions there might be something to be said for this contention, but that where highly controversial matters were involved it was not right to compel a man to support political propaganda to which he was diametrically opposed. It would appear that this injustice has only to be stated to become apparent, but all the same the amendment was only negatived by a majority of two.

Many important points have yet to be considered, as, for instance, the safeguards offered to the minority, and, above all, the question whether the provisions of the Trade Disputes Act, 1906, which protect the unions from being answerable in the Courts of law in respect of tortious actions committed by them, will extend to acts done by them in their enlarged political sphere, and when these come before the Committee we shall treat of them in a further paper.

PAINTING AND DECORATING STUDENTS' VISIT.

ON Saturday, October 26, the students of the painters' and decorators' classes, held at the Battersea Polytechnic, Willesden Polytechnic, and Redhill Technical Institute, accompanied by their instructors, Mr. Charles H. Eaton and Mr. John West Derrett, visited the various works of Messrs. Robert Ingham Clark & Co., Ltd., at West Ham Abbey. The party assembled at Westminster and were met by Mr. Henry Corner, one of the firm's representatives. At the works they were received and welcomed by the works manager, Mr. T. W. Bamford, who invited them to view a variety of samples and specimens of oils and gums used in the manufacture of high-class varnishes. He also gave some interesting details of the sources from which such materials are obtained.

They then proceeded through most of the twenty-six buildings on the site, where, by the way, one stood the Abbey of West Ham, and some of the modern machinery of the model workshops were set in motion. Among the interesting processes seen were oil boiling, where a special exhaust apparatus carried away the fumes, gum crushing and running, and the grinding of zinc oxide. Special mention should be made of the Pearlina and Abbey white enamel factory, where the latest machinery is employed in the manufacture of these specialities.

The last building inspected was the large Exhibition Hall, which has only recently been completed, its object being to serve as a permanent invitation to all interested in the art of painting and decorating. At the conclusion a vote of thanks was passed to the firm.

LIVERPOOL BUILDING TRADE.

Liverpool building trade workers have started a movement. It is stated to secure a higher rate of wages, and notices have been given to the Master Builders' Association on behalf of the men. The joiners and masons ask for 2d. an hour increase, and the bricklayers and slaters 1d. an hour.

GENERAL BUILDING NEWS.

ABERDEEN RAILWAY STATION.

Constructed about forty-five years ago, the passenger station at Aberdeen has long been inadequate for modern traffic requirements. Powers for its reconstruction were obtained in 1899, and the works have recently been commenced. The new station will include thirteen platforms in all, the four through lines being on the west side and the buildings on the east side approached by a covered roadway. The main roof, of the ridge and furrow type, will be 600 ft. long by 150 ft. wide, with transverse girders spaced 35 ft. apart longitudinally, and supported by piers and columns. Outlying platforms will be sheltered by roofing of the umbrella type. Various works connected with the general reconstruction of the station have already been executed. These include the widening of the approach viaduct from Ferryhill Junction, the remodelling of the goods depots of the Caledonian Railway and the Great North of Scotland Railway, and additional sidings.

ROBERT GORDON'S TECHNICAL COLLEGE.

The original college, the work of Mr. Ogg Allan, dates from 1871, and the building was extended in 1890 and 1903 by Mr. William Kelly, A.R.S.A. Messrs. Kelly & Nicol have now made an addition to the Domestic Science School. The new buildings include a demonstration-room with floor space of 900 sq. ft. There are two cookery kitchens of equal size, the total floor space being 2,400 sq. ft. The science-room has a floor space of 575 sq. ft. There is accommodation in the new buildings for 184 students working simultaneously. The contractors for the new building, all of Aberdeen, were:—Mason work—Mr. George Hall; carpenter work—Messrs. D. MacAndrew & Co.; plaster work—Messrs. James Stephen & Son; plumber work—Messrs. John Blaikie & Son; slater work—Messrs. Alexander Harper & Sons; asphalt work—Messrs. J. Scott & Son; painter and glazier work—Messrs. G. Donald & Son; smith work—Mr. George Bisset; electrical work—Messrs. Pratt & Keith. The clerk of works was Mr. John Malcolm.

SCHOOL OF PHOTO-ENGRAVING, BOLT-COURT, FLEET STREET, E.C.

Lord Chelmsford, the Chairman of the London County Council, opened on the 30th ult. the new building of the School of Photo-engraving and Lithography, in Bolt-court, Fleet-street. The new building stands on the site of that in which, since 1894, the school work has been carried on, and accommodation is provided for a museum, a lecture hall, a photographic studio, etching-rooms, rooms for work in lithographic drawing, collotype, and photogravure, drawing from the life, and colour composition. Messrs. Peabody & Fotheringham, Ltd., of Theobald's Road, W.C., and Park-street, Islington, N., were the builders and general contractors. The architect was Mr. W. E. Riley, Superintending Architect of the London County Council.

BUILDING TRADE DEPRESSION IN EDINBURGH.

The annual meeting of the Guildry of Edinburgh was held in Edinburgh City Chambers on the 28th ult. Lord Dean of Guild Carter, in presenting the statement of the business which had occupied the attention of the Court during the year, expressed regret that the tale he had to tell was a most depressing one, depicting as it did the utter stagnation of the building trade in Edinburgh. This was doubly disappointing considering the view which he expressed to them last year, viz., that the depression in the building trade had turned the corner, and that brighter times were in store for them. The value of the work passed through the Dean of Guild Court in 1910 amounted to 349,895*l.*, so that when in the following year the sum had risen to 474,578*l.*, they were justified in concluding that the tide had turned, and that brighter prospects were at hand. But this year they found their hopes dashed to the ground, for the value of the work turned out to be only about 323,365*l.* The main drop in business in the past year had occurred in connexion with public buildings, for, whereas in 1911 they had 184 public buildings on their roll of cases, this year they had only sixty-nine such public buildings on the list, and none of them of very great magnitude, the largest contract being for the Fountainbridge School, at a cost of 17,000*l.* The whole of this kind of work amounted to 116,000*l.*, as compared with 275,000*l.* in the

preceding year. While there were built thirty-one self-contained houses more than in the previous year, there were eight fewer blocks of tenement houses, so that the actual number of individual houses was on the decrease, and the community, instead of expanding, was tending to contract. This was also reflected in the net productive rentals of the city on which their rates were assessed, for while in 1910-11 these amounted to 2,828,718s., in 1911-12 they only came to 2,826,762s., and were estimated for the current year at 2,825,037s., showing the assessable value of the city to be on the decline. One factor, however, in the problem was a little more reassuring, and that was that the rental value of unlet property had decreased during the last year by 10,000s., thus showing that the unlet property was gradually being absorbed, and when that absorption became more complete new buildings would again come into demand. The money which would be spent on the widening of the roads at Lothian-road and Fountainbridge by the removal of the canal basin, in so far as it would render this particular spot more attractive and less of a blot on the fair face of Edinburgh within a few minutes' walk of their beautiful Princes-street, would be profitably expended, to say nothing of the direct returns which would come from this area in future as a rateable subject. He had also hopes that the liberation of this area in the very heart of the city would encourage extensive building operations and so come to the aid of an industry which, at the present moment, was practically dead.

RECONSTRUCTION OF PERTH ACADEMY.

There has been circulated among the members of the Perth School Board a report by Messrs. Miller & Jarvis, architects, as to the practicability of reconstructing and adapting the Perth Academy and Sharp's Institution to form a junior or preparatory school, together with the respective costs thereof.

TOWN HALL, PORTOBELLO.

Some time ago, the Corporation acquired the property of Inverey House, which is situated on the south side of the High-street and about 40 yds. distant westwards from Bath-street and Brighton-place. The new hall, the foundation-stone of which was laid on the 25th ult., occupies the north-eastern section of the property acquired, and is set back about 45 ft. from the present front boundary wall. The Corporation decided, however, at a recent meeting to widen the High-street at this point to 60 ft., which will result in an encroachment of 10 ft. on the property of Inverey House, thus making the front of the hall building about 35 ft. distant from the street frontage line. This ground will be laid out as an ornamental approach to the new building. The hall is designed to accommodate 1,000 persons, allocated equally to the area level and the balcony respectively. The entrance is by an outer vestibule giving access to a crush hall 45 ft. long by 15 ft. wide. At either end of this hall staircases lead to the galleries, while cloak and retiring rooms are provided with lavatory accommodation. On the right and left corridors lead to side doorways giving access to the hall. The galleries and balconies occupy three sides of the hall, a back gallery being formed over the entrance vestibule. The galleries connect at the farther end of the hall with two emergency staircases. At the first-floor level—accessible by the principal staircases—a small hall or committee-room is placed, capable of accommodating about 120 persons. The platform is capable of seating about seventy persons, and has an ornamental proscenium opening of 36 ft. The main hall is 80 ft. long by 58 ft. wide and 39 ft. high. It will have a roof, semi-circular in section, which will be pierced at the spring by five semicircular lunettes on either side. The roof will be of steel construction. The entrance front consists of a portico of four three-quarter columns, flanked by two pylons, more plainly treated. The entrance doorway forms a central feature in the scheme of fenestration, and a balcony is placed over the central doorway, access to which is obtained from the small hall over the entrance vestibules. In the rear of this portico the gable of the large hall rises, and this is flanked by solid tower-like features which contain the staircases. The centre of the hall gable is pierced by a semicircular window 16 ft. in diameter. The building will cost over 8,000s. The whole work is being carried out from designs prepared by the City Architect, Mr. James A. Williamson, A.R.I.B.A.

TRADE NEWS.

The "Boyle" system of ventilation (natural), embracing Boyle's latest patent "air-pump," ventilators and air-inlets, has been applied to the Palace Theatre, Westcliff-on-Sea.

The pedestal for the memorial to his late Majesty King Edward VII., to be erected

shortly in Birmingham, is in course of preparation in the works of the Stancliffe Estates Company, Ltd., Darley Dale, and they have also recently supplied the pedestals for the following memorials, viz.:—King Edward VII. at Brighton, Lord Tredegar at Cardiff, Capt. Cook at Whitby, Marquis of Ripon at Ripon. Another work at present in course of erection for which the firm are supplying their stone is the Land Registry in Lincoln's Inn-fields, London, for his Majesty's Government.

The Tredington Isolation Hospital, Gloucestershire, is being supplied with Shorland's double-fronted patent Manchester stoves with descending smoke flues, patent Manchester grates, patent exhaust roof and inlet ventilators, by Messrs. E. H. Shorland & Brother, Ltd., of Faislowth, Manchester.

APPLICATIONS UNDER LONDON BUILDING ACTS, 1894 TO 1909.

At Tuesday's meeting of the London County Council the following applications under the London Building Acts were dealt with. (The names of the applicants are given in parentheses):—

Lines of Frontage and Projections.

Cliff (5,578l.); Messrs. Hardy & Co., builders,
Woking.

Heywood.—Extensions to works, Rochdale-
road East, for the Roe Acre Dyeing and Felt-
ing Company.

Hirnant.—School; Mr. L. Phillips, County
Education Offices, Newtown.

Houghton-le-Spring.—Fire-station for the
Northumberland and Durham Collieries Fire
and Rescue Brigade, Scotswood-road, New-
castle-on-Tyne.

Huddersfield.—Post-office, Northumberland-
street; Messrs. T. Obank & Sons, builders,
Leeds-road, Thackley, Idle, Bradford.

Lancashire.—School, church, and school,
Ormskirk (about 3,000l.); Mr. H. Littler,
architect, 16, Ribblesdale-place, Preston.

Leek.—Shops, Picton-street; Mr. R. T.
Longden, architect, St. Edward-street, Leek.

Messrs. J. Heath & Sons, builders, Shoobridge-
street, Leek. Silk mill for Messrs. Wardle &
Davenport; Mr. R. T. Longden, architect, St.
Edward-street, Leek. Mr. T. Grace, builder,
Broad-street, Leek. Extensions to Albion Silk
Mills for Messrs. A. Ward & Sons; Mr. R. P.
Longden, architect, St. Edward-street, Leek;
Mr. S. Salt, builder, Overton's Bank, Leek.

Limavady.—Court house (2,000l.); Mr. M. A.
Robinson, Surveyor, City Hall, Londonderry.

Liverpool.—Factory (40,000l.) for Messrs. J.
Bibby & Sons, oil boilers and refiners, Bibby's
buildings, King Edward-street, Liverpool.

Llanelli.—Six tinplate mills for the St.
David's Tinplate Company, Loughor.

Llantrisant.—School; Mr. D. P. Jones,
architect, Castle-street, Cardiff.

Luton.—Factory for Messrs. Currant &
Creak, straw hat manufacturers, 39-41, Bute-
street, Luton.

Marlborough.—Housing scheme; Mr. E. L.
Gwillim, Clerk, Town Hall, Marlborough;

Marlborough.—Housing scheme; Mr. E. L.
Gwillim, Clerk, Town Hall, Marlborough;

Mechley.—Offices, Savile Pit, for Messrs.
Briggs, Son, & Co., Ltd.

Napsbury.—Additions and alterations at
Asylum for Middlesex County Council (5,570l.);
Mr. Rowland Plumble, architect, 13, Fitzroy-
square, W. Houses at Asylum (1,275l.); Mr.
H. T. Wakelam, Surveyor, Middlesex County
Council, Queen Anne's-chambers, S.W.

Nenagh.—Premises for the Munster and
Leinster Bank; Mr. J. F. Fuller, architect,
179, Great Brunswick-street, Dublin.

Newlands.—Church; Mr. P. McGregor
Chalmers, architect, 95, Bath-street, Glasgow.

Newton Abbot.—Alterations at works; Mr.
J. G. Clark, engineer, Newton Gas Company,
Newton Abbot.

Newtown.—Hospital; Mr. G. A. Hutchins,
Surveyor, County Hall, Welshpool.

Perry Bar.—School (1,517l.); Messrs. G.
Webb & Sons, builders, 156-164, Soho-hill,
Handsworth, Birmingham.

Pinvin.—Sixteen houses (150l. each); Messrs.
Dicks & Waldron, architects, 1, Market-place,
Evesham.

Portland.—School, Portland Underhill
(3,950l.); Messrs. Jesty & Baker, builders,
Castle Town, Portland.

Porsmouth.—School, Stubbington-avenue
(18,890l.); Mr. James Tanner, builder, 15,
Castle-road, Southsea.

Possilpark.—Additions at works, Balmore
Park, for the Glasgow Steel Roofing Company,
Ltd.

Princes Risborough.—School (1,800l.); Mr.
C. G. Watkins, County Education Offices,
Aylesbury.

Raynes Park.—School (250 places); Mr.
Ramsey Nares, County Education Offices,
Reading.

Redish.—Schools for the Trustees of St.
Joseph's Roman Catholic Church.

Reed.—School (850l.); Messrs. Grimson &
Sons, builders, Roston.

Rhosda.—School (300 places); Mr. J. C.
Davies, County Education Offices, Colwyn.

Roose.—Extensions to workhouse infirmary;
Mr. F. Smith, Clerk, Guardians' Offices,
Barrow-in-Furness.

Rotherham.—Alterations and extensions to
St. Ann's-road Schools (2,556l.); Mr. J. Platt,
architect, High-street, Rotherham.

S. Silk, builder, Westbury, Horsell, Woking.

Woodhampton.—Alterations to Rose and
Crown for Blatch's Theale Brewery, Theale,
Reading.

FOREIGN AND COLONIAL.

Portland Cement, Australia.

The Commercial Intelligence Branch of the
Board of Trade is notified by the Agent-
General for New South Wales that he is pre-
pared to receive tenders up to November 4
for the supply and delivery at Sydney during
1913 of 130,000 casks of Portland cement.
Tenders for small quantities will be considered
provided they are for not less than 30,000
casks. The cement is to be subject to New
South Wales standard specification tests before
shipment. Forms of tender, specifications,
conditions of contract, etc., may be obtained

South Wales, 123 and 125, Cannon-street,
London, E.C.

Proposed Public Works in San Francisco.

H. M. Consul-General at San Francisco (Mr.
A. C. Ross, C.B.) reports that it is estimated
that over 32,000,000. will be expended on
public works in that city during the next two
years. Of this amount 59,000,000 dollars (about
12,228,000l.) are to be spent in the erection of
buildings, etc., for the Panama-Pacific Inter-
national Exhibition. Among other items of
proposed expenditure are the following:—

	Dollars.
Harbour Improvements	9,000,000
Civic Centre and City Hall	8,000,000
Opera House	1,000,000
Twin Peaks Tunnel	3,500,000
Fillmore-street Tunnel	2,000,000
Stockton-street Tunnel	1,000,000
Geary-street Railroad and Extension	571,431
City and County Hospital	320,725
Carnegie Library	750,000
Refuse Incinerators	100,418
Fire Equipment and Stations	191,869
United States Sub-Treasury	500,000
Dollar 4s. 11d.	

International Architectural Exhibition in Leipzig.

Der Deutsche Zeichnerkreis (Berlin) of
October 14 publishes a notice whereby the
Law of March 18, 1904, for the temporary
protection of patents, designs, and trade marks
will be put in force in connexion with the
International Architectural Exhibition and
Special Exhibitions to be held in Leipzig from
May to October in 1913 (see *Board of Trade
Journal* of May 16 last, p. 341).

TRIBUNAL OF APPEAL UNDER THE LONDON BUILDING ACT.

Lewis v. London County Council.

The Tribunal of Appeal constituted under the London Building Act, sat at the Surveyors' Institution on Wednesday to hear an appeal on behalf of Mr. George Lewis, under sect. 22, subsect. 1 (b) of the London Building Acts (Amendment) Act, 1905, against the requirements of the London County Council in their notice served on July 22 in respect of the building known as 21, Australian-avenue, Barbican, City. Mr. J. W. Hickman was for the appellant, and Mr. Cecil Walsh for the London County Council.

Mr. Hickman, in opening the case, said it was an appeal against the requirement of the County Council for the provision of additional protection in case of fire, and the main contest would depend, not upon the details of what had been required by the County Council, but whether any requirements of the County Council could be reasonably required under the circumstances of the case. The building was one of six floors, and was of a long, narrow shape, and there was one staircase at the eastern end. The requirements of the Council were:—(1) That stairs be provided towards the eastern end of the building from the third to the fourth floor levels, and continued from the latter floor to the roof; (2) that the existing partition and door separating the first floor from the staircase be removed and replaced by a fire-resisting partition with a self-closing fire-resisting door; (3) that a fire-resisting partition with a self-closing fire-resisting door be provided to separate the upward and downward flight of stairs at the first-floor level; (4) that a fire-resisting partition be provided at the ground-floor level upon the eastern side of the upward flight of stairs, to separate this flight and the landing at the foot next the street; (5) that the exit doors from the stairs to the street be kept fully open and locked against the wall, etc.; and (6) that clear gangways be kept up to and between the stairs and exits upon all floors. With regard to the first requirement, at the present moment there was on the fourth floor a gangway outside the window at the eastern end of the building guarded by a hand rail, connecting with another building on the other side of the party wall.

Mr. Walsh said that this had been put in since the notice, and the County Council were prepared to agree to this as an alternative to the staircase leading to the skylight, provided that the window was altered.

The Chairman said the Tribunal had viewed the building, and they took it that the parties would agree that this gangway would be an efficient substitute for the staircase to the roof, provided that the window was made into a casement-window or otherwise, to the satisfaction of the Council.

Mr. Hickman expressed agreement with this. With regard to the second and third requirements, when the preliminary notice was served the floors were in different occupation, but now the first, second, third, and fourth floors were in one occupation, and, therefore, he imagined that the Council would not insist on the requirements. The result of carrying out the fourth requirement would be that a kind of box would be formed, which, he should think, would be an excellent means of allowing a fire to get a good hold of a building. The fifth and sixth requirements ought not to be placed on the owner at all. It was a matter for the occupiers, as the owner could have no control over such things. The top four floors were used by a furrier, and the ground floor and basement by a boot warehouse, and no one slept on the premises. The possibility of any serious fire occurring on the premises was infinitesimal. There was no question of a dangerous trade being carried on, and his clients were prepared to enter into an undertaking to give the County Council notice if at any time the premises should be used for trades in which celluloid or other dangerous substances were used. He submitted that the essential point was that persons should have proper notice of the outbreak of fire, and in this case the owners had installed a most efficient automatic fire-alarm system on the premises.

The Chairman pointed out that they could not consider the provision of a fire-alarm, however skilfully arranged, as a substitute for means of proper escape in case of fire. Mr. Hickman said it was one of the circumstances of the case bearing upon what might be reasonably required as means of escape.

The Chairman said the Act provided for permanent means of escape in case of fire, and they had to take into account the circumstances of each building; but they could not take into consideration the question of the

efficient or inefficient working of a fire-alarm. It was quite clear that they could not substitute a fire-alarm for the means of escape which they had to deal with under the Act. Mr. Hickman argued that, as the existing partitions would resist a fire getting into the staircase for at least twenty minutes, the early notice of the outbreak of fire was of the greatest importance; and in this case, where there was a fire-alarm, there would be no additional security if the requirements of the County Council were carried out. Therefore, he submitted, that it was putting an unnecessary expense on the owner to ask him to carry out the requirements. Further, it would diminish the warehouse-room, which meant reduction of rent to no purpose.

Mr. W. E. Osmond, fire loss assessor, was called, and expressed the opinion that the existing partitions would resist a fire reaching the staircase, and if the occupants had warning of a fire, as was provided, they could easily get away by the present means of escape.

Mr. George Lewis, one of the owners of the premises, described the present means of escape, and said that, having examined the reports of the Chief Officer of the Fire Brigade for three years, he found that there had only been two deaths in fires occurring in similar premises.

In cross-examination, witness said he admitted that if the lower part of the premises were unoccupied, and people were working on the upper floors, there would be danger to them in case of fire, and it was to meet this contingency that he had installed the fire-alarm.

Several witnesses were also called to prove the efficiency of the automatic fire-alarm.

The Chairman, without calling on Mr. Walsh to address them, said that up to the present no objection had been raised to the requirements of the County Council. There was no specific objections except that the cost would be expensive, and there would be no return on the money spent. They had been expecting to hear some criticisms of the particular requirements, so that they might pay attention to them. The only real question they had raised there was that an automatic fire-alarm should be substituted for proper means of escape in case of fire. The Tribunal had come to the conclusion that they could not do that, and the Act did not legislate with that object.

Mr. Hickman asked if the Tribunal was of opinion that the provision of the alarm was not one of the circumstances to be considered in the case?

The Chairman said he did not say that at all, but distinct evidence had been given by the appellant's own witnesses that the building would be unsafe if the alarm was not also coupled with proper means of escape. There was no doubt that the alarm was a very valuable addition to a building, but they were not satisfied to accept it as sufficient for all purposes, and to do away with what they considered proper means of escape in case of fire. The Tribunal had seen the building, and they considered the requirements of the building very reasonable. They were all three practical men, and that was their view.

The Tribunal then made a formal order for the carrying out of a number of requirements, which were agreed on after discussion by the parties. Costs were awarded the respondents.

LAW REPORTS.

KING'S BENCH DIVISION.

(Before Mr. Justice BAILEY.)

Holland, Hannen, & Cubitt v. Lord Decies.

In the King's Bench Division on Monday, November 4, before Mr. Justice Baillie, an action was commenced by Messrs. Holland, Hannen, & Cubitt, Ltd., the well-known builders of Gray's Inn-road, against Lord Decies, for a balance of £4,200. In respect of the renovation work carried out to his Lordship's residence, Sefton Park, Stoke Poges, Bucks, under a contract dated February 2, 1911. The total cost of the works amounted to £9,920, of which Lord Decies had paid £3,000.

For the defence it was alleged that the sum charged was excessive, and he counterclaimed a large amount.

Mr. Leslie Scott, K.C., with Mr. R. A. Wright, appeared for the plaintiffs; and Mr. W. J. Waugh, K.C., and Mr. H. W. Rowell were counsel for the defence.

Mr. Leslie Scott, in opening, said the claim was upon a contract known as the measured rate basis. The work had been done at a very rapid rate, as Lord Decies was going to America to be married and was anxious to have his house ready as soon as possible after his return. Consequently it was not possible to enter into a formal contract. A schedule

of prices recognised by the building trade was agreed upon, and plaintiffs were to carry out whatever work was ordered. At the time instructions were given the architect himself hardly knew what work was to be done. It grew, and as money was to be no of the work was carried out continuously day and night, and the very best workmanship was put in. The result was a big bill, to which there were no specific objections for months until before the action was brought, when various defences were set up. First, that representation was made by the architect that the prices in the agreed schedule were fair market prices, which they were, and, secondly, that the price of the work was to be 8,000, 10,000, whereas, in fact, the bill amounted to 20,000. This increase, said Counsel, was largely to the fact that the increased work of a structural and ornamental character, at a cost over 7,000. Counsel then dealt with correspondence, with a view of showing that Lord Decies followed the progress of the work very carefully, and knew exactly what was being done. During the course of the work, said Mr. Scott, a letter was written by Lord Decies, in which it was stated that the total cost had then reached about 17,000. Instead of complaining of this, all Lord Decies said was: "It costs a great deal, but suppose it is all right." Counsel submitted that the defence which had been put in by the defendants was only bound to pay quantum meruit prices in regard to the rest of the work. Such a defence, however, was not consistent with the history of the case. Throughout the whole work the additional orders were treated as part and parcel of the same job. The fact, said Counsel, that the properties of the plans and the decorative work were afterwards altered, still, it was only a question of amount. It was not a contract to do a certain work, specification, but to do work at a certain rate subject to the architect's instructions.

On answer to this, Mr. Waugh said the first question was whether certain representations were made which induced making of the contract, and whether plaintiffs were not bound by this representation. On other words, in no circumstances could they, in respect of the work which was ordered in the contract shown upon the drawings, receive more than 10,000; and in the case the plaintiffs were bound by prices which were fair market prices for first-class work. Defendant further said that the architect ordered certain work in addition to the work specified, which was far more expensive, and that he did so entirely on his own authority and without the acquiescence of Lord Decies. Therefore defendant could not be held to be responsible for such work.

Mr. Horace Farquharson, architect, was then called, and said that he had been practising such since 1897. For some time he was a pupil of the well-known architect, Mr. E. L. Lutyens.

1910 he was brought into communication with Lord Decies in connection with the work at Sefton Park, and eventually he prepared the plans for it. At an interview with his Lordship witness understood Lord Decies to say that the question of money did not bother him; the money would be found for him. Defendant asked witness to mature his plans at that interview and submit them, which he did. Lordship told him that the work was to be quite plain, as the decorative work was to be looked after later by Lady Decies' mother, who was interested in such work. The work proceeded at a very rapid pace, as it had to be carried out before Lord Decies came home.

On question to some extent as to the nature of the work, witness said that all the window-sashes were ordered in teak, because in first class window-frames were always made of solid hard wood.

Mr. Wright (for plaintiffs): Did Lord Decies ever complain to you that you were doing a thing without instructions?

Witness: Not once.

Did he complain to you about the expense? Lord Decies never complained of the expense. Both his Lordship and Lady Decies visited the work, and looked at every detail. Cross-examined by Mr. Waugh, witness said he had not gone into the question of price at all himself, except in regard to work in forecourt.

Whatever figures you received and communicated to his Lordship were the figures of plaintiffs?—Yes.

You relied upon those figures?—Entirely.

It was true, witness said, that the bill considered at the start that 10,000 would cover the work required, including the contingencies.

Mr. Waugh: What structural defects were set with?
Witness said that walls which were thought to be perfectly sound were, when exposed, found to be absolutely rotten. Practically every wall was rotten in the house, except the wall and one of the dining-room walls. What was the additional cost for dealing with these walls?—I could not say.
But it is an important matter?—It is a matter for the surveyor and not for my department.
But it is your estimate.—I am merely the outspoke of other people. The architect represents the whole body of people carrying out the work.
It was thus Lord Decies said he required a work to be done plainly.
And the reason he gave was that he did not want to spend more than 10,000L on the house; he said he would prefer to get another mansion if more money was to be spent?—No; the first time the question of money was mentioned between us was in the report sent to Lord Decies.
Did Lord Decies say that he would prefer purchase another mansion rather than spend larger sum of money on Sefton Park? I cannot say.
His reply have done?—It is quite possible, but no figure was mentioned.
Further cross-examined, witness denied that took upon himself to alter some of the works without Lord Decies' authority. The work was done at very great speed, and the details were left to the discretion of the witness.
Witness denied that deal would have been a proper wood to use for painted window-shes. In good work window-shes were invariably made of teak.
Did you order American walnut for the window-shes of Lady Decies' bedroom?—Yes.
And were they to be painted white?—No, I hoped to persuade Lord Decies to panel the room in walnut later on.
Did you succeed? No, but he did order at my suggestion later on.
Witness said it was quite possible that a Mr. Anderson was given a power of attorney for the work by Lord Decies.
Why did you not consult Mr. Anderson when you knew the way the cost of the work was increasing?—Mr. Anderson was in York, and the work was going on hard at the heels of the plans. I had to use my discretion.
You knew the cost of the work was increasing?—We did not consider that at the time; there was no time to consider anything.
Further cross-examined, witness said the question of cost was never referred to in any of the proceedings before Lord Decies went to America, and the matter was referred to the people who were going to pay. Witness had never gone into the question of price.
Do you say the prices charged were fair market prices?—Yes.
But you say you have never gone into them; I relied implicitly upon my advisers.
When Lord Decies made the remark, "It is a lot," did that refer to the oak panelling only?—No.
Mr. Waugh: Did you not certify that 13,000L was due to the builder when as a fact measurements were only taken on that date to an amount of 11,000L, or a little under?
Witness: You must ask the surveyor about it.
Mr. D. Morle, partner with Mr. Norman Hill, quantity surveyors, said his firm were employed in regard to the work at Sefton Park by Mr. Farquharson, and they prepared schedule of leading prices in all the various trades to cover anything which would be needed to carry out the work. The job was completed on August 4, and witness's firm did a measuring up for the purpose of the pounds. Where work was according to the schedule they used the schedule prices, and where it was not, they followed the usual practice of deducting the prices from the schedule. They did this work with the plaintiffs and agreed on the prices.
Questioned with regard to the oak work, witness said the very best wood was supplied at a great deal of it had to be worked by hand, which, of course, cost more. There were places where Cubitts asked for a higher price than was actually agreed upon, and witness cut them down.
Cross-examined, witness said every item was gone through, and there was a bargain come between witness's people and plaintiffs as the price to be charged.
Mr. Waugh: If that was so, how is it that the cost of mahogany was charged at 43s. a foot?
Witness: Oh, that was a clerical error! It ought to have been 4s. 3d.
And then there is another item, "35 ft. of mahogany at 46s. a foot, making a total charge for the two items of 129L 10s. instead of 12L 15s.—That was also a clerical error.

Mr. Waugh: Well, I don't see what protection Lord Decies had if this was the way the matter was gone through.
Witness said he was instructed that the whole of the work was to be plain, with the exception of a few hardwood doors.
Cross-examined with regard to the certificates, witness said it was true the work was not measured up as it went along. The measurements were taken approximately. He did take measurements, upon which he could tell Mr. Farquharson he could certify.
Do you say the prices in this schedule were fair market prices?—Yes.
What is a fair market price?—A price which would give the builder 10 per cent. profit.
I suggest to you that in nearly every instance these prices are in excess of what is understood by fair market price.
Witness dissented from this.
I suggest to you that a fair market price would be the price people would be willing to obtain for the work, taking into consideration the fact that other firms of equal repute were competing for that practically amounts to what I have said.
Further cross-examined, witness said the market price for Portland stone and all labour was about 10s. 6d. per foot cube.
Mr. Waugh: We say 3s. 6d.
Witness: That is matter of opinion.
For Bath stone, witness said, 7s. 6d. per foot cube was a fair market price.
Mr. Waugh said 5s. 6d. was a fair price, according to defendant's contention. His Lordship would see that such differences would amount to a very substantial sum in the aggregate.
Mr. Thomas William Donovan, branch manager to the plaintiff company, said he was responsible for the original estimate of 9,500L, which was drawn up for the work at Sefton Park. Had the work been carried out according to the data then supplied to him, his firm would have made 25 per cent. profit on the work. As it was, they would only get 7 per cent. on their charges.
Mr. Benjamin Hansen, director of the plaintiff company, in charge of the building branch of his company, said that on February 9 of last year the contract was signed, Mr. Anderson, Mr. Farquharson, and witness being present. When the contract was shown to witness he noticed that there was a heavy penalty in case of non-completion within the period named. Witness said they did not know what amount of work would be required, and he objected to signing a contract on those terms. He said it was absolutely unfair to ask any firm to undertake such a contract, for how could they say how long it would take when they were given no indication of what there was to be done? Mr. Anderson then told witness that if he did not sign he would not have the contract, and the situation having arrived at something in the nature of a deadlock, Mr. Farquharson interviewed and asked witness whether he could not trust him (Mr. Farquharson) to protect the builder and see that too much work was not put upon him to carry out in the time named. Witness felt he could trust Mr. Farquharson, and signed the contract. There was a clause in the contract leaving the matter to the discretion of the architect.
Mr. Arthur Sickmores, surveyor in plaintiffs' employ, said he went through the schedule with Messrs. Eville & Morle.
This concluded the evidence for the plaintiffs.
Mr. Waugh, K.C., then opened the case for the defence, and submitted that if it were proved that the prices in the schedule were not fair market prices, and that it were represented by plaintiffs that they were, then Lord Decies could not be bound by such prices. The next point for his Lordship's consideration was, was there any representation made to the defendant that the whole of the work then contemplated would cost more than 9,500L? He contended that defendant was only liable for work done according to the plans to the extent of 9,500L, and, of course, any repair work found necessary outside that estimate.
His Lordship intimated that he could not hold that there had been any representation by the plaintiffs that the prices in the schedule were fair market prices. He would also put on one side the question of the giving of the certificates as being wholly immaterial to the case. That reduced the issue very much to the question of discrepancy between prices in the schedule and the work actually done.
Mr. Waugh then proceeded to call evidence.
Mr. George Stephenson, quantity surveyor of considerable experience, including the measuring up of the new War Office, and the Admiralty buildings, stated what was the usual form of procedure in contracts of this kind. He had examined every item in the schedule and had found that in regard to oak panelling some 19,000 ft. were charged for at 6s. 6d. a foot, whereas he could only account for some

17,000 ft., and would only allow 4s. a foot for it. That would mean a reduction in the total of 364L. Proceeding, witness alleged other instances of over measurement and overpricing.
The hearing was then adjourned, and was continued on Wednesday.
Albert Edward Addis, a quantity surveyor, gave evidence with regard to the items in the schedule of prices, with a view of showing that they were excessive.
His Lordship, in giving judgment, said that at the end of 1910 Lord Decies, being about to be married, was minded to make extensive alterations and repairs to his mansion, Sefton Park, and to that end employed a Mr. Farquharson as his architect. Everything had to be done in a great hurry, and the architect had only the most general intimation as to the nature of the work required to be done. He got out certain plans, which gave a broad indication of the work required. Lord Decies was naturally anxious to know about what the cost of the work would be, and rough plans with indications of the work to be done were submitted to the plaintiffs, who were an eminent firm of builders. They figured out on the plans and arrived at a sum of about 9,500L. Mr. Farquharson, no doubt, being influenced perhaps by his general experience of this class of work, thought that the expense would be from 8,000L to 10,000L, and reported to this effect to Lord Decies. The work was put in hand, but it was not by any means carried out according to the original plans. Suggestions were made by Lord Decies, and considerable alterations to the plans were made. The main alteration made in the course of the work was that, after Lord Decies had returned from America in April, 1911, he desired to have a large scheme of decoration carried out, which was not contemplated in the original plans, the result of which was that when the work was done Lord Decies was faced with a very heavy bill. Instead of the cost being about 10,000L, it was nearly double that figure. Naturally, the defendant was very much surprised and disagreeably astonished. He knew that a great many extras had been ordered, and that the original estimate must have been exceeded, but he never expected so heavy an account. His Lordship sympathised with Lord Decies in that respect, and with the regret Mr. Farquharson had expressed that he had not warned the defendant as to the extent to which the original amount would be exceeded. It was a pity that that was not done, as it would perhaps have obviated the bringing of the present action. The work had to be done, and on the primary question of liability his Lordship had no doubt that Lord Decies was liable to pay. With regard to the question of details and deductions, they would go to an arbitrator to be appointed.

COURT OF APPEAL.
(Before Lords Justices VAUGHAN WILLIAMS, BUCKLEY, and KENNEDY.)
Action against Builders upon Architect's Order: Ramsden & Carr v. Chessum & Sons.
THIS case, the hearing of which was concluded on Wednesday, November 6, came before the Court upon the cross appeals of the parties from a decision of Mr. Justice Hamilton, the plaintiffs being metal workers of Seymour-place, South Kensington, and the defendants being the well-known builders of South-place, Finsbury, the question in dispute being liability for goods supplied on an architect's order in connexion with the building of a cinematograph theatre at 225, Oxford-street.
Mr. Radcliffe, K.C., for Messrs. Chessum & Sons, said the theatre was built for a company which had since gone into liquidation. The plaintiffs supplied a quantity of hammered silver and brass door plates, artistic door handles, and other goods, which were ordered by the architect (Mr. M. S. Ward), and for which Messrs. Ramsden & Carr contended the builders were responsible. The plaintiffs at the trial in the Court below, before Mr. Justice Hamilton, without a jury, claimed 142L 15s., alternatively in respect of goods sold and delivered, or as money had and received by the defendants for the use of the plaintiffs, or as money held in trust for them. Messrs. Chessum & Sons denied liability, and repudiated the authority of the architect to pledge their credit. Mr. Justice Hamilton held that the plaintiffs had failed to show that any money was received by the defendants from the company that should be allocated to the account for the goods, but that Messrs. Ramsden & Carr succeeded on the issue as to goods sold and delivered to and used by the defendants, which raised an implied promise by

them to pay for them. On that issue the learned Judge entered judgment for the plaintiffs with costs, the defendants getting costs on the issues on which the plaintiffs had not succeeded. Mr. Ward was not a party to the action, so it was a question of whether the builders or the building owners should pay.

After some discussion Lord Justice Williams said: It is plain there was a difficult question to be answered here, yet the plaintiffs asked for summary judgment without a trial. They say they believe there is no defence to the action. I can only say that is most improper, and if I were the Judge in chambers, and the summons had come before me, I should not only dismiss the summons, but I should order the plaintiffs to pay the costs in any event, and should see if I could not make the solicitors pay too.

Mr. Eames, for the respondents (plaintiffs), said at the time the matter was in chambers his clients were unaware of the facts disclosed in Court that day.

Mr. Radcliffe said the architect ordered the metalwork, or a great deal of it, purporting to act on behalf of the contracting builder. But the architect had no authority to do that. They were extras, and the contractor was not responsible for them. Under no circumstances could his clients be held responsible. Mr. Justice Hamilton said: "If Mr. Ward is not your agent, you have had these things—they have been fixed in that house, and that is an implied contract." The contractor was not bound to supply these goods, and the architect had no authority from them to order them. They were certainly affixed by a workman of his clients, but that was by order of the architect.

Lord Justice Buckley: Did Mr. Ward give evidence at the trial?

Mr. Eames: Yes; but he was not a party to the action.

Mr. Radcliffe said what the architect should have done was to tell the contractors what things were needed and let him obtain them.

Mr. Eames said the defendants had had their goods and used them, and should pay for them. They took the benefit of them as though they were supplied under the contract. It was inferred the goods would be paid for by Messrs. Chessum. His learned friend was wrong in suggesting that the architect had done something wrong, but in the Court below Counsel for the defendants (Mr. Scott) formally admitted that they knew of the goods, that they were seen on the premises, and that they were ordered by contract. It was also admitted that they were goods treated as coming under the contract. The defendants further admitted that Mr. Ward had done nothing wrong, and the only ground on which the defendants objected to pay was that they had not been paid by the building owners. In regard to that, the sum due to his clients was included in a certificate the architect gave for £500. There was, he submitted, authority under the contract for Mr. Ward to order the goods. There was good cause for the action because money had been received.

Lord Justice Kennedy: I did not understand that money had been received.

Mr. Eames: Oh, yes! In fact, there were bills which were treated as cash. If you take a negotiable instrument and treat it between yourself and the debtor as cash that renders you liable for money had and received, although as a negotiable instrument it has never been met. Continuing, Counsel said he wished to correct an error that was made the previous day. It was said that at the time the orders were given the Cinematograph Company was in financial difficulties. That was a misapprehension, because, so far as the first lot of good was concerned, amounting in value to £18,000, most of the goods were given as early as April, 1910, before the architect or the builders had any idea that financial difficulties would arise. In desiring to lay the whole facts before the Court, he wished to say that the plaintiffs were not a business firm in the ordinary sense, but high-class dealers and experts. They had been accustomed to accepting Mr. Ward's orders and crediting the contractors with the items, though the first invoices in these particular transactions was made out to Mr. Ward.

Lord Justice Williams: Is not that *prima facie* evidence that Mr. Ward is liable?

Mr. Eames said it could hardly be called an invoice; it was a memo. that the goods were supplied to Mr. Ward's order.

Lord Justice Williams, in delivering judgment, said the appeal of the defendants must be allowed, and the cross appeal dismissed. He agreed with Mr. Justice Hamilton in so far as he dealt with the subsidiary questions that had been argued, but the architect did not act in the character of an agent for the contractor. That being so, the question naturally arose, when the architect gave the

order, had he entered into a contract on behalf of the building owner? He was not prepared to come to the conclusion that he did act as the agent in giving the order in the sense that he made a contract on behalf of the building owner, or even of the contractor. There was no proof here that he acted as the agent, authorised as such, for either the building owner or the contractor. If there was no contract on behalf of the contractor through Mr. Ward they had to see whether, under these circumstances, the contractor used the goods supplied in such a way as to imply on the part of the contractor a promise to pay, or a responsibility to do so. In his opinion, they should not assume that. During the arguments in the case it had been said that the architect had twice given orders. But it did not matter how many times he had done that. What they had to consider was, when these goods were delivered at the theatre was there anything to tell the contractor that they had been ordered on his behalf, or that they had been ordered for his benefit and by his order, so that he could use them if he thought fit or reject them if he thought fit? There was no evidence to show that the contractor had any such information. They might have been sent by order of the building owner. There certainly was nothing to indicate to the contractor that he was liable for them. There was no information as to price, specifications, or conditions. He had a right to all that information, but it was not given to him. It had been said that it was the duty of the contractor, when he saw the goods, to ask for that information and to avail himself of the opportunity, if he chose, of knowing what was happening. In his opinion, the architect, if the contractor was to be held liable, should have given him all that information. It was said the contractor ought to have known these things and where the goods came from, but if there was any evidence of that it was of the faintest description.

Lord Justice Buckley concurred. Lord Justice Kennedy dissented. He agreed with everything said and done by Mr. Justice Hamilton. The contractors had used the goods of the plaintiffs, and they should pay for them. They could not expect that the goods were a gift. They had the opportunity of using or refusing them, and they used them, and that made them liable.

By a majority of the Court the appeal of the defendants was allowed and the cross appeal dismissed.

CHANCERY DIVISION.

(Before Mr. Justice SWINFEN EADY.)

Ancient Lights at York:

Delittle, Fenwick, & Co. v. York Industrial Co-operative Society, Ltd.

THIS case was heard on November 4, 5, and 6, and was a claim by the plaintiffs for an injunction to restrain the defendants, their servants and agents, from so erecting premises in Railway-street, York, as to obstruct the access of light and air to the plaintiffs' ancient windows, and thereby cause a nuisance, and for damages.

Hon. Frank Russell, K.C., and Mr. J. M. Gover (instructed by Messrs. Ridsdale & Son, agents for Messrs. George Crombie & Son, of York) were for the plaintiffs; and the defendants were represented by the Hon. E. C. Macnaghten, K.C., and Mr. F. H. Maughan (instructed by Messrs. Munns & Longden, agents for Mr. F. A. Camidge, of York).

In opening the case, Mr. Russell said that the property of the parties was on opposite sides of Railway-street, York. It was a narrow street, 42 ft. in width, which approximately ran north and south. The plaintiffs were printers, and they owned Nos. 5, 7, 9, 11, 13, and 15, Railway-street on the west side of the street. Counsel put in a model of the premises and explained the situation to his Lordship. It was not disputed that the plaintiffs' windows were ancient lights, and the plaintiffs were seeking damages. The defendants completed part of their buildings last year, and in the present year they commenced a further extension. Thereupon the plaintiffs commenced the action and moved for an interlocutory injunction. On the hearing the defendants undertook not to carry their buildings higher than 32 ft. The height of the old premises of the defendants varied from 18 ft. to 32 ft., and the plans under which they were now building showed that the height would be again 49 ft. to 52 ft. In addition, there was a gable 17 ft. high above that. It was only fair to say, however, that the defendants had offered not to proceed with the gable.

His Lordship: The new buildings are 14 ft. higher than the old ones. It substantially comes to

this: that the undertaking prevented putting on the top story. The old buildings were nothing like as high as the street was wide, so that the diminution in light was considerable. He was claiming damages in respect of the buildings put up last year, an injunction in respect of the buildings put up this year. The latter were commenced in July, but had not exceeded the height.

Counsel then went into the details of the alleged infringement. The basement was seriously affected, the loss in percentage of direct light being 40 per cent., 32 per cent., and 32 per cent. In the first room had been used for a colour machine, and artificial light was now used all day long. The ground floor had suffered considerably, the percentage being 32 per cent., 49 per cent., and 51 per cent. The first-floor rooms were not so very affected, but if the defendants' scheme fully carried out they would suffer considerably.

Mr. Arthur William Cooksey, F.R.S., 6, Adam-street, Adelphi, W.C., architect and surveyor, detailed the result of his examination of the premises in conjunction with Mr. Man, of York. He saw the premises on 3 and 4 p.m. on October 24 on a very day. He had examined Mr. Monkman, and found them to be accurate.

Did you find that an angle of 45° of light had been left?—Not on the floor and basement.

It is stated that the damage to the premises is inconceivable, and would be compensated by a very small sum of money?—I think if the sum is omitted, in my substantial damage would be caused to the plaintiffs.

He had considered the question of diminution in the value owing to the loss of light, and estimated that there would be a loss of 400 per cent. in the letting value, 900 per cent. in capital value. If the loss proceeded with, he estimated the loss at another 2 ft. put on the defendants' buildings would make the basements very dim, and had made various tests with coins and papers, and found that in the middle of the basement he could not read the latter.

Mr. Macnaghten: Would a further extension of the defendants' buildings materially affect the light to the ground and first floor windows?—To a considerable extent.

Mr. Thomas Monkman, of Melksham, corroborated Mr. Cooksey's evidence, estimated that the loss in rental was at least 40 per cent. per annum. He was acquainted with the premises, and property in York generally.

In cross-examination witness admitted he had not taken particular notice of the coming to the back of the premises in question where there was a glazed yard. This did not, however, penetrate as far as the front of the premises.

Delittle, Fenwick, & Co., partner in the firm, said that the light had greatly dimmed in the rooms facing the defendants' premises since the defendants' buildings had been put up. They did not require a special light for the machine-rooms, and before the defendants' buildings were put up the rooms were quite sufficient. Now, however, they use artificial light. The workmen did not use artificial light, and if the machines to be removed it would cost the firm 50 per cent.

In cross-examination Mr. Delittle did not admit that the premises were convenient, or that they had been convenient to other premises. They could work the machines safely without a light.

Mr. John Fenwick, also a partner in the plaintiff firm, gave evidence as to the variation of light caused by the defendants' buildings. It first became noticeable when elevation had reached the second floor. As the buildings progressed, it grew worse, until the basement and first floor were relatively in darkness. Witness consulted a member of the Streets and Buildings Committee of the York Corporation, who him certain advice. He also consulted Monkman, who wrote to the Secretary of the defendant Society on the matter.

Having to use artificial light in the basement affected both the quality and quantity of work done there.

In cross-examination Mr. Fenwick said that he had been trying to sell their premises for many years, and had approached the defendants for that purpose.

Mr. R. J. Bond, a draper, and tenant of the plaintiffs, gave evidence with regard to the effect of the buildings on the light shop. He said he now had to use a light under circumstances which would

are required it before the defendants' buildings were erected.

Four machinemens employed by the plaintiffs also gave evidence as to effect of the diminished light, and this closed the plaintiffs' case.

For the defence, Mr. Macnaghten, K.C., called Mr. H. Chaffield Clarke, F.R.I.B.A., of Bishopsgate, E.C.1, who detailed the inspection of the plaintiffs' premises in October last. In Mr. Bond's shop he found no difficulty in reading his pocket-book, and it was possible to test colours quite well. In a room used by the plaintiffs for photographic purposes there were "floods of light." The basements had reasonable light for ordinary purposes. They were deep basements, and even when the defendants' buildings were carried up to the full height proposed it would not, in his opinion, cause inconvenience to the plaintiffs so far as the ground and first floor were concerned. He thought the same amount of light would go through to the basements as before, though it would not penetrate so far into the room. He did not, however, consider that a material loss, having regard to the nature of the basement.

In cross-examination, Mr. Chaffield Clarke said that, in his opinion, the erection of the new buildings would not obscure so substantial an amount of light as to render the basements unfit for the use to which they were put.

Corroborative evidence was given by Mr. Sidney D. Kison, F.R.I.B.A., of Leeds, who visited the plaintiffs' premises with the last witness. The ground-floor rooms were all well lighted, and in the basement there was the average amount of light. In Mr. Bond's shop he could read small print quite easily. In his opinion, even if defendants' buildings were carried to a height of 52 ft., there would be no material diminution of light. Of course, the basement would be more affected than the rest of the premises. As a rule, however, basements were not sufficiently well lighted for printing business.

In cross-examination, Mr. Kison agreed that the 40 per cent. of light from the basement would, no doubt, affect it very much. Printing required a special light, and he would not think of using one for such a purpose. The ground-floor rooms were adequately lighted.

Mr. Henry Beck, senior partner in the firm of Messrs. Henry Beck & Son, architects, of 20, Abchurch Lane, E.C.4, also gave evidence. He was the architect for the defendants, and had been so since 1908. The front elevation was now 16 ft. above the pavement. The question of infringement of lights received very careful consideration before the buildings were proposed. In July last, before the defendants' buildings were put up, he noticed that the plaintiffs were using artificial light in one of their basements on a perfectly clear day.

Other evidence having been called for the plaintiffs, Mr. Macnaghten, K.C., submitted that the plaintiffs had made out no case for an injunction, and if they were entitled to any relief, such relief should be a small sum by way of damages.

Mr. Russell, K.C., for the plaintiffs, asked 200,000, in respect of the buildings completed last year, and an injunction in respect of the buildings erected during 1912.

His Lordship, in giving judgment, said that the defendants desired to put on another story to their building, and from the evidence it appeared that there was no point between 38 ft. and 25 ft. at which they desired to stop building. He was satisfied that before the action was brought the defendants abandoned any intention of putting on the gable, and for the purposes of the action he did not consider the gable as all. The plaintiffs, in their business as printers, did not require especially good light—it was a case of ordinary light for the ordinary purpose of business. Messrs. Cooksey Monkman had been called on behalf of the plaintiffs to particularise the extent of the loss. Mr. Chaffield Clarke, the architect called for the defendants, at first alleged Mr. Cooksey's sections, but on consideration he accepted those sections, and his Lordship said he therefore proposed to rely on them for the purpose of his judgment.

The question he had to consider was whether the obstruction of the plaintiffs' lights prevented them from carrying on their business as comfortable and beneficial a manner as before.

His Lordship then reviewed the evidence, referring to the evidence of Mr. Chaffield Clarke, he said that that gentleman gave evidence of a startling character. The view given by Mr. Clarke was that no matter what extent the height of the new buildings was raised, it would cause no obstruction to the light of the plaintiffs' premises, but would only alter the direction of the light. He produced a diagram, showing the amount or volume of light coming to the premises, but

he had to admit that his was a mistaken view. Mr. Clarke also seemed to hold the view that so long as an angle of 50 degrees of light was left there would be no case of obstruction.

Mr. Beck took even a stronger view, his opinion being that even an obstruction under 60 per cent. would seriously affect the building. Mr. Kison's evidence was, in his Lordship's opinion, more reliable.

On the whole of the evidence his Lordship said he was satisfied the plaintiffs had succeeded in proving a very serious loss of light, which was not only material and substantial, but which would render it very difficult, if not impossible, for them to carry on their business in as beneficial a manner as before the erection of the defendants' buildings. He awarded the plaintiffs 100,000 damages in respect of the buildings erected last year. The buildings erected this year were a much more serious matter. In his Lordship's opinion, the plaintiffs had suffered an injury which could not be fairly compensated by money, within the meaning of Lord Macnaghten's judgment in *Colls v. Home and Colonial Stores, Ltd.* He, therefore, granted an injunction in the form asked as regards the uncompleted buildings. The injunction would not prevent the defendants putting the roof on their buildings as they stood, but they must not put on the third story, which, in his opinion, would occasion a nuisance to the plaintiffs. The defendants must pay the costs of the action.

OFFICIAL REFEREE'S COURT.
(Before Mr. EDWARD POLLOCK.)
Light and Air Claim against an Hotel: Anderson v. Walduck.

JUDGMENT was delivered on November 4 in an action by Mrs. Harriet Anne Anderson, of 2, Queen's-square, wife of Mr. Rasmus Anderson, against Mr. Harold Walduck, the managing director of the Imperial Hotel, Ltd., and the Imperial London Hotels, Ltd., of Russell-square, consequent upon extensions carried out in connection with the hotel. This was a light and air claim by Mrs. Anderson, as the owner of premises adjoining. In the course of the hearing certain heads of the claim were abandoned by Mrs. Anderson, under the advice of her Counsel, those relating to alleged loss of custom and goodwill.

Mr. Conway Wertheimer and Mr. Marston (instructed by Mr. J. J. Chapman) appeared for the plaintiff, and Mr. Cecil Walsh and Mr. Thomas (instructed by Messrs. Clowes, Heckley, & Co.) appeared for the defendant.

In the course of his judgment, after hearing the evidence, Mr. Pollock said that Mrs. Anderson, who lived in Bloomsbury, claimed damages for interference with light and air at her premises by the defendants; she also claimed an injunction and damages for trespass, but these premises were said to be a nuisance, and there was no justification in the proceeding of the defendants in putting them up. Mrs. Anderson, who apparently had had these premises twenty years, was leaseholder under a repairing lease for 1,000 years, and that condition of things was material as to the question of the value of the premises, and as to the amount of damage that had been done by the defendants. It had been admitted in effect that the defendants had done something which entitled the plaintiff to recover some amount of damage, and the question he had to decide was as to the amount to which Mrs. Anderson was entitled. He must say that he thought Mrs. Anderson's claim was not in the least the fault of her advisers, who had been absolutely unaware of the business which Mrs. Anderson had carried on in this place, and they had accepted, as they were bound to do, her estimate of the value of the premises and the goodwill had been calculated on a certain basis which she said were the profits of her business. A claim based on the estimate of her statement as to the course of custom to be relied on had been advanced. It was quite clear to his mind—and he thought it was—Mrs. Anderson found that these premises were not suitable to let as ordinary lodgings. Therefore, it was quite obvious to his mind that her estimate of the custom she lost was based entirely upon the profits of her business in this particular business. She said she made in this particular business. He doubted much whether she would have been able to substantiate that estimate, but that point was not now before him. Proceeding to deal with the phases of the case before him, the Referee said that Mrs. Anderson had been in very properly advised not to press for an injunction. It seemed to result in this, that by not pressing for an injunction she had, in effect, acquiesced in allowing the defendants to erect this building. He did not think she could say she ought to have more damages

because she could have got an injunction. Therefore, he thought the damages were to be based only on the basis that they were an alternative to the injunction, and not, therefore, a case in which she was entitled to an injunction, and to have increased damages by reason of that fact. Having referred to the fact that the usual notice regarding party structure was given the plaintiff, the Referee dealt with the allegations of trespass. He said that, in his opinion, there was no foundation whatever for saying that Mrs. Anderson was entitled to treat the Hotel Company as a trespasser. He had to ask how much had really the value of the plaintiff's house been diminished, if at all, by the erection of this building by the defendants? It was quite obvious to his mind that the only rooms which had been at all interfered with within the legal rights were the basement and the ground floor. Ample light came in from the south to the basement. Upon the ground floor, too, there was a fair light, having regard to the occupation of these premises as a living-room. One of the witnesses had taken the rooms at a certain value and calculated how far the light in the rooms had been interfered with, and how far that had depreciated the value of the premises, not only as rooms occupied separately, but as rooms occupied, having regard to the whole house being occupied by the tenant. That estimate had been brought up to 100,000. It might be that was a low estimate; at all events, the defendants' advisers thought it was rather a low estimate, and they had made it 200,000. He thought 200,000 was a very handsome sum to be paid in respect of depreciation. The Referee then reviewed the various items, and proceeded to express the opinion that the work conducted by the defendants had been done extraordinarily carefully and properly. Upon the evidence it had been shown that no subsidence had taken place. There was not the slightest chance of any settlement taking place in these premises as the result of any of the work executed by the defendants. That settlement might occur from the inherent vice and the great age of the premises was quite possible, but that was a thing for which the defendant company was not responsible. There would be judgment for the defendants, as the amount paid into Court by them was more than sufficient to satisfy the plaintiff's claim; 51,000 in Court would be paid out to the defendants, and the balance would remain in Court pending taxation of costs. Defendants would pay the costs up to the date of payment into Court, except as to about nine items, and the plaintiff would have to pay all the costs after the payment in.

CHANCERY DIVISION.
(Before Mr. Justice PARKER.)
Heavy Claim by and against Contractors: J. Aird & Co. v. the Tanjong Pagar Dock Board.

THE hearing was resumed of this case last week in which the plaintiffs claim from the defendants 500,000, as damages for alleged breach of contract in connexion with the construction of a wet dock at Singapore. Plaintiffs, who are the well-known Singapore contractors, allege that the defendants misrepresented the conditions under which the contract was to be carried out, and therefore that they were justified in repudiating the contract. Defendants denied these allegations, and served a notice on the executors of the late Sir John Aird, who in his lifetime was a member of the plaintiff firm and a party to the contract, making a claim against his estate of about 1,000,000, as damages for breach of contract.

Mr. Upjohn, K.C., Mr. Macnaghten, K.C., and Mr. Schiwan, appeared for the plaintiffs; Mr. Upjohn, K.C., Mr. George Cave, K.C., Mr. Romer, K.C., Sir Hugh Fort, Mr. Mathews, and Mr. Hall for the defendants.

Mr. Sidney Walker, engineer, said he was engaged on the Tanjong Pagar Dock for an year, from September, 1908, as timberman ganger, and he had some of the supervision of pile driving. In his opinion, the white supervision over the natives was sufficient. Over him was a walking ganger, a substantial man, who visited him every three or four days, and sometimes two or three times a day. This was his first experience in the East, and as he had just arrived from England, he thought, naturally, that if they had Englishmen to do the timbering they could do any thing. After the English timbermen arrived, he was by the Chinamen. The bottom of the trench in Singapore was decidedly not the place for an Englishman to work in. The mud was "like a handful of grease." The shales they first encountered was too soft for the engineers to accept as a foundation for the dock, although it was too hard to allow the piles to enter, and it had to be excavated. They attempted to drain the pockets, and

constructed a sump for the pump to hang in. They also tried to make channels across to the pump, but it was like trying to make a channel in water; the stuff was very little thicker. A scaffold was erected for the men to work on, and as soon as a Chinaman stepped off he was "in the mud" up to his knees. It was impossible to mould a handful of the mud or to hold a handful of it. In the trench at the east entrance to the dock the mud was of the consistency of soft soap—so long as it was left alone.

Mr. J. S. Gaskell, civil engineer and member of the Institution of Civil Engineers, now in practice as consulting engineer at Victoria-street, Westminster, said he had been chiefly engaged in designing and engineering of dock work in this country and in the East. He was resident engineer of the dock works at Calcutta from 1886 to 1891. On that work there were 2½ miles of dock wall built in timber trenches in mud. Witness said he was chief engineer of the Surrey Commercial Dock Company until the Port Authority took it over. In February, 1910, he was retained by Messrs. Aird, as an independent engineer, to proceed to Singapore and make a thorough inspection of the work at the Tanjong Pagar Docks. He went out and made the inspection. He found that the western trench had been opened out as a trench for 280 ft., the greatest depth being about 22 ft. He made a very careful consideration of the timbering and pile driving, and everything connected with the work. The timbering had a rough appearance, owing perhaps to the timber being hewn, but it was evidently very sound and substantial and well put together. The sheeting was of the usual heavy size. He formed the opinion that it was quite sufficient for the purpose which it was intended to fulfil. Witness carefully examined the mud and found it was of a very treacherous character. He saw it in varying circumstances and under all working conditions, and he found it impossible to walk upon it. The coolies had to walk on planks. When it was raised by the steam navy it had the movement of a huge mass of dough. Looking at the maps put in, witness said there were always local faults in timbering, but they did not indicate that the work was generally faulty.

Mr. M. B. Friedberger, a civil engineer, gave evidence that the plaintiffs had an enormous amount of plant on the works, the value of which must have run into six figures. He said that most of the plant was modern, and all of it was kept in a proper state of repair. He considered that the plant was adequate for the purpose of carrying out the contract. The defects shown on the photograph were not due to inferior workmanship, but to the pressure of the mud. During the fifteen months he was on the works the average number of men employed was one European to forty-eight natives, and he considered that a reasonable amount of supervision.

[The case had not concluded as we went to press.]

LONDON COUNCILS.

Action.—The tenders of Mr. H. Morecroft, of Acton, has been accepted, at 315*l.* and 27*l.*, for resurfacing the carriageways of Montagu-gardens and Oakley-avenue respectively with tar macadam.

Hornsey.—The tender of the Praed Road Construction Syndicate, Ltd., has been accepted at 3,072*l.* 10*s.* for repairs to Fortis-green, Fortis Green-road, and part of Colney Har-borne. At the meeting of the Council last week the opinion of Mr. Macmorran, K.C., on the question of the liability of the London General Omnibus Company in respect of the motor-bus traffic along roads in the borough was given. Mr. Macmorran states that he thinks there is justification for the suggestion that the motor-omnibus traffic over such a road as Fortis-green is 'extraordinary traffic within the meaning of the statute, and that the omnibus company may be made liable in respect of it, partly because it is of the character and description which is quite new to a road like Fortis-green, and partly because it is exceptional in the frequency of the journeys over the road. The company, therefore, are to be asked to make a contribution towards the repair of the roads mentioned, and informed that, in the case of their not doing so, they will be held liable for the expenses. Plans have been passed for Mr. George Taft, Turnpike-lane, for four houses in Rokewood-avenue, and for Mr. Charles Tucker, Southern-road, Muswell-hill, for houses in Fordington-road, Muswell-hill.

Midhurst.—At the meeting of the County Council last week a proposal by the Highways Committee was approved for widening the Brent Bridge, Hendon, at an estimated cost

of 4,755*l.* The existing bridge, the Committee stated, which is built entirely of bricks, and has a width of only 28 ft. between the parapets, with a carriage-way of 23 ft., is now quite inadequate for the needs of the present traffic, which has, during the last few years, increased to a very material extent. The scheme provides for the widening of the bridge and approaches for a distance of 500 ft., either side to a width of 50 ft. The widened portion (on either side) will be constructed with longitudinal steel girders and decking. The same Committee also reported having had under consideration a communication from the Twickenham Urban District Council covering a copy of a resolution adopted by them pointing out the inadequacy of Richmond Bridge to serve the present traffic, and urging the County Council to take the matter into consideration so as to obtain further powers for the Commissioners, or for the transfer of such powers. The Committee had also considered a communication from the Society for the Protection of Ancient Buildings, protesting against any alteration of the existing bridge, also a letter from the Bridge Commissioners addressed to the Twickenham authority, intimating that they had neither the power nor the funds to carry out the proposed reconstruction of the bridge. The Committee recommended that intimation should be given to the Twickenham Council and the Society for the Protection of Ancient Buildings that the County Council is now expending, in conjunction with the Surrey County Council, a large sum of money in widening Kingston Bridge, but that at a later date they (the County Council) may communicate with the Surrey County Council with regard to the widening or reconstruction of other bridges over the Thames. Mr. F. Aylard moved that the recommendation be referred back, because he believed the Committee put this recommendation forward in this way because they would not take the responsibility of initiating so expensive a scheme as that of a new bridge across the Thames. The improvement or reconstruction of Richmond Bridge was generally admitted to be one of the most urgent and important questions in South Middlesex, as the traffic had very largely increased. The general notion seemed to be that it was necessary to rebuild the bridge, which would entail a very heavy outlay, but an improvement which would go far to meet present needs could be carried out for a few thousand pounds, seemed to him that something should be done to widen the centre spans of the bridge. After further discussion the matter was referred back to the Committee in order that they might obtain further information. The Asylums Committee reported that they had found in practice that additional accommodation was required for the female staff at the Napbury Asylum. They state that the nurses' rooms provided in their recent extensions are insufficient for proper administration, nor is there sufficient room for the extra domestic staff required. There were also no messrooms, recreation-rooms, or staff scullery accommodation, which are now found to be essential. The existing accommodation in the upholsterer's shop and hair-picking room is also quite inadequate, and, further, a residence should be provided on the estate for the Assistant Medical officer. The Committee requested the architect, Mr. Rowland Plumble, to prepare plans of the works proposed to be carried out, and which they recommended the Council to approve. The whole cost of the work is put at 6,461*l.* The Committee also consider that desirable to build six additional cottages for garden laborers, the cost of which, according to the estimate of the County Surveyor, would amount to 1,255*l.* The Committee's proposals were agreed to. The County Buildings Committee reported that at the close of the excavation for the foundations of the new Guildhall the architect had drawn attention to the fact that it had been found necessary to excavate some 2 ft. deeper than had been anticipated in order to find a satisfactory foundation for the new building, and that this alteration in the depth to which the foundations were to be taken would cause extra cost in excavation, concrete, and walling. It is not possible to ascertain the additional cost of the extra work to the foundations, but the quantity surveyors estimate the extra cost at about 3,500*l.* The lowering of the foundations has allowed the height of the rooms on the basement floor to be increased by some 2½ ft. to 3 ft. In consequence of the lowering of the basement the architect advises the installation of a Shon ejector, at cost of 1,500*l.*, to deal with the sewage, so as to prevent any risk of flooding from the public sewers. The Committee recommended the Council to adopt the architect's advice. This was also agreed to.

Regent.—Plans have been passed for Mr. W. G. Jackson and Messrs. Harry Hooper & Co., for the erection of a factory in Epsom-street, Millwall, for the D.B.P. Syndicate, for additions to Nos. 1 to 10, Marsh-street, respectively.

Southgate.—The Surveyor has been instructed to report upon the additional work to the main roads in the district needed by the motor-omnibus traffic, and, at the same time, to submit an estimate for paving wood-lane, at unpaved portion of H. lanes and a portion of the Southgate-road.

Wandsworth.—A plan by the Borough Engineer has been approved for paving proposed to be carried out in connection with the widening of Putney-hill. The estimated cost is put at 330*l.* Channelling, kerbing, and works are to be executed in various roads in the Borough at an estimated cost of 1,000*l.* Tenders are to be invited for paving P. Southcoff-road, Streatham, as a new Tenders of Messrs. H. Woodham & Co. at 255*l.* and 27*l.*, have been accepted for carrying out repair work in portions of Wimbledon Park-road and Viewfield Southfields, respectively. A plan has been passed for Mr. W. Saint for the erection of St. Thomas's Church Hall in Telferds-Redbourne roads, Balham; also for Mr. G. Godson & Sons, for additions to Gregory's Presbytery, Garratt-lane, hill, Springfield.

Watford.—Application is to be made to the Local Government Board by the Watford Sanitation Committee for the carrying out of a scheme for increasing the accommodation at the house. The cost of the work is estimated at 250*l.*

Wimbledon.—A surface water sewer to be laid along Park-side and Queensmere Road, at an estimated cost of 175*l.* Plans submitted by the Borough Surveyor have been approved for making up Marryat-road at a new. The estimated cost is put at 2,182*l.* A plan by the Surveyor has also been approved for providing for an additional ward at the St. John's Hospital, at an estimated cost of 1,000*l.* Plans have been passed as follows:—Potterton, additions to "Bedruff," Marryat-road; Mr. R. J. Thomson, alterations Nos. 30 and 31, Broadway; Messrs. F. Bros., eight houses, Vineyard-hill. All have been lodged by Mr. T. W. Moser, alterations at "Hillbrook," Murray-road.

PATENTS.

APPLICATIONS PUBLISHED.*

21,743 of 1911.—Joseph Collinson Cuddeon, etc., roads, or the like.
21,999 of 1911.—Hookes Evelyn Ball Cotton and Nigel George Crompton; Machines for laying down and spreading road material.
22,671 of 1911.—Dr. Casimir Nowotny; Gregr Franz Beltowski; Door locks.
25,194 of 1911.—Alfred Owrarn; Extension ladder.

* All these applications are in the state which opposition to the grant of Patents thereon can be made.

List of Competitions, Contracts, etc.

For some Contracts still open, but not included in this List, see previous issues. Those with an asterisk (*) are advertised in this number: Competitions, —; Contracts, iv. vi. viii. x.; Public Appointments, xviii.; Auction Sales, xxiv. Certain conditions beyond those given in the following information are imposed in some cases, such as: the advertisers do not bind themselves to accept the lowest or any tender; that a fair wages clause shall be observed; that no allowance will be made for tenders; and that deposits are returned on receipt of a bona-fide tender unless stated to the contrary.

The date given at the commencement of each paragraph is the latest date when the tender, or the names of those willing to submit tenders, may be sent in.

* It must be understood that the following paragraphs are printed as news, and not as advertisements; and that while every endeavour is made to ensure accuracy, we cannot be responsible for errors that may occur.

TO CORRESPONDENTS.

NOTE.—All communications with respect to literary and artistic matters should be addressed to "THE EDITOR" (and not to any person by name); those relating to advertisements and other exclusively business matters should be addressed to "THE PUBLISHER," and not to the Editor.

All communications must be authenticated by the name and address of the sender, whether for publication or not. No notice can be taken of anonymous communications.

The responsibility of signed articles, letters, and papers read at meetings rests, of course, with the authors.

We cannot undertake to return rejected communications, and the Editor cannot be responsible for drawings, photographs, manuscripts, or other documents, or for models or samples, sent to or left at this office, unless he has specially asked for them.

All drawings sent to or left at this office for consideration should bear the owner's name and address on either the face or back of the drawing. Delay and inconvenience may result from inattention to this.

Any communication to a contributor to write an article, or to execute or lend a drawing for publication, is given subject to the approval of the article or drawing, when received, by the Editor, who retains the right to reject it if unsatisfactory. The receipt by the author of a proof of an article in type does not necessarily imply its acceptance.

N.B.—Illustrations of the First Premiated Design in any important architectural competition will always be accorded for publication by the Editor, whether they have been formally asked for or not.

TENDERS.

Communications for insertion under this heading should be addressed to "The Editor," and must reach us not later than 6 p.m. on Wednesday. [N.B.—We cannot publish Tenders unless authenticated either by the architect or the building owner; and we cannot publish announcements of Tenders accepted unless the amount of the Tender is stated, nor any list in which the lowest Tender is under 100, unless in some exceptional cases and for special reasons.]

THE NEW BRITISH SCHOOL AT ROME.

THE project, which is now well-under way, to expand the present British School at Rome and make it a centre, and a residential centre, for picked students in architecture, painting, sculpture, and archaeology, will call for the cordial good wishes of all. Up to now the British School at Rome has been the focus of much archaeological work, and particularly under the gifted guidance of now Messrs. Danister Plitcher & Sons. But it has been cramped for space and limited in scope, unable to receive the many students of art who come to Rome more than the hospitality of its common room in the Odescalchi Palace, and the ready advice and sympathetic help of its directors in the framing of plans of study. With the help of funds obtained from the Commissioners of the 1851 Exhibition will before long be possible to substitute for this a new school more spacious on the lines of the French School at the Medici Villa; each of the branches of architecture, sculpture, painting, and archaeology will then be free to develop its own lines of study, drawing at the

same time inspiration from its sense of being one part of a great whole.

It is a scheme quite new to British ideas. Hitherto our schools both at Rome and Athens have been essentially archaeological, rather for the scholar than the artist. It is now proposed to combine the two. And there may be some who would at first sight be inclined to look askance at the suggestion where it touches the training of architectural students; some who feel that we are now to conceive of architecture as essentially something alive, a thing of the future, not of the past, "a living architecture" (to quote Professor Lethaby), "always being hurled forward from change to change."

We must at once confess to a large amount of sympathy with this view of architecture as a something vital which is looking to the future, but not with the further implication that in order to see the future we must turn our backs upon the past. If the student is to deal finely with the architectural problems of the future he must add to his knowledge of structural mechanics, his familiarity with materials, his grasp of arrangement, a faculty of imagination without which

these various factors cannot be fused into a single whole. Imagination, that most elusive of faculties, might perhaps be provisionally defined as the "power of detachment from the present, the power which can make the past live for the poet or historian, the future for the artist. Rome is so permeated with the spirit of the past that it is difficult to be there long and escape the infection. And from the earliest days of the settlement on the Tiber hills, when the "bridge-builder" was "pontifex" and chief priest, to the audaciously dominant memorial of King Victor Emmanuel in our own day, Rome has tended to express herself in 'building. This in itself naturally stirs the architectural imagination, and the student will feel the force of this appeal strengthened in proportion as he feels himself, not a unit in a multitude of sightseers, but in a measure a citizen of it, through his membership of the British School, as an undergraduate feels himself a citizen of his University town.

So much by way of general reply to those who might be led to consider the whole project a step back rather than forward. The details of the method of

selecting students have already been published. There is to be, in the first place, an open qualifying examination, the subject set for this being worked out as far as possible concurrently in this country and in the colonies. The designs must be submitted by competitors in Great Britain not later than December 7 of this year, and by those in the Colonies not later than January 20, 1913. This will be followed by a first competition, open to candidates selected in the open examination, to the winners of certain scholarships, and to candidates nominated by certain bodies, and to colonial students upon certain conditions. It will be judged on the designs of given subjects worked out in the students' own time and at home. Out of this competition will emerge ten tested men qualified to sit for the final competition, which will be held on the premises of the Royal Institute of British Architects. These candidates will work *en loge*, and at the end of the first day the sketch designs will be sealed down under tracing-paper. The designs will then be worked out in the three weeks allowed *en loge*, on the lines of the first sketch design. Candidates must be British subjects and less than thirty years of age at the date of entry for the final competition in September of each year. The general control of the examination will be vested in the Faculty of Architecture of the new School, with Professor Reginald Blomfield, A.R.A., as Chairman and Professor Reilly as Hon. Secretary.

The Rome Scholarship will be tenable for three years, and will be of the yearly value of 200*l*. When the scheme has been working three years there will be at Rome three architects, three painters, and three sculptors, working there in any one year exclusive of the archaeologists, who will be on somewhat different lines, each drawing 200*l*. per annum. Similar in every way, except that it is open to all Associates and students of the Royal Institute of British Architects under the age of thirty years, and to them alone, will be the scholarship which is now being founded by the Institute from money left by the late Mr. Jarvis. And no doubt other exhibitions and studentships will be founded in connexion with the new School.

We are further enabled in this issue, by the courtesy of the Commissioners and the architect, to reproduce plans and the principal elevation of the new School on one of our Plates. For the British Fine Art Section in last year's Rome Exhibition Mr. E. L. Lutyens designed a temporary building in the Borghesi Gardens; this has been generously given by Colonel Humphreys to the new School, and the Syndic of Rome has given the freehold site. The original building was of timber framing and plasterwork, built with that remarkable skill in counterfeiting stonework which the Italians possess. The general design of the façade is not unfamiliar to students of Wren's work. The timber and plaster façade is to be replaced by brickwork similarly plastered. The Italians thus perpetuate the methods of Imperial Rome, using, however, the dust of Tivoli stone in place of powdered marble. It is, of course, an imitation of stonework, as is nearly

the whole of Palladio's work at Vicenza. Though it may seem an insincere method to the Englishman, it is almost the normal to an Italian. All the same, it might be wished that the Commissioners had seen their way to using travertine. But the additional cost, we understand, would have been prohibitive.

The immediate intention of the Commissioners is to build the part distinguished by a slight tint on the plans we reproduce, omitting at first the Director's room and the common-room at each end of the façade, and also all the residential quarters. We must strongly express our hope that it will be possible very soon to build the students' rooms, and further to lay out a garden. The idea of the School as a hostel—a college where students can live together—is one of the most attractive points about the scheme, and one fullest of promise.

A certain amount of criticism has been directed against the system of the Final Examination, and particularly against the *en loge* system. No doubt this method is unfamiliar to British students, but the architectural schools can remedy that. It is questioned further whether the best designs are going to be produced on these lines, whether it is not likely to be most fruitful to encourage the slow maturing of an idea and its rapid working out, rather than a swift conception elaborated at leisure; or at least whether it is wise to tie the competitors down to any particular method. We gather that in France one result of the *en loge* method has been to develop the facility of sketching out a first design which is so vague that it will not hamper later and happier ideas. In any case, however, the system of examination is at first necessarily experimental, and we do not suppose that there will be any difficulty in modifying it later. This is only a criticism of detail. The larger question of administration is no doubt being thoroughly considered. We imagine that each of the four branches of the School will be eventually under its own Director. The appointment of the Director of Architecture naturally concerns us most here. He will need to be a man of wide sympathies and infectious enthusiasm, and at the same time able to hold his own in an intellectual centre such as Rome. We shall look forward with interest to the appointment.

The lines of study to be pursued by the prizemen will naturally be left to the Director and the Faculty. They will no doubt be guided to some extent by the experience of the French School, but the model will not be servilely copied. A vast amount of restoration work on paper has already been done; without doubt the French School has made that field peculiarly her own. The educational value of some ambitious restoration work, such as that of M. Chedanne at the Pantheon, or M. Hulot more recently at Selinus, is very great. It is a big work, needing all a man's energies, a systematic and exacting piece of training, demanding observation, accuracy, and imagination. And it is lit by the glory of the explorer. The major portion of the student's time as scholar of the School at Rome will doubtless be devoted to one large

and absorbing labour, whatever it be, whether recording masterpieces of the Renaissance in Italy, collating plans of Baroque churches, or investigating the ancient Etruscan remains scattered about the country about which all too little are known. For Rome will be the headquarters, but not necessarily the field of action. Advantages will naturally be taken of its position as centre of the Mediterranean world. But we hope a *chef-d'œuvre* will be an essential part of the course. The butterfly habit is too largely ours. And it is important that the student should have the stimulus of the feeling that he is really doing a work of importance, adding to the world's stock of knowledge and inspiration. "Self-improving" is abhorrent to the right-minded.

Will this great adventure be backed up? Will men be found ready to devote three years to further study? For by the nature of the competition only mature students, who have already undergone a stringent apprenticeship, are contemplated. We may say at once, fully and frankly that the whole scheme is in jeopardy unless there is some guarantee that the Rome prizemen will be marked men in after life, reasonably secure of work under Government patronage. Even the French, who have far more a nation of students than we have this stimulus, in addition to the distinction of the Prix de Rome, of an assured career. We have reason to believe that the Commissioners are by no means blind to this aspect of the question. And the success of the scheme is largely bound up with it.

It is, indeed, a notable adventure, a promise. Should it succeed it may react upon the intellectual as well as the artistic life of the nation. To have in Rome a great college of scholars supported by public and private money and devoted to the study of what has been that we may know more clearly what shall be—a building which will naturally tend to become the centre of English life there—is to take our place again among the cultured nations in the eyes of Europe, a place we have lost since the Napoleonic wars. To the Commissioners and the Committee we have carried on the preliminary negotiations we owe a debt of gratitude. It can only be hoped that the response will be adequate to the opportunity.

A CITY IMPROVEMENT.

WE are glad to note that the Corporation of the City of London appear to be taking a keen and intelligent interest in the possibilities of improvement brought on the tapis in connexion with the building of St. Paul's Bridge, and we may congratulate the newly-formed London Society on the useful public work they appear to be doing in initiating interest in these improvements.

A brief résumé of the various steps which have led up to a meeting of the Corporation, which we understand to be held next Thursday, at which some general settlement may be arrived at, may not be out of place.

In answer to a question asked in the House of Commons on July 24 last

whether street improvements in
ity to the Post Office could be
ered, the Postmaster-General re-
that if the City Corporation desired
any suggestions he "would be
de to consider them."

holidays intervening, the Secre-
the London Society wrote to the
Commissioner to ask whether the
operations at the south end of
General Post Office site could be
over till the end of October, and
er was received in reply stating
it would be some time before
ag operations on that part of the
uld be commenced.

sub-committee of the London
y was then appointed to consider
atter, and on October 30 a depu-
from the Society waited on the
ation and placed before them
plans embodying suggestions
by Mr. Crow, to which we referred
issue of August 16, and also a
tion of Mr. Leverton for con-
g the new road in a straight line
would absorb Foster-lane, open
Vedast, as well as the fine front
Goldsmiths' Company's Hall, and
place an additional site at the
al of the General Post Office.
ewly-formed street would form at
point a wide access into Aldersgate-

latter scheme has much to recom-
it, and from a descriptive article
Daily Telegraph of November 11
uld appear that the Corporation
sympathetically consider what
be a very important improvement.

NOTES.

THE eminently weighty
and balanced Presidential
address delivered by Mr.
ald Blomfield, A.R.A., at the
ng meeting of the Institute is
stive and stimulant of thought in
directions. None of his utterances
n appear to us to be more cogent
rgent with vital interest than those
the relation of architecture and
ssional training to science. Living
s age of science, in which its appli-
s to and developments in building
ther industries have been so many
so rapid, the modern architect, in
ion to the wider range of attain-
s and of responsibilities required
n, finds his domain in the construc-
t invaded by others, and his work
to criticism by a standard which,
limitations and one-sidedness, be-
s unfair and irrelevant. Brick and
as Mr. Blomfield says, must always
their place in building; but new
ms such as steel construction and
concrete have their undeniable
ntages and are not to be ignored.
ar they fall short in aesthetic expres-
the artist constructor is in no
ion to complain that others have
ly usurped his realm, for, though the
tions have been against him, it
as fairly be retorted upon him that
as not held his own, that he has
d behind and failed to make use
w knowledge and opportunity. In
nthusiasm and search for beauty he
lwt too much in the past, paid too
sive court to the elder and fairer

of architecture's handmaidens, and been
somewhat prone to condemn unreasonably
her vigorous younger sister, science. And
so perhaps has tended to forget that
beauty in all its infinite variety, whether
it be sensual, intellectual, or of that
deeper kind we call spiritual, must be
organic, having its being in serviceable-
ness. We find a sensuous and intel-
lectual satisfaction in Greek and Gothic
art as well as an æsthetic, of profounder
quality, in their several kinds. There
is but one art, and its territory is as wide
as all creative industry of human brain
and hand. It has no fence dividing it from
applied science, for science and scholar-
ship are its ministers. Our task is now
to reclaim lost ground, to reintegrate
things wrongly separated. We must
remember there is a science as well as an
art of architecture, and bring the scien-
tific and æsthetic study of it into a
closer unity; for not use alone, or beauty
alone, is our aim, but use and beauty in one.

The Problem of Steel. THE fine constructional
drawings and views of
the Birmingham Council
House extension we were enabled to
publish last week afford a case in point,
and contain an excellent instance of
how a fitting architectural expression
has always lagged behind constructional
science. Saying this, we are not, of
course, offering any criticism upon the
high merit of this particular building,
but pointing only to what has become
an admitted and common practice, to
wit, the clothing of the real—in this case
steel—construction in a sheathing of
stone in the irrelevant forms of an earlier
structural system. For a bridge span-
ning a street to connect two buildings
there are obvious practical advantages
in steel construction; while there are
equally obvious difficulties in its naked
use, not alone on account of the present
purely utilitarian stage of steelwork,
but also the difficulty of combining
in any recognised historic style two
materials of such different physical and
constructional qualities; the airy light-
ness of steel with the massive solidity
of stone in the prevailing severe manner
of classic. It seems to us that the
solution of such problems as this of the
aesthetic treatment of steelwork in con-
junction with brick or stonework is the
philosopher's stone of a modern style.
The intelligent study of the beauty of
past art will still help us here; not by
direct copying or adaptation, for indeed
there is no precedent, but by learning
how it grew in very large measure out
of the full use of such knowledge—science
as well as scholarship—as was available
and the application of it to practical
purpose with the utmost possible tech-
nical efficiency.

Sta Sophia in Jeopardy.

SOME months ago it was
reported that the dome of
Sta Sophia was in danger
of collapse and that the tell-tale strips
fixed in various places had cracked. The
danger now, however, is not that part
only of this superb building is likely to
collapse, but that the whole is threatened
by the infuriated Turks, who, beaten
up to the present by the allied Christian
States, threaten to demolish the whole
of this ancient edifice rather than let it

fall into the hands of their victorious
enemies and allow the Cross once more
to stand over the first Christian church
which has for some 500 years stood
under the Crescent. If the rumours of
pillage and massacre by retreating
Turks be true, the fear that their revenge-
ful spirit will vent itself upon inanimate
matter is likely to be only too well
founded, and the threat of demolition
of this masterpiece of domical construc-
tion by them, as reported in the daily
Press, is likely to become an accom-
plished fact when and if the forts at
Chatalja fall into Bulgarian hands and
the investiture of Constantinople be but
a matter of time. Such a threat shows
a lingering of a barbarous spirit, and
it were a pity that such things should
be allowed to be. It has been wished
by many that this church were in
Christian hands, as it has been argued
that then it would have been kept in
proper repair and not allowed to be the
home of pigeons, who alone have done
irreparable damage. It is to be hoped
that this destruction will not be allowed
by the authorities, but whether they
will be in a position to enforce their
authority—provided they are so inclined
—upon an infuriated mob of armed men
if Constantinople is likely soon to be in
the hands of their enemies is another
matter. We can only hope that events
will prove our fears to be groundless,
rumour being a lying jade, and that
this priceless jewel of construction by
master-minds will be left alone in its glory.

The Insurance Act.

A QUESTION was recently
raised under the Insurance
Act at the West London
Police Court. A carpenter and joiner
took out a summons against a firm of
builders for having failed to deliver to
him his unemployed insurance book.
It was alleged that the defendants, having
omitted to apply to the Labour Exchange
for the insurance book, were unable to
deliver it to the workman, and the
workman claimed damages, 30s. 8½d.,
for having in consequence been prevented
from obtaining employment for four days.
The point raised in the case was whether
under the Insurance Act there was any
jurisdiction to entertain a claim like this
for damages which is in the nature of
a civil action. The magistrate decided
he had no jurisdiction, but said the point
was of importance. We dealt with the
question of penalties under the Insurance
Act for failure to deliver up insurance
cards and books in our issue for October 4.
Under Part II. of the Act relating to
unemployed insurance there is nothing
to suggest a claim being made such as the
above for damages, and the complainant
had to invoke the provisions of the
Employers' and Workmen's Act, 1875,
which relates to "disputes between an
employer and a workman arising out of
and incidental to their relation as such."
In the present case, even if this Act
applied, the relationship would seem
to have been at an end, as the cause
of damage arose in connexion with the
detention of the book after the contract
of service was determined, but no doubt
the case will be taken to a higher Court.
The merits of the case were not entered
into as to whether there had been any
default on the part of the employers.

THE ARCHÆOLOGICAL CONGRESS AND THE CONGRESS OF THE HISTORY OF ART IN ROME, OCTOBER, 1912.

THERE could, from many points of view, have been no city more fitted to be the seat of the third International Archaeological Congress than Rome—the centre of the ancient world during the period of her greatness. Homage had been done to earlier ages of the world's history by the first Congress held at Athens and the second held at Cairo; and now it was the turn of Imperial Rome.

In a way, perhaps, the very wealth of material available in her museums and monuments was a hindrance; those who came for a brief stay from a long distance were often irresistibly drawn, in the fine October weather, from the discussions of the Congress to visit some of the many sights that the Eternal City has to show. It is true that a certain number of such visits were on the programme. Comm. Boni conducted members of the Congress to see his new excavations on the Forum and the Palatine, after having facilitated their comprehension of what they were to see by an eloquent lecture in the hall attached to the new Forum museum, which is housed in the former monastery of S. Francesca Romana, ensconced in the ruins of the temple of Venus and Rome. There were, too, two whole day excursions, excellently arranged, in which the members of the Congress were the guests of the local Committee. The first led them to the necropolis of the ancient Etruscan city of Caere, the modern Cerveteri. Here one saw the discoveries made by Signor Mengarelli, who has been conducting excavations on behalf of the Government, and adding new tombs of great interest and importance to those already known. Some of these contain interesting architectural features, and the circular mounds in which many of the rock-cut chambers are hewn have boldly profiled architectural mouldings hewn round their bases, in imitation of masonry, the upper part of the mound being composed of earth.

The second excursion was made to Ostia, where the excavations in progress are leading to discoveries of the highest interest and importance. Ostia was the port of Rome, and the remains now being laid bare are most imposing, and show us something of the life which must have flourished in this great commercial harbour. They belong, it seems, in the main to a reconstruction on a new plan in the time of Hadrian, but traces of earlier periods are not lacking.

The Congress itself was divided into twelve sections, but these were reduced by fusion to nine, some of which hardly met at all, while others had very full programmes. There were also, especially towards the end, joint meetings of several sections. Even so, however, it was felt that there was too much subdivision. Cognate subjects were often dealt with simultaneously in different sections, so that it was difficult to be present at all the papers which one might have desired to hear. Had there been fewer sections, and these mutually exclusive, it might have been easier. There were, too, frequent postponements and changes of programme—a defect common to all Congresses, but none the less annoying to those who wish to hear particular papers bearing on their special subjects of study. Among the papers most interesting from the architects' point of view, besides Comm. Boni's lectures, may be mentioned M. Balanos' paper on "The Consolidation of the Buildings of the Acropolis of Athens"; Mgr. Bulic's paper on "Two Christian Basilicas Recently Excavated at Salona"; Miss Van Deman's papers on "The Development of Brick-faced Concrete Construction" (in which a serious attempt is made to provide a trustworthy system of dating the brick-faced walls so commonly used in Imperial Rome, previous criteria having proved unsatisfactory); the communication of Professors

Hampel, Hekler, and Kuzinsky on "The Excavations being carried out at Aquinum and Interisra, in Pannonia, by Hungarian Archaeologists"; Mr. O. L. Richmond's exposition of his theories in regard to the temple of Apollo and the palace of Augustus, on the Palatine; Professor Spinazzola's account of the recent excavations at Cuma, Paestum, and Pompeii* (a visit to these places was organised as a sequel to the Congress); Dr. Fritz Weege's paper on "The Paintings of the Golden House of Nero," in which he described a number of paintings in rooms not accessible to the public, many of which have been drawn by artists of the Renaissance, and even in the XVIIIth century, which, owing to their beauty and interest are deserving of being rendered generally known; and Dr. Ashby's paper on "The Aqueeducts of the City of Rome."

The next Congress is to be held in the South of France and in Algiers, in 1915.

The Archaeological Congress was immediately followed by the Tenth International Congress of the History of Art. The succession of the two was appropriate, inasmuch as Ancient Art was fully dealt with at the Archaeological Congress, while the four sections of the Art Congress dealt respectively with Christian and Medieval Art, Renaissance Art, Art from the XVIIIth century onwards, and the Methods of Publication and Study. As, however, it is not likely that the two Congresses will coincide in the future, it is not unlikely that a section dealing with Ancient Art may be added at the next Congress, in order that what is really an artificial division between the various stages of a continuous development may not become stereotyped.

The discussions in the various sections took place in the mornings, while the afternoons were devoted to plenary sittings, in which the more important papers were read before the whole Congress.

The discussions on the relations of Italian art and architecture to that of the rest of Europe (which was, appropriately enough, the special subject to which the Congress devoted its attention) were so many and diverse that it would be difficult to fix upon particular points more deserving of emphasis than others, and those who were not able to attend the Congress must rather be referred to its *Transactions*, which will appear in a few months' time.

As in the case of the Archaeological Congress, much had been done by the local Committee to render the visit of the members of the Congress pleasant and profitable. Many of the private collections and galleries of Rome, which are often inaccessible to the ordinary visitor, were thrown open to them (such as the private rooms of the Palazzo Doria, with their splendid pictures and furniture; the Villa Albani, with its fine collection of ancient statuary; the magnificently decorated saloons of the Palazzo Farnese, the Palazzo Barberini, etc.). A visit to the villas of Frascati was organised; while the excursions to Viterbo and Subiaco were unfortunately spoilt by bad weather.

There were interesting exhibitions of works relating to the History of Art, both generally and specially, and of specimens of processes of reproduction.

Both Congresses held their meetings in buildings architecturally interesting. The Archaeological Congress met in the University (1575-1650), with its fine two-storied colonnaded court—the work of Giacomo della Porta and others (it is said from a design of Michelangelo); while the Art Congress held its sittings, by courtesy of the Academy of the Lincei, in the Palazzo Corsini, which formerly belonged to the Riario family, and owes its present Baroque form to Fuga (1729-32). It has a fine and very large staircase, and a curious well-opening, lighting the large hall on the first floor, which gives access to the various rooms.

The next Congress of the History of Art is to be held in Paris in 1916; and it would

be a very great boon to students of art and architecture if the following Congress were to be held in London.

In Great Britain instruction in the History of Art, in comparison with what is done in other countries, more especially in Germany and Italy, practically does not exist, and there can be no doubt that it should be recognised as a subject of study at secondary schools and at Universities and colleges. In the present, as the Preface to the first annual volume of the Walpole Society complains for some reason not easily to be understood, the history of the Fine Arts in Great Britain and Ireland has attracted but a small number of students, even among our countrymen. The consequence is that British art, as a whole, does not occupy the place it deserves in general estimation, either at home or abroad. The subject might be added in regard to the scientific study of the art of other countries in the periods than the classical; and the mass of the Congress of Art in England would be more than anything else to reveal the necessity of such a study, and to stimulate interest throughout the country.

A NEW HISTORY OF ARCHITECTURE.

He who undertakes to write a history of architecture may be likened to the navigator who sets sail on a dangerous sea beset with perils which may cause shipwreck. It is necessary to generalise soundly and to bring to the critical faculty in a high degree to assist in giving what is necessary and germane to the subject in hand, while at the same time avoiding unnecessary detail.

To this task Mr. Statham has brought an immense fund of knowledge and the sympathy and insight which can only come from a lifelong study of the subject; and may say that he has produced a book which will prove most useful to the student, and will also be a treasured possession to all who are interested in architecture.

In the introductory chapter the author criticises the usual division into styles, being likely to convey a false impression. Every work of architecture is but a transitional link between past and future, and only style we know of to which this does not apply is the Egyptian, and if we have fuller knowledge of past history we shall probably find in it, too, a link with a superior development.

Mr. Statham accordingly divides his history into seven sections, which may be described as periods of development, viz.:—(1) Architecture before the Greek Period; (2) Greek and Rome, the Great Columnar Styles, the Domed Styles and the Byzantine Type; (3) From Romanesque to Gothic; (4) Saracenic Interlude; (5) The Gothic Period; (6) From the Renaissance to Modern Times; (7) From the Renaissance to Modern Times.

Architecture is described as "a symbolism." "Symbolism controlled and expressive of, structure might be defined as architecture in the highest sense." The three great culminations of architectural achievement are instanced as being the Greek of the Vth century B.C., Hagia Sophia, and XIIIth and XIVth century Gothic. In the two latter the author was to "eliminate everything which was not required in working out a difficult form of building construction in a complete manner in the former, as the author puts it, there is "no constructive problem."

Architecture is defined as being more imaginative than painting or sculpture, inasmuch as the latter "address our mind through objects that are familiar to our human senses," while the appeal of music and architecture is rather "metaphysical than physical."

The review of the first period is very able, complete, and a clear and lucid description.

* Cf. *Builder*, October 4, 1912, p. 876.

* "A Short Critical History of Architecture." H. H. Statham, F.R.I.B.A. (Batsford, 1912, 10s. 6d.)

period anterior to Greek is given in sixty-five pages. Mr. Statham appreciates of the fine qualities in architecture, taking a judicious between critics like Mr. March Phillips, who have unsparringly condemned, and who have equally extravagantly praised it. We are reminded both of its beauties and its failure in detail and pretence in the distribution of

architecture is fully and carefully shown, and, as we should have expected from the author's thoroughness, a careful study is given of the refinements and beauties of this wonderful phase in the artistic history. He very truly writes of the Orders that "there is nothing to be gained for training the eye and taste. If we were made to go through a course of the Orders as part of their training they would not startle us by those coarsely carved and disproportionate mouldings, rude attempts at ornament which are so unfortunately characteristic of their early and important and valuable works."

The great subject of Roman architecture is treated as completely as it can be within the limits of some forty pages. We feel that, in writing, architectural writers have less to do with the great works of Rome than they deserve, and it has always been to us unfortunate that this chapter in the history of architectural development so fully follows one characterised by the refinement met with in the history of the

art, showing crudities of design we sometimes forget that under the Roman the art of architectural planning was perfected, and perfected as it never had before and never has been since, and it constitutes a contribution to our knowledge second to that of Greece.

The mind of man being finite, and architectural possibilities almost infinite, it is impossible to expect the highest measurement in the whole field at one and the same time.

The chapter on Romano Egyptian building is important, for in one respect it is unique. "The Serpent of Old Nile" absorbed the land in Egypt alone of Roman times was the architecture of the country race not only modified but completely transformed.

The succeeding section dealing with the style of the conditions of domical construction are thoroughly and carefully written, and the Persian domical buildings under the Sassanids are first treated. Mr. Statham points out that "it is Asia Minor and the East, not to the West that we must look for the suggestions culminated in Byzantine Art." The church of Sta Sophia and the ramifications of Byzantine influence in Greece, Italy, and the South of France are well described. The Sophia the author observes that the "is a remarkable combination of styles not often found together; it seems to combine the refinement of Greek detail with the warmth and colour of Oriental

The succeeding section deals with the development from Romanesque to Gothic. Vivid and striking are such sentences as the following:—"Romanesque, though it opened into Gothic, was in itself a kind of architectural culmination, the achievement of a consistent style of round-arched vaulted buildings still retaining in the arch the reminiscence of its Roman

The germ of the mediæval arcade is found in Diocletian's Palace at Spalato, for the first time arches were used directly from columns without the intervention of an entablature. This section with a long series of buildings from the Christian basilicas to the great German, Italian and Italian cathedrals and our own churches.

Mediæval architecture is entitled to conclude"; it is described as continuous

with Mohammedan religion and Mohammedan conquest; yet at the outset that religion had no traditional form of temple, and was affiliated with no traditional form of architecture. The difference between a mosque and temple or church is well defined; the mosque is not "erected in honour of the Deity; it is erected for the shelter of the worshippers and the provision of a place of prayer and temporary seclusion from the outer world." In the fact that the Mohammedans were not of one race but many, simply united by a common faith and unlike the Romans having no style of their own, lies the reason for the great difference between their buildings in different countries. The various developments in Egypt, Spain, and India are touched on. Mr. Statham, in concluding, says:—"Just as the Jews have remained a distinct people through all the phases of human history, Saracenic architecture remains a thing apart from all other phases of architectural history, preserving everywhere its own marked character and, like the religion of which it is the expression, owing no community with anything outside its own limits."

The next section covers that crowning glory of the great mediæval epoch, the Gothic period, which was the culminating effort of the newly-formed countries of Western Europe enthusiastically expressing their vitality and love of life and the ideals of a great church in stone. It is impossible to think without wonder of the great structures of the Ile de France, built among all the difficulties of a rude age, and which enshrined their beliefs and hopes. Mr. Statham, in his introductory chapter, very picturesquely says:—"The mediæval mind was too restless to seek out and bind itself down to the perfection of detail in a single building which was the ideal of the Greeks," but we must, all of us, feel in our blood how glorious were the achievements of this great age in spite of its occasional defects. The author's analysis of the development of vaulting is an able one, and his description of typical buildings as complete as is possible within the limitations imposed by the size of the book. The analysis of the relative merits of English and French Gothic is fair and well presented. The radically different way in which scale was interpreted by the Greek and mediæval architects is touched on; the Greek only considered the "relative proportions of the building itself," the mediæval architect taking as the standard of scale the human figure.

The concluding section brings the book to modern times, architecture in the Renaissance—"for the first time in her great history looking not forward but backward to the precedents of what was considered to be, and was, in some senses, a greater age." "Architecture became, not an automatic evolution of style influenced by construction and material, but a conscious artistic effort, the outcome not of habit, but of choice and culture, the expression not of national but of individual taste and style." A review of the Renaissance buildings of various countries follows, analytical and critical; and very clearly and concisely put. The work is brought to an end by a description of some of the more notable modern buildings, and finishes with a protest against the new spirit shown. "The ultra-commercial spirit which began in America, the spirit which regards a building merely as a thing to be run up as fast as possible to bring a commercial return, has invaded London and is beginning to invade Paris; and unless it is checked will be the death of architecture."

We make no excuse for so frequently quoting the author, as nothing can better indicate the admirable nature of this last addition to architectural literature.

We may, with others, not be able to accept all of the author's views and to agree with all his theories. Mr. Statham is far too original a worker to confine himself to safe platitudes, but no one can escape the conviction that the book is one of which architects

will value and from which the student will benefit.

Like all of Messrs. Batsford's works, the book is admirably produced and very well illustrated, and can with confidence be recommended to all who are interested in the "Mistress Art."

An ordinary general meeting of the Architectural Association was held on Monday, at the Rooms, Tufton-street, Mr. Gerald Horsley (President) in the chair.

Mr. Hall, Hon. Secretary, announced that a visit has been arranged to the Wesleyan Church Hall, Westminster, on Saturday, November 16. Members are requested to meet outside the main entrance at 2 p.m. Also that the Annual Conversazione will be held at 18, Tufton-street, Westminster, on Thursday, November 21, at 8 p.m., and in connexion with this function a "London" exhibition is being arranged by the London Society; and that an exhibition of sketches will be held in connexion with the Camera, Sketch, and Debate Club on November 23, when criticisms will be given by eminent artists.

The President proposed the election of Mr. W. G. Newton as Hon. Librarian and Mr. H. M. Fletcher as an ordinary member of Council to fill the present vacancies.

This was agreed to.

It was further resolved, on the motion of the President, to record a vote of thanks to Mr. T. H. Watson for presenting 233 slides to the Association.

New Members.

The President announced the election of Messrs. R. B. Carruthers and Kozo Kitamura as members of the Association.

Architectural Education.

Mr. Sydney Perks said that lately there had been a letter in the lay Press calling attention to a kind of system of architectural education, and he thought the general impression of the public was that there was no good system of architectural education in existence. He had heard a good many men say that they thought the Architectural Association should have caused a letter to have been sent to the Press calling attention to the magnificent work the Association was doing. He did not know whether the Council had had the matter before them, but he did not think it too late now to let the public know that the Association did exist.

The President said the point would be considered.

MARBLES USED IN GREEK, ROMAN, AND BYZANTINE BUILDINGS.

Mr. J. A. Marshall then read a paper on "Marbles Used in Greek, Roman, and Byzantine Buildings." He said:—

"In this country, where marble is almost an exotic, not yet acclimatised, the subject of to-night's paper can scarcely be considered of vital interest; yet, as students devoted to architecture, you are expected, I assume, to acquire some knowledge of the noblest material ever utilised by man for building and decorative purposes. Apart from its utility, marble has an

inherent and mysterious beauty that appeals to everyone, and especially to those who can study its infinite variations in the light of modern geology. The sparkling fracture of white marble interested the ancient Greeks, but they did not know, as we do, that the minute cleavage planes or facets that cause the lustre denote a molecular change in the structure of ordinary limestones.

We are told by geologists that this change has been produced by "pressure metamorphism," a high-sounding term, implying that the crust of the earth is mobile, and subject to crumplings, foldings, squerings, shearings, and other ailments, mostly very insidious in their attacks.

By this gentle treatment sedimentary rocks, such as limestone, can in the course of ages be altered beyond all recognition; what was once a limestone mud becomes a hard crystalline rock by pressure, friction, heat.

How the chemical or electrical forces act on the minerals of a rock to form crystals I cannot tell you, but it is known that crystals develop according to the freedom given them, and to the length of time they are under the influence of the forces that produce them.

In a compact rock like simple marble, where the crystals have not had room to develop, there is merely a confused aggregation, but if you could find a small cavity, or shrinkage fissure, left in the mass when it cooled and crystallised, you would see the crystals of calcite, beautiful and fragile, protruding from the sides of the cavity.

Most crystalline marbles, when seen in a large way, bear evidence of the flow or movement to which the material was subject before it crystallised or became firmly solid; the lines of disturbance are perpetuated by folia, streaks, or veining, that sometimes represent the thin beds of clay, shale, or other impurities with which the original limestone was interstratified. They are often associated with silvery mica or greenish chlorite, developed under pressure during the movement of the mass. In some instances the pronounced development of these minerals along the planes of contortion makes the marble almost schistose in structure, it readily cleaves along these planes, but is broken with difficulty in a transverse direction.

It is not uncommon for marbles, like human beings, to show "faults"; this is a geological term applied to rocks that have been split in a direction opposed to the veining, and, after having slipped, had again become united. In some of the strongest marbles the only evidence of the rupture is a sudden break in the continuity of the veining; the scar itself has healed so perfectly, by a mysterious process of chemical secretion, that the strength and homogeneity of the mass are not in the least impaired.

Needless to say, the metamorphosis of limestone may take place at any time after its deposition and consolidation; the great formations of marble in Greece and Italy owe their present structure, it is believed, to comparatively recent geological periods, when the main upheaval of the mountain ranges took place; yet countless ages have passed since then, and thousands of feet of contorted strata have been "denuded" or worn away, leaving exposed, for the benefit of man, the upturned edges of congealed streams of marble.

Marbles Used by the Greeks.

The traditional forms of classical Greek architecture demanded that marble should be used in massive blocks, so that it expressed the construction, without being, in the ordinary sense, a decorative material; applied decoration was provided by sculpture and painting. This being so, we can understand why, in the classical age, the Greeks preferred the white marbles of their country to the variegated species. The latter, so much sought after by later generations, were never thought of while the art of Polygnots flourished, and they were utterly incompatible with Hellenic building construction and design.

Before the Persian invasion common limestone was mostly used for building purposes in Greece; this applied even to Athens, although that city is only a few miles from an unlimited supply of the purest white marble.

Later, during the years of comparative peace, the statesman Pericles gave to the public buildings of Athens a crystalline aspect that made the city the most magnificent in Greece. It must not, however, be supposed that this emphatic choice of marble was entirely independent of precedent, any more than the surpass-

ing genius of Phidias, Ictinus, and Mnesicles, was spontaneously developed for the occasion. Long before the time of Pericles marble was used for a part of the Temple of Apollo, at Delphi, and for parts of the Temple on the island of Egina.

In Athens itself the early Propylæa of Kimon was partly of limestone and partly of marble, and on the opposite shore of the Ægean, the Ionic Vth century Temple of Artemis, at Ephesus, was entirely of marble.

Pentelicon Marble.

For the consummate work of the Periclean period, in Athens, the white marble of Mount Pentelicon was exclusively used. Though brilliantly crystalline, this marble is intercalated with thin seams or ribbons of greyish mica shale, derived from the shaly deposits of the original limestone, and liable to disintegration more than the harder parts. If a piece of the marble is broken along one of these planes, the newly-exposed surface, smeared with mica, will clearly show the direction of the strain when the materials were escaping from enormous pressures. Specks of ferric oxide will also be noticed that have been developed just as garnets commonly are in schistose rocks. When exposed to the weather they produce that mellow tint that comes with age, and which all travellers admire who visit the ruins, grand and beautiful in their desolation, on the Acropolis at Athens. In the British Museum the student will find the structural peculiarities of Pentelicon marble clearly indicated by the scarred and furrowed surfaces of the matchless fragments from the Parthenon.

Hymettian Marble.

The bluish-grey marble of Mount Hymettos, that overlays the white, was not, I believe, much used by the Greeks, but 5 miles nearer Athens, on Mount Hymettos, they quarried a white marble streaked with grey. These quarries were probably worked before the Pentelicon, and their close proximity to the city accounts for the prevalent use of Hymettian marble for secular buildings, especially for the steps, pavings, and thresholds. The grey veining of this marble—straight, nebulous, or jagged, according to the direction in which the blocks are cut—was, perhaps, not greatly valued by the Greeks, and when the marble was used for statuary, during the archaic period, no doubt its natural markings were concealed by decorative painting.

Some years ago an inscribed slab of Hymettian marble was found, which proved to be the specification for building an arsenal at Zee, the principal war harbour of Athens. A Greek named Philo was the architect, and the date of the inscription is about 346 B.C.

There is a flavour of the sea about this "document" quite refreshing. I should say, to the archaeologist whose time is mostly spent amid the dust of ages. Intended for the storage of gear, sails, cordage, tackle, etc., the building was devoid of architectural refinements, yet it was famous for its great size. Four hundred and five feet in length and 55 ft. in width, it was divided into three aisles by two rows of columns. At each end of the central gangway were doorways with inner vestibules and bronze doors, and in the side walls were small windows with bronze shutters. There are no remains of the building, but we learn from the specification that the walls were to be of local limestone; the vestibules were to have independent ceilings of Hymettian marble, and thresholds of the same material; the doorways were to have lintels and linings of Pentelicon marble; the columns were to be constructed of seven drums of Hymettian, while the capitals were to be Pentelicon.

Parian Marble.

The most beautiful of white marbles is that of Paros, where it occurs on Mount Marpesias, between beds of grey, or shallow streams, limpid and brilliant. Out of it were fashioned many masterpieces of Greek sculpture, and thousands of roofing tiles for the temples of Greece. The Athenians built a Treasury of it, by the Sacred Way, at Delphi; so did the Siphnians; and later some of it was used for the monument of Prince Mausolos of Caria.

As an early instance of the use of marble I have mentioned the Temple of Apollo at Delphi, built 530 B.C. It was agreed that this temple should be built entirely of local limestone, but, according to Herodotus, the contractors won a reputation by using Parian marble for the columns of the façade, and declining to

make any claim for the "extra." It need lessen our interest in this statement by "Father of History" to know that no column of Parian marble belonging to this temple has been found.

The archaic pedimental sculptures from Æginetan Temple are of Parian marble, but these were partly painted, we may conjecture that the material was used in this instance not merely for its intrinsic beauty, but because it was most suitable for figures possessing certain slenderness and tenuity, reminiscent work in bronze.

The little Treasury of the Æthionians at Delphi, built just after the battle of Marathon, is like that of the Siphnians, an invaluable example of Attic art at the time of its transfer into the perfect work of the Vth century. From the point of view of our subject it is interesting to note that the sculptured members of the frieze are of the finest white variety of Parian marble, while the triglyphs are of grey and coarser kind.

In Bloomsbury Prince Mausolos of Caria and his consort are familiar figures, as they passively survey the relics of a monument, one of the "seven wonders of the world," if the student wishes to see specimens of Parian marble from this building he must turn to the fragments of the "chamfron" frieze and others in the wall cases of the "Mausoleum" room. The marble used in the main parts of the structure, including colossal statuary, is not as translucent as Parian, and it is not scarred by mica laminae like the Pentelicon; it more closely resembles a marble of the Carian mount, exemplified by the magnificent fragments in the "Ephesus" room of the Museum; and the Temple of Athens Polias, Priene, in the "Mausoleum" room. The main parts of the temple were built of a local bluish marble quarried on Mount Mycale.

The Use of Marble by the Romans.

The Romans by their conquests had facilities which they could not resist for obtaining marbles from all parts of the known world. They eagerly quarried and sent to the capital of their empire not only the simple white and greys of Greece and Italy, but also coloured marbles disregarded by the Greeks, and it is chiefly to their enterprise we owe knowledge of the finest species.

Like the Greeks, the Romans were accustomed to build with enormous blocks of monolithic stone and white marble, but they found the process slow and costly, and the building of the empire practised another, less expensive and more rapid, besides being more durable and more lasting in its results. The concrete and brick called for decoration that could be applied, and as the idea of applying the "Orders" to façades, in connexion with the fenestration, was probably derived from the Hellenistic cities of Asia Minor, so perhaps we may accept the suggestion of the elder Pliny that the Romans derived the art of using slabs of marble for decoration from the Sicilian cities. The statements that the Palace of Mausolos at Halicarnassus and a chamber of the Mausoleum were plated with marble may be true, though there is always the possibility that the incrustation was not completed by the erection of the building. The instance given by Pliny of the early use of marble in Rome cannot be verified from existing examples, yet they are none the less interesting on account. They take us in imagination to the residential quarter on the slope of the Palatine overlooking the Forum, where dwelt many of the rich and influential citizens famous in history.

From Pliny's account it seems clear that the introduction of foreign marbles into Rome was not due to a desire to embellish sacred edifices or public buildings, but rather gratify the private interests of certain officials of the State. After the Roman arms had been carried into Greece, Africa, and Spain, the Romans had increased facilities of enrichment themselves, and with a view to their election for another term of office some of them did not scruple to expend vast sums on the purchase of games, banquets, and dramatic representations, which it was their duty to superintend, besides looking after the streets, sewers, and public buildings. It was in this connexion that a certain Lucius Crassus when he came into office saw an opportunity of getting marble columns over from Greece which he wanted for his house on the Palatine. At this time few, if any, of the public buildings

Rome possessed pillars of marble, and the use of this material by a private individual is certain to be deprecated as savouring of ostentatious luxury; so, to put a fair complexion on the matter, when the columns arrived, they were "offered up" in the temporary theatre as decoration or background for the stage. From the front row of the stalls the Right Honourable Lucius Crassus noted the effect, and when the festivities were over he was in no doubt about the columns, for they were next in erected in the *atrium* of his house, half a dozen of them, 12 ft. in height, the first monoliths of Hymettian marble imported into Rome. This happened about 91 B.C. Later, about 80 B.C., another rich *exile*, *Æmilius Scaurus*, by the instincts of a millionaire and a great collector for columns, imported 360 that were of the black. For nearly a month these supported the upper stories of a temporary theatre, and then the largest of them, 38 ft. in height, were carted away by *Scaurus* to the Palace in the *atrium* of his house.

We need not stay to inquire how columns of enormous dimensions could be utilised for their entirety for an ordinary house; but they may note that their removal through the narrow streets of Rome was not a light affair. It could not be done by stealth, nor without the aid of the authorities, and this "First Commissioner of Works" had to give security for any damage it might be done to the public sewers. It is not known where this marble came from, but Pliny only names it after *Lucullus*, a general, who greatly admired its funeral, and died 56 B.C.

On the authority of *Cornelius Nepos*, who wrote in the reign of Augustus, Pliny tells us that a military engineer, called *Mamurra*, was the first person in Rome who covered the whole of the walls of his house with marble, and who had all the columns of solid marble from *Carystus* and *Luna*. This was about 48 B.C.

Luna Marble.

When referring to the works of certain sculptors Pliny says:—"They used nothing but the white marble of *Paros*, but since their time many other whiter marbles have been discovered, and very recently that of the quarries *Luna*."

It is impossible to say what Pliny meant by "very recently," in view of the statement implying that *Luna* marble was used for columns about seventy years before his birth; perhaps to Pliny's comprehensive mind "one hundred years was one day."

Luna marble was undoubtedly used during the Augustan period, and a block has been found with an inscription cut during the reign of *Tiberius*. The marble was also known as *Ligurian*, from the ancient district in which was found. The nearness of the quarries to the sea facilitated the transport of the blocks to Rome, but their passage through the streets of the city was not without danger, as *Juvenal* reminded his readers, near the close of the 1st century. "Imagine," he says, "the awful consequences of a dray loaded with *Ligurian* marble, that turns over on to the passers-by, when every one of their vulgar carcases is pulverised and vanishes like a breath." Fine in grain, and with only a small percentage of iron in its composition, this white marble does not, like the *Pentelicon*, readily get bronzed by exposure to the air, although after an experience like that of *Trajan's Column* and the *Arch of Constantine* it does get to look a little seasoned or mature. The drums of *Trajan's Column*, about 12 ft. in diameter, and of its counterfeits in the *Piazza Colonna*, are of solid blocks of *Luna* marble, in which the winding stairways were hewn.

The white marbles of *Luna* and *Athens* were used impartially by the Romans for columns, entablatures, and wall linings. The well-known circular temple in the *Forum Boarium* of solid blocks of *Paros* marble; this marble was also used, according to *Procopius*, for the stupendous *Mausoleum* of *Hadrian*.

Hymettian marble was used for paving the vestibules of the Temple of *Faustina*, in the *Forum Magnum*; and antique columns of this marble, futed and unfuted, are to be seen in the churches of *S. Sabina*, *S. Pietro* in *Vincoli*, and *S. Maria Maggiore*. The columns on each side of the *Arch of Severus* are of *Hymettian* marble.

Excepting the grey and black marbles, most of the coloured species known to the Romans have been identified; they were named after the places they came from, and hundreds of roughly-hewn blocks, many engraved with the name of

the quarry and of the *procurator* who managed it, were discovered some years ago in an ancient *emporium* near the *marmorata*, or landing-stages, on the banks of the *Tiber*. Most of these blocks, I regret to say, have been cut up for the churches of Rome.

From the inscriptions collected and explained by an Italian priest, *Fr. Bruzza*, much information has been obtained about the origin of the marbles and the way in which they were brought to the capital. The quarries belonged to the Emperors, and in the course of time the number of convicts employed in them became so great that in *Trajan's* reign a special administration had to be formed to look after them. Each quarry was managed by a *Steward* or *procurator* of the Emperor, who had under him numerous officials. The blocks, before being shipped off, were usually numbered, and frequently marked with the name of the reigning Emperor and that of one of the officials in charge of the quarry. Shiploads of marbles were continually being sent from the ports of Greece, Asia, and Africa. At the port of *Ostia*, near the mouth of the *Tiber*, the Government had an administration to receive the blocks, which were then forwarded in smaller vessels to the *marmorata* at Rome. To convey monolithic columns and obelisks vessels of enormous size were specially constructed. One of these "empties," like the Roman galley recently found in the *Thames*, is still in existence at *Ostia*, where it was utilised by the Emperor *Claudius* for the foundations of a harbour. It is now impossible to realise the quantity of marbles sent to ancient Rome, but it impresses one to know that there is scarcely a church or a palace without columns and wall linings taken from the ruins of the city. Then we must not forget that enormous quantities were burnt into lime in the Middle Ages, and broken up for concrete, and the hard white stucco used by the architects of the Renaissance.

Typical Coloured Marbles Used by the Romans.

The coloured marbles used by the Romans are not only more complex than the marbles used by the Greeks but there are so many varieties of each species that the mere accident of colour cannot be taken as a standard for classification by the student who wishes to have more than a superficial knowledge of the subject; indeed, he should try to realise, difficult though it may sometimes be, that the typical colour of a species, like the flush on a maiden's cheek, is not always present.

For our purpose to-night we may place the coloured marbles in three groups.—Firstly, the foliated and schistose species, in which the folia are sharply defined by colour; secondly, those species that exhibit both the spathic and the brecciated structure; and, thirdly, the true breccias that seldom degenerate into a streaky formation.

The marbles of the second group are the most complex, and they sometimes, I believe, indicate a secondary or later process of metamorphism.

The rock may have been fractured, crushed, or remelted, and invaded by viscous material, or thermal waters; these carried with them fragments, often split across, corroded, and discoloured by the magma, or drawn out into streaks until their identity is lost. The true breccias may consist either of fragments that have been pressed into a viscous material, or of detritus deposited in a fine sediment, which has hardened into a calcareous, siliceous, or ferruginous cement.

The mystery of the origin of most metamorphic rocks will probably always remain. As creatures of a moment we cannot follow a process, plutonic and slow, yet ceaseless in its energy; the change has been revealed to us; but, as *Ruskin* has said in one of his geological disquisitions, the mode of it is "concealed in a deep obscurity."

I will now, before resuming the historical phase of our subject, ask your attention while I very briefly describe a few of the typical coloured marbles used by the Romans, keeping mainly to the sequence indicated by our three groups.

The antique specimens I am permitted to show you, chiefly through the kindness of Mr. *Ernest W. Savory*, of *Bristol*, and Messrs. *Arthur Lee & Brothers*, of *Hayes*, are very interesting and valuable; but you will understand that no single specimen of marble, however large, can represent the variations of a species, just as the varied splendour of a sunset cannot be seen through a telescope.

Marmor Carystium.—From the white and grey

marbles of *Attica* it is an easy transition to the more highly foliated and schistose marble of *Carystus* in the neighbouring island of *Euboea*.

You are no doubt familiar with its bold markings of restful green, grey, and white that made the labour of fitting undesirable when the marble was used for columns. The cloud-like sinuosity and crinkling of the strata are probably due to lateral pressure, just as the grander foldings of the Alps are in Switzerland and Italy; and perhaps from no other species of marble can such decided variations in the veining be got out of a single block, according as it is sawn longitudinally, horizontally, transversely, or obliquely, in relation to the bed. Dislocations or "faults" are often indicated by a sudden break in the veining, and fine shrinkage fissures or cracks, filled in with white crystalline material, sometimes cross the veining; these are not, however, a source of weakness, and the Romans very soon appreciated the strength of the marble for columns. Its weak point is due to talc and chlorite, closely interlaved with the crystalline calcite, that forms the main constituent of the marble.

This intimate admixture makes the marble absorbent, and eventually, when exposed to the weather, the surface peels away. If this marble is infixed with a high polish it soon recovers and the colours become tender. The finest *Carystian* columns in Rome are those ten monoliths, said to be 38 ft. in height, that form the portico of the Temple of *Faustina* in the *Forum*. The antique columnar pedestals of *Carystian* marbles in the *British Museum* can be distinguished from the unripe modern representatives in the same galleries by their mellow tint.

We will next group together three species in which the general structure may be described as a condition between the spathic and the brecciated; both conditions may be present in the same mass, or either altogether absent. The marbles I refer to are the *Marmor Numidicum*, from *Simnitia Colonia*, near *Tunis*; the *Marmor Chium*, from the island of *Chios*; and the *Marmor Scyrium*, from the island of *Scyros*.

Marmor Numidicum.—This yellow marble was greatly prized by the Romans, if we may judge from the quantity found in Rome and from the frequent allusions to it by the classic writers.

It seems to crop up everywhere, from the sacrificial depths of the *Heron* of *Romulus* to the enormous rubbish heap of *Mount Testaccio*. Besides columns, it was largely used for wall decoration and pavings in connexion with other marbles.

The primary colour of this calcareous rock was a creamy-white, but the presence of iron has deepened this to a crocus colour, rose and purple. The excessive induration of the rock with iron has made it very hard and rather brittle. The texture is very minute. The rock invariably shows evidence of having been shattered or cracked after consolidation; and patches of true breccia occur in fissures or cavities, the fragments being cemented together by russet metallic oxide. Some of the spathic rose and purple varieties are very beautiful and baffie description, but the Romans preferred the monochrome yellow variety, and when this was used for columns I believe they were always fluted.

Rough blocks of *Marmor Numidicum* have been found inscribed with the names of the Emperors *Trajan*, *Hadrian*, and *Marcus Aurelius*.

When *Hadrian* visited Africa he constructed a road from the quarries to *Tebarsa*, on the coast, whence the marble was shipped to Rome.

According to *Sententius*, the first *Numidian* column brought to Rome was that erected in front of the *Rostra Julia*, at the east end of the *Forum*, on the spot where the body of the great *Dictator* was burnt; but, according to *Pliny*, some blocks were brought over from Africa, ten years before the assassination of *Cæsar*, by the Consul *Marcus Lepidus*, for the doorway of his house.

Seven "Numidian" columns from the destroyed *Arch of Trajan* now enrich the *Arch of Constantine*, and one is in the *Lateran Basilica*; another in the same church came from the *Basilica Ulpia*, built by *Trajan*. The eight columns in the *Pantheon* are probably of *Hadrian's* time. The paving of the central part of the *Basilica Julia*, probably a restoration by *Severus* or *Diocletian*, is mainly of "Numidian" marble. With the close of the Roman Empire the use of this marble for columns seems to have died out, and, so far as I know, it was not revived during the Byzantine

period, although the marble continued to be used sparingly for inlay.

Marmor Chios.—The marble of Chios, one of the Ionian Islands, was known as early as the IVth century B.C. to the Greek philosopher, Theophrastus. I have not consulted this rare classic, as Pliny did, neither have I looked up the geology of Chios; but Mr. William Brindley has told us he found ancient workings there that yielded a marble very similar to that known as "Porta Santa" by the Italians. This marble is not an easy one to describe, so manifold are its

varieties, which seem to have been most in favour with the Romans, have been found in the ancient *emporium* on the Tiber, with inscriptions of the time of Nero; and many fragments have been discovered among the ruins of a villa, dating from the time of Hadrian, near the Via Tuscolana, five miles from Rome.

According to Strabo, monoliths and large slabs of Scyrian marble were to be seen in Rome near the close of the 1st century B.C., and it became so fashionable there that the price of white marble greatly declined.

basilica are said to have been taken from a triumphal arch erected in honour of Marcus Aurelius, and destroyed in the XVIIth century. I regret I do not remember seeing these columns, but they are probably not fluted.

The main constituent of *Marmor Atracium* is serpentine, mixed with carbonate of lime. For a description of serpentine I must refer you to the text-books on mineralogy.

The calcium carbonate is not all intimately mixed with the green serpentine; some of it appears as pure white fragments, with nebulous edges, suggesting dissolution from the surface inwards. Besides these white calcareous fragments, there are others nearly black that are rather siliceous, and always retain their outlines sharply defined, though they are often split and permeated with the green magma, which, of course, has modified the intensity of their original colour. In an inferior and darker variety the movement of the material while in a viscous condition is indicated by a streaky or spathic arrangement, and the total obliteration of the fragments. The transition may sometimes be seen in a single block. This is also the structure of the serpentinous limestone of Tenos in the Grecian Archipelago, and of the "Rosso de Levante," and the "Verde de Ponsivera" in Italy. The variations in colour, from green to red, that are sometimes met with, though rarely in *Marmor Atracium*, depend on the proportion and degree of oxidation of the iron they contain. Pedestals and slabs of all these marbles are in the museums. In the Victoria and Albert Museum a beautiful Renaissance pedestal of typical *Marmor Atracium*, "becked with snow," ought to arrest your attention.

[The second half of Mr. Marshall's paper and some notes of the discussion which followed will be given in our next issue.—ED.]

Llangar Church, Merionethshire.

From a Sketch by Mr. C. P. Wade.

variations; and its nondescript character is shared by several kindred species, found not only in Italy, but in the "Devonian" series of our own country. Assuming the ancient *Marmor Chios* to be correctly represented by the marble used for the Renaissance framing of the "Holy" doorways of the four great Christian Basilicas of Rome, we may safely say its colours are not decided—neutral greys, reds, and yellows, none of which predominate, if the marble is looked at in a large way.

Opaque and close in texture, the rock is nearly always confusedly spathic. Streaks and patches of grey, mingled with the red, are apparently sometimes due to the dissolution of fragments which in places give to the marble a brecciated appearance. Masses are also found of a tawny colour, tinged with grey and finely reticulated with yellow; this variety is often fractured, the interstices being filled in with dark chocolate-coloured cement. A small antique pedestal of this kind, discoloured by age, is in the "Roman" gallery of the British Museum; and a columnar pedestal is in the "Ephesus" room, faintly reticulated, but not brecciated. Like some other coloured and spathic marbles, *Marmor Chios* is occasionally traversed with streaky infiltrations of white. A great quantity of "Porta Santa" remains in Rome, but not much in its original position, only, so far as I know, a few slabs in the Forum and fragments on the Palatine. Two fluted columns of this marble, found near the tomb of Cecilia Metella, are in the Capitoline Museum, and others are in the Church of Sta Agnese, outside the walls.

From the very early notice of *Marmor Chios* by Theophrastus, and the fact that the walls of Chios were built of it, Pliny concluded that variegated marbles were first discovered by the people of Chios. This simply means, I take it, that the builders of the walls availed themselves of the materials nearest to hand, but when the rain brought out the tints, the delighted inhabitants showed the walls to everybody as something quite new and magnificent.

Marmor Scyrium.—The marble of Scyros is also perplexingly varied, both in structure and colour, as anyone may see while taking refreshment in some of the popular tea-rooms of London; and, although the quarries were once imperial property, the material cannot be said to possess that unfading stamp of nobility that distinguishes the species already described.

The white ground and the colour contrasts are often harsh, and the stone is brittle. Some varieties are minutely brecciated, others are untidily streaked and blotched with red, yellow, or purple. Blocks of the brecciated

Marmor Synnadicum, perhaps the most beautiful marble known to the ancients, deserves to stand alone. The typical variety may be described as a fractured rock of ivory-white crystalline limestone, with purple infiltration in the fissures and cavities. The fragments are very unequal in size, and the veining is always mottled by an intimate admixture of the calcite that forms the main constituent of the marble. Sometimes the limpid white fragments disclose faint tints of amber, purple, and grey. The quarries are at Docimium, a village thirty-two miles from Synnada, in Phrygia. Strabo records that only small blocks were extracted at first, but in his time larger blocks were got as translucent as alabaster; and, although their transport to the sea was difficult, yet columns and slabs of stupendous size and great beauty were sent to Rome. Rough blocks have been found with inscriptions dating from the time of Augustus to that of Marcus Aurelius, and from this time onward the quarries supplied Rome until the division of the Empire, when the exportation of the marble was diverted to Constantinople.

Columns of this marble, of the time of Hadrian, have been found near the *marmorata*; and, if we are to believe the ancient writers, it was Hadrian who sent columns from Phrygia "by the hundred" to Athens and Smyrna, just, I suppose, as you might send a friend a box or two of choice cigars.

According to the legend, as related by Statius, the white marble of Synnada was stained with the blood of the Phrygian shepherd, Attys. An unflinching portrait of this unfaithful swain is in the "Ephesus" room of the British Museum; yet I need hardly say geologists have not accepted the legend as an explanation of the marble so beautifully "inscribed with woe."

Columns of this marble were invariably fluted; those in the Pantheon possibly reflect the partiality of Hadrian. Other columns of Phrygian marble are in the basilicas of S. Lorenzo and Sta Agnese, outside the walls. *Marmor Atracium.*—The green serpentinous breccia from Atrax, in Thessaly, is well known to you by its Italian name, "Verde Antico." I believe the earliest description of it is by a Christian writer of the VIth century, and its introduction into Rome was probably late.

Small pieces have been found in the Tiber excavations, but no rough blocks in the deposits of the *marmorata*. Of the 200 columns in the churches and palaces of Rome, two in the Church of Sta Agnese, in Piazza Navona, and two in the Corsini Chapel of the Lateran

LLANGAR CHURCH, MERIONETHSHIRE.

The church at Llangar has no village attaching to it, but is placed apart in a most charmingly-situated valley. The approach to it is through a meadow which abuts on the upper road from Corwen to Bala, in North Wales, about a mile and a half from the former. There is a wide expanse of water and meadow below the church at the part where the River Dee is joined by one of its beautiful tributaries, the Alwen. Llangar is a shortening of the old Welsh place-name Llan-carw-gwyn—"The Church of the White Hart." According to an old legend, the church was finally built on the spot because it was revealed to the builder in a dream that they were to place it where a white hart was seen to run across the foreground. Previous attempts to erect the church elsewhere had all ended in disaster.

Externally this little church is typical of the rude, weather-beaten buildings of the Welsh hillsides. The walls are of rough grey local stone, many of the stones being merely large, undressed slabs, and the roof is covered with thick grey slates. The south-east side is now quite buried in the churchyard. The interior presents a dilapidated appearance, as services are only held there once in the year, but there are some fine old high-backed pews and a three-decked pulpit, which, with the cool whitewashed walls, produce a distinct feeling of old-world charm. It is regrettable that the church has been allowed to deteriorate, and a few pounds judiciously expended would go far towards its repair and clearance.

ARCHITECTURAL SOCIETIES.

Glasgow Technical College Architectural Craftsmen's Society.

At the fourth meeting of the session, under the auspices of the Architectural Craftsmen's Society, held in the Royal Technical College, a debate on "Single v. Separable Contracts" took place. Mr. A. H. Purvis presided. The debate was opened by Mr. A. Davidson, architect, and Mr. A. Smith, builder. The former advocated the "contractor" system, and gave instances of situations best suited to such an arrangement. Mr. Smith took the opposite view, separating contracts being, in his opinion, the best method of accommodating the ambitious tradesman who was anxious to start business on his own behalf. A discussion followed.

THE SURVEYORS' INSTITUTION: PRESIDENT'S ADDRESS.

The opening address of the session of the Surveyors' Institution was delivered on Monday by the President, the Hon. E. Gerald Stuart, M.P., at No. 12, Great George-street, Westminster, S.W. The address dealt almost exclusively with agricultural questions, and in the course of his remarks the President said: "In speaking of rural depopulation and its antidotes, among the latter may be placed a proper and convenient means of cheap transit. This might be provided in some districts by an extension of light railways, and in others by a system of motor cars in connexion with the great railways or the centres of population. Mr. Rowntree in his book describes of what great assistance the former are in Belgium, how little the cost to the community, and yet how material the benefit to the rural population.

An extension of forestry is also proposed by many as a means of increasing the country population, but while much might be done to improve our existing woods, and possibly to plant some waste places, I hesitate to accept the optimistic views of the enthusiasts. It is difficult to see how planting on land of fair value could be made a commercial success when compound interest on the original outlay is taken into consideration, there being in addition the annual charges for rent, rates, and taxes—though possibly as a form of compulsory saving to landowners it might have advantages."

In reference to rural housing, he said: "Much has been done by the larger and richer landowners in the building of healthy cottages on their estates, and though in most cases the smaller landowners have done their best with considerable self-sacrifice and pluck, it is difficult for those whose sole income is derived from land to face the cost of erecting cottages which will not return 2 per cent. on the outlay. The problem, however, is one which must be faced in a serious spirit if anything is to be done materially to increase the numbers of those employed on the land, so that those who are interested in the prosperity of agriculture should use every endeavour to impress the importance of this question upon the Government of the day. It is possible that something might be done to reduce the initial cost of erection by amendment of the building by-laws, permitting the use of a greater variety of materials, or by taking advantage of the public credit to provide loans to landowners or local authorities at a low rate of interest, while additional garden ground attached to cottages might enable higher rents to be paid in many instances. But when the difficulty could not be met in this manner it might become advisable to follow the example of Ireland under the Labourers Acts. There the district councils formulate schemes for the erection of houses and securing garden plots in accordance with the requirements of their districts, the Local Government Board being the department responsible for holding local inquiry into any schemes put forward and for sanctioning them if satisfied that they are reasonable.

If a scheme is sanctioned the necessary capital is advanced by the Land Commission, repayable in 6½ years by equal payments. The interest is 3½ per cent.—2½ per cent. representing interest and ½ per cent. sinking fund. The number of houses authorised to March 31, 1912, was roughly 49,000, of which 40,000 have been built and occupied, and 9,000 are in process of erection. Parliament voted 5,250,000*l.* altogether in connexion with these Acts, and it has all been ear-marked for housing purposes.

Some such scheme would surely be justified in this country even though it might necessitate a call upon the national purse; for it would do much to assist in the solution of the housing problem of rural England. If, however, such legislation were passed it would be incumbent upon landlords to do their part by finding the necessary sites for the cottages at a low rate.

Whatever may be done, either in the direction I have indicated or in others, it is essential, if the rural population is to be increased, that the cultivation of the soil should be a paying business. The English cultivator has to compete with all parts of the world, and no undue burden, therefore, should be placed on his industry. A wise Government should give him every assistance possible, particular care being taken to encourage the expenditure of capital on the land, and so far as possible to

assure to all those engaged in the industry a reasonable reward for their enterprise.

The remedies for staying the depopulation of England may, therefore, be summarised as follows:—

1. A large increase in the acreage of arable land, which would necessitate the employment of more agricultural workers, and would probably raise the standard of their wages;
2. An extension of the area under small holdings; of co-operation and credit banks; and of profit sharing and co-partnership in the case of large farms, in order to give the workers some opportunities of improving their position and obtaining independence;
3. Additional and more practical assistance in agricultural education; a wider dissemination of practical information useful in rural work; and further investigation into animal and plant diseases;
4. The extension of light railways and other methods of transit;
5. Government assistance in the erection of cottages in country districts; and
6. Assurance that capital invested in the soil will not be subject of adverse legislation.

If these remedies were applied, and an effort were made to introduce into the life of the countryside more of that pleasure and amusement which is lacking in so many villages, I believe a marked increase in the rural population of Great Britain might be anticipated."

As to the breaking up of large estates, the President said: "This is being caused by the fact that many large landowners have either sold—or have decided to sell—their outlying properties, while the owners of smaller estates have in some cases come to the conclusion that it will be wiser for them to invest their money in other securities.

This breaking up of estates has probably two main causes: the chief one is, I fear, the Finance Act of 1910 and the increase of death duties, which press with peculiar severity on agricultural estates, together with the promise of further legislation which may be antagonistic to the landowning class. On the other hand, there has, no doubt, been a revival of agricultural prosperity during the last five or six years, prices of agricultural produce having considerably increased, and the scientific use of artificial manures has added to the productiveness of the soil. Many landowners had reduced farm rents to an extremely low figure during the period of extreme agricultural depression, and rather than go through the unpleasantness of raising them again they have taken advantage of the increase in the economic value of the land to realise their property, and thereby to obtain a considerably higher income. It is possible, however, that this latter reason would not have influenced the landowners so much had it not been for fear of the former."

A hearty vote of thanks was accorded to the President for his address.

BRITISH SCHOOL AT ROME.

THE following is the scheme of competition for the Scholarship in Sculpture at the British School at Rome, offered by the Commissioners for the Exhibition of 1881:—

The scholarship will be of the value of 200*l.* per annum, and will be ordinarily tenable for three years. Candidates must be British subjects, and less than thirty years of age on July 1, 1913.

The competition, which will be conducted by the Faculty of Sculpture of the British School at Rome, will be in two stages:—(a) An open examination; (b) a final competition, open to not more than four candidates selected from those competing in the open examination.

(a) The Open Examination.—Competitors in this examination must submit the following works:—(1) A model of a nude figure in the round from the life, half life size. The model to be executed by the competitor. (2) A model in bas-relief, 2 ft. 6 in. by 1 ft. 6 in., modelled and designed by the competitor, the composition representing not less than two figures. (3) Four drawings from the life, two of which must be of the nude figure, one of drapery, and one of hands and feet life size. The drawings must be the work of the competitor, and must be on sheets of paper 30 in. by 20 in. (4) Some drawings or photographs, or both, of original

works which have been designed by the candidate. (5) Not less than two photographs or drawings of designs for decorative purposes with architectural features, the designs to have been the work of the candidate.

Competitors must notify the Hon. General Secretary, British School at Rome, 54, Victoria-street, London, S.W., of their intention to compete in this examination not later than February 15, 1913, and with such notification must enclose a certificate of birth or a declaration as to age and nationality, duly attested by two responsible persons. The models must be cast in plaster and, together with the drawings and photographs (which must be unframed and unglazed), addressed to the Hon. General Secretary, British School at Rome, care of James Bourlet & Sons, Ltd., 17, Nasseau-street, London, W., and delivered at that address not later than April 5, 1913.

(b) The Final Competition.—This competition will be held in London from June 30 to August 23, 1913, and will be open to not more than four candidates selected from those competing in the open examination. The subject will consist of a design for a figure, group or relief (as determined by the Faculty of Sculpture), to fill a given space for a given purpose and to a given scale. Eight weeks will be allowed for the execution of the design.

SOCIETY FOR THE PROMOTION OF HELLENIC STUDIES.

SIR ARTHUR EVANS presided on Tuesday at the Rooms of the Society of Antiquaries, Burlington House, over a meeting of the Society for the Promotion of Hellenic Studies.

Sir Charles Waldstein gave an illustrated address on the head of Phaidian style now in the museum at Holkham House, Norfolk, in support of his conclusion that it is probably from the eastern pediment of the Parthenon. The head, he explained, is in the possession of Lord Leicester, and was added to the collection at Holkham in the XVIIIth century. It was made of Greek marble, but was partly restored, probably in the early part of the XVIIIth century in Italy, and with Italian marble. They first heard of it from Matthew Brettingham, the architect who carried out the general design of Kent for the building and decoration of the house, and who travelled through Italy, where he bought most of the marbles and works of art for the Earl of Leicester in 1755. In his book he referred to it as a head of Juno, and it was so described in other works. In 1882 Michaelis published his important book on marbles in Great Britain, and he realised with all others that in the head they had to deal with a Greek masterpiece and not a Roman copy, and he described it as one of the most striking specimens of a collection which richly merited being known. The illustration in Michaelis's book was, however, somewhat misleading, for the head was tilted too far backwards, and, further, it conveyed an expression of softness not to be found in the original. Michaelis placed the head between the Aphrodite of Melos and the Cnidian Aphrodite, but he (the speaker) considered distinctly that it was not derived from these, but was of an earlier period. He believed that everyone conversant with the study of Greek works of art could not possibly doubt that the head had not the characteristics which were attributed to later Roman art. If it was a Greek head, then it was not likely to be a copy, for a copy made in the Vth century would be unique. Taking it to be original, it would not be likely to be either a temple statue or a sepulchral monument, as it would be too large for that. If earlier than the Cnidian type, the question would be asked whether it might not be earlier than the IVth century, but not as early as the great Phaidian period. Professor Waldstein discussed the conditions of modelling in the Praxitelean Age, and in the period following this master, and said he was strongly convinced that the highest development of modelling as such was in the period following on Scopas and Praxiteles. With the development of tinted and coloured statues in the Scopasian and Praxitelean period, modelling and the indication of different textures was to a great extent supplied by the colour. Then came the new

Business Premises, City, E.C.

Messrs. Banister Fletcher & Sons, Architects.

period with Lycurgus when they returned to more vigorous mainly art. The public eye demanded greater perfection in the modelling of surface and indication of texture, which had to be supplied by modelling as such; and thus in the works which succeeded the IVth century he found that, whatever the other artistic qualities might be, the modelling reached a greater stage than in the preceding periods. He considered on these grounds that the heads from Chios and Athens in the Boston Museum were later than Praxiteles. The Holkham head distinctly went back to the Vth century B.C., for the construction of the head and the modelling of the surface clearly pointed to Attic art of the Vth century B.C. They further pointed to its being a part of architectural decoration, to be viewed by the spectator from one point. The treatment of the brow, the accentuation of the straight lines of the nose, the half-opened lips and mouth, and chin and various other features went to show that the statue was intended to be seen from a distance. He had made measurements, and would place the statue on the eastern pediment of the Parthenon. Its natural position was on the spectator's left of the centre of the pediment,

the third or fourth figure from the centre. Mr. A. B. Cook had made a restoration of the eastern pediment of the Parthenon, which he would publish, and he accepted the view that the head would be suitable for the statue of Aphrodite. If he was right in his view, they had in the head at Holkham a work of Attic art of the Vth century B.C., which in all probability ought to find its place in the Parthenon pediment. It was a great deal to claim, and, if it was not absolutely demonstrable, they certainly had a very valuable specimen of the type of Aphrodite of the great Periclean Age.

Professor Ernest Gardner said that one must have time to think over the suggestions which Professor Waldstein had made, but certainly he had made out a *prima facie* case. The cast and the photographs did not enable one to come to a final conclusion, and doubtless Sir Charles's conclusions were drawn from the original. That it was earlier than the Praxitelean type one might certainly admit, but he did not feel sure as to how much earlier it was.

Mr. Forsdyke said he felt they could hardly give a head like the cast before them to Pheidias. Firstly, the method of assigning

the head to the Parthenon by what one might call the process of exclusion was hardly to be justified. It came close to the style of Pheidias, but there was a separation in style between the upper and lower parts of the head. If they compared it with the head of Theseus they would find the lines of the nose and brow were not so sharp, but the lines of the cheeks and mouth and chin were very much harder. He did not think it could be called Greek of the Vth century B.C.

Sir Charles Waldstein, in reply, said he did not bring the Theseus head because all detail was lost in that. The corruptions were such that any lines which might have existed were entirely obliterated. He certainly disagreed that the head was a Roman copy.

Sir Henry Howarth suggested that perhaps the Earl of Leicester might be induced to allow the original to be placed in the Elgin Room of the British Museum for some months. He considered that, wherever it came from, it was a pedimental statue.

BUSINESS PREMISES, CITY.

THE business premises 17, Kingly-street and 25, Ganton-street, here illustrated, have lately been erected by Messrs. W. S. Shepherd & Co. The building is constructed with ferro-concrete floors and staircase on the expanded metal system.

The piers to the shop-front are of Aberdeen granite, with the entablature in White Portland stone, the upper part of the walling being carried out with dressings of red gauged brickwork and Crowborough bricks.

The panels between the windows are made in cast lead. The wrought-iron guard railing at the top of the cornice is provided for a means of escape from fire. The shop-front is constructed in mahogany, and the bays have been arranged symmetrically, and occupy part of the site of the old projections. The building has been planned for use as a warehouse, and a plain treatment has been carried out consistent with its use. The architects were Messrs. Banister Fletcher & Sons, 29, New Bridge-street, E.C.

GENERAL NEWS.

Professional Announcements.

Mr. Evelyn Hellicar, A.R.I.B.A., has moved his offices to No. 7, Quality-court, Chancery-lane, W.C. His telephone number remains as before, Holborn 5410.

Appointment: Admiralty Office.

Mr. Thomas Sims, C.B., M.Inst.C.E., Assistant Director of Works, has been appointed Director of Engineering and Architectural Works to the Admiralty, vice Colonel Sir Edward Raban, K.C.B., R.E., retired.

A Painting of Old Lud Gate and St. Paul's.

A large picture that has lain for many years in the cellar of an auctioneer's premises in Cheltenham was bought a few days ago by Mr. Wm. Jones, the curator of the local Art Gallery, and will, it is said, be sent to the London Museum, Kensington Palace. A cleaning of the canvas has revealed a painting of the Old Lud Gate, with (old) St. Paul's in the background.

The Layard Collection, Venice.

Consequently upon the death of Lady Layard, widow of Sir Henry Austen Layard, the Assyriologist and archaeological explorer, the nation succeeds to the magnificent collection of pictures, mostly Italian, which for some years have been hung in his house, the Ca' Capello, on the Grand Canal, Venice. It is stated that the restrictions against the exportation of works of art from Italy imposed by the Facca laws have been removed, in this case, by agreement with the Italian Government. In the gallery are Gentile Bellini's portrait of Sultan Mahomet II., 1480, and "Adoration of the Magi," Carpaccio's "Departure of St. Ursula," examples of Moroni and Cosimo Tura, and a bust portrait by Vandyck.

Admiralty Arch.

Captain Murray asked the representative of the First Commissioner of Works on Monday whether he was in a position to make any statement as to the group of statuary which it was proposed to place upon the Admiralty Arch and Mr. Benn replied that the proposal had been abandoned.

ART EXHIBITIONS.

The present exhibition at the Leicester Galleries, Leicester-square, consisting of works by Mr. George Clausen, R.A., Mr. Arthur Mackham, and the late Phil May, will close on Saturday, and will be succeeded on the 23rd inst. by recent water-colour drawings by Mr. Edmund Dulac, illustrating the poems of Edgar Allan Poe; another exhibition will be a collection of water-colours of "Harbours and Towns," by Mr. Torrick Williams, R.L.; and lastly a series of paintings in tempera and water-colour usurping the life of the Virgin Mary by that able decorative artist, Mr. R. Anning Bell, R.W.S.

BOOKS.

The Living Wage. By PHILIP SNOWDEN, M.P. With a Preface by Harold Spender. (Hodder & Stoughton. Price 1s.)

THOROUGHLY no candid onlooker in the commercial arena is really more satisfied with the conditions of labour to-day than were Kingsley and Carlyle fifty years ago. Conditions have improved since then, but standards of living have advanced also. We are no longer quite satisfied with that point of view which includes labour under the law of supply and demand. The claim for a "living wage" is nothing new, but "there is a great appealing force in a telling phrase," according to Mr. Snowden. We are sure that mere phrases really do assist social progress. They are effective in advertising certain goods, where they appeal to an unthinking public. But in any such cause as that we are now considering it is the thinking public that must be captured.

Such a form of claim would seem to break down at the start since a living wage for the single man would not be so were a family dependent on him. The claims of a "minimum wage" may be more scientifically considered, and since the establishment of the Wages Board in 1909 such consideration has received organic shape. This Board was created to deal with grievances of certain trades only, such as the chainmakers. The Coal Miners' Minimum Wage Act of this year was a further application of the principle. Greater progress has been made in the colonies. Both in Australia and New Zealand arbitration courts are established. From their findings there is no appeal, and to strike is illegal. Canada is not so advanced. There are arbitration courts there, but strikes and lock-outs are only illegal prior to arbitration. What keeps us back at present is a shyness on the part of both masters and men towards compulsory arbitration, towards yielding their respective rights to lock-out and strike. "The strike spirit" is considered a necessary element for preserving solidarity amongst the men. So, strangely enough, the Minimum Wage Act was opposed by the trade unions and their representatives in Parliament. They said the Government "must not dare" to fix a minimum rate for any other industry than the one immediately in question, and that any Bill must be temporary in operation, and arbitration must not be compulsory. The first two of these conditions are embodied in the Act, the last is not, but an infringement is not illegal and punishable as in the colonial examples. A defaulter must be sued in a court of law.

At present, therefore, we have not gone very far towards the establishment of a minimum or living wage. But a discovery has been made within the last six months that is likely to have far-reaching effects in the handling of trade disputes. "The right to strike" has been shown to be by no means so valuable an asset as the labour leaders thought it. It is the labouring classes that suffer first and last. The public, who it was intended should be terrorised towards intervention, has never been reached at all. Compulsory arbitration will not do, it is not probably the most advantageous claim labour can make, and the masters will doubtless be wise not to push their newly-established power unreasonably. We doubt if any theory of wage will go very far with the public. It is a subject where even expert opinion must await the result of statutory interference, and Mr. Snowden, amongst others, is obliged to recognise that one of the first effects of a minimum wage will be to throw the older and less skilled men out of employment. But where public opinion may assist, and has assisted, toward better conditions of labour, is in the matter of housing. Much has already been done in this direction and much still remains to be done. If rents are not any less in the cities, the working-man gets something

better for his money than formerly; while such experiments as garden cities are evidence of a popular interest in this direction. The enterprise, too, of some of the larger manufacturers in providing homes for their workpeople have furnished examples that are familiar to all of us. Such social developments must be furthered by the interest which Mr. Snowden's book legitimately arouses in the welfare and future of the working-classes. It is written with a knowledge of the difficulties which beset labour, and its arguments are not impaired by unreasoning hostility to the employer and the capitalist.

Notes on the Florentine School. By THOMAS L. TUDOR. Price 4d. *Umbrian, Venetian, and Other Masters of Italy.* By THOMAS L. TUDOR. Price 3d. (Published by the Central Educational Company, Ltd., Derby.)

IT is the practice of the authorities of the National Gallery to lend to the various provincial galleries their collection of the original drawings from which the "Arundel" Prints were made. It is with reference to an exhibition of these drawings at the Municipal Art Galleries, Derby, that these short summaries of the Schools of Italian painting have been written. Such enterprise on the part of the author is in the highest degree praiseworthy.

These drawings scarcely pretend to be more than careful reductions prepared for a commercial purpose. In some instances, however, particularly as regards the copies from Benozzo Gozzoli, a distinctive decorative effect is obtained. They are in any case of value in creating an interest in Italian painting, an interest which cannot fail to be assisted, and indeed demands such assistance, as these little books give. The classical schools must always be important subjects of study whatever be the tendencies of the time toward the romantic or psychological aspects of art; perhaps the more so as one or the other of these tendencies presumes to dominate. These drawings will, in all probability, be dispatched to other centres, and we recommend these carefully-prepared handbooks by Mr. Tudor to their visitors.

The Concrete Institute: Transactions and Notes. Vol. IV. Part II. 1912. Published at the offices of the Concrete Institute, Westminster, S.W.

IN this part of the *Transactions* will be found the text of, and discussions on, papers read by Professor Fite, F.R.I.B.A., Mr. Reginald Ryves, A.M.Inst.C.E. and Mr. Maurice Béhat, C.E. (Ecole des Ponts et Chaussées), and various reports, including that of the Tests Standing Committee on the "Testing of Reinforced Concrete Structures on Completion." The paper by Professor Fite on "The Aesthetic Treatment of Concrete" is one of considerable interest to our readers. As most of the contents of the publication have been reported and commented upon in our columns from time to time, we need not refer to them at length on the present occasion.

THE LONDON COUNTY COUNCIL.

The usual weekly meeting of the London County Council was held in the County Hall, Spring-gardens, S.W., on Tuesday, Lord Chylesmore, Chairman, presiding.

Temple Bar.—The Chairman of the Local Government Committee was asked whether, in view of the great historic interest of Temple Bar, and its intimate connexion with the life of London for over 200 years, he would ask the Committee to consider the desirability of taking steps to approach the present owner, Sir Hedworth Beux, with the intention of negotiating for its re-erection in London. The Chairman replied that he would bring the matter before his Committee.

Loans.—The Finance Committee recommended and it was agreed to make a loan of 3,900l. to the Bermondsey Borough Council for repaving works; and of 16,785l. to the Wandsworth Borough Council for contribution towards the cost of street widenings.

Theatres, etc.—The following drawings have been approved by the Theatres and Music Halls Committee:—140, Maids-vale (proposed cinematograph hall)—ventilation and lighting arrangements and rearrangement of seating. New Cross Hall, Lewisham High-road—lighting installation. 226, Commercial-road—provision of cinematograph chamber. Battersea Palace, York-road—

provision of a cinematograph enclosure. Bowman's-mews, Holloway-road (Globe Cinema)—heating installation; arrangement of the exit doors to Bowman's-mews. Carlton Hotel, Haymarket—arrangement of electric lighting and power installations. New Kilburn Empire, High-road, Kilburn—means of escape from the prompt fly. Walham-green (Broadway-gardens Cinematograph Theatre)—raising of the level of the floor in the front portion of the hall, and the erection of a shelter from the southern corner of the hall to the station arcade.

Drawings have also been submitted to the same Committee for new cinematograph theatres as follows.—By Messrs. Isaacs and Cannell, for a proposed cinema to be erected in Arnside-street, Walworth; by Mr. P. H. Adams, for a cinema proposed to be erected in Osborne-place, Stepney; for a boxing-ring and cinematograph hall proposed to be erected at 100, Whitechapel-road on a site formerly occupied by Wonderland and the East London Palace. Messrs. W. Deves, Max Clarke, and Garbutt have also submitted drawings for proposed alterations at the Florence Restaurant, Rupert-street, W.

FIFTY YEARS AGO.

From the *Builder* of November 15, 1862.

Life, Growth, and Development in Architecture.

IT is strange and curious how, starting with the avowed intention of correcting prevalent fallacies, in the rising school of architects, who have set themselves against the omnipotence of precedent, they adopt ideas first promulgated by those they wish to refute and parade them under a slightly changed name or aspect; leaving the reader to infer that they are the result of their own investigation. Though the leading axiom that the principal styles have resulted from the combination of blending of the features of opposite styles individualised by after development has been conceded by contemporary writers, yet, fearing, I suppose, to travel too far at one stage, they urge that the combination is always effected by gradual growth.

To say that a style must be the result of centuries of labour is simply to prohibit invention; and it is no less humiliating than distressing to think that we are all contributing towards some result in the far-off future, which no one can understand or interpret, but which only future generations are to enjoy. Such labour would prove more unsatisfactory than that of Sisyphus; for we should roll up our rock for the sole pleasure of future generations seeing it roll down again. What interest can any human being feel in his work unless directed by a definite aim and he sees some prospect of beholding his endeavours realised; or, at all events, can trace the tendency of his work? He can find no more pleasure in his pursuits than a blind mill-horse, whose continual occupation is an eternal going round and arriving nowhere! Indiscriminate combination is what no man, to my knowledge, has recommended; and the accusation is only the invention of some one who spends his time in beating the air and slaying shadows.

* * * The processes which time laboriously evolves towards the formation of style is anticipated by human consciousness. This is the mark of greatness, of great men who are spoken of as being born before their time. And there must be many gifted in the same manner, though not in the same degree. Were it not that folk will follow fashion as a flock of sheep follow a bell, while others in consequence of imperfect sympathies are devoted to specialising, a truer architectural acknowledgment might be found of influences, paramount at some period of our history, and which still appeal to us from the past. The calm and dignity of repose insisted upon by the English Renaissance did not steal from us our heritage of romance. To many who survey the past, the appeal of one is not less strong than the other, and both may find within us responsive notes which, sounded together, produce harmony.—Ed.

ILLUSTRATIONS.

Missouri State Capitol Building.

WE supplement this week, by illustrations of the designs of Messrs. Tracy & Swartwout, our notice of the competition which appeared last week (p. 534). We are indebted to our New York contemporary, the *American Architect*, for permission to use their original illustrations for the purpose of making our blocks. To that paper, dated October 23, Mr. Egerton Swartwout contributes a description of his firm's design, and the following paragraphs are quoted from this source:—

"The site of the Capitol is superb; situated on a great bluff 100 ft. or so above the river, on a promontory which projects so well into the stream that it can be seen 15 miles or so up and down the river, the bluff ending in a jagged cliff and with natural terraces to the water, with excellent soil and well wooded. It is not only naturally beautiful but presents an extraordinary chance for artistic development. The programme demanded that the dome should be on the axis of Main-street, but left unsettled the frontage of the building. In our judgment there was but one location for the Capitol; its longitudinal axis should be parallel with the river and on the axis of Main-street, and the approach should be from High-street, the transverse axis coinciding with that of the Supreme Court building. In this way the Capitol is nearly in the centre of the plot, slightly to the south of the location of the old Capitol building. The grades are an unusual feature of the plot, and, though steep, are fortunately located. The high point is about on the transverse axis, in front of the Supreme Court building, and as from this point is the main approach it is absolutely essential that the lowest steps of the Capitol shall be as high or higher than this high point, as otherwise the structure would seem depressed. This necessitated placing the building on a terrace about 14 ft. above the natural grade and a couple of feet higher than the high point. This terrace is approximately 30 ft. wider on all sides than the building, and will be constructed with masonry, with a simple broad flight of steps fronting the portico with ramps for vehicles at each side, the terrace becoming higher and the ramps of steps longer as the grade falls away on the sides.

As to the Capitol building itself, the requirements are in no way dissimilar to those of most of the existing Capitols, the Senate and House, with their dependencies, being on the second floor as usual, and the executive floor just below. This scheme, while general, is open to several disadvantages—an adequate approach

to the legislative floor is difficult, and is usually on the dome, or has to be reached through a rather low vestibule; while the space under the legislative chambers is dark and is usually made of use for storage space and vaults. These disadvantages we have tried to overcome in our plans. We started with a definite decision that the floor of the dome should be on the legislative floor, that the floor of the dome should be unnumbered by monumental stairs, that the legislative chambers should be as near to each other as practicable and the circulation uninterrupted. Also, we felt that the entrance should be through a portico and not through a series of congested arches in a basement; and, further, we did not consider it architecturally good to enter a low vestibule from a great portico; so we did the only logical thing—we placed the portico on the first floor level. This gave a flight of steps in front of the portico about 18 ft. in height, the portico giving entrance through a large central door to a barrel-vaulted vestibule about 60 ft. high, in which is a monumental flight of steps leading directly to the dome. This is the main principle of our design, a perfectly simple and logical feature, but which, strangely enough, has never been applied to a State Capitol, or, to our knowledge, to any monumental building in this country.

The exterior explains itself. The main thing noticeable is the relation of the exterior orders. The columns of the portico are 48 ft. high, somewhat on the lines of the columns of the Temple of Jupiter Stator, and are supported by the subordinate order, which is that of the Temple of Vesta. I know of no other way by which the scale could be maintained when the Corinthian Order is used in the relative proportion of 10 to 12. As to style, it is on the lines along which we have been working entirely for the last three years—that free adaptation of the classic which was beginning to be felt in this country in the early XIXth century. It is not Colonial, nor is it Georgian. It was only a suggestion found in some parts of the old work in Washington and in the more pretentious work of that period in other parts of the country. It is logical, adapted to modern conditions, and is capable of development with the utmost freedom, and is, in our opinion, a beginning from which a real national style can be developed."

Baroque Architecture.

OUR sixth article on Baroque architecture begins on p. 577, and the illustrations of the Palazzo Frescobaldi, Florence, and of the Fontana dei Fiumi, Rome, are in connexion with it.

Missouri State Capitol: Side Elevation.

Messrs. Tracy & Swartwout, Architects.

The British School at Rome.

EARLY in 1911 the Royal Commissioners for the Exhibition of 1861 decided to establish a system of travelling scholarships in architecture, sculpture, and decorative painting, of lines similar to those of the French Prix de Rome. After some correspondence with the British School at Rome information was received that the site of the British Pavilion of the Rome International Exhibition of Fine Arts, 1911, had been offered by the Italian municipal authorities to Sir Rennell Rodd, the British Ambassador, to be used for the purpose of a British institution of national interest. The Commissioners, with the concurrence of the British School at Rome, intimated to Sir Rennell Rodd that if the site in question were made over to them they would be willing to purchase and adapt the building for the purposes of an enlarged British School at Rome, which should be made thoroughly representative of art as well as archaeology. Arrangements were soon in progress, and matters were simplified by the gift to the Commissioners of the building itself, through Colonel Charles Humphreys, head of the firm of contractors who had built the pavilion, and to whom it would have reverted at the close of the Exhibition.

"Wisely directed," wrote Mr. Reginald Blomfield shortly afterwards, "the new British School may go far to remedy certain defects that lie at the root of much of our failure in modern architecture, both in training and practice. Particulars have been published of the competitions for the Scholarship in Architecture, the value of which is 200*l.* per annum for three years. Designs must be delivered as regards competitors in Great Britain by December 31st, and by those in the Colonies by January 20th, 1913. The conditions may be obtained from the Office of the British School at Rome, 54, Victoria-street. (See article on page 563.)

One plate shows the south elevation and the plans of the new building as designed by the architect, Mr. E. L. Lutyens, F.R.I.B.A. The walls shown in black on the plans indicate the area of the Exhibition building, and the alterations to adapt it for the purposes of the British School. The walls left in outline are the extensions to provide residential quarters for the students and Director. The portion of the plans tinted shows the extent of the work now in progress.

MEETINGS.

FRIDAY, NOVEMBER 15.

University Extension.—Visit to the Soane Museum, Lincoln's Inn-fields (Greek and Roman Antiquities 3 p.m.)

SATURDAY, NOVEMBER 16.

Edinburgh Architectural Association.—Forenoon visit of Associate Section to Messrs. Redpath, Brown, & Co. Ltd.'s works, Easter-noon visit of which is to the Association to (1) New Masonic Hall, (2) New Hall of United Free Church of Scotland, 121, George-street.

MONDAY, NOVEMBER 18.

Royal Institute of British Architects.—Mr. J. L. B. on "Bath: A Comparative Study." 8 p.m.

Liverpool Architectural Society.—Mr. J. A. Gorch on "The Original Drawings for the Palace at Whitehall Attributed to Inigo Jones." Lantern slides.

The Institute of Sanitary Engineers (Caxton Hall, Caxton-street, Westminster).—Mr. Ernest van Putte, M.Inst.C.E., Borough Engineer and Surveyor, Lewisham, on "Intercepting Traps in House Drains." 8 p.m.

TUESDAY, NOVEMBER 19.

London University (British Museum).—Mr. Kaine Smith on "Art and Humanity: The Need for Beauty." The Illuminating Engineering Society (Royal Society of Arts).—The Hon. Secretary will present a report on progress during the vacation, with special reference to his visits to the Continent and to the United States. Other items will include: "Ancient Forms of Lamps" (Mr. J. W. Johnston), "A New Illumination Photometer" (Mr. Haydn T. Harrison), "Some Simple Colour Boxes" (Mr. W. C. Clifton), "Photography in Illuminating Engineering" (Mr. J. S. Dow and Mr. V. F. Mackimney), and "Miner's Lamps." 8 p.m.

Royal Sanitary Institute.—An adjourned session meeting will be held at 30, Buckingham Palace-road, S.W., for the purpose of continuing the discussion of "The Report of the Departmental Committee on Intercepting Traps in House Drains," opened by Mr. H. Percy Boulnois, M.Inst.C.E. 8 p.m.

Institution of Civil Engineers (to be held at the Institution of Mechanical Engineers, Storey's-gate, S.W.).—Papers to be further discussed: (1) "The Construction of the New Dock at Methil" by Mr. Benjamin Hall Blyth, jun., Assoc. M.Inst.C.E.; (2) "Alterations and Improvements of the Port Talbot Docks and Railway during the Last Decade," by Mr. William Cleaver, M.Inst.C.E. 8 p.m.

WEDNESDAY, NOVEMBER 20.

Royal Society of Arts.—First ordinary meeting. Opening address by Lord Sanderson, G.O.B., K.C.M.G. 8 p.m.

THURSDAY, NOVEMBER 21.

The Architectural Association.—Conversations to be held at 18, Tuford-street, Westminster. 8 p.m.

Society of Antiquaries.—8.30 p.m.

THURSDAY, NOVEMBER 21.

Leeds and Yorkshire Architectural Society.—(1) Address President, Mr. A. E. Kirk, A.R.I.B.A. (2) Distribution of prizes. 6.30 p.m.
London University (Victoria and Albert Museum).—Kaines Smith, M.A., on "Decoration of Buildings: Painting and Mosaic." 3.30 p.m.

FRIDAY, NOVEMBER 22.

Glasgow Technical College Architectural Craftsmen's Society.—Mr. J. Allan, jun., on "The Manufacture and Use of Moulded Concrete Blocks." 7.45 p.m.

SATURDAY, NOVEMBER 23.

Aberdeen Architectural Association.—Mr. A. N. Paterson, M.A., A.R.S.A., Glasgow, on "French Influence on Scottish Architecture." 7.30 p.m.
The Royal Sanitary Institute.—Provincial sessional meeting, Doncaster, when a discussion will take place on "Town Planning in Relation to the Development of the South Yorkshire Coalfield." To be opened by Mr. A. B. Dume, M.B., D.P.H. 11 a.m.

COMPETITION NEWS.

A list of current Competitions is printed on page 504.

Belfast Museum and Art Gallery.

Mr. John J. Burnet, LL.D., F.R.I.B.A., has consented to act as assessor in the competition for a Museum and Art Gallery, Belfast. Mr. Burnet will meet the Library and Technical Instruction Committee early next month, after which probably the conditions will be issued.

Glasgow and West of Scotland Teachers' Training College.

We understand that the conditions of the competition for the proposed Training College at Jordanhill have now been issued to the six competitors selected whose names are given in our issue of December 1 last, and that the date fixed for sending in the designs is February 22, 1913. The cost of the scheme is to be about £30,000.

Glasgow Municipal Buildings Extension.

One hundred competitive designs have been received, and the assessor (Mr. John J. Burnet, LL.D., A.R.S.A.) is now engaged in selecting from these the six designs whose authors are to be invited to join in the second competition.

British Institution Scholarships.

At a meeting of the Trustees of the British Institution Scholarship Fund, held on the 7th inst., a scholarship in architecture (50% a year for two years) was awarded to Mr. Frank K. Pope, of the Royal College of Art. Similar scholarships were awarded in painting, sculpture, and engraving.

American Academy in Rome.

The annual scholarship (architecture) for the American Academy in Rome has been awarded to Mr. Kenneth E. Carpenter, of Boston, Mass. The subject set was "A Navy Yard on an Island in the Southern Pacific Ocean," and illustrations of the successful design appear in the November issue of the *Architectural Record* (New York).

New York Court House.

The names of the competitors for the new Court House, New York, have been announced. "Twelve architects were invited at first to submit plans without competition," says the *New York Times*. "This aroused such a protest from the architects who had not been invited to submit designs, that a competition was arranged through which ten names were selected. Thus twenty-two architects will submit plans from which the final designs will be accepted. The architects who are to participate in the final competition will start work on their designs as soon as Mr. Walter Cook, the Consulting Architect of the Court House Board, can arrange the terms of the contest. It is hoped to select the final plans for the new structure by January 1. The architects selected for the final competition will receive \$1,000 each for the designs they submit." Those who will compete are:—

Messrs. Howells & Stokes, 100, William-street; Messrs. Maynicke & Franke, 25, Madison-square; Messrs. Charles C. Haight, A. M. Githens, and Aymar Embury, 452, Fifth-avenue; Messrs. Griffin & Wynkoop, 30, Church-street; Messrs. K. M. Murchison and Howard Greenley, 298, Fifth-avenue; Messrs. Wilder & White, 155, Fifth-avenue; Messrs. Shure & Kaufman, 373, Fourth-avenue; Messrs. Walker & Gillette, 128, East Thirty-seventh-street; Messrs. George and Edward Blum, 205, Fifth-avenue, and Mr. Guy Lovell, 225, Fifth-avenue. The architects invited to submit plans without competition were:—Messrs. McKim, Mead, & White, Messrs. Carrère & Hastings, Messrs. La Farge & Morris, Messrs. Tracy, Swartwout, & Litchfield, Mr. James Rieley Gordon, Mr. H. V. Macgonigle, Messrs. York & Sawyer, Messrs. Charles Butler & Charles Morris, Messrs. Trowbridge & Livingston.

Missouri State Capitol: Block Plan.

Messrs. Tracy & Swartwout, Architects.

Mr. A. W. Brunner, Mr. Cass Gilbert, and Messrs. George B. Post & Sons.

The total cost of the new building is estimated at \$30,000,000, of which \$10,000,000 is for the site.

Palais Royal and Palais de Justice, Sofia.

Those who have read the conditions of the competitions for the Palais Royal and the Palais de Justice at Sofia, and have been at work on designs, will have wondered what effect the war would have on the ambitious schemes advertised. We are now informed by the Ministère Royal des Travaux Publics de Bulgarie, that the date for sending in designs has been altered to March 1, 1913, so that competitors will have a further three months to work at the problems.

Missouri State Capitol.

Last week (p. 534) we referred to the result of the competition for this building. In this issue we illustrate fully the winning design by Messrs. Tracy & Swartwout.

CORRESPONDENCE.

Teachers as Adjudicators.

Sir,—Your correspondent who signs himself "Cricket," has expressed thoughts that must have arisen in the minds of a great many of your readers.

The new regulations governing the R.I.B.A. Final Examinations, whilst admirable in many ways, have one weak point, namely, by attaching so much more importance to works which are not done in the actual examination it is impossible for the examiners to know just how much assistance the candidate has received in the preparation of his testimonies from students of the Liverpool School, and it is significant that all of them were

based on identically the same motif. Such instances as these lead one to wonder how much of the candidate's own individuality there is in the design.

To quote Mr. Kipling, "There are nine-and-sixty ways of writing Tribal lays, and every single one of them is right." The similarity, to say the least of it, between these designs, therefore, arouses in one's mind the idea that the "supervision" of the professors must have been very thorough; in fact, one might be pardoned for thinking that it amounted to "material assistance!"

Is it not time the R.I.B.A. examiners demanded that the testimonies of study should be the entirely unaided work of the candidate? If not, one fears that it will be possible to a very considerable extent for a student to "buy himself through" the examination. Most assuredly this is not what the examiners aimed at when revising the syllabus, and it would certainly not be "Cricket."

ALREADY AN ASSOCIATE.

House of Commons Ventilation.

Sir,—Your extract in last week's issue from Professor Lock's letter to the *Times* shows once more how varied are the ideas with regard to the principles of ventilation.

It is a beautiful idea that by warming the Cambridge examination hall with radiators placed against the walls "the air of the hall up to the height of the neck has little movement, and remains warm and practically unchanged," and that by forcing practically cold air into the room from a height of 8 ft. or 9 ft. "with a steady and almost imperceptible flow, spreading itself over the hall, slowly falls to the level of the face . . . is then breathed, made warmer and lighter, and rises through the outlets in the ceiling."

It may not be treating the subject with sufficient seriousness to suggest that Professor Lock only accepts students with the correct length of neck, or that those of stunted growth are handicapped in their examinations owing to the necessity of continually breathing that lower strata of air which "changeth not."

And I would suggest as a subject for a painter of the Futurist school a picture of the warm, moist microbe-laden air rising from the students' nostrils through the cold descending fresh air, and chasing the harmless microbes in the latter in the attempt to contaminate them.

Professor Lock's points are contrary to those accepted by the engineering profession, and still more contrary to the facts proved by Dr. Leonard Hill and others, whose revelations (recently related in your columns) clearly show that continual movement of air over the body is essential.

Apparently the air in the Cambridge examination hall is stagnant. "below the neck," though one can scarcely believe it possible, since the heat from the human body will cause it to rise continually. It is important that the whole body is in contact with moving air, or the pores of the skin become clogged and the moisture from the body cannot be evaporated.

Professor Lock will find that by keeping the temperature of the heating surfaces below 160 deg. Fahr. he will find nothing unpalatable about the air, since the dust impinging on the hot pipes is not affected by lower temperatures.

S. WHITMORE ROBINSON,
Consulting Engineer.

"Estimating."

SIR,—I have to tender my thanks for your kindly criticism of my book on "Estimating," which appeared in your issue of October 25. As you have been so kind it seems ungrateful to cavil at anything you have said, but I should be glad if you would allow me to reply to one or two points.

I prepared the articles for my book for builders in the Southern districts, and the rate of wages given are those adopted by our Municipal authorities and recognised by the

trade unions. I quite agree with you they are too low.

The difference in the price of brickwork between the London districts and ourselves lies in the fact that the "labour" shown in my book (although the rates are lower) is more than that usually adopted by the London builders, which is not sufficient for "all round" general building purposes, and again you would find this also applies to scaffolding. I took a great deal of trouble with the brickwork, and found that a bricklayer and labourer would lay generally seventy bricks per hour, but, as the question of footings had to be contended with, I adopted the system of "averaging" them as shown, which, as you say, is not proportionate to the remainder of the building. Again thanking you, T. D. L. PIREN.

Brighton.

INTERCOMMUNICATION COLUMN.

Maintenance of Party Wall.

SIR,—If it comes within the scope of the *Builder* to advise correspondents, will you kindly give me your opinion on the matter below? I own a property adjoining another. These have a dividing wall. This wall clearly shows that it was built on my neighbour's land, but, being a 4-in. it was necessary to build on my side several pillars to support it. These pillars are on my land. The question is—Does it necessarily follow that, because the pillars are on my land, that I am, equally with my neighbour, responsible for rebuilding the wall? It will render me a great service if you can assist me. F.L.K.

. It is very difficult, if not impossible, for us to express a definite opinion upon the point raised in this letter without having all the facts and circumstances of the case fully before us. The general rule is that where it is not known under what circumstances a wall was built the presumption is that it belongs to the two proprietors as tenants in common (*Wiltshire v. Sidford*, 1 M. & R. 404); but where the precise extent of land originally belonging to each owner can be ascertained the presumption of a tenancy in common does not arise, and so if two persons have a party wall, one half of which stands on the land of each, they are not tenants in common of the wall,

even though the wall was erected at their joint expense (*Matta v. Hawkins*, 5 Taunt. 20). In the case now before us there appears to be no doubt that the wall was built entirely upon the land belonging to our correspondent's neighbour, and, therefore, presumably belongs to him, with an easement of support, so far as the pillars are concerned; but as, generally speaking, easements impose no personal obligation upon the owner of the servient tenement to do anything, it would certainly appear that the burden of repair falls entirely upon the owner of the dominant tenement—that is to say, in this case upon the owner of the wall.—ED.]

Effect of Great Heat on Stone.

SIR—I was interested in the condition of the Portland stone after the fire at Messrs. Barker's premises. Perhaps some reader will be good enough to inform me, through your columns, as to the comparative merits of a dolomite and a sandstone under great heat. P. J. WESTWOOD.

THE NATIONAL GALLERY.

Mr. Ormsby Gore on Monday asked the representative of the First Commissioner of Works whether, in view of the overcrowded condition of the Venetian rooms in the National Gallery and the necessity of finding suitable space for the newly bequeathed Layard collection of Venetian pictures, it was proposed to further enlarge the Gallery; and, if so, whether he was prepared to receive representations of the subject before any action was decided upon. Mr. Wedgwood Benn replied that the First Commissioner was quite ready to receive representations on the question of enlarging the National Gallery. A request for increased accommodation could not, however, be considered until it had been put forward by the trustees.

BAROQUE ARCHITECTURE.

VI.—A BAROQUE CITY.

(Continued from page 444.)

many countries or provinces there is some small town, perhaps a mere village, which by some curious chance escaped the ruthless hand of change preserves within its walls a little picture of days gone by. And of these dear to artists, those are most precious which enable one without undue labour to study some period of mediæval

or more recent history in its proper setting; not within the academic walls of a museum or between the sumptuous covers of some illustrated monograph, but in the place itself.

To students of Baroque architecture there is probably no town of Italy so little altered since it was laid out in the XVIIth century as unknown Lecce, in far Apulia. A smiling, sunny little city on the bare plain, near the

Adriatic, it has somehow survived to-day much as it was in the remarkable burst of building activity which made it a veritable Baroque museum. And, having concerned ourselves largely hitherto with the more celebrated monuments of the style in Rome, Genoa, and Venice, we must in justice pay some heed to its other aspect, to its far more numerous and far less famous examples in

[Photographie Artistique.]

Palazzo S. Croce, Rome. S. Carlo and Catinasi.

every country village, often the most charming of all. For in these minor buildings, seldom trumpeted by critics, we see its more picturesque side—the side on which it claims our affection rather than our respectful admiration. In the case of some colossal palace or church in Rome we solemnly weigh the architectural pros and cons of its façade or its plan, rigorously compare its proportions and details with accepted canons. An experienced or keen critic of our art carries this same spirit into less important matters, and mentally labels some little balcony which he passes in the street as Gothic of one period or another, as Cinquecento perhaps, or as Baroque. That plentiful class, the non-architectural critic of architecture, is less discriminating, and will only use the epithet "Baroque" for the numerous and widely-differing specimens of building which do not happen to suit his half-fledged mind, whether of the XIVth century or the XXth.

But there are laymen who are more enlightened, and one of them is Paul Bourget, the French essayist, who in a charming chapter tells how Lecce—"this precious jewel of a town"—altered his whole

preconceived idea of the style and made him one of its warmest defenders.

Why, one naturally asks, should such a city lie stranded away from the tide of celebrity? And why should it possess so strong a claim for recognition? Are there not other remote towns no less richly dowered in the wilds of Abruzzo or on the Romagna plains? If there was in reality a "Baroque period," one might surely find other places to dispute with Lecce its unique claim as a Baroque city.

He would be a bold man who could say that, after an intimate study of all the towns of Italy, he could assure us that Lecce occupied this position, and in making such a statement one runs the risk of probable contradiction and of possible error. But it is sufficient for the purpose of these articles to take Lecce as a most remarkably complete example of this style, and to draw from its completeness such general criticisms as we may.

During the earlier part of the XVIIth century the tide of reaction from architectural pedantry gradually filtered through the country, as we have already shown. It moved placidly, steadily, as is the way of

such things. Now and then it encountered local tradition, sometimes hostile, at times favourable. In hill towns of Umbria and Tuscany the seed fell on stony ground, but managed to produce some sort of result. In the Alban Hills, on the fertile meadows of the Papal States, and, indeed, where the great Papal families were supreme, it flourished exceedingly; but nowhere more than in the South, where the influence of Spain was particularly strong. Southern Rome there are few noteworthy monuments of the XVth and early XVIth centuries, the Renaissance age in Italy. Beyond the classic sites of Paestum and Pompeii, of which and Magna Græcia—nearly all buried and unknown in these days—a XVIIth-century architect in the Kingdom of Naples sought to draw his inspiration from a magnificent series of early Gothic buildings rich in naturalistic ornament and tinged with the romantic spirit of the Crusades. Among doors and windows, piers and vaults which recall the mediæval churches of Provence, germinated the predisposition to a free and luxuriant fashion in decoration. Then came two converging influences from widely-different quarters. The Jesuits, the Theatines, the Papal emissaries, princely families, brought from Rome the new Baroque movement already in vogue there, and where the scholarly genius of Bramante had failed to penetrate, the talents of Bernini and his kind were met with upon with admiration. The little towns of Sicily and the Adriatic seaboard, as well as great centres such as Palermo and Naples, bedecked themselves in the new manner and rejoiced at their added splendor. Meanwhile, political changes had so brought it about that Southern Italy was saturated with Spanish ideas and customs following in the train of those stern governors who held a little court in every provincial town of importance. Spanish architects already displayed some startling characteristics before other countries in Europe revolted against the schoolmen, and Spanish influence was for ostentation, elaboration, and outward show.

It is, therefore, hardly to be wondered at that the Baroque movement is particularly widespread in these provinces, and that the typical centre of the movement is to be found at Lecce.

The buildings of this town may be regarded as ecclesiastical, public, and private, and treated accordingly. All of them are compressed into small space by the medieval walls, and the streets are, to English eyes, ridiculously narrow. Lying on a level a few miles from the sea, there are no those effective stairways so characteristic of the hillsides of Naples or Genoa, nor there any of the monumental vistas which one associates with Baroque enterprise in Rome. It might even be said that the thing is against the picturesque, and without hills, without a harbour, without a river, or even a sleepy canal, in the midst of a sunbaked plain, Lecce is severely capped as a beauty-spot. Yet, admitting that it has an undeniable charm, we recognise the merit of architecture is independent of its surroundings; moreover, that the Baroque style, so relying on a theatrical setting for effect, in itself commands admiration.

The Lecce churches are in some ways representative series such as one finds in other towns, yet in a sense unique. Their number alone is extraordinary in proportion to the area of the city, there being forty within the walls and the immediate suburbs. With a few exceptions, they are all built within a limit of a hundred years, from about 1575 to 1730. The Baroque in character of these dates from the XVIIth century, say, from 1620 to 1710, therefore have here an epitome of the style applied to ecclesiastical buildings in its stages; firstly, a gentle breaking away from late Renaissance models; secondly, a period of anarchy and extravagance; and, lastly,

to return to more classic forms, first stage such churches as the Gesù Irene show us more classic inspiration and delicate Cinquecento examples which they; yet the former, though so early as 1575, is of fully-developed Baroque character, with its broken pediments, scroll brackets, and its unconfined detail. Alike in its façade and interior, with four chapels on either side of the nave, the ceiling of the nave is flat, domed roof over the crossing, and a vault above the choir. The pilasters are decorated with arabesques, and the interior is ornate in most respects. The most of Lecce churches, however, is S. Maria della Porta, a remarkable building. A national monument, it is being at present very carefully restored. The façade represents an extraordinary orgy of bold and intricate carving in the golden local stone, and, for that matter, its representation in photographs, for the sphere and surroundings lend it a certain which its unreality seems to call for. Baroque in a sense which cannot be traced even in Rome, recalling some of the grotesque marvels of Spain. The interior is no less singular, and only a little ornate, but, save for the transept altars, more attractive. For here we find an ably Baroque architect utilising all the delightful Gothic and Byzantine forms typical of Adriatic provinces and mingling them with Renaissance swags in his novel creation. A well-travelled and well-read architect suddenly placed in this church find it difficult to give a date to work in, he had probably never seen before, which forms so strange a combination of mental forms. To the writer's mind appears certain that architectural circles would be much exercised if a set of measured drawings of this unique edifice were to be made.

Croce was followed by a long series of churches of varying merits and fashions; some comparatively simple and academic, some rusticated and carved from plinth to cornice, and for the most part without any coherent logical sequence. Two or three of the most ornate were never completed (and hence an incomplete and lofty façade has been the charm of that old wisteria-enclosed palace basement which one recalls the Grand Canal at Venice). In a few cases, as in most other towns, the ambitions of the Baroque builders are confined to the old church being left standing and it. In Lecce, as in Rome, there was times a certain striving after originality for its own sake, at other times a too-flagrant display of display. Good interiors were often led by pretentious altars. The final stage building, in the XVIIIth century, though away a return to classical forms, is not marked by any very distinct line of difference, and is on the whole, a decline, architectural hardities being retained without the serious spirit of licence which made absurdity absurd.

In Lecce secular buildings one can write with enthusiasm, and that partly because of natural freedom in their design all too rare in a period when artificiality was the prevailing weakness. It is true that in some of the larger and more public institutions, such as the Seminario (or training college) and the Covado (or Bishop's palace), one finds the floridity as on the façade of the Prefettura (formerly the cloister of the Celestini, whose church of S. Croce adjoins it). But these were the handiwork of the same ambitious prelates who built the churches, and must have been in their day very much the most original folk in Lecce. One, at least, of the large city gateways, too, is due to them, and commemorates the virtues of theological founders and Christian saints

with an excellent breadth of outlook. Comparing the Prefettura and the Seminario with the Palazzo Doria at Rome, one sees the prevailing symptoms of an Italian Baroque palace of the grander kind.

In Lecce, however, one may study far better than in Rome the vernacular architecture of the period, for XVIIIth-century Rome was full of officials herded together in "colleges" and palaces, whereas Lecce, though abounding in clerics, retained its own domestic life. So, though Spanish grandees may have occupied one or two of its stately mansions, we may reasonably attribute Lecce's chief architectural attractions—its quaint little street fronts and sunny courtyards—to the prosperity of its merchants and professional men. No doubt Spanish manners helped to produce a love of heraldry at every possible corner, of enormous front doors to comparatively small houses, and so on; but in this case the influence has added to the interest. The infinite variety of design in so small a place shows the possibilities of Baroque as useful architecture compatible with ordinary life.

What we may call "civic art" is absent here more than one would expect in so gay a city. Fountains do not exist, there is only one formal square in the place, and the municipal spirit of the past appears for little

more than two great stone gateways in the walls and a small town hall. In this respect Lecce is not typical of the rest of Italy, where one finds in almost every village a fountain or two, an archway here and there, some small structure or ornamental feature forming part of a lay-out dating from the Baroque period, when a lay-out became a practical proposition with many city fathers. The port of Ancona, the Molo Vecchio at Genoa, the Dogana at Venice, Bernini's projects at Civitavecchia—all these were maritime schemes; others, again, call for canals or rivers, for a flow of water from spring or aqueduct; but Lecce, in its parched plain, served even now by a primitive supply, has always lacked one of the most frequent causes of monumental Baroque architecture.

Looking back over this study of Baroque architecture in Italy, a study of necessity confined to two or three representative centres, one feels the need for some summary of conclusions, for drawing together the loose ends of discursive criticism. After six chapters of wandering among these interesting and misunderstood buildings it should be possible in a few paragraphs to estimate their value to posterity.

An unbiased opinion on Baroque architecture cannot be altogether laudatory. Its greatest exponents were not on the level of

A Lecce Street.

For further illustrations of Lecce buildings see "The Heart of Italy," by M. S. Briggs. (Mellrose, 1910.)

In Lecce.

In Lecce.

Praxiteles or Michelangelo, of the builders of Salisbury or Beauvais cathedrals. But, on the other hand, they were not all worthy of absolute neglect or of hasty condemnation. If they did not always touch the clouds, they were not continually grovelling in the mire of debased design. And they did, without doubt, stand for something important in architecture, which neither we nor our successors can afford to scoff at.

The highest aspect of architecture is presumably the ideal—the spirit manifest in a building. But the builder's ideal may be one thing and his critic's ideal some centuries later a very different one. Can we, then, hundreds of years after one of these old masters has perished, look back into his mind and read the thoughts he was thinking as he piled up these ancient stones?

There are some men who tread unhesitatingly on this delicate ground, and most of those who have made any general criticisms on Baroque architecture have neglected the possibility of any ideals, and have labelled it as false, pagan, and altogether degraded. Sweeping and didactic as this view may be, it is probably sincerely held, and is, at any rate, worth consideration.

In a previous chapter it has been pointed out how much this period owes to the militant vigour of the Church, and hence one would expect to find a deeply religious feeling exhibited in her works. But a would-be defender of Baroque cannot say much of deep feelings in this connexion, for the ruling passion blazoned from the stones of the Salute in Venice or the Gesù at Rome is spiritual pride—the pride of a powerful Church exulting over vanquished foes, strong in the confidence of her own integrity. The ambition of the Gothic cathedral-builders must have been a disinterested one—to glorify God and to efface themselves—for their churches bear few labels.

The XVIIth-century Popes may also have had lofty motives, but their desire for self-advertisement often overshadowed their better selves. One feels a subtle distinction between those Jesuit churches, crammed with marbles and gold, and the earlier

treasure-houses at Venice and Ravenna, where rich mosaics blaze from consecrated walls. In the one case a visitor's first thought is of the vast wealth of the ancient Church, in the other of the devotion which brings the wealth within her walls. Yet even in making so guarded a criticism as this one feels a certain diffidence, remembering how differently the present generation interpret architecture from their fathers' and Ruskin's day. Who knows but that in thirty years the religious feeling in architecture as we regard it may be eliminated altogether? The Gothic revivalists admired St. Paul's no more than Wren admired "Gothick." However, even at the risk of being jeered at by our grandsons, let us put it on record that the religious ideal in architecture of this period gave place to the glorification of the Church and her ministers.

Granting so much, we need not dwell on the reputed paganism of her statuary, her muscular saints, and her sensuous Madonnas. For religious ideals can be carried too far in such matters, and we need think no less of St. Peter if he be a fine figure of a man or of St. Clare if she be a type of full-blooded feminine beauty. Whether depicted on canvas or graven in stone, the human form need be neither stiff nor archaic because it happens to adorn a sacred building.

One other criticism should be admitted with reservations—that Baroque architecture is false. In certain instances, which may be grouped under two or three heads, this is unfortunately correct. It can only be relatively said of any style of art that it is false or truthful, and to say that Baroque *quâ* Baroque is false is absurd; to say that in many matters of detail it is untruthful is possible. Of all shames the one most commonly found is that of disguising a church with a façade having no reference to the construction behind it. The effect from any position but immediately in front is most despicable, and is worthy of the strongest terms of condemnation, which should be applied in all charity to many world-famed mediæval churches for the same reason. These, however, need not be extended to the

design of the façade itself as an architectural composition—the only aspect in which can conceive of its designer regarding it.

A kindred defect is to be found, not crowning such façades, but in many prominent places where the backs of statues are left unfinished so that, as in the instance, a spectator is limited to one view. Here we have not only untruthfulness but slackness. Another and petty deceit is confined chiefly to cathedrals and large churches, where marble is used to imitate other materials. Thus in the church at Venice we have a marble canopy for the chancel floor and marble curtains for the pulpit! If we are to discuss the propriety of drapery being imitated in coloured marble—as in various tombs in St. Peter's—whole problem as to whether coloured marble is justified in statuary comes up and involves us in elaborate points of aesthetics, but general such imitations partake of the vulgar and are to be discouraged.

Having said the worst that can be said of Baroque, we come to a more debatable issue (and here, be it remembered, we limit ourselves strictly to Italy), whether its decorative features are plentiful and too grotesque. Again a must tread with the utmost circumspection for who is to say with any finality what is good ornament and how much of it is necessary? Provided that due regard had to nature in adopting conventional forms, that the limits of the material used are borne in mind, and that decorative features do not disguise or hide construction it is difficult to make ornament more a matter of taste. Thus a panelled ceiling is used in nearly every style of architecture for ornamental purposes, and simple. That every line had a constructive significance could not be claimed for any period, even the purest of Greek. Nor would it be possible to lay down a law as to the amount of ornament which might be legitimately employed per square super., nor even the amount of relief which might be possible per yard of ornament. That, as a matter of taste, and varies in a country.

point and renders it immortal, as in
respect of Rome from the Villa d'Este
voli.
other great quality was his ability
think imperially." In Rome especially,
n other cities too, it seems as though
heme defied the daring of those days,
ough the greatness of Imperial Rome
filtered through many generations into
eins. The Piazza of St. Peter and the
a Navona at Rome, the many other
cts of those Papal architects, Alessi's
e, and Bianco's three palaces at Genoa,
Salute at Venice—these were not the
s of men on a small scale.
preciative of possibilities, able to think
e grand manner, our Baroque architect
brought to his work a gift which alone

should prevent his being ignored—the
originality of an artist. For his immediate
predecessors, with one or two glorious
exceptions, seemed to be forgetting that
architecture was not an "exact science,"
that a knowledge of certain figures and
formula was not sufficient to produce a
great building. Michelangelo himself was
one of the exceptions—a painter born. He
brought into architecture a painter's mind,
percepts a sculptor's mind too, and designed
his buildings by eye rather than by formula.
It was his unconventional impulse which
drove his successors to fling away convention
in greater or in less degree and to plan their
buildings with a view to scenic effect. So,
whether in a case of grouping, in the framing
of a picture as part of a decorative scheme,
in the disposition or design of ornament,
in the silhouette of a campanile, in the
planning of a bridge, the Baroque architect
is striving for the picturesque. He takes
great pains in arranging his gardens and his
terraces in many such artificial problems.
His experiments often land him in difficulties
or turn out failures eventually; but surely
his conscious striving for the beautiful is to
his credit? One shivers to think of what
the world would have lost without the works
of this period, and not least what modern
architecture would have lost if no examples
existed in Italy later than the middle of
the XVth century.
For the objections which apply to some
Baroque churches, and some only, on the
grounds of religious aspiration and untruthful
design, do not apply to all the other buildings
of that great period. For the purpose of
expressing pride of birth the Baroque noble-
man's palace was perfectly suited; for the
purpose of beautifying a town the Baroque
fountains and gardens were unsurpassed;
for the purpose of providing gay vistas and
charming houses nothing in Italy rivals
the bright little Baroque streets of Lecce.
It might almost be said that in this period
were developed the piazza, the street, the
country villa, the monumental staircase,
and the congregational church plan. Even
in the vexed region of decoration few would
gainsay the charms of the dainty ornaments
and features which came into being, framing
the long lines of doors and windows which
otherwise would have resembled closely
Renaissance work in Italy.
The subsequent articles of this series
will show the effects which this remarkable
movement had in other countries.

**THE ANCIENT WALLS OF
ATHENS.**

AFTER the Medes had returned from Europe
defeated both by land and sea by the Hellenes
at Marathon and Salamis the Athenians brought
back their wives, children, and such property
as had been saved in the various places in which
they had deposited them before the Medes
attacked Athens and prepared to rebuild their
city and its walls.
Thucydides, in his history of the Pelopon-
nesian War, says that only portions of the
circumference had been left standing by Xerxes,
and most of the houses were in ruins, though a
few remained in which the Persian grandees had
taken up their quarters. Thus, on their return
to Athens in 479 B.C., Themistocles advised
the Athenians to rebuild the walls with all
possible speed. The wall was to be built first,
and the whole population in the city was to
labour at the wall, the Athenians, their wives,
and their children, sparing no edifice, private
or public, which might be of any use to the
work, but throwing all down. Thus the
wall was erected with great dispatch, and as
can only be expected, the work was of the
roughest nature, for, to quote Thucydides,
"the foundations are laid of stones of all kinds,
and in some places not wrought or fitted, but
placed just in the order in which they were
brought up by the different hands; and many
columns, too, from tombs and sculptured
stones were put in with the rest. For the
bounds of the city were extended at every point
of the circumference; and so they laid hands on
everything without exception in their haste."

"Themistocles also persuaded them to finish
the walls of Piræus, which had been begun
before in his year of office as archon; being
influenced alike by the fineness of a locality
that had three natural harbours, and by the
great start which the Athenians would gain
in the acquisition of power by becoming a
naval people." By his advice it was that they
built the walls "of that thickness which can still
be discerned around Piræus, the stones being
brought up by two waggons meeting each
other. Between the walls thus formed there
was neither rubble nor mortar, but great
stones hewn square and fitted together, cramped
to each other on the outside with iron and
lead."
From this last we might infer that the
rapidly-constructed wall of Athens before
mentioned was filled with rubble and jointed
in mortar.
The foregoing description will be found in
Thucydides' first book, Chapter IV., as also
the means employed by Themistocles to deceive
the Lacedæmonians, who sent an embassy to
the Athenians asking them not to rebuild
the wall. This explains the reason for the
very hurried rebuilding.

HISTORICAL NOTES.

**"The Blue
Shop,"
Gloucester.**
THE premises of the City Tea
Warehouse, known as "The
Blue Shop," near the Cross in
the City of Gloucester, have
just been sold to the Corpora-
tion for 3,500*l*. Fortunately the Elizabethan
decorations of the interior will be preserved and
without disturbance, as also the two finely-
panelled rooms, in one of which is a handsome
mantelpiece bearing the coat-arms of Yale.

**Stafford
House,
St. James's.**
It is stated that Messrs. Knight,
Frank, & Rutley, on behalf of
the Duke of Sutherland, have
sold to Sir W. H. Lever the
lease of Stafford House, which
it was suggested some months ago would form
a suitable residence for the Prince of Wales. In
pursuance of the Acts 4 & 5 Vict., c. 27, and
5 Vict., c. 20, the Crown sold the house to
George, second Marquis of Stafford and second
Duke of Sutherland, for an annual rent of 758*l*.
and the cost, 72,000*l*, of the building—the latter
sum was devoted to the laying-out, by Penne-
thorne, of Victoria Park. The mansion, which
for its situation and interior is not excelled in
London, was begun in 1825 for the Duke of
York from the designs by Sir Robert Smirke,
who, however, was superseded in favour of
Wyatt when the building of the fabric had
reached to the ground floor. Two years after
the sale to the Duke of Sutherland Sir Charles
Barry remodelled the interior, added the
masked top story, and built the stables. For
clearing the site were pulled down Godolphin
House, a home of C. J. Fox, and Queen
Caroline's library, built by Kent in 1737. Sir
Charles Barry was the architect, too, for the
extension and improvement, together with the
erection of the central tower, for the Duke of
Sutherland, of Trentham Hall, Staffs, whereof
the greater portion was recently pulled down.
It is understood that Sir W. H. Lever will
devote Stafford House to some national or
public service.

**Paleolithic
Art in South
Wales.**
THE announcement of the
discovery of paintings of the
Paleolithic Age in the cave
known as Bacon's Hole near
the Mumbles, to which we
referred in our issue of October 18, has been
received with considerable incredulity in the
locality, and suggestions of a would-be
humorous and satirical nature of a much more
recent and romantic origin for the paintings
have not been lacking. Professor Sollas, how-
ever, has been convinced by what he observed
on a second visit to the cave that the theory
put forward by Professor Breuil and himself is
accurate. On removing a projecting portion
of the painted rock, it is seen that not only are
the red bands painted on a stalactite surface,
but that they have subsequently been covered
by a fresh layer of stalactite as thick in some
places as two millimetres, which conclusively
proves a considerable lapse of time since the
artist was at work.
The owner of the cave, Colonel W. Ll. Morgan,
has taken precautions against defacement of
this oldest example of the art of our island by
enclosing the entrance to the inner chamber of
the cave in which it occurs with a stout iron
grille, but admits visitors on personal application.

THE BUILDING TRADE.

BUILDING CONTRACTS AND CONTRACTORS.

THE case of Ramsden & Carr v. Chossum & Sons, recently heard in the Court of Appeal, is one of those cases which exercise the minds of those connected with the building trade. The case was reported in the *Builder*, January 26, 1912, and, on appeal, in our issue of last week, page 555. The defendants were contractors under a contract in the form approved by the Royal Institute of British Architects for the erection of a cinematograph theatre. The plaintiffs were designers and makers of articles in ornamental metal, and, as it was alleged, at the invitation of the architect quoted prices for the supply of door-handles and other articles. Their quotation was accepted, and the articles were supplied. Subsequently the building owners, the theatre company, went into liquidation. The plaintiffs sued the contractors for the price of the goods delivered, and alleged that the architect had certified for a sum which included the sum due to them. In the Court below it was held that no sum had been received by the defendants in respect of the goods, and that the architect had not acted as the agent of the defendants, but that, as the goods had been delivered to and used by the defendants, there was an implied promise to pay for them. The Court of Appeal agreed with the finding of the Court below as to agency and payment, but reversed the finding (Lord Justice Kennedy dissenting) as to the implied promise to pay. The two Lords Justices held that there was no acceptance of the goods and use of them by the contractors for the purposes of their contract from which an implied contract to pay for them could be presumed, nor had they received payment for them from the building owner.

If the fittings in question had been within the specification—that is, within the contract between the building owner and the contractor—then no doubt those clauses in the Institute's form of contract relating to special artists, etc., would have come into operation and the contractor might have been liable. But it would appear that the fittings in question were outside the contract, although the architect had power to order them as extras, but in doing so he would be acting as agent for the building owner and not the contractors.

For acceptance of the goods supplied or services rendered to serve to imply a contract to pay for them it is obvious that some benefit must accrue to the person who accepts them. Thus in cases where the contractor has become insolvent a contract has sometimes been implied as against the building owner who has benefited by the services rendered or the goods supplied (see *Crittall Manufacturing Company v. London County Council*), but in the case under consideration the Court found that there was nothing to show the contractors that the goods had been ordered on their behalf or for their benefit, or even that they could either accept or reject them, as for all they knew they might have been sent on the order of the building owner.

The law relating to building contracts is not so obscure as many persons suppose, and questions such as the above generally only arise when one of the parties becomes insolvent, a contingency which usually causes someone to suffer. The real lesson to be learnt from these cases is that litigation and loss can only be averted by precautions being taken by those entering into contracts and inquiries being made into the solvency of those to whom it is intended to give credit.

BUILDING IN PAISLEY.

Dean of Guild Barr, who presided at a meeting of the Paisley Dean of Guild Court on the 6th inst., made reference to the number of buildings which had been erected in the town during the year ending October. There were only thirty-nine plans submitted to the Court as compared with fifty-two for the preceding year. There was, however, an increase in the value of the linings passed, the total valuation being 76,620*l.* as compared with 76,310*l.*

THE TRADE UNION BILL.—II.

THE Standing Committee have proceeded with their consideration of the Trade Union Bill. The amendments to Clause 2 were not very important. By Subclause (2) the registrar may withdraw a certificate of a registered trade union if the constitution has been so altered that in his opinion the principal objects of the union are no longer statutory objects, "or if in his opinion it is no longer being carried on in good faith as a union"; for these latter words were substituted—"or if in his opinion the principal objects for which the union is actually carried on are not statutory objects."

On Subclause (4), which gives an appeal from the registrar refusing or withdrawing a certificate to the High Court, an amendment substituting the Secretary of State for the Court was lost by 28 votes to 6.

By far the most important discussion arose on Clause 3, which provides that the funds of a trade union shall not be applied to the political objects specified in this clause (which we set out in our former article) by a union, registered or unregistered, unless rules to be approved by the registrar are in force. An amendment was moved that the conditions to be secured by the rules should be statutory conditions, so that for any breach redress could be obtained in the Courts. This point is one of vital interest to the working classes, as the rules in question purport to secure the rights of those in the minority.

The rules have to provide—1. That the funds of the union shall only be applied to such of the political objects specified in the Bill as are approved by a majority of the members voting on a ballot. 2. That these objects shall be supported by payments out of a separate fund, and that any member intimating that he is unwilling to contribute to such fund shall be exempt from contributing. 3. That any member claiming exemption shall not be deprived of any benefits or placed under any disability or disadvantage except in relation to the management and control of such political fund.

These rules are the charter of the minority, and their liberty depends upon them, therefore it is important to see how they can be enforced. Under sect 3 of the Trade Union Act, 1871, the Courts are deprived from entertaining any legal proceeding instituted with the object of directly enforcing or recovering damages for the breach of any agreement (i.) concerning the conditions on which any members of a union shall sell their goods, transact business, or employ or be employed; (ii.) for the payment of subscriptions or penalties; (iii.) for the application of funds of the union to provide benefits.

It has been held over and over again that members cannot sue for benefits, but the latest decision is that in the House of Lords, *Russell v. Amalgamated Society of Carpenters (the Builder, April 5, 1912)*; see also *Thomas v. Portsmouth A. Branch of the Ship Construction, etc., Association (the Builder, April 26, 1912)*. The object of the amendment was to give recourse to the Courts to any member who was penalised by the union in dereliction of the rules because he declined to subscribe to the political objects, but it was lost by 26 votes to 14, great opposition being expressed to it on behalf of the Government. What real protection is there extended by the Bill to the minority? The Attorney-General in Committee stated that, if a minority claiming exemption could show that the executive were depriving them of benefits not for legitimate reasons, but because they had claimed exemption, he could not conceive of a general meeting of the union not giving redress at once. We venture to think there is no evidence to support this view. By the rules, as we have shown, a majority voting have to decide whether the union shall support political objects, and, where political feeling is concerned, the right of the minority are not likely to receive consideration. The Labour leaders have

openly declared that the minority are disregarded. A man is hardly likely to venture to dissent from the majority decline to subscribe if he knows his and his fines, etc., are entirely in the discretion of the majority from whose vote he has dissented and from whom there is an appeal. The debate in Committee has one useful purpose, as it has demonstrated the absolute futility of the rules which introduced with the estimable object of protecting minorities, and that this part of the Bill is for show only. If a dissenter were expelled the Courts could grant an injunction (see *Osb. Amalgamated Society of Railway S. No. 2, the Builder, March 24, 1911*), which is of little advantage for a man to retain membership of a society if the society can withhold all the benefits owing to membership. The Bill as it appears to offer no protection to those whilst joining a trade union for trade purposes, wish to dissociate themselves from the political propaganda.

A LARGE CRANE.

ONE of the largest cranes in the world erected at Govan, on the Clyde, in 1911, is a jib-head of the crane is of the hammer type, built on the cantilever principle, stands 160 ft. above high-water level, the jib, with a total length of 270 ft., is 160 ft. 6 in. outward from the centre, and is utilised within every point of 336 ft. in diameter. The motors for the gear vary from 60 to 90 horse-power, the crane, on slow gear, will lift 200 tons or 75 ft. along the jib, and on quick gear will lift 135 ft. The maximum load of 200 tons will be lifted from 30 ft. below to 140 ft. wharf level, a total lift of 170 ft.

The three controlling brakes are worm, magnetic, mechanical, and hydraulic. The stability of the structure of the crane depends on four huge steel cylinders, at each corner of the tower. These grow 15 ft. in diameter at their base, are filled with concrete and sunk 74 ft. below ground.

LIVERPOOL OPERATIVES' CLUB.

NOTICES have been sent in to the Builders' Association of Liverpool to test the present agreement under which bricklayers, masons, and slaters are employed, and new demands have been formulated, if accepted, will come into force next year.

The concessions now demanded by masons, bricklayers, slaters, and joiners is, per hour, bricklayers 1*s.*, masons and slaters 10*d.*, and slaters 12*d.* per hour in the first three cases, and 1*d.* in the case of the slaters.

There is no likelihood of a strike at even though the request is refused. The master builders refuse the demands, and go on automatically before its own Conciliation Committee; failing agreement, to the strike is unlikely for at least six months. The view of the cordial relations between master builders of Liverpool and the Amalgamated Society of Carpenters and the Operative Stonemasons, the Brick Society, and the Slaters and Plasterers Society, it is anticipated that there will be no cessation of work. It is nearly forty years since the last great strike in the building trade, and according to a well-known correspondent, "it is very likely that years will pass before we have another Liverpool Post."

GENERAL BUILDING NEWS.

NEW CHURCH, SOUTH KNIGHTON.

Mr. Stockdale Harrison is the architect of the new church of St. Guthlac, which is erected at an estimated cost of 5,000*l.* The nave will be 31 ft. wide and 40 ft. high, and will probably be extended in the future to 80 ft. The lighting will be by electric, the heating by hot water. The contractors are Messrs. Haskard, Rudkin, & Beal.

WESLEYAN SCHOOL, NEWLYN.

This new Wesleyan Sunday-school is erected at a cost of 2,700*l.* from the gift of Mr. Henry Maddern, architect, of P.

Building will include a large hall 36 ft., providing accommodation for small hall 40 ft. by 36 ft., six class-rooms, and other offices. The contract is secured by Mr. J. S. Tregenza, of

NEW OFFICES, NEWCASTLE.
New block of offices which has been on the Cross House site in Westgate (has been built in ferro-concrete from designs of Messrs. Cackett & Burns Dick, &c.). The building is faced with Portland stone and consists of seven floors, and on top of the building are two sculptured representing "Industry" and "Commerce." The contractors for the work were Davison & Miller.

JAM WORKS, BRISTOL.
Jam works are being erected at Bristol by Messrs. James Robertson & Sons, Paisley, London. The architects are Messrs. W. H. & Sons, Warrington-street, Ashton-Lyne.

SHEFFIELD TOWN HALL EXTENSION.
Proposed shortly to extend the Sheffield Hall at an estimated cost of 45,000. Present building, which has a front to the street and Surrey-street, was erected from plans by the late Mr. E. W. Ford, of London (illustrated in the issue of the time), at a cost of nearly £100,000. The proposed extension will consist of a rectangular, and will close up an unsightly gap on the Cheney-row side of the hall. It has been designed by Mr. P. Edwards, F.R.I.B.A. (the City Architect) who carried out the Bradford Town Hall extension, completed in 1900—to be in general harmony with the rest of the building, but it is carried to a considerably greater height in order to increase the accommodation as far as possible. The site originally available for extension contained 1,113 sq. yds., but this has been increased to 2,673 sq. yds. by addition of the adjacent churchyard of St. Paul's. The floor area of the existing hall is 9,455 sq. yds., and that of the extension will be 4,500 sq. yds. The whole of the ground floor of the extension will be allocated to the Overseers' rate-collecting department, and part of the court will be taken by a rate-collecting hall, with direct access from Cheney-row and Norfolk-street. Floors above will be used in amplification of accommodation now provided for the City Clerk, the City Engineer, the City Engineer, and the Water Department, and will be a new committee-room and spare room. The plans also provide for the erection of a new public gallery in the Council chamber, which will be so arranged as to take the space occupied by the existing gallery to be included in the floor area of the extension.

CINEMA PALACE, NORWICH.
Picture theatre has been erected in Talen-street, Norwich. The building occupies an area of 3,500 sq. ft., and will seat 850 people—600 on the ground floor and 250 in the balcony, which has been constructed of the same material. The operator's box is fireproof. The building has been erected entirely by local labour. Messrs. Dean & Buckingham were the architects, and the following were subcontractors: Messrs. Crotch & Son, plasterers' work, restricted stone, and glass mosaic; Messrs. E. Dunnell, & Co., terra-cotta; Messrs. Lee & Pye, ironwork; Mr. A. E. Chaplin, painting and decorating; Messrs. Curd & Co., reinforced concrete; the Norwichester Company, pavements; the Norwich Corporation, electric wiring, fittings, and gas; and the British Gas Light Company, gas and gas heating.

TRADE NEWS.
Under the direction of Mr. William Hucker, architect, Tring, Boyle's latest patent pump ventilators have been applied to the Natural History Museum, Tring, and to Plesley Hill Schools, Mansfield, and are ventilated by means of Shorland's patent dust roof ventilators, supplied by Messrs. J. Shorland & Brother, Ltd., of Fallowfield, Manchester.

BIRMINGHAM COUNCIL HOUSE EXTENSION.

Supplementing and correcting our article last week on the Birmingham Council House Extension (p. 543), we find that the plans for the constructional steelwork were fully prepared by Messrs. Whitaker, Hall,

& Owen, of 1, Gresham-buildings, Basinghall-street, E.C., who were the consulting engineers for the building, and are engaged at the present time on further work in connexion with it. Messrs. Charles Wade & Co., of Birmingham, were the manufacturers of the steelwork, and worked under the superintendence of the consulting engineers. We may add that Messrs. Samuel Elliott & Sons, Ltd., of Reading, carried out the whole of the joinery work, with the exception of the furniture, at this building. The work executed consists of a very large quantity of Austrian walnut oak and Spanish mahogany.

APPLICATIONS UNDER LONDON BUILDING ACTS, 1894 to 1909.

At Tuesday's meeting of the London County Council the following applications under the London Building Act were dealt with. (The names of the applicants are given in parentheses.)

Lines of Frontage and Projections.
Chelsea.—Erection of an addition to the bay-window at No. 55, Pont-street, Chelsea (Messrs. Buckland & Gerrard for the Guardian Assurance Company).—Consent.

Hackney, South.—Erection of a projecting porch in front of the Homerton Public Library, on the eastern side of Brooksby's walk, Homerton (Mr. E. Cooper).—Consent.

Hampstead.—Buildings on both sides of a new street leading from Orman-road to Belsize-lane, Hampstead, and on the eastern side of Belsize-lane (Messrs. W. Woodward & Sons).—Consent.

Hampstead.—Bay-windows to a proposed house on the north-eastern side of Finchley-road, Hampstead, between Fernald-lane and Heath-drive (Mr. G. H. Fox for Mr. S. J. Hankey).—Consent.

Hampstead.—Porches and hoods to buildings on the northern side of Kingscroft-road, Hampstead (Messrs. Rix & Wilkins for Messrs. T. H. Perkins & Co.).—Consent.

Hampstead.—Two sign-boards in front of Nos. 254 and 256, Belsize-road, Hampstead (Messrs. P. Hilborn & Son).—Refused.

Lewisham.—Wooden bay-windows, hoods, and shawl half-timber work to six houses on the western side of Guibal-road, Lee (Mr. A. Roberts).—Consent.

Stepney.—Erection of an addition at the rear of "The Mitre" public-house, White Horse-lane, Stepney, next to Rectory-square (Mr. W. Park for Mrs. Waldorf Astor).—Consent.

Strand.—Erection of a projecting illuminated sign at No. 25, Villiers-street, Strand (Mr. W. E. Sanders for Mr. A. Grass).—Consent.

Waltham.—Addition in front of No. 55, Camberwell-road, Camberwell (Mr. A. R. Westworth for Messrs. Pettie & Mills).—Refused.

Width of Way.
Hampstead.—Erection of additions at "Wildwood," North End, Hampstead (Messrs. Read & MacDonald).—Consent.

Width of Way and Line of Frontage.
Mill End.—Erection of an iron and glass shelter, projecting steps, and a pay-box in front of No. 31, Globe-road, Mill End (Messrs. Lovegrove & Papworth for Mr. P. Abrahams).—Refused.

Width of Way and Construction.
Hampstead.—Retention of a motor-house of a temporary character at the rear of Rickford Lodge, The Grove, Hampstead (Messrs. Bannan & Rowe for Mr. W. H. May).—Consent.

Lines of Frontage and Construction.
Finsbury, East.—Retention of a steel and concrete gangway over the public way of Cayton-street, City-road, Finsbury (Mr. T. F. Summers for Messrs. Lipton, Ltd.).—Consent.

Hoxton.—Erection of a steel, iron, and concrete gangway over the public way of French-place, Shoreditch High-street (Messrs. W. G. Lark & Sons for Mr. A. C. Fowler).—Consent.

Lewisham.—Retention of a wood and iron building at No. 2, St. Fillan's-road, Lewisham, next to Elmer-road (Mr. F. Dis).—Refused.

Paddington, North.—Open shed of a temporary character at No. 335, Shirland-road, Paddington, abutting upon Bravington-road (Mr. G. R. Robins).—Consent.

Wandsworth.—Temporary wood and glass showcases in front of Nos. 2 and 4, Revelstoke-road, Wandsworth (Mr. C. Barwell).—Consent.

Width of Way, Lines of Frontage, and Construction.

Kensington, South.—Showcase in front of No. 6, Kensington Court-place, Kensington (Messrs. J. Poole & Son for Mr. M. Hirschkop).—Refused.

Marylebone, East.—Erection of an iron and glass shelter at the entrance to the Welbeck Palace Hotel, Welbeck street, St. Marylebone (the General Electric Company, Ltd.).—Consent.

Formation of Streets.
Kensington, North.—Formation or laying-out of a new street for carriage traffic to lead from Daigarno-gardens to Barby-road, Kensington, and a new street to lead from such proposed street to Highlever-road (Messrs. P. & H. W. Currey).—Consent.

Cubical Extent.
Brixton.—Additional cubical extent in respect of an additional story over the central division of the Bon Marche building, Fendale road and Stockwell-avenue, Brixton (Mr. H. Payne Wyatt for Bon Marche, Ltd.).—Consent.

Marylebone, East.—Rebuilding of Nos. 179, 181, 183, and 185, Great Portland-street, St. Marylebone (Mr. R. Angell for Mr. C. E. Pecenik).—Consent.

Marylebone, East.—Additional cubical extent in respect of the erection of a building upon the site of Nos. 7, 8, and 9, Union-street, and Nos. 46, 47, and 48, Foley-street, St. Marylebone (Mr. F. Foster for Mr. J. R. Foster).—Refused.

Peckham.—Additional cubical extent in respect of a garage addition, to abut upon Nunhead-lane and a roadway leading out of Nunhead-lane, Peckham (Milner's Safe Company, Ltd.).—Consent.

Uniting of Buildings.

City of London.—Consent to the enlargement of an existing opening, uniting Nos. 1 and 2, Finchchurch-street, with Nos. 3 and 4, Finchchurch-street, City (Mr. L. U. Grace for the Union Castle Steamship Company).—Consent.

Islington, North.—Uniting of Nos. 17 and 19, Archway-road, Highgate, by means of an opening at the ground-floor level (Mr. H. Goodchild for Messrs. R. Filby & Sons).—Consent.

Stepney.—Formation of an opening at the second-floor level between Nos. 127 and 129, Commercial-road East, Stepney (Mr. G. J. Clarke).—Consent.

Cubical Extent and Construction.

Holborn.—Additional cubical extent in respect of an additional story to a division of the premises of Messrs. Lambert & Butler, Branch of the Imperial Tobacco Company (of Great Britain and Ireland), Ltd., Nos. 20 and 22, Wild street, Drury-lane, and the erection of external iron gangways and steps (Mr. G. C. Lambert for Messrs. Lambert & Butler).—Consent.

Poplar.—Iron building at No. 84, West Ferry-road, Poplar (Electrical Power Storage Company, Ltd.).—Consent.

Working-Class Dwellings.

Dulwich.—Block of buildings approached out of the southern side of Melford-road, Dulwich, and the north-eastern side of Lordship-lane (Messrs. Watson & Ellwood).—Refused.

PROJECTED NEW BUILDINGS IN THE PROVINCES.*

ABERDEEN.—Three shops and store, corner of Orchard-street and Orchard-place; Messrs. Joseph Shirras & Son, builders, Clifton-road, Aberdeen. Additions to premises, Canal-road, Aberdeen, for Messrs. John Thirld & Son, granite manufacturers.

Accrington.—Weaving shed at technical schools (1,200); Mr. H. Luttler, architect, 16, Ribblesdale-place, Preston.

Barrow-in-Furness.—Baths, Abbey-road (16,000); also 200 houses; Mr. Arthur Race, Surveyor, Town Hall, Barrow-in-Furness.

Bailey.—Warehouse for Messrs. J. W. Blackburn, Ltd., cloth manufacturers, Old Mill, Bailey.

Bedwellty.—Thirteen houses off Pengam New-road for the Powell Duffryn Steam Coal Company, Ltd., 54, Butte-street, Cardiff.

Bentley (Doncaster).—Rebuilding "Three Horse Shoes" Hotel, Messrs. L. Tacon & Son, architects, 11, Westgate, Rotham, Doncaster.

Beltway-Cood.—Proposed school; Mr. E. R. Davies, County Education Officer, Carnarvon.

Bingley.—Electric theatre (3,000); Messrs. J. B. Bailey & Son, architects, Scott-street, Keighley.

Blackpool.—Primitive Methodist church; Mr. J. D. Thornley, architect, Market-street, Darwen.

Bridlington.—Residence (5,000); Messrs W. S. Walker & Son, architects, 77, Lowgate, Hull.

Burnley.—Schools, Padiham-lane (8,000) and Burnley-lane (8,000); Mr. H. Luttler, architect, 16, Ribblesdale-place, Preston.

* See also our list of Competitions, Contracts, etc., on another page.

Bury St. Edmunds.—Block of almshouses; Mr. S. Naish, architect, Norfolk-street, Bury St. Edmunds.

Chapel-en-le-Frith.—Alterations to parish church (1,000*l.*) for the Vicar.

Chelmsford.—Stable (1,550*l.*); Mr. C. Brown Engineer, Town Hall, Chelmsford. Municipal offices (8,000*l.*); Mr. P. Harrison, Council Offices, Chelmsford.

Chorley.—Alterations to premises, Cleveland-street, for the Maypole Dairy Company, Ltd., 27, Leonard-street, E.C.; alterations to premises, Bolton-street, for the Co-operative Society.

Clayton-le-Moors.—Proposed Sunday school; Rev. I. Jones, Pastor, Baptist Church, Clayton.

Cleckheaton. Stores for the Co-operative Society; Messrs. R. Castle & Son, architects, London County and Midland Bank-chambers, Cleckheaton.

Clitheroe.—Schools (1,500*l.*); Mr. H. Luttler, architect, 16, Ribblesdale, Preston; Messrs. C. Bosland & Son, builders, Clitheroe.

Colne.—Additions to Waterside Tannery for Messrs. S. Smith & Sons, hide and skin factors.

Consett.—Proposed Sunday-school for Trustees, Baptist Church, Consett.

Co. Durham.—Co. Hospitals at Bishop Auckland (3,200*l.*) and Helmsdon; Mr. R. Thompson, architect, Market-place, Bishop Auckland.

Cowshill.—Church (3,000*l.*); Messrs. Clark & Moscrop, architects, Fitchams, Darlington.

Croydon.—Proposed rebuilding of fodder stores and stables, Cherry Orchard-road, for Messrs. Hall & Co., Ltd., coal and builders' merchants, Croydon; proposed rebuilding of sawmills and joinery shops for Messrs. Halland & Harmer, limber and builders' merchants, Albert Wharf, Cross-road, Croydon.

Cudham.—School; Mr. W. H. Robinson, Architect, Kent Education Offices, Caxton House, Westminster, S.W.

Dalton.—Enlarging school (560*l.*); Mr. W. V. Dixon, West Riding Yorks Education Offices, Wakefield.

Darlington.—Proposed Sunday-school; Rev. J. G. Holburn, Vicar, St. Luke's Church, Darlington.

Deal.—Pavilion; Mr. T. C. Golder, Surveyor, Town Hall, Deal.

Dewsbury.—Receiving wards at workhouse (1,600*l.*); Mr. J. Pease, Clerk, Guardians' Offices, Dewsbury.

Doncaster.—Works for the Peat, Coke, and Oil Syndicate, Ltd.

Donington.—Parochial hall, additions at Sunday-school, etc., for the Vicar, Parish Church, Donington.

Ellesmere Port.—Chapel, Westminster-road, for the Trustees, Welsh Chapel.

Essex.—Cookery and handicraft centre, Burnham-on-Crouch; teacher's house at school, Chadwell St. Mary; handicraft centre, Frinton; special instruction centre, Salisbury-road, Romford; Mr. F. Whitmore, architect, Duke-street, Chelmsford.

Failsborough.—Shops, Gregory-street and Droylsden-road, for the Co-operative Society.

Flushing.—Houses; Mr. J. H. Chubb, Surveyor, Council Offices, East Kemmer.

Folkestone.—Band pavilion (2,000*l.*); Mr. A. E. Nicholls, Surveyor, Town Hall, Folkestone.

Gainsborough.—Additions to King's Theatre; Mr. E. Green, architect, 32, Caskgate-street, Gainsborough.

Glasgow.—Additions to wireworks for Messrs. Christie, Ltd. (2,000*l.*); Messrs. Miller & Black, architects, 58, Renfield-street, Glasgow. Stores and works for Messrs. Wallace & Co., East End; Mr. L. B. Buik, architect, 196, St. Vincent-street, Glasgow. Extensions to Knightswood Hospital (4,000*l.*); Mr. A. B. McDonald, Engineer, City-chambers, Glasgow. Additions to warehouse, Miller-street (3,000*l.*); Mr. J. A. Laird, architect, 45, West Campbell-street, Glasgow. Picture house, Argyle-street (3,000*l.*); Mr. G. Kay, 73, Quarry-street, Hamilton. Picture house, Sauchiehall-street (2,000*l.*); Mr. T. Baird, architect, 134, Bath-street, Glasgow. Stables, etc., for Messrs. Bilsland Brothers, Glasgow (3,500*l.*); Messrs. Frank Burnett & Boston, architects, 180, Hope-street, Glasgow.

Great Yarmouth.—Children's home; Mr. F. Harward, architect, Queen-street, Great Yarmouth.

Greenock.—Dairy, Moarns-street, for the Central Co-operative Society. Clubhouse; Secretary, Auchmountain Harriers.

Grimsby.—Children's homes, Brighwgate (8,000*l.*); Mr. J. F. Winttingham, Clerk, Guardians' Offices, Grimsby.

Gwynne Vawr.—Additions at waterworks for the Aberlilly and District Water Board.

Harrogate.—School, Skipton-road (675 places); Mr. J. T. Taylor, Education Offices, Harrogate.

Haslingden.—Alterations to old infirmary (321*l.*); Mr. J. H. Sinkinson, Clerk, Haslingden Guardians' Offices, Rawtenstall. Weaving shed for Messrs. James Rothwell (4,000*l.*); Mr. N. Sutcliffe, Dale-street, Haslingden.

Heysham.—Nine houses and two shops, Main-street and Barrow-lane, for the Lancaster and District Co-operative Society.

Heywood.—Enlarging mill for the Heywood Spinning and Manufacturing Company, Ltd.

Holmhrth.—Hippodrome (3,000*l.*); Mr. P. M. Brown, Hawthorn Bank, Holmhrth.

Huddersfield.—Receiving home, Ramsden-street; Mr. E. A. Rigby, Clerk, Guardians' Offices, Huddersfield.

Hull.—St. Peter's Hall, Southbank (1,610*l.*); Messrs. Lowther & Rigby, 77, Lowgate, Hull.

Hyde.—Proposed institute, etc., for the Truro, Baptist Church, Hyde.

Jarrow.—Power-station, etc.; Messrs. J. W. White & Co., builders, High Barnes Works, General Graham-street, Sunderland.

Koigley.—Cinematograph theatre (3,000*l.*); Messrs. J. B. Bailey & Son, architects, Scott-street, Koigley.

Kettering.—Additions to factory, Rutland-street, for the Kettering Corset Manufacturers, Ltd.; two houses, Kingley avenue, for the Kettering Industrial Co-operative Society; additions to factory, Haylock-street, for the Co-operative Boot and Shoe Manufacturing Society, Ltd.

Kingston-on-Thames.—Congregational church; Mr. E. Carter, architect, 86, Eden-street, Kingston.

Leigh.—Methodist church; Mr. W. H. Dimsley, architect, 12, Cleveland-street, Chorley.

Longford.—Electricity substation, Longford Bridge; Mr. George Tough, Electric Light Works Manager, Town Hall, Coventry.

Loughborough.—Refuse destructor house (720*l.*); Mr. A. Faulk, builder, 4 and 5, Sparrow-hill, Loughborough.

Luton.—Alterations at church (2,600*l.*) for the Vicar, St. Mary's Church, Luton.

Maidstone.—Alterations to premises, Week-street, for Messrs. Boots, Ltd., chemists, Nottingham.

Marsdon.—Additions and alterations to Old Red Lion Inn for Messrs. Benney & Shaw, Ltd., brewers, Lockwood, Huddersfield; Messrs. J. B. Abbey & Son, architects, 34a, New-street, Hyde.

Milton.—School; Secretary, Education Offices, Portsmouth.

Newcastle.—Picture hall; Messrs. Hope & Tasker, architects, Trinity Buildings, Newcastle-on-Tyne.

New Mills.—Alterations at Providence Congregational Church; Rev. W. D. Edmunds, Pastor.

Newtown.—Consumptive hospital near Newtown; Mr. G. A. Hutchins, Surveyor, County Hall, Welshpool.

Northampton.—Proposed technical school; Mr. L. Beattie, Town Hall, Northampton.

The following plans have been passed:—For stores, Albert-street, for Messrs. W. Wren & Co.; and for eighteen houses in Sharnham-road, for Mr. G. F. Sharnham.

North Ormsby.—Proposed enlargement of mission hall and alterations to Parish Church for the Vicar.

Nottingham.—Enlarging pupil teacher centre (2,500*l.*); Hucknall Torkard; school (500 places), Kirby-in-Ashfield; and school (400 places), Sutton-in-Ashfield; Mr. L. Maggs, Architect, Shire Hall, Nottingham.

Okhampton.—Territorial drill hall (2,000*l.*); Messrs. Ellis, Son, & Bowden, architects, Bedford-circus, Exeter.

Oldham.—Proposed additions to mill for the Belgrave Mills Company, Ltd., cotton spinners, Honeywell-lane, Oldham.

Oswestry.—Drill hall, Llanyfyllan; Mr. R. W. Davies, Carme, Montgomery.

Oxford.—School (7,200*l.*); Mr. W. H. Castle, Architect, Education Offices; Oxford.

Padiham.—Rebuilding shops, Burnley-road, for the Co-operative Society. Town and market hall, baths, fire and ambulance stations, etc., for the Urban District Council (30,000*l.*); Messrs. Pollard & Pollard, Architects, County Bank-chambers, Padiham.

Paignton.—Additions to Isolation Hospital; Mr. O. Baines, Architect, Town Hall, Paignton.

Prestwich.—Proposed church, Simister-lane (about 2,000*l.*); Rev. J. H. Kidson, Vicar, St. Margaret's Church, Prestwich.

Ruiddlan.—Alterations to New Inn for Messrs. Soames & Co., Ltd., brewers, Cowbit-street, Spalding.

Sheffield.—Laundry adjoining Attercliffe Baths; also alterations and additions to said baths (3,000*l.*); Mr. F. E. P. Edwards, Architect, Town Hall, Sheffield. The following plans have been approved:—Premises, Northfield-road, for the Sheffield and Eccleall Co-operative Society, Ltd.; alterations, Lyceum Hotel, Pond-hill, for Messrs. Tennant Brothers.

Ltd.; additions to premises, Eccleall-road, the Old Albion Brewery, Ltd.; additions to premises, Rotherham-street, for E. W. Oakes & Co.; additions to premises, Malindale-street, for Messrs. J. Elwell, Sons, Ltd.; additions and alterations to premises, Saxon-road, for Messrs. G. E. Co., Ltd.; additions to premises, street East and Scott-street, for Messrs. Brown & Co., Ltd.; additions to premises, Carlisle-street East, for Messrs. C. Lister & Co., Ltd.; additions to premises, Warren-street, for the Temperate Spring Company, Ltd.; eight houses, Walkley Bungalows, for Mr. B. F. Glossop; alterations to premises, Westbar, for the Don Picture Company; additions to premises, Sheffield Terrace, for Messrs. W. T. Flather, offices, Edingham-road, for Messrs. W. Biggin, Ltd.

South Bank.—Extensions to St. Roman Catholic School for the Trustees, Stockport.—Mill for Directors of the New Mill.

St. Neots.—Additions to factory, Outton-road, Messrs. Bostock & Co., boot manufacturers, Stretdorf.—Church for Vicar, St. Church, Gorse Hill; Rev. W. L. H. W. 2, Queen's-terrace, Stretdorf. The following plans have been approved:—Additions to offices, Westinghouse-road, for Messrs. path, Brown, & Co., Ltd.; additions to works, First-avenue, for the Ford Motor Company (England), Ltd.

Tavistock.—Almshouses (3,500*l.*); Pearn Brothers, builders, Gilwell-street, Tavistock.

Todmorden.—Pavilion, Centre Vale; Mr. J. A. Heap, Surveyor, Town Hall, Todmorden.

Tynemouth.—Extensions to Holy Sepulchre Church; Mr. A. B. Plummer, architect, Grosvenor-street, Tynemouth.

Walsall.—Proposed baths; Mr. John T. Surveyor, Town Hall, Walsall. Plans for extensions to factory, New-street, for Messrs. Thacker & Sons, have been approved.

Warsop.—School, Burns-lane (7,700*l.*); Greenwood, builder, 2, Wood-street, Mansfield.

Waterloo.—School (5,231*l.*); Mr. J. R. builder, Railway Saw Mills, Turners, Ashton-under-Lyne.

Westhoughton (Lancs).—School (10, Mr. H. Luttler, architect, 16, Ribblesdale, Preston.

Wolverhampton.—Works, Walsall-street, the Briton Motor Company, Ltd., Wolverhampton. Plans have been passed for houses, Lea-road, for Mr. L. Clarke.

FOREIGN AND COLONIAL

Building in Brazil.

The *Diário Oficial* of October 5 of Decree No. 3,783, approving a plan estimate of 874,000 milreis submitted by Pará Harbour Company for the construction of a building for the storage of inflammable and explosive materials. The building is situated at Miramar. The same issue of the *Diário Oficial* contains applications received up to December 30 at the intendencia da Defesa da Borracha, I. Janeiro, from persons who are desiring establishing buildings for the storage of inflammable and inflammable oil required by vessels engaged in the rivers of Amazonia. The containing further particulars, may be British firms at the Commercial Intelligence Branch of the Board of Trade, 73, Basin street, London, E.C.

According to a summary, published in the *Review*, of the recently issued plan of the Brazil Railway Company, the first-class hotels in Rio de Janeiro, São Paulo, and other important cities has retarded development of Brazil. The position has been carefully investigated by an English architect, who visited Brazil in order to make examination of the local conditions and result of his Report the company has decided to undertake the construction of first-class hotels at Rio de Janeiro and São Paulo have been acquired in both cities, and for the construction of the hotels are under consideration.

Building in Buenos Aires.

The *Boletín* of September 27 contains a decree authorising the General Directorate of Architecture to proceed departmentally with the supplementary work connected with the enlargement of the Casa de Moneda in Buenos Aires. The cost of this enlargement amounts to 381,162 pesos (about 33,300*l.*), same issue of the *Boletín* includes a decree of the said Directorate of Architecture to erect a night refuge home at Buenos Aires harbour, at a cost of 1,025,000 (about 90,000*l.*).

HERAN CHURCH, PORT ELIZABETH.

was the design placed first in a limited competition. As shown by the plan, the church includes a pastor's house and a schoolroom in addition to the church. It is intended to proceed with the church building shortly, and to the present the schoolroom only has been built. The principal materials used are washed plaster and a few facing bricks on stock brick backing, building stone being practically unobtainable in the neighbourhood. Mr. Orlando Middleton, A.R.I.B.A., Port Elizabeth, is the architect.

THE SOCIETY OF ARCHITECTS.

The opening meeting of the new session of the Society of Architects was held on Thursday, March 28, Bedford-square, W.C.; when the annual address of the President (Mr. Percy Lubbock, F.R.I.B.A.) was delivered. In the course of his remarks, the President said that the proposals for the re-organisation of the Society were already in the members' hands, and as no new principles were introduced it was confidently hoped that the Council's proposals would be confirmed.

Education and Elimination. The President said: "They are the introduction of a new class of students designated 'Graduates,' who will be those who have been examined as to their capabilities with a view of eliminating those who do not show sufficient artistic ability from successful practising architects of a high standard that the future will demand. Perhaps has done more in the past to lower the standard of architecture and to retard its progress than the entry into the profession of those who have not the instinct of architecture—it has been detrimental to all concerned."

The community has got common-place instead of architecture, and the profession has got discredit, while many very able architects have been placed in a false position, and those of special aptitude denied real and permanent success they might have achieved in some other and to them more congenial profession.

This raises the question of architectural training generally, in regard to which a special committee are already actively at work on the basis of a scheme for the establishment of architectural ateliers in the United Kingdom, the lines of those which are so successfully followed on in Paris. This Committee have already held several meetings, and I have no doubt will be able to arrive at a satisfactory conclusion in due course. I still hope to see their report adopted and carried into effect without delay, so that before ateliers may be established both in London

and the large provincial towns. The Council, in taking a step so fraught with possibilities for good, hope for and confidently anticipate the cordial approval and co-operation of that large and ever-growing body of professional opinion, which is alive to its value and necessity. A question of such vital interest to the future of architecture does not concern this Society alone. The idea being to supplement the existing methods of training rather than to supplant them, it should receive the support of every architectural Society. We therefore

invite the whole-hearted and active co-operation of the Royal Institute of British Architects and its allied Societies, and of all other interested bodies, so that we may accomplish more quickly and more efficiently a reform which we are convinced is in any event bound to come in the near future.

Those who have studied the various methods of architectural training are of opinion that while there may be some faults or weaknesses in points of detail in the French system, yet it has proved in principle to be of the greatest possible advantage to the profession where it has been adopted. This is particularly the case in America, where, since the introduction of the Beaux Arts system, the whole tone and standard of architectural design has been enormously raised within a comparatively short period. In the United Kingdom there are a number of architects of great ability and eminence, and we may be said to possess a distinctive architectural style particularly in domestic work, yet we are far behind other countries in the public appreciation of architecture as an art and in the standard of architectural design as applied generally.

Public Recognition and Appreciation of Architecture.

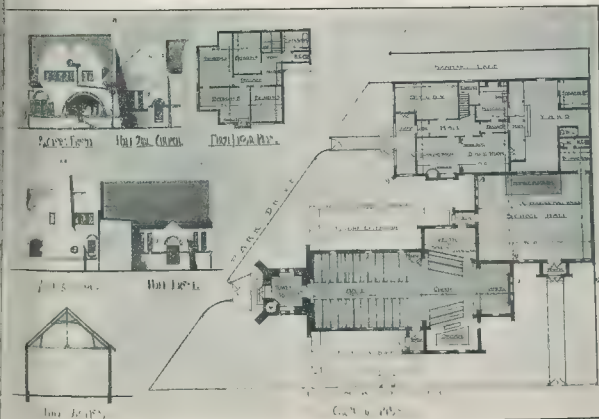

I think we may venture to believe, without undue optimism, that we are fast approaching a time when architecture will at last come into her own again and resume that place in the public estimation which is her due, and which she already enjoys in more favoured countries. On all sides we see indications of an increasing public interest in the greatest of the fine arts.

Parliament has recently for the first time in this country, so far as I am aware, taken architecture seriously, and during the debate on the proposed St. Paul's Bridge laid down the principle that no public improvement should be carried out without due consideration being given to the architectural aspect or without consulting those qualified by nature and training to advise. Then the Town Planning Act (again for the first time in this country) has officially recognised the value of architectural

beauty and has given it the sanction and authority of an Act of Parliament, and the art of architecture is recognised and protected to some extent by the recent Copyright Act. These are what I believe to be signs of the times, signs that may be noticed with increasing frequency both in the Press and in ordinary daily intercourse.

It is for us to rise to the occasion: and if we expect recognition as artists, we must be artists, and well-trained ones too. Unfortunately, however, it has long been felt by those who have given much thought to the training of architects that our present system is far from satisfactory, and not adapted to produce the trained artist. Since the breakdown of the pupillage system, which was so scandalously exploited by a previous generation, great progress has undoubtedly been made in building up architectural schools to replace it. We have done the best we could, but, hampered as we have been by our own haphazard upbringing and by our own lack of theoretical and systematic training, it was not to be expected that we could know all at once how best to organise a perfect system of architectural education or be in a position to impart a theoretical training which we ourselves had not received.

It is generally conceded, I believe, that however well our schools may teach the various branches of knowledge with which an architect should be acquainted, they are not so successful in teaching the student the one thing needful, viz., how to apply this knowledge. They may teach everything connected with architecture, except the art of architecture itself, the art of design. I believe I am right in saying that the most enlightened opinion of the day realises how far we are in this respect below the Continental schools, more particularly those of Paris, to which so many architectural students are going every year owing to the lack of facilities in their own country. The Society of Architects has always striven in the cause of architectural education, and the Council are of opinion that the time has arrived to make a determined effort to lift our educational system to the level of that obtaining on the Continent. This is no light undertaking, and it cannot be brought about all at once, but your Council believes that an important step towards this end may be achieved by their proposal to bring within the reach of all concerned those educational facilities which have been responsible for producing most of the best architects of the day, both in Europe and America.

Registration of Architects.

The statutory education and registration of architects is a question which the Society has made its own and with which it has been identified for upwards of twenty-eight years, and in order to achieve the result which we all have so much at heart negotiations were entered into with the Council of the Royal Institute of British Architects more than two years ago. The negotiations were primarily on the registration question only, but the proposals of the Royal Institute Council differed so essentially in principle from those of the Society that we could not accept them, and the only way out of the difficulty, so far as the Institute was concerned, was to make provision for the members of the Society to join the Institute so that in any Registration Bill put forward by the Institute their interests would be protected. In other words, the proposed fusion was to the Society merely a means to an end, and that end was registration.

The Society have always stated that if the Royal Institute will produce a Registration Bill with which they can agree, they will step aside and let the Institute lead, and the Council of the Society kept their word by accepting the proposals of the Council of the Royal Institute. As you all know, the proposals were submitted to the members of the Institute in general meeting, but after a lengthy and somewhat heated discussion the whole matter was referred back to their Council for further consideration, and they have been considering it in Committee ever since. This action was taken by the members of the Institute more because the proposal was complicated by the introduction into the proposed agreement between the two bodies of all sorts of provisions, including the heads of a Registration Bill, than because the principle of the scheme was objected to.

Until the Committee's report is issued it is not possible for the Council of the Institute to make any official statement to this Society, but

the negotiations have not been broken off, which is a great advantage, as it is always possible that the two bodies may meet again and resume their deliberations. Unfortunately, we are not in a position to guarantee that the negotiations will be renewed, and in the meantime the work of the Society on behalf of Registration has been held up for two years, and if we are to await the result of the deliberations of the Committee of the Institute before taking any action, the whole question may be retarded for an indefinite period.

We feel that the more delay there is in introducing a Registration Bill into Parliament the less chance there is of its becoming an Act, consequently it would be unwise in the interest of our members to further delay the matter pending a final report from the Institute. Registration is of such vital importance that it cannot be left in abeyance indefinitely, and under these circumstances we feel it a duty to the members to introduce the Society's Bill into Parliament at the earliest possible moment, and we hope that it will be presented during the present session.

We do not yet know what attitude the Royal Institute of British Architects will adopt in this event, but we do know that the present Council, and the Institute as a corporate body, are pledged to registration, and further, seeing that the Royal Institute of British Architects' Council was returned last June for the express purpose of carrying the registration movement a step further, I do not see how they can consistently oppose the Society's measure, or what they can gain by doing so.

I am glad to say that a better feeling undoubtedly exists between the Society and the Royal Institute of British Architects than ever before, and if full advantage is taken of this on both sides, great progress may be expected in the near future, not only with regard to registration but in connexion with other necessary reforms that are urgently needed in the profession.

Official Architecture.

The question of official architects is one which most seriously affects the future of our profession. Just when a generation of able men has arisen who have devoted their lives to the study of the more monumental aspect of architecture, we find the growth of a system which threatens to deprive them of their livelihood and of any opportunity of placing their special attainments at the disposal of the community.

But, although the growth of the practice of employing official architects deprives the independent and specially trained men of the bulk of the public work, it is necessary to endeavour to approach the subject from the broadest possible point of view, in the interest of the public and the advancement of architecture, for, after all, architects exist for the good of the community. I think that the present system only exists because the public is misinformed, and it will only continue to exist just as long as the indifference and ignorance of the public lasts. The public has a right to the services of the best talent in the country, but under the present system it does not get it, although it may be under the impression that it does.

There can be no doubt that every building erected by public authorities should be designed by the one man in the country who is best able to solve the particular problem involved. The system of employing the official architect does not insure this, and the public interest suffers in consequence. Instead of securing the best available architect by public or limited competition or otherwise, we find Corporations and Government departments entrusting important buildings, requiring special skill in design, to the officials who were appointed to their positions for qualities of an entirely different character, such as administrative ability or because of their special qualifications as surveyors.

The public does not seem able to discriminate between knowledge and skill, the knowledge of the requirements of a building or of a public department, which other than architects may acquire, as distinct from the trained skill of the designer in the use of that knowledge when acquired, which no one but an architect can possess.

The public does not realise that the arguments which apply to the appointment of surveyors and medical officers of health do not apply to the appointment of architects. One never hears of a medical officer of health being

called upon to perform a serious abdominal operation on a Lord Mayor, he calls in a specially trained man to do it; but we do hear often of an official architect being called to design a building requiring special knowledge and skill, and it seems to me that a public official routine faithfully performed does foster the development of the imagination, faculties or make for the high standard of design, obtained only by long year practice, which all our public buildings show. Neither does the public realise, I think, the lower standard of design which designers we possess do not and will hold official positions under present conditions and that when a public body advertises for an official architect the very men to whom the work should be entrusted refuse to apply for the post.

Figures have lately been produced to show that it is as economical to employ officials as to employ independent architects, but even if it is true the value of the article obtained is the lower standard of design produced by officials compared with what would be produced by the very best of our designers, which destroys the value of the comparison.

If the conditions of official service were revolutionised as to tempt the most gifted designers to sacrifice their independence, to produce the best possible architecture in capacity as officials, the cost of official architecture would be far in excess of what it is at present and far in excess of what it would cost to employ the same man as an independent architect under conditions that entail no sacrifice on part.

It appears to me that there is a great obligation resting on the President of the Society as this to place these facts before the public without fear or favour, for after a public suffer most by the present system it must be clear that if the present system increases till at the public work is done by officials, the ablest men, finding no opportunity in this direction, will no longer devote attention to public work, but will concentrate on private work, and the standard of buildings will be permanently fixed at that of respectable mediocrity that is characteristic of nearly all the official architecture in the country. I venture to think when the public realise that they get their work for less money by employing an independent architect they will not hesitate to demand an alteration in the present system and will not be content till they get it.

It must not be supposed, however, that the architectural department for routine advisory work is not capable of doing a public service; on the contrary, I think it is indispensable; but it should not be employed in original creative works of architecture. Many of our public authorities maintain a staff of assistants of a high standard of knowledge and experience who are intimately acquainted with the practical requirements of every type of public building, and if this knowledge and experience could be placed at the disposal of the most brilliant creative designer obtainable, any original work was contemplated, the result would be a blending of the practical with the artistic and the production of a well designed and thoroughly satisfactory public building.

The Royal Institute of British Architects and the Society.

With regard to the future of the two Societies which represent the profession of architecture, there is a point I should like to bring forward which I venture to think is worthy of the earnest consideration of the Royal Institute of British Architects and of this Society, as each have the same object in view, viz., advancement of architecture and the protection of the rights and privileges of architects. As at present constituted and administered, each is of necessity a certain amount of overlap and clashing of interests which is much to be regretted.

The Institute has a Royal Charter which granted "for the general advancement of architecture and for promoting and facilitating the acquirement of knowledge of the various arts and sciences connected therewith, it is an art esteemed and encouraged in enlightened nations as tending greatly to promote the domestic conveniences of citizens and the public improvement and embellishment of towns and cities."

One gathers that the Council of the Institute is very much overworked. This somewhat involves considerable delay in dealing

ant points that are constantly arising, of which are perhaps not directly connected with civil architecture or the various sciences connected therewith, but more to do with the business side of the

in the medical profession there are the Colleges of Physicians and Surgeons, and the Medical Association, and what happens in this case is that matters of business interest and things affecting the interests of the members of the profession are left to the latter body to deal with while the Royal Colleges confine their attention to examinations and ethics, and to holding generally a high standard of medicine. Why should not architects work on similar lines? The Royal Institute of British Architects might be the sole examining body and be responsible for a standard of

Relieved of routine work of a business nature, which now appears to cripple them, it would be free to devote all its time and duties imposed upon it by its Charter to work for the advancement of architecture and the mistress art regardless of all other considerations. It would find more time to give new ideas, to discuss and formulate them for the future progress of our art, and to be the lead in the artistic, scientific, and other aspects of our work of which we always are in need. Freed from considerations of decency or suspicion of personal interest, it would speak with greater authority, would take a higher place in public estimation than which it now rightly holds, and be a Society which it would be a still greater honour to join. But no art can flourish unless those who practise it can live by it in decency and honesty, and receive that consideration from the public which the value of their work deserves. The Society, by giving its undivided attention to studying the welfare and the business interests of all members of the profession, and to doing a work of paramount importance necessary to the advancement of architecture, even if less ornamental than that demanded by the Institute. It would then be more to the interests of every practising architect to join the Society.

From the mere increase in the number of practising architects, the increasing complexity of civilisation entails upon a profession such as ours, which touches life at all points, an increasing number of problems that call for solution; our interests from day to day are more varied, our responsibilities more numerous. But although one Society, if properly used to that end, might be capable of dealing with every aspect of our responsibilities and interests, I think it would be a distinct advantage to have two Societies in London going in perfect harmony, each supplementing the other, each with its clearly defined duties and sphere of influence. I am of opinion that the best such arrangement as this could be based upon by the Royal Institute of British Architects and this Society, it would be a great advantage to the profession and to architecture as an art. There should be no real difficulty remaining the functions of each body, they would naturally fall under the two headings of architecture and architects."

Professional Defence.

dealing with the development of the city, the President said: "A very important question of the work of the Society is the formation of an Advisory Committee to deal with questions arising out of professional practice. A considerable sum has been set aside for this Committee to practically and impartially assist members in any litigation or question which involves questions of principle and not only their own interests, but those of the profession generally. The fund, which is for present needs, is only a nucleus, and it is the intention of the Council to add to it as may be necessary, so as ultimately to be in a position to pay any case which, in the opinion of the Council, acting on the advice of this Committee, is of sufficient importance to the profession as a whole."

Architectural Competitions.

The remedy for unsatisfactory competition conditions rests very largely with the profession. The promoting bodies do not always wisely err, but are sometimes in ignorance of the existence of the conditions which they are considering should be laid down for future competitions. Something might be done by a statement issued in the first place to

every local authority in the Kingdom, and from time to time to other promoters of competitions giving the general lines on which it is suggested a competition should be conducted, and making it clear that if these lines are departed from, architects who are members of architectural societies will refrain from competing. This circular should be signed by the responsible officials of every architectural society in the Kingdom. I also feel that an advertisement inserted each week in the professional journals making it clear to all promoters of architectural competitions that the conditions have to be approved by the Society before any of their members will compete, and suggesting that the conditions governing the competitions should be drawn up to agree with the printed particulars issued by the Society and the Royal Institute of British Architects, it would very soon educate the promoters up to a proper standard, and the competitions of the future would be much more satisfactory. Much could also be done if the Competitions Committee of the Royal Institute, for example, were to give notice of any objectionable conditions to every architectural society, so that all might act in unison.

Some architects hold the view that in the case of limited or local competitions if the invited competitors or the architects within the defined area are agreeable to the conditions laid down, whatever they were, such competition should not be barred by architectural societies, but I personally feel that all competitions should be conducted on recognised lines and that there should be no exception to the rule."

The President also referred to the good work carried on by the Architects' Benevolent Society—work which was hampered by the want of funds—and to the formation of an Approved Society under the Act for architects and surveyors' assistants.

The Unattached Architect.

In referring to "the unattached architect," he said: "A great deal of interest has been shown in the proposal of the Society to publish a code of ethics for the guidance of members, but the main difficulty has been that of dealing with the unattached architect. The ideal arrangement would be a Board of Professional control for the whole profession, but this could only be effectively constituted under a Registration Act. It remains in the meantime for the various Societies to insist on a high standard of professional morals and conduct, on lines somewhat similar to the Society's proposals."

Whilst on the question of the unattached architect, I should like to point out that the ranks of the Royal Institute of British Architects in any class are now closed to candidates other than those who have passed the Associateship Examination, but there are still very many qualified architects in practice who are unattached and are consequently "free lances," and this seems to me to be a disadvantage to the profession, which would be the stronger for their co-operation, and I think it should be the aim of this Society to do all in its power to enroll such of these gentlemen as are eligible and qualified in our ranks as members.

It must not be forgotten that if a Registration Act was passed it would, no doubt, recognise all vested interests, and consequently all *bona fide* qualified architects would be entitled to register, and we, by adopting the policy I have outlined, would only be anticipating what would be compulsory when the Act became operative.

The Royal Institute of British Architects have succeeded in getting some 2,000 architects to become licentiates, but numbers of these appear to have joined under the misapprehension that it would be quite easy, in fact, more or less a matter of form, for them to become Fellows of the Institute. As a matter of fact, only ten have been able to satisfy the examiners, and qualify as candidates for election as Fellows, at the first examination which has been held. This examination proved not to be a mere matter of form, but a very real test extending over six days. How licentiates feel about this I do not know, but possibly some or even many of them would rather be corporate members of a progressive and thoroughly up-to-date society, making for reform all the time, than merely non-corporate members of the senior body. I, for one, shall watch future developments in this respect with great interest.

The President also referred to the work of the South African branch of the Society, and said that the passing of the Transvaal Architects' Registration Act was largely due to the energy

and initiative of the branch, backed by the financial support of the parent Society, and further efforts were now being made by the branch towards extending the Act to the Union of South Africa. In conclusion, the President detailed some advantages of membership of the Society, which has now a total membership of 1,200.

A hearty vote of thanks was accorded to the President for his address.

INTERCEPTING TRAPS IN HOUSE DRAINS.

A SESSIONAL meeting of the Royal Sanitary Institute was held at No. 90, Buckingham Palace-road, S.W., on Tuesday, when a discussion took place on the "Report of the Departmental Committee of the Local Government Board on Intercepting Traps in House Drains." The discussion was opened by Mr. H. Percy Boulnois, M.Inst.C.E., Chairman of the Council of the Institute, and in the course of his remarks he said that the report practically condemned the intercepting trap.

He then dealt with the various indictments which are raised in the report against the use of the intercepting trap, and the conclusions at which the Committee have arrived in each case.

No. 1.—That as the trap forms an obstacle to the passage of sewer air through the house drain its use renders the ventilation of sewers more difficult and costly.

This contention, he said, raised the whole question of the ventilation of sewers. We were all of us acquainted with the difficulties which surround this subject, and the Committee had evidently been thoroughly aware of these difficulties, with which they deal at some length, and it was interesting to observe that on page 41, paragraph 119, they state:—

"Too much importance has been attached to the question of sewer ventilation, for there is a considerable amount of evidence which indicates that the necessity for ventilation of sewers has been exaggerated."

The report went very fully into this question of ventilation of sewers, and arrived at the following conclusion:—

"If, therefore, the objection to the intercepting trap rested solely or mainly on its interference with sewer ventilation, we should be inclined to question the importance of such an objection." [Page 42, par. 121.]

He agreed with this conclusion, though no doubt the advocates for the abolition of the trap might have many arguments in favour of the free ventilation of sewers through the house drains as being the solution of the problem. It was contended by many persons, and the report also dealt with the question, that the presence of the trap in the house drain containing sewage, often in a state of decomposition, largely contributed to the formation of gases and offensive smells in the sewer, and there was some considerable weight in this contention, if it could be shown that a house drain, without an intercepting trap, would never contain decomposing sewage.

As to the second contention, *i.e.*, that the fresh-air inlet necessitated by the provision of an intercepting trap, often acts as an outlet for foul air and creates a nuisance, Mr. Boulnois said:—"This contention is supported by considerable evidence in the report, especially by Dr. Butler, of Willesden, who stated, *inter alia*, that diphtheria had prevailed in his district, more over a series of years in areas where the intercepting trap is universal, than in other areas where the trap was absent."

The report says [page 3, par. 10]: "With few exceptions the evidence was unanimous that the inlet is an objectionable feature of the house drainage system," not only as an outlet for smells, but also as being sometimes responsible for blockage of the trap through earth and detritus getting into it.

The Committee, moreover, were not sure that a fresh-air inlet is essential for an intercepting trap, and they quote some experiments made by Mr. Steele in support of this contention.

We shall, I think, all agree that if the fresh-air inlet is placed in an inappropriate position, it may at times become a nuisance by acting as an outlet for drain air instead of as an inlet, even if provided with a mica flap; but even if this is so, it may be argued that a smell coming from the inlet indicates that there is "something wrong" with the drain which requires remedying. In other words, the fresh-air inlet becomes a useful "detective." The remedy also, if a remedy is required, would appear to be that of placing the mouth of the inlet in such a position that, even if it did act as an outlet, it would be harmless."

As to contention 3, i.e., "that the provision of a trap and its companion ventilation of the house drain increases the cost," that, he said, was obvious, and the report did not deal with this question beyond stating it as a fact.

Contention 4 was the final indictment, and that which was of the greatest importance, i.e., "that the intercepting trap 'forms a serious impediment to the passage of sewage from the house drain [to the sewer, and that this frequently results] in more or less complete blockage of the drain.'"

It was, he said, this alleged blockage by the presence of traps in the house drains at Willesden that first called the attention of the Local Government Board as to whether the intercepting trap was not more of a danger to the occupiers of a dwelling-house than a safeguard against the intrusion of the air from a sewer. The whole trend of the report was in the direction of proving that this indictment was correct, that such blockage may, and does often occur, by reason of the trap failing to clear itself, and that this objection caused a greater danger to health than the possible admission of sewer air into the house drains.

Proceeding, Mr. Bonhous said:—"The report gives the result of the systematic examinations by Dr. Butler of intercepting traps in his district, which show a total number of blocks of 3.7 per cent. of the total drain inspections. In addition to this the Committee caused examinations to be made of traps in other districts throughout the country, with the result that of the traps examined 6.9 per cent. were found to be blocked at the time of examination, and 16.2 per cent. "gave evidence that at one time and another they had been blocked sufficiently to cause an accumulation of sewage in the inspection chamber." The total number of traps either blocked at the time or indicating previous blocks, amounted to no less than 23 per cent. of the total traps examined for both purposes.

But this is not all. Mr. Patten Barber, the Borough Surveyor of Islington, carried out a series of exhaustive trials in order to ascertain what amount, if any, of the solid matters, usually flowing in a house drain, would be retained in an intercepting trap, placed in the usual manner upon a house drain. These experiments showed conclusively that with every class of trap he tried (seven in number), more or less solid matter was always retained in the trap. In some cases this amounted to from 42 to 49 per cent. of the solid matters, and in others from 73 to 78 per cent.

If it were not for these experiments, it might be argued that some, if not all, the blockages might have arisen from one or other of the following causes: the improper fixing of the trap, the choice of an improperly designed trap; the insufficient fall of the house drain; or, from its size, the admission of some foreign matter into the house drain; or from some other cause for which the intervention of a trap *per se* was not responsible; but in view of Mr. Barber's experiments, which appear to have been carried out with great skill and care, these arguments appear to be inadmissible.

It may, of course, be argued that the two-gallon or even the three-gallon flush is insufficient to keep the trap or even the house drain clear of obstruction.

The remedy, if the trap is to be retained, appears to be either that a larger flush of water is necessary, or that the drain must be laid with a steeper gradient, or that the design of the present trap must be altered.

Mr. Barber's experiments go to show this, for whereas a 4-in. trap, "No. 4," retained 79 per cent. of solids, an "experimental" trap he tried only retained 8 per cent. of the solids, and this after ten experiments, in which on six occasions no solids whatever were left in the trap.

With regard to the possible forcing or unsealing of an intercepting trap by air compression in a sewer, the Committee deal with this question at some length, and refer to the Bristol experiments. They come to the very proper conclusion that:—

"when a trap is forced by air pressure the water seal, though reduced in depth, is not liable to be destroyed"; and they further state [page 16, par. 50]:—

"On the whole, therefore, it would appear, according to the evidence presented to us and according to our own experimental observations, that under practical conditions the intercepting trap usually answers its purpose as a barrier to the passage of air from the sewer into the house drain."

With which conclusion I cordially and entirely agree; it is well known that air will always take the least line of resistance.

As to the passing of rats through a trap, the report states that in the opinion of the Committee it is doubtful whether the trap is a barrier, and they give two instances of chased rats seeking refuge through traps into house drains. In the cases quoted it would appear that the rats were actuated by fear, and that in order to escape they preferred a bath to sudden death! I am personally of opinion that the trap is a barrier to rats under normal conditions, and that they will not pass through the water in a trap except under some live pressure. I have known several cases of house connected to old sewers which were infested with rats, and that these pests disappeared when the house drains were properly trapped and disconnected. It is evident that rats, like sewer air, will take the least line of resistance.

I will now pass on to one of the most important investigations of the Committee, viz., that of the chemistry and bacteriology of sewer and drain air, on which considerable time and thought appear to have been devoted.

Evidence on the chemistry of sewer air was laid before the Committee by such well-known experts as Dr. T. S. Haldane and Dr. Hurlley, and the report of Professor Delpeyre on the Manchester sewers is also referred to.

The conclusion to which the Committee arrived [page 20, par. 62] is as follows:—

"The results obtained by these observers are practically identical, and they indicate that in sewers, whether old or new, ventilated or unventilated, in which sewage is moving and is not lying stagnant, the air differs but little from that of the atmosphere outside."

Carbon dioxide was only found to the extent of from 17 to 20 parts per 10,000 as compared with 3 or 4 parts per 10,000 outside, the excess of ammonia and organic matter was almost negligible, and the sewer air was free from any appreciable traces of methane or carbon monoxide, and if present must have been due to the admission of coal gas.

Sulphuretted hydrogen also, they state, is not present in the air of sewers. In some sewers, notably at St. Helens, Lancashire, this gas is found, due to the nature of the trade effluents discharged into the sewers, but, of course, this is a rather abnormal case.

Dr. Haldane, however, has found that this gas is given off in considerable quantity "from the traps of house drains in which sewage is apt to be retained, such as large grease traps."

This evidence by Dr. Haldane is another serious indictment of the trap, although in this case he refers specially to "large grease traps."

With regard to the smell of sewer air, which is evidently not due to sulphuretted hydrogen, but more probably from "the presence of minute quantities of a variety of volatile substances," the report says, it is doubtful whether the smell of sewer air is usually more offensive than drain air, and that "unfettered waste pipes of sinks and lavatories discharged into the open air" may cause a "serious nuisance."

The Committee are further of opinion that the effect of smell on the human body may not only be repugnant, but that "there seems to be no reason to doubt that it may produce definite ill-health."

With regard to the bacteriology of sewer air, they made many investigations, and, *inter alia*, they say:

"The bacteriology of sewer air has been the subject of many investigations, and in one respect the results obtained have been practically uniform, namely in showing that notwithstanding the immense number of microbes in sewage, the number to be found in sewer air is extremely small."

Further, they say that:—

"It seems also clearly established that not only the bulk of the bacteria of sewer air are derived from the atmosphere, but also that bacteria of sewage origin (that is, those that may be pathogenic) are very rarely present in sewer air, and that, when their presence can be detected at all, their number is very small."

They then deal with the bacteriology of drain air as distinguished from sewer air, and quote the experiments made by Colonel Horrocks, Dr. Andrews, Dr. Renney, and Professor Winslow, and they arrive at the conclusion that there are more microbes in drain than in sewer air, and that this is mainly accounted for by "splashing," which occurs in the passage of sewage in a house drain, "especially when falling from a height or passing through a trap." This makes a further, and rather unexpected, condemnation of the intercepting trap, and I do not see unless it were made in the form of a spiral, and even then I fear there would be some splashing. The question of the possible passage of microbes

from sewers into drains is dealt with at considerable length, and altogether no less than fourteen pages of the report are devoted to questions of the chemistry and bacteriology of sewer and drain air. The conclusions of the Committee arrive at are as follows [par. 97]:—

"The results of these experiments emphasize a point to which we have already referred, namely, the bacteriological evidence indicates that if a serious danger exists at all in house drainage, it is found in the drain air that may escape from the ventilating shafts of house drains. But every danger requires to be regarded in its true perspective as we have pointed out." [Para. 91 and 92.]

The paragraphs here referred to are of considerable length, and refer, so far as I understand, to the important point as to whether disease germs from a neighbouring house find their way through an untrapped drain to the house in question. This seems to be the crux of the whole question. The object of intercepting trap as I have always understood it, is to sever, or isolate, the house from the drainage of other houses in order to protect it from possible infection from other houses. It would appear from this important report that it is extremely doubtful if this result has been obtained, and that, notwithstanding numerous legal cases that have been fought on the question of sewer air entering houses and causing disease and even death, we are told that drain air is more dangerous than sewer air, and that the intercepting trap is not a delusion and a snare, but that it is a danger to the health of the inhabitants of its liability to choke, the accumulated sewage which it holds, the germs which it is the splashing which it causes, and its interference with the proper ventilation of sewers.

Mr. R. Reed (City Surveyor, Gloucester) expressed his entire approval with the report of the Departmental Committee. The report, he said, was patented in a panic, and was a dangerous obstruction which paralysed action of the drain, and rendered it throughout. He trusted that the Local Government Board would withdraw the by-law that sanitary inspectors and building inspectors would display as much zeal in removing a had done in inserting the trap. If abolished they would get real clear instead of a sham.

Dr. P. Roobhaar (Medical Officer of Health, Nottingham) whilst unhesitatingly accepted the scientific results and conclusions of the distinguished investigators, demurred at the general application of the results to cases essentially different from those furnished them. The behaviour of drain air in different localities was as diverse as the method of construction, their situation, their contents. Speaking generally, he was in favour of retaining the intercepting trap. He was strongly of opinion that it was rather in the direction of improving the construction of these traps, securing regular flushing and cleansing to attempting their abolition.

Mr. T. de Courcy Meade, M.Inst.C.E. (Manchester), gave the results of some experiments he had made with artificial faecal matter.

Mr. F. Sumner, M.Inst.C.E. (City of London), spoke strongly against intercepting traps, the distance from the trap to the lavatory was of any great distance. He considered the report sounded the death-knell of the intercepting trap. He strongly advocated house drains should be made of iron, and that for a reasonable sized house the expense would not be more than 20 per cent.

Dr. W. Butler, speaking from his experience at Willesden, was against the intercepting trap, and said that in most cases were not aware of the choking of the trap. He advocated that drains should be laid in such a manner, whether they had intercepting traps or not, that choking would become apparent immediately. At present brickwork of the manholes permitted no inspection.

Dr. Parkes (Medical Officer of Health, Chelsea) discussed the question of blockages of drains were due to the laying of drains, to the bad form of trap used, and to the use of 6 in. traps when traps would be sufficient; and, what was the most important point of all, the fault in the construction of the intercepting traps with the trap.

Mr. Van Putten (Levensham) as one who long time had been against intercepting traps welcomed the report. He had no objection

was for a proportion of the costs of the defendants in defending a counterclaim. The previous action before Mr. Verey, J., was in the case of *Mr. Mellor, for the plaintiffs, said that he had obtained judgment in the action with a stay of execution pending the hearing of the defendants' counterclaim. The only question for the Court was the hearing of this counterclaim. Mr. P. Valetta, in opening the case for Eardley & Smyth, said that in June, 1911, plaintiffs were employed by him to do certain work for them at the house of Mr. John White, at 65, Redcliffe-square, W. The work in question included taking up of the floor of the butler's pantry, the basement, and when this was done, as noticed the joists and floor were accordingly new joists, plies, and were put down. By August, Messrs. Eardley & Smyth wrote to the plaintiffs, Messrs. Bridge Barrett & Co., pointing out some reason the house had become leaky by the window of the kitchen and asking them to search for any leak and repair it. The leak could not be found about the end of November, Mr. White had been away, returned to the house soon after this a new system of supply had to be installed. Even on December 31, 1910, the leak was found and it was brought to the notice of Eardley & Smyth that it was nothing but a nail which had been driven into the lead pipe which rested upon one of the joists in the pantry. Upon that, Mr. White told Messrs. Bridge Barrett, and they replied, said they had nothing to do with the leak. On the 2nd of 1911, this was the position. Mr. White told Messrs. Eardley & Smyth 277l. 10s. 6d. Messrs. Eardley & Smyth owed Messrs. Bridge Barrett & Co. 24l. Under the circumstances, it having been brought to the notice of Bridge Barrett's notice that there was a leak, Mr. Bridge Barrett telephoned to Messrs. Eardley & Smyth and asked for payment of that 24l. 10s. 6d. Mr. Bridge Barrett said that Mr. White had to claim damages for the leak by the nail in the pantry floor by your men." Mr. Harrett replied: "I am not after the job has been finished this I did not do it." He then broke off the conversation, and the Court issued and served a writ for the 24l. owing. Messrs. Eardley & Smyth went to their solicitor, Mr. Jacob, and he gave Messrs. Bridge Barrett a cheque for the amount. At that time Messrs. Eardley & Smyth were giving Messrs. Bridge Barrett work to do at exhibitions like the Royal Academy, and other places. Mr. White said Bridge Barrett from time to time, later's attitude throughout was that he had not have been their man who was not for them. Efforts were made to get at a settlement with Mr. White, but he remained obdurate. It was the expense of putting in a new system, which was no longer when the leak was located, and wanted 20 Messrs. Eardley & Smyth issued against Mr. White for 277l. 10s. 6d., and under Mr. White paid 175l. into Court, and the liability. He objected to the 102s. of the account, and filed a claim for damages. Upon receiving the writs of the counterclaim, Mr. Jacob upon Mr. Bridge Barrett, who again the idea of his men having caused the leak. The case came before Mr. Verey, the Official Referee said that when Mr. Bridge Barrett gave the work to neither he nor his men had anything to do with the damage at Mr. White's house, the case was, that of the claim 24l. 10s. 6d. The Official Referee allowed 10s. 6d., and on the counterclaim by Mr. White, the Official Referee said: "I find the evidence that a nail driven through the floor by the plaintiffs' workmen caused the leak affected the hot-water system." Mr. White was awarded the costs of the action, and Messrs. Eardley & Smyth had in consequence become liable for the payment of 3000l. That action, concluded Counsel, never have been persisted in but for the intervention by Mr. Bridge Barrett. Robert Eardley, one of the defendants, in the evidence of the case, occupied eight for the Official Referee. Percy Smyth, the other defendant, also evidence. Representing the plaintiffs' defence, Mr. White said it had not been made out on the evidence that the injury to the house was caused by one of Messrs. Bridge Barrett & Co.'s workmen, and unless they*

could prove that Messrs. Bridge Barrett's men had been responsible, the whole case must fall to the ground. What Messrs. Bridge Barrett's workmen had to do was to put in new sleeper walls, relay the joists, and then put down new boards upon the floor. In the course of that work, as plumbing was going on at the house, the foreman told the men that two boards running across the end of the room should be left up, so that the plumbing should not be interfered with. After all the boards, except these two, had been nailed down, orders were received to place air bricks in the front of the pantry wall. In order to do so it was necessary for the workmen to get down under the floor, and they actually got down through the space where the two boards had been left. None of Messrs. Barrett's workmen at any time nailed down the two boards which had been left. When they were left, these two boards were still up. In regard to Mr. Bridge Barrett, his attitude now was the same as it had been all along—that he was not responsible.

Evidence for the defence was then called. Answering questions left to them by the Judge, the jury found that the hole in the pipe, was caused by Messrs. Bridge Barrett & Co., and that Messrs. Eardley & Smyth acted reasonably in defending the counterclaim of Mr. White. His Lordship entered judgment for Messrs. Eardley & Smyth, the defendants, and left the amount to be paid to them to be assessed by Mr. Verey.

OFFICIAL REFEREE'S COURT. (Before Mr. H. W. VEREY.)

Builder's Claim against Surgeon Dentist.

Mr. Verey concluded, after a lengthy hearing, on November 4, the hearing of a claim by Messrs. R. Gulson & Sons, of Hampstead, builders and decorators, against Dr. Henry Wren Oliver, a surgeon-dentist, of 10, Park-crescent, Portland-place, of 675l. 6s., balance of an account for work done at 10, Park-crescent.

Mr. Kingsbury represented Messrs. Robert William Gulson and Alfred Gulson, suing as administrators of the estate of the late Robert William Gulson, their father, who traded under the style and name of B. Gulson & Sons. Mr. Nolson appeared for the defendant. The defendant formerly carried on business in Harley-street, but he was minded in 1903 to move to a better house at 10, Park-crescent, at which the plaintiffs were engaged by him to carry out decorative and repairing work, so that he might reside and practise his profession there. The total charges of the plaintiff came to 1,056l. 6s. 7d. Three payments on account totalled 361l. 0s. 7d., leaving 675l. 6s. 6d. due for the defendant paid a further 400l. into Court as sufficient to satisfy the claim.

Having heard evidence and arguments on both sides, the Official Referee said he thought evidence for the defendant was to be relied upon. He came to the clear conclusion, upon the whole facts of the case, that the 400l. paid to the Court, with the sum paid previously, was sufficient to satisfy the claim. There would be judgment for the defendant. Plaintiff would have the costs up to the date of the payment into Court, and defendant would have the costs thereafter. The 400l. would remain in Court until the costs were paid.

KING'S BENCH DIVISION: DIVISIONAL COURT. (Before the LORD CHIEF JUSTICE and Mr. JUSTICE DARLING.)

A Builder and the Insurance Act.

ON Friday, November 9, the Court heard an application made by Mr. Jellicoe on behalf of Mr. Walter Slate, a builder, of Islington, for a rule nisi for certiorari to the magistrate at the North London Police Court directing him to show cause why three convictions against Mr. Slate for non-compliance with the Insurance Act should not be quashed.

Mr. Jellicoe explained that Mr. Slate was charged at the Police Court on three informations preferred against him by an inspector under the Act, and charging him with having on July 20 and 27 and August 3 failed to pay an employee named Upchurch, contrary to the regulations in the Act.

The Lord Chief Justice: What is your point?

Mr. Jellicoe said he moved on three grounds, the first being that the regulations on which the conviction proceeded were invalid and inoperative on the ground that the Commissioners had not the power to exercise the Rules Publication Act, 1893.

In what respect? asked the Lord Chief Justice.

Because the Commissioners are not within the power of that statute at all, was the reply. The Lord Chief Justice: That is rather a

large question, and depends upon the language of the statute.

Mr. Jellicoe said the words he relied on in the Act were: "Or any other Government Department." Those words were not, in his submission, wide enough to cover the Insurance Commissioners. The next point was, that there was no jurisdiction in the magistrate to hear and determine the charges under the Summary Jurisdiction Act, 1879; and the third was, that the convictions did not disclose any offence under the National Insurance Act. The Court granted the rule.

COURT OF APPEAL.

(Before the MASTER OF THE ROLLS and Lords JUSTICES PARWELL and HAMILTON.)

A. C. Jones & Co. v. Electric Palaces, Ltd.

THIS was an appeal by the defendants from an order of Mr. Justice Joyce, whereby he granted a mandatory injunction or order directing them to remove an electric clock erected for the purpose of advertising an electric theatre. Their Lordships held that the clock was an alteration to the front of the building and a projection bringing the front forward. As such they decided that it came within the terms of a restrictive covenant, and the judgment of the Court below was affirmed.

Mr. Younger, K.C., who appeared for the appellant defendants, stated that the points raised by the appeal, were:—(1) Was Mr. Justice Joyce right, in holding that the clock came within the terms of the restrictive covenants? (2) If he was right, was there not sufficient compensation for the breach of the covenant in damages?

The respondents to the appeal, proceeded Counsel, were tobacconists, having a number of shops over and throughout London. One of these was situated in High-street, Clapham—at the corner of Venn-street, in which the appealing defendants had an electric theatre. Respondents' business at Clapham was carried on on the ground floor, and their only interest in the premises was under a lease. They had underlet the upper floor to the appellants for a term of years, and the latter, used these rooms for the purpose of advertising their electrical theatre by means of an electric clock regulated from Greenwich, and lighted up at night. A great many such theatres were so advertised. They got the permission from the London County Council, which was necessary before anything hanging over the street could be put up, and the erection of the clock was completed on April 15. On April 19 respondents' solicitors wrote asking appellants to apply for a licence. Appellants said they were willing to pay 10s. 6d. for the licence, but ultimately Messrs. Jones & Co. intimated that they would assert their strict rights. They also said that they were themselves under covenants with the head lessor which the clock broke. It now appeared, however, that the head lessor considered the clock an improvement to the premises, and the only question was one of bare law between these two parties.

The clause in the agreement, which, it had been held, was broken by the erection of this clock, read as follows:—

"The lessee will not make any alteration in the fore or side fronts, and shall not, nor will bring, the said fronts forward by any bows, projections, or building, nor make nor set up any buildings without the previous consent in writing of the lessors, their executors, or assigns. But the lessees shall be at liberty to erect, or assign, buildings in the rear of 192, High-street, Clapham, and erect other buildings to form an annexe to the electric theatre now in course of erection in Venn-street, and be permitted to fix or inscribe on their walls a fascia whose design has been approved by the lessors' surveyors."

The Master of the Rolls: The design which has been approved does not include the clock?

Mr. Younger: No; but it does include the projection, or we could not have put up the fascia. I submit the making and putting of a clock there is not within the meaning of the lease an "alteration"; and, secondly, that although it may be in a sense a projection, it is not a projection which brings the front forward. And no projection or building which does not bring the front forward is within any part of the covenant.

Lord Justice Hamilton: Would a balcony be a projection from the front or would it bring the front forward?

Mr. Younger: That would depend on the balcony.

The Master of the Rolls: A porch would certainly bring it forward.

Mr. Younger: The sort of distinction I would desire to draw is this:—One might say the front was brought forward if, as the result of the erection, you used that as part of the

In considering the hygienic claims of the gas-stove we must take into account, first, the way in which the heat passes from the stove to the room and its occupants. With the coal-fire this is done almost entirely by radiant heat, which does not directly raise the temperature

front. A substantial balcony, on which people might stand, would be different from, say, a banner or a flagpole, and I don't see how it could be said that a clock was a projection bringing the front forward. This case is no different from a flagpole or one of those signs sometimes hung outside of public-houses. The illustration of the flagpole is much in point. Music-hall people are essentially patriotic, and they might want to put out a flagpole with a flag on it to attract attention. I say that is not a projection, and plainly this clock is not. It is nothing more than the ordinary advertising of an electric theatre for the purpose of attracting the innocent public within our walls. We are within the cases with regard to the restriction as to alterations, and I submit we are not within the covenant at all in respect of projections.

Mr. Hughes, K.C., on behalf of the respondent plaintiffs, submitted that the erection of this clock came clearly within the terms of the covenant, and that therefore the learned Judge was quite right in making the order. The lessees under the lease were at liberty to fix facias whose designs had been approved. These designs were comparatively innocent when approved, but had become much more offensive now, and the clock was a very large projection, which came out 6 ft. from the front of the building and weighed about 3½ cwt. It was a considerable structure, and Counsel submitted it was an alteration of the fore or side front—that is, it was an alteration such as was contemplated in the restrictive covenant.

The Master of the Rolls intimated that it would not be necessary for Mr. Hughes to address the Court further, and the appeal was dismissed.

In giving judgment for the Court the Master of the Rolls said this was an appeal from the decision of Mr. Justice Ferge, and depended on the true construction of covenants in the lease. It was not disputed that if there had been a breach of the covenants the order of the Judge was right. In his opinion the putting up of this clock was a breach of at least two parts of the covenants, and the Judge was right in his decision and in the relief he granted.

Fourteen days were given to the appellants to remove the clock or come to terms with the other side.

LONDON COUNCILS.

Battersea.—The Medical Officer of Health, in his Annual Report for the past year, states that street-paving had been continued during the year, several additional streets having been paved with impervious material, to the already considerable number thus paved. He was convinced that much benefit had resulted from the adoption of this method of paving of the side streets in the poorer districts of the Borough, and the improved position which the Borough has attained in recent years in regards to its vital and morbid statistics is, to some extent, to be attributed to this hygienic innovation. This was not surprising when it was borne in mind that these streets form the playgrounds of the children who dwell in them, and that, moreover, much loss dust is formed and they are more readily scavenged.

Brentford.—At a recent meeting of the District Council Mr. Mills moved:—"That this Council, as the local road authority, consider the new road as proposed by the Road Board detrimental to the best interests of the district, and disapprove of, and will oppose, any scheme other than the widening of the existing High-street as approved at the recent Town's meeting." He said a new road would not get rid of the present congestion, because the heavy traffic would not be diverted, nor were the trams going to be transferred to the new road, so that Brentford had nothing whatever to gain by the provision of the new road when they were expected to help pay for. In the interests of Brentford he thought they should strongly oppose the scheme and concentrate upon the widening of the existing street. Mr. Poole thought they should press for the High-street widening first, and perhaps they would get the new road afterwards. Mr. Clements said that at the Road Board meeting they were told by Sir George Gibbs that whatever Brentford was prepared to give, the Road Board would not agree to the widening of High-street, and that the new road would be put through in spite of them. Dr. Walter said that, for the benefit of the town as a whole, he thought the new road would be the best thing, for it would open up a very large residential area. In the results, amendments were carried to the effect that no action should be taken until a scheme was submitted.

City of London.—The tender of Sir W. Arrol, Ltd., Queen Victoria-street, E.C. 4, has been accepted by the Bridge House Estates

Committee for reconstructing Southwark Bridge and its approaches.

East Ham.—Plans by the Surveyor have been approved for the erection of a public convenience at an estimated cost of 180*l*. Another convenience is also to be erected at the junction of Station and Leicester roads.

Fellingham.—The tender of Mr. T. Chapman, Hounslow, has been accepted at 375*l*. for constructing a 9-in. sewer in High-street.

Finchley.—A Local Government Board inquiry was held last week regarding the Council's application for a town-planning scheme. The case for the Council was conducted by Mr. E. H. Lister, who stated that from 1881 to 1911 the population had increased by over 28,000, and for the past six years houses had been erected at an average rate of about 400 a year. All the available building land in the district was gone for development, and as building operations might commence on any part of it at almost any moment the proper steps had been taken to bring the provisions of the Town Planning Act into operation at the earliest moment. The lands, the subject of the application, had an area in all of about 1,050 acres, and were divided into two areas. Of the first of these areas by far the largest portion was to the south of East End-road. It consisted of the unbuild-on land adjoining the southern boundary of the district, contained about 1,000 acres, and included some of the best building land in the district. A considerable portion had a southerly aspect, and was ripe for the erection of houses of a high class. Over 400 acres of this portion had already been acquired by the Hampstead Garden Suburb Trust and the Co-Partnership Tenants, Ltd., for immediate development in connexion with, and as an extension of, the Hampstead Garden Suburb. Both the Trust and the company were willing to co-operate with the Council in the preparation of a scheme. The lands in the second area two consist of unbuild-on lands in the southern portion of the district and areas occupied by large houses and glasshouses. The latter were included, as it was found that the large houses were being pulled down and the land developed as building estates on speculative lines. Mr. Lister proceeded to point out that if the area was not town planned there was a possibility that the much-needed means of communication between one part of the district and another would not be obtained. He had the strongest possible evidence that out of the 946 acres in area No. 1 between four and five hundred acres would be built upon immediately. Plans had been prepared in anticipation of the town-planning scheme. An agreement had been entered into between the Garden Suburb authorities and the Council for the drainage of the area, and the covenants had been entered into for the erection of property of the estimated value of 950,000*l*. He also understood that the Garden Suburb authorities were about to acquire 40 acres of the Ayden Estate in the Regent Park-road. The Council's Engineer (Mr. Jenkins) in evidence, said that the average number of houses erected for the last five years was 399, during his period of office, had escaped the worst attentions of the town-builder, so far as houses are concerned, but the development of the land, especially in small isolated estates, left very much to be desired. The district was, generally speaking, a high-class residential one, with the usual and necessary portion of houses for the working-classes, and it was felt desirable to ensure that the future development of the district should be on the best and most approved lines. It was the intention of the Council, generally speaking, to provide through access roads between existing trunk roads, and by means of cross roads to link up such access roads, and the existing roads in the neighbourhood. Mr. Raymond Unwin said that the Co-Partnership Tenants, Ltd., had expended 400,000*l*. in buildings at the Hampstead Garden Suburb. Negotiations had now been entered into by which the Hampstead Garden Suburb Trust had leased from the Ecclesiastical Commissioners 112 of this area, and a sublease in respect of 80 acres Partnership Tenants, Ltd. The company was also leasing direct from the Ecclesiastical Commissioners an area of 300 acres, on which it was proposed to build. In reply to the Inspector, Mr. Unwin, he said that there were roads. The lease granted to the Co-Partnership Tenants would be for 999 years, and they were under covenants with the Commissioners to protect large property in Bishop's-avenue and to build good property of a certain minimum value against it. Mr. Oliver, for the objector, to the scheme, submitted that the Council had not made out a *prima facie* case for the inclusion of that property in the scheme.

There was no chance of the land being put upon. If any such property came on the market it was immediately bought for residential purposes. When the town planning was first considered the Council did not think it necessary, the owner of "Elmhurst." Addition was issued, and the only logical result was that it was for the benefit of Partnership Tenants. Another also lodged on behalf of the owner of "Old House," East End-road, T. then closed.

Friern Barnet.—The Surveyor has furthered the application for the paving the footpaths in Beaconsfield, Victoria stone. Plans, for paving paths in seven other roads, have been approved. The estimated cost of the work is 350*l*.

Hendon.—The following plans have passed:—Messrs. Hamilton, five Woodville-road, Golder's Green; Mr. Simmonds, four houses, Heathside, Green; Mr. A. J. Reynolds, six in Ridgeway, Golder's Green; Mr. St. John, four houses, Golder's Green; Mr. W. Bradshaw, three houses, East-End-Oak; Mr. Peter S. Dollar, more Crickwood-lane, Crickwood; Mr. J. H. G. Golder, six houses, Golder's Green; Mr. J. H. G. Golder, six houses, Brookside; Mr. V. L. Reynolds, motor garage, Ho, Golder's Green.

Hertfordshire.—The Asylums Visiting Committee of the County Council have entered into a contract for the purchase of further land in the neighbourhood of the asylum buildings at Hill End, near Hemel Hempstead, for the purpose of providing further accommodation, practicable. In connexion with this it has also been decided to enter into with Mr. G. T. Hine, 35, Parliament Street, Westminster, S.W., the architect of the asylum, to erect a similar capacity in connexion with the proposed enlargement of 5 per cent., on the actual expended, and reasonable and necessary expenses. The Public Health Committee have been instructed to raise the sanatorium and dispensary accommodation required in the county. The tender of A. T. Catley, 25, Lloyd square, W.C. accepted, at 590*l*. for the construction of a new bridge at Holbrook Ford. Plans for the County Surveyor have been approved for the erection of a new bridge at the same place. The estimated cost is put at 1,000*l*. and tenders are to be invited for the same. The Surveyor has been instructed to carry out the work of erecting new the St. Paulswooden Schools at St. Pauls, and the President of the County of Education is to be interviewed with to obtaining the Board's sanction to the vision of a secondary school at St. Pauls. The Surveyor has been instructed to plans, specification, and estimates for the erection of a new bridge at the same place, to accommodate thirty-eight children.

Leyton.—The sewer in a portion of road is to be relaid with new 9-in. an estimated cost of 140*l*. Two triple handcraft centres are to be built on the Goodall-road and Mayville-road. The following plans have been passed:—Messrs. Cutts, Johnson, & Boddy, chapel, St. Margaret's, Woodhouse-lane; W. A. Finch, extensions to factory, Works, Skelton-lane; Mr. R. G. Golder, houses and garage, Forest Drive; plan has been lodged by Mr. J. E. D. six houses in Essex-road.

Ruislip Northwood.—The tender of Willis & Powis has been accepted, at 1,000*l*. extending the sewer in Frog-lane, and the footpaths in Green-lane, and the sewer in the road, the tender of Mann, at 76*l*., has been accepted.

Sunbury.—Plans have been approved for the widening of the Littleton and Charlton roads. At a recent meeting of the Council Mr. Johnson moved:—"That the sanction of the Local Government Board be obtained for the necessary loan for the provision of a engine power at the sewage works, installing a pair of ejectors near Gr. The estimated cost of the work is 2,400*l*." The motion was agreed to.

Watford.—The Surveyor has been instructed to prepare an estimate of the cost of a portion of Watford-crescent. The Messrs. C. Brightman & Sons, Ltd., has been accepted for the erection of a new bridge at Cassiobury Park. Plans have been passed for:—Messrs. J. Bonham & Sons, four houses, Bushey Mill-lane; Mr. A. for four houses, Euston-avenue; Messrs. J. C. Ltd., bank, High-street; Messrs. Bracey & Clarke, six houses, Ashby-lane; the King's Ward Conservative and Club, billiard hall, Harwood-road.

OBITUARY.

Mr. G. E. Grayson.

On November 7, is announced the death of George Enoch Grayson, of Green Egerton Park, Rock Ferry, aged seventy-eight years, the Liverpool architect, who was a Fellow of the Royal Institute of Architects in 1886, and served as municipal and of the Practice Standing. He was President of the Liverpool Architectural Society, 1886-7. Mr. Grayson was a member of the City Liberal Club, E.C., illustrated in the *Builder* of 1876. Messrs. Grayson & Ould, of Liverpool, were the architects of many buildings in that city, and in Cheshire, and the neighbouring counties. Of these we may mention several for Messrs. Lower Brothers at Port St. Barnabas, Rock Ferry, and St. Waterloo, churches; the Girls' Schools at Carlisle (Warwick-road), and the (Balliol-road), 1907-8; the Bank of Liverpool, Wrexham; "The Mount," a large house, Wrexham; the new buildings at Upton Asylum, near Chester, new 100 additional patients, and administration, 1899; Rainhill County Asylum; the Elmsmere Port for the Bank of Liverpool; the Bank, Heswall; and in Cheshire, the new buildings at Mersey Railway-station, illustrated in our *Builder* of February 23, 1885; Marine Offices; Leyland & Bullen's Bank; the Hospital, Mount Pleasant, 1903-4; Exchange Buildings extension, 1899; the new buildings at the Trinity Hall, with extension of the Master's Lodge; additions to Selwyn and the Clergy Training School; also Wick Manor-house, for the late Mr. W. Bidston, Bidston Court, Cheshire, a new house (1898), for Mr. R. W. Wootton Parish Church; and, in competition, Hoylake Cottage Hospital, A. Lyle Ould, F.R.I.B.A., died on November 1, 1909, aged fifty-six years.

Mr. F. G. Debenham.

Frank Gissing Debenham, F.S.I., who died November 7, at Chesham Park, Hertford, was, until lately, principal partner of Messrs. Debenham, Tewson, and Co., formerly Messrs. Debenham, Farmer, & Bridgewater, of the Liverpool, auctioneers, land surveyors, and agents. Mr. Debenham was a resident authority upon commercial properties; he was a director of the Mart Company, Ltd., and a liberal member of the Incorporated Auctioneers' Fund. He was elected a Fellow of the Institution in 1868. His two sons, F. B. and Mr. H. B. Debenham, are partners of the firm.

Mr. E. B. L'Anson.

It is to announce the death, on November 7, of Mr. Edward Blakeway L'Anson, of St. John's College, F.S.I., aged 74 years, of 74, Laurence Pountney, architect and surveyor. Mr. L'Anson was the elder son of Edward L'Anson, of Hindhead (who died January 18, 1850), with whom he practised under the firm of Messrs. L'Anson & Son. He was the architect of the St. Mary, built in 1820; in 1865 he became a member of the Architectural Association, and for many years an Examiner, member of the Institution, 1903-4, and was elected for 1912-3 resident, Surveyors' Institution. Mr. L'Anson was the architect of the St. Mary, built (Manor-place), baths and wash-house, erected in 1895-7 at a cost of 40,000; almshouses at Charlton, built by the Trustees of the Dutch Church, Liverpool (May 14, 1877); Corn Exchange, E.C. (June 24, 1882); St. Luke's, Cornhill (June 30, 1888*); St. Luke's, Grayshott (1899-1900), in the Early style, and the "Three Cups," Colchester, built by the St. Mary, in Public Libraries; and the London Commercial Sale Rooms in Mark Lane, E.C., erected in 1891-2 at a cost of 90,000. As Surveyor to the St. Bartholomew's Hospital, he carried out some extensive sanitary improvements of the hospital buildings, and his main work and designs for the sites of Nos. 193-221, City-C., and, in conjunction with Mr. Plunbe, for the rebuilding, at an

estimated cost of about 300,000. of the hospital (July 23, 1904,* outpatients' and "casualty" departments, dispensary, officers' quarters, dinner hall, common-rooms, etc., Gillspur-street front), of which the late King laid the first stone on July 6, 1904, and the first portion was built by Messrs. Dove Brothers, who contracted for about 150,000. He was the architect of the General Steam Navigation Company's head offices, Trinity-square, E.C. (1906), and warehouses in Park-street, Southwark (June 30, 1888*), these jointly with Mr. E. Haslehurst; for the reparation, with removal of human remains and other works, St. Magnus Church, London Bridge, 1883; Convalescent Home, Craig-y-don, Llansudno; Lord Chief Justice, Lord Alverstone's, Cottage Hospital, Shanklin, I.W.; and for the laying-out of new roads and streets and the building of houses, for the South London and Streatham Estates, Ltd., and the Drew and Morimer Estates at Streatham and Tooting, in Camberwell; Wandsworth, Streatham High-road, Canterbury-grove, Norwood, and elsewhere in the south-western suburbs. Mr. L'Anson was employed in several important cases of arbitration or assessment, comprising, by appointment of the Local Government Board, the London County Council's assessment of improvement charges for the southern approach to Tower Bridge; and the award (6,100l.) out of the City consolidated rate to the Governors of Bethlehem and Bridewell Hospitals, in the matter of the widening of Tudor-street, Whitefriars. He was elected to the Council of the Architects' Benevolent Society, 1911-2 and 1912-3, and made liberal donations to the fund, as well as to the New Premises Fund, Architectural Association. Mr. L'Anson was a prominent member of some City Guilds, he was a Warden, and Master, 1911-2, of the Merchant Taylors' and Warden, 1911-2, of the Ironmongers' Companies. In 1898 he was one of the six architects nominated to compete for the St. Pancras (Kentish Town) Baths, to cost about 64,000l. The funeral is fixed for to-day at Grayshott.

PATENTS.

APPLICATIONS PUBLISHED.*

- 23,443 of 1911.—Ethel Bessie Sanders: Air inlets for building and the like.
- 23,659 of 1911.—Harry Johnson and George Paddison: Kitchen and like fireplaces.
- 24,037 of 1911.—Nathaniel Roe: Gearing more particularly adapted for use with awnings.
- 24,124 of 1911.—Jonas Walter Ayleworth: Plastic compositions and method of preparing the same.
- 24,187 of 1911.—Alfred Squire: Domestic stoves.
- 24,481 of 1911.—Harry Vaughan Rudston Read: Apparatus for use in extinguishing fires.
- 24,546 of 1911.—Henry Frank Berry: Heating and drying of stone and other materials for use on roads and like surfaces.
- 27,196 of 1911.—John Spencer, Ltd., Thomas Spencer, Herbert Spencer Smallman, and Spencer Horton: Valves and fittings for controlling the water supplies for installations of automatic sprinkles and fire-alarms.
- 27,856 of 1911.—Robert Charles Sugg: Valves used for the flushing of water-closets.
- 19 of 1912.—Walter Jones: Sprinklers for sewage and other liquids.
- 2,554 of 1912.—Polydore Wenmaekers: Construction of cement and the like foundations and ground anchorages.
- 2,782 of 1912.—Robert Head: Combined closure and faucet.
- 11,069 of 1912.—William Mayo Venable: Temporary forms or supports for casting concrete floors *in situ*.
- 11,375 of 1912.—Hans Munding: Means for treating smoke in chimneys.
- 11,489 of 1912.—Adolf Bleichert & Co.: Carriages for ropeways and the like.
- 13,427 of 1912.—Theophile Victor Louis Boile: Portable scaffolds.
- 14,646 of 1912.—Industrie Gesellschaft, m.B.H.: Closet seat and process of manufacture.

SELECTED PATENTS.

13,956 of 1911.—Ferdinand Burchartz: Hollow building-blocks.
This relates to hollow building-blocks wherein each block is first formed with spaced partitions 10 extending the whole length, and is then cut into two parts: the partitions are removed from each part for a distance from

the centre by a wire or other cutter 13, and the two parts are reunited. The space between

13,956 of 1911.

the partitions may be lessened by splaying the material with a toothed plate 17.

14,031 of 1911.—James Joseph Smith: Sawing-stone.

This relates to a rotary stone-cutting saw in which magnetism is employed to hold abrasive material to the cutting edge, and pole-pieces are provided to give maximum attraction at the periphery of the saw. An electro-magnetic field is employed. The saw consists of V-jointed plates 7 connected by

14,031 of 1911.

rings 8 and hugs 9 to the shaft 4, which forms the core for an electro-magnet on each side of the saw. The magnets carry-rings, to which spring-pressed brushes convey current. Mounted in the bearing of the shaft 4 are cup-like shields having arms 12, 13, carrying radially adjustable pole-pieces 15, 17, 18. The pole-piece 18 is also pivotally adjustable. Abrasive material is fed from a hopper 32.

14,506 of 1911.—Harold Clinton Ferree: Reinforced concrete.

This relates to an expanded metal reinforcement for concrete structures, which comprises stud members 2, connected in their own plane by members 3, and side members 5, which are expanded transversely to the plane of the members 2, and are provided with integral

14,506 of 1911.

hooks 4 for securing adjacent reinforcements together. Moulding-forms and cores for hollow walls may be supported from the expanded metal frames by means of sheet-metal strips 17 formed with tongues 18, and eyes for the reception of long wire stays 20 and wedging-nails 21.

BARNARD CASTLE SEWAGE DISPOSAL.

The Barnard Castle Urban District Council have instructed Messrs. Taylor & Wallin (Mr. Harry W. Taylor, A.M.Inst.C.E.), of Newcastle-on-Tyne and Birmingham, to report upon the condition of the existing sewerage farm, with a view to its extension and improvement.

* All these applications are in the stage in which opposition to the grant of Patents upon them can be made.

* Illustrated in the *Builder*.

List of Competitions, Contracts, etc.

For some Contracts still open, but not included in this List, see previous issues. Those with an asterisk (*) are advertised in this number; Competitions, —, Contracts, iv. vi. viii. x.; Public Appointment, xx.; Auction Sales, xxiv. Certain conditions beyond those given in the following information are imposed in some cases, such as: the advertisers do not bind themselves to accept the lowest or any tender; that a fair wages clause shall be observed; that no allowance will be made for tenders; and that deposits are returned on receipt of a bona-fide tender unless stated to the contrary.

The date given at the commencement of each paragraph is the latest date when the tender, or the names of those willing to submit tenders, may be sent in.

. It must be understood that the following paragraphs are printed as news, and not as advertisements; and that while every endeavour is made to ensure accuracy, we cannot be responsible for errors that may occur.

Competitions.

NOVEMBER 25.—**Newcastle-on-Tyne**.—SCHOOLS.—Limited to local architects. Particulars from the Education Office, Northumberland-road, Newcastle-on-Tyne.

NOVEMBER 29.—**Langside, Glasgow**.—BRANCH LIBRARY.—Assessor, Mr. Alex. N. Paterson, A.R.S.A. Premiums, 50l., 30l., and 25l. Particulars from the Town Clerk, City-chambers, Glasgow.

NOVEMBER 30.—**Balham**.—SWIMMING-BATH.—The Wandsworth B.C. invite designs. See advertisement in issue of August 16. Particulars from Mr. E. Dodd, 215, Balham High-road, S.W.

DECEMBER 2.—**Carlisle**.—SCHOOL BUILDINGS, ETC.—Particulars from the City Surveyor, 36, Fisher-street, Carlisle.

DECEMBER 7.—**Rome**.—BRITISH SCHOOL AT ROME. SCHOLARSHIP IN ARCHITECTURE.—2000. per annum for three years. Particulars from Mr. Evelyn Shaw, 54, Victoria-street, S.W.

DECEMBER 20.—**R.I.B.A.** Competitions.—All work for the Studentship and Prizes, 1913, must be delivered before 4 p.m. at 9, Conduit-street, W.

JANUARY 1, 1913.—**Dublin**.—MUNICIPAL BUILDINGS.—Assessor, Mr. Albert E. Murray, A.R.S.A. Conditions from the City Treasurer, Dublin. Deposit, 2l. 2s.

FEBRUARY 3, 1913.—**Harrogate**.—SCHOOL.—The Harrogate Education Committee invite designs for a Council school in Slipton-road. See advertisement in issue of November 1 for further particulars.

FEBRUARY 22, 1913.—**Jordanhill, Glasgow**.—PROPOSED TRAINING COLLEGE.—Limited to six firms, named in "Competition News," December 2, page 635.

MARCH 1, 1913.—**Rangoon**.—MUNICIPAL BUILDINGS.—The Committee of the Municipality of Rangoon invite designs for the new Municipal Buildings, Honoraria of 300l., 200l., and 100l. respectively for first, second, and third. See advertisement in August 2 and 30 for further particulars.

MARCH 1, 1913.—**Sofia**.—DESIGNS FOR A ROYAL PALACE AND LAW COURTS.—Particulars from the Commercial Intelligence Branch of the Board of Trade, Basinghall-street, E.C. (see p. 173, August 9, and p. 350, September 27).

MARCH 1, 1913.—**Winnipeg**.—CITY HALL.—Particulars from Mr. A. Waugh, City Hall, Winnipeg. See page 509, November 1.

NO DATE.—**Dursley**.—WORKMEN'S DWELLINGS.—The Parish Council of Dursley, R.D.C. invite designs for about thirty workmen's dwellings. See advertisement in issue of October 25 for further particulars.

NO DATE.—**Folkestone**.—PROPOSED KURSAAL.—Cost not to exceed 20,000l. Premiums 100, 50, and 25 guineas. See "Competition News," page 542, November 9.

NO DATE.—**Motherwell**.—HIGH SCHOOL.—Dr Burnet, assessor. Premiums 50l., 30l., and 20l.

Contracts.

BUILDING.

The date given at the commencement of each paragraph is the latest date when the tender, or the names of those willing to submit tenders, may be sent in.

NOVEMBER 15.—**Newquay**.—TANKS, ETC.—For the erection of dyke and tanks at Per, Hensbarrow China Clay Ld. Particulars on deposit of 2l. 2s. from Messrs. Cowell & Cowell, Central-chambers, Newquay.

NOVEMBER 15.—**Rhondda**.—ALTERATIONS.—For the carrying out of alterations at the girls' and infants' departments of the Cwncyl-ydach Council School. Plans and specification seen, and quantities and tender forms from the Architect, Mr. Jacob Rees, Hillside Cottage, Pentre. Deposit of 1l. 1s.

NOVEMBER 16.—**Blaenrhondda**.—INSTITUTE.—For erection of branch institute at Blaenrhondda for the Fernhill and Blaenrhondda workmen. A deposit of 2l. 2s. for quantities to Mr. W. D. Morgan, M.S.A., architect, 194, Ystrad-road, Pentre Rhondda.

NOVEMBER 16.—**North Anston**.—CLUB.—For the proposed new Working Men's Club, North Anston. Quantities on deposit of 1l. 1s. Mr. John W. Winter, architect and surveyor, St. Peter's Close, Sheffield.

NOVEMBER 16.—**Rochford**.—BLOCK.—For erection of an age and infirm block at the Workhouse, Rochford. Names to the architect, Mr. Walter J. Wood, 39, Alexandra-street, Southend-on-Sea. Deposit of 1l. 1s.

NOVEMBER 18.—**Cloughton**.—VESTRIES.—Erection of new vestries at the Church of St. Mary, Cloughton, Yorks. Quantities from Messrs. W. S. Walker, F.R.I.B.A., & Son, architects, 77, Lowgate, Hull.

NOVEMBER 18.—**Port Talbot**.—FURNITURE, ETC.—For new shop front and fixtures at the Co-operative Stores, Pontypridd, near Port Talbot. Plans, drawings, and specification with Messrs. Evans & Jones, M.S.A., architects and surveyors, High-street, Port Talbot.

NOVEMBER 18.—**Resolven**.—STORES, ETC.—Erection of stables, coach-house, stores, etc., for the Resolven Co-operative Society. Plans, specification, and quantities to Mr. J. Cook Rees, M.S.A., Parade-chambers, Neath.

* NOVEMBER 18.—**Staines**.—SANITARY CONVENIENCE.—The Staines U.D.C. invite tenders for a small sanitary sewer, and specification in this issue for further particulars.

NOVEMBER 18.—**Stornoway**.—ADDITIONS.—For alterations and additions to Stornoway Post-office. Drawings, specification, and conditions and form of contract at Stornoway or Inverness Post-offices. Quantities and forms of tender at H.M. Office of Works, 3, Parliament-square, Edinburgh. Deposit of 1l. 1s.

NOVEMBER 20.—**Brodie**.—STORE.—For erection of a store at Brodie Station, for the Forres and District Farmers' Association, Ltd. Plans and specifications at Brodie Station.

NOVEMBER 20.—**Cardiff**.—MARKET.—Construction of a livestock market at Sloop-road. Drawings, specification, and deed of contract seen, and form of tender, with quantities, at the City Engineer's Office, City Hall.

NOVEMBER 20.—**Chorley**.—ROOM.—For erection of a skin-cleaning room, etc., at the public slaughter-houses. Plans seen, and quantities at the Borough Surveyor's Office. Deposit of 10s. 6d.

NOVEMBER 20.—**Dewsbury**.—HOUSE.—For erection of a dwelling-house in Northfield-road West, Dewsbury. Plans seen, and quantities from Messrs. Kirk, Sons, & Ridgway, F.R.I.B.A., architects, Market-place, Dewsbury.

NOVEMBER 20.—**Oldham**.—SHOPS.—For erection of a number of lock up shops adjoining the Victoria Market Hall. Plans and specifications seen, and quantities and form of tender at the Borough Surveyor's Office.

NOVEMBER 20.—**Swallowfield**.—COTTAGES.—For the erection of a pair of cottages at Risleey, Swallowfield. Plans seen, and quantities at Mr. William Yee, jun., Clerk to the Council, Risleey, Swallowfield.

NOVEMBER 21.—**Lepton**.—INSTITUTE.—For erection of a church institute at Lepton, near Huddersfield. Drawings seen, and quantities from Messrs. J. B. Abbey & Son, 344, New-street, Huddersfield.

NOVEMBER 21.—**Romford**.—SHED, ETC.—For erection of a new cart-shed and paving the stable yard at town yard, Market-place. Specification and forms of tender from Mr. H. T. Ridge, Council Offices, Romford.

NOVEMBER 21.—**Wednesbury**.—ALTERATION.—For alteration of premises in the Market-place, known as 30 and 31, into institute buildings, for the Foresters' Institute. Specifications and particulars from Messrs. Scott & Clark, architects, Lower High-street, Wednesbury.

* NOVEMBER 22.—**West Ham**.—ADDITIONS, ETC.—The County of Essex Territorial Force Association invite tenders for alterations and additions to "The Cedars," Portway, West Ham. See advertisement in this issue for further particulars.

NOVEMBER 23.—**Morley**.—PREMISES.—Erection of additional premises at Wesley-street Mills, Morley, for Messrs. C. South & Sons, Ltd. Plans and specifications seen, and quantities from Mr. T. A. Buttery, Lic.R.I.B.A., architect, Queen-street, Morley.

NOVEMBER 23.—**Rochdale**.—HOUSE, ETC.—For erection of a bandstand (steel and wood) for Falinge Park; shelter and bowl-house for Bursell Bowling Green, and other buildings at Mr. F. W. Hathaway, A.R.I.B.A., Town Hall.

NOVEMBER 23.—**Tynemouth**.—ALTERATIONS.—For structural alterations to the buildings recently occupied by the children at the Union Workhouse, 50, Preston-road, North Shields. Plans seen, and specification and quantities from the architect, Mr. V. Stockdale, A.R.I.B.A., at 81, Howard-street, North Shields.

NOVEMBER 25.—**Bratford**.—REPAIRS, ETC.—For the execution of ordinary works and repairs to the buildings in the Bratford, Yorks, district. Conditions and form of tender, with particulars, on deposit of 1l., from the Secretary, H.M. Office of Works, etc., Storey's-gate, London, S.W.

NOVEMBER 26.—**Portsmouth**.—HOUSES, ETC.—Erection of twenty-two houses on the west side of Curzon-Howe-road, Portsea; erection of seven houses on the east side of Curzon-Howe-road, and four houses in Kent-street, Portsea, together with a wall and iron for Deposit of 2l. 2s. for quantities. TO CORRESPONDENTS.
NOTE.—All communications with respect to literary artistic matters should be addressed to "THE EDITOR" (and not to any person by name); those relating to advertisements and other exclusively business matters should be addressed to "THE MANAGER." Communications must be authenticated by the name and address of the sender, whether for publication or not. No notice can be taken of anonymous communications. The responsibility of signed articles, letters, and reports read at meetings rests, of course, with the author. We cannot undertake to return rejected communications; and the Editor cannot be responsible for queries, photographs, manuscripts, or other documents, or for models or samples, sent to or left at this office, unless he has specially asked for them. Drawings sent to or left at this office for consideration should bear the owner's name and address on the face or back of the drawing. Delay and inconvenience may result from inattention to this. Any communication to a contributor to write an article, execute or lend a drawing for publication, is given subject to the approval of the article or drawing, when sent, by the Editor, who retains the right to reject unsatisfactory. The receipt by the author of a notice of an article in type does not necessarily imply its acceptance. Illustrations of the First Premiered Design in an important architectural competition will always be sent for publication by the Editor, whether they have been formally asked for or not.

New "Ideal" Wall Radiators.

We are now making at our Hull Works, in two heights 22 in. and 13 in.—the new "Ideal" Plain Wall Radiators—illustrated—and a good stock of sections in both sizes is available for immediate despatch.

22 in. "Ideal" Plain Wall Radiator.

"Ideal" Plain Wall Radiators can be used to advantage wherever floor space is restricted or valuable—their depth only 3 in.—they occupy about half the space required for a pipe coil of equal capacity—are better in appearance—kept in more readily—cheaper to install—can be built up in small units, ensuring economy in maintenance—are equal to bought pipe coils for indirect hot water supply.

Fully descriptive leaflet giving heating surfaces, prices, etc., post free on request.

RICHARD NORMAN SHAW, R.A.

WITH Richard Norman Shaw there passes one of the great figures of the Victorian age. To realise what he achieved necessary to reconstitute as far as may be the world of art and thought as he found it when he came to London sixty years ago. Towards the middle of last century thoughtful men began to be troubled at what seemed to be the passing away of the beautiful from the earth. To win the turmoil of the grotesque day-train was a defilement of the countryside. The East Indian home bound with all sail set was soon to be seen in the Channel no more. "We build iron ships," says John Rhead. "Painters, too, with some eminent exceptions, reflect the general baldness of the age, and are alive with little save the idle of tea-cups and the conversation of the curate"; while in architecture, particularly in domestic work, the Georgian tradition had run dry, and was to be succeeded by a florid and stucco which was called "Italian," for no apparent reason save that it was neither Georgian nor Gothic—the style of

the new Royal Home at Osborne, in the Isle of Wight, the style of the many independent mansions beginning to spring up among the cedars and monkey-puzzles of the southern suburbs of London.

At the same time it was the beginning of big movements in art, religion, literature, social life. The Tractarians had already ruffled the placid Protestantism of Oxford. Ruskin and his ardent lieutenant, the younger Pugin, were beginning to arouse the imagination of architects. The Pre-Raphaelites were at the start of their adventure. The year of the Great Exhibition, while it revealed a hardly credited barrenness of artistic achievement and inspiration, also saw the publication of the "Stones of Venice," "In Memoriam" and "Pickwick" were already being read. "Adam Bede" was written soon after.

The first movement away from the smugness of an etiolated Georgian tradition was in the direction of the picturesque. In literature the so-called "Lake School" of poets had already broken with the classical tradition. Tennyson's work is largely infused with a kind of twilight mystery of ivied tower and haunted room. It is Teutonic, not classic,

in the source of its inspiration. And the Gothic Revival is in essence a similar movement. It is on the personal, the human side of architecture, the fervent faith, or the happy imaginativeness of the craftsman-builder that Ruskin lays the emphasis, rather than upon the abstract beauties of the thing built, its nearness to an established ideal of form.

The immediate results of the preaching of the Gothic Revivalists were twofold. The Pre-Raphaelites tried to get back behind the intervention of the Renaissance and recover the inspiration of a more ingenuous time. But the most eminent of them, William Morris, is in his many-sided humanist enthusiasm far less a medievalist than a Hellene. The second result was the formation of an intellectual school of architects who are really, in the hard correctitude and formalism of their work, far more classic than Gothic in outlook, even though the "Orders" which they systematised are the forms of medieval rather than of Greek or Roman work.

If the lesson that Ruskin sought to teach was that architecture is less a matter of head than of heart, that a building was not to be judged as one

Bryanston, near Blandford, Dorset.

R. Norman Shaw, R.A., Architect.

instance of a formulated law of the beautiful, but was to be something personal, pleasant, adaptable to varying conditions, fulfilling the demands made upon it, instinct at the same time with a character of its own which it drew from its position, its uses, its materials, then perhaps Norman Shaw was his aptest pupil. Coming to London in the middle of the century, it was impossible that he should not be influenced by the current of his time. In his education he was a keen student of Gothic work, as is evidenced by his "Sketch-Book of Continental Studies," first published in 1858. Moreover, he spent many hours on the scaffolding of the new Houses of Parliament, attracted by that remarkable essay in contemporary Gothic. The earliest of his work to be illustrated in the *Builder* was a writing-table and bookcase in the Gothic manner. "Mr. Shaw," the editor writes of him at the time, "is thoroughly imbued with the mediæval spirit."

It is in a real sense that Norman Shaw was more truly than his contemporaries a child of the Gothic Revival, though his work is not Gothic in the accepted sense at all. In his detail, indeed, he employed rather a flamboyant Jacobean, such as to call forth an earnest rebuke from Professor Donaldson, who, in a letter to the *Builder* of August 9, 1873, criticises the recently-built New Zealand Chambers. "I cannot conceive," he writes, "what motive can have induced its author, a man of acknowledged talent, to rake up a type of the very lowest state of corrupt erections, of a period that marks the senility of decaying taste. . . . This elevation seems to me like the last somersault or gambol of the agile gymnast who seeks to extort a laugh at the end of his performance. It is a sad spectacle of abuse of high powers."

This criticism is worth quoting, because it shows very clearly the point of view of leaders of architectural thought of the time, a point of view which Mr. Shaw's work was largely to discredit. It is the point of view of the pedant who, whether he calls himself Gothic or classic, can only see architecture as a matter of detail. In its simple structural idea of brick piers and glass and plaster bays,

the New Zealand Chambers building is neither Jacobean nor any other of the styles so facetiously labelled. It is a strongly individual and an austere picturesque solution of the problem of providing with simple materials a well-lighted block of offices in a London street. In his opposition to the current mode of considering building solely from the point of view of its detail Norman Shaw perhaps went so far as to be sometimes careless of detail. But even if this is so, his motive seems to have been a conscious reaction against the views of his time, an earnest wish to emphasise the whole even at the expense of the parts.

On the surface his times were too strong for him. Certainly his own style of domestic architecture has not escaped a label. As he built largely in red brick, in a style that was not conventionally the Gothic style, the pedant must needs call this work a "free Queen Anne." In fact, the work that is most typically his own is as different from the flat serenity of the XVIIIth century as the essays of Carlyle from the *Spectator* of Addison.

It is individuality, a dominant idea, that Norman Shaw is always seeking. Dignified, workmanlike, without irrelevant trappings, his Scotland-yard buildings take their place on the Embankment as the embodiment of civil order, of the force whose headquarters they are. And equally expressive of an idea of a stateliness that is picturesque yet ordered are his larger country houses:—Crag-side, or Adeote, or Dawpool, with their great chimneys, great roof, great hall window, great recessed fireplaces, often with an agglomeration of materials, brick and stone and half-timber work, that seems almost the haphazard growth of centuries, but reveals to closer scrutiny the hand of a single designer. There is balance, if there is not rigid symmetry; there is coherence and order in the most tumultuous plans, a grouping of rooms round the great hall, a vista through drawing-room, library, and picture-gallery; convenience of service is considered, and the aspect of rooms. No doubt, while fully alive to the importance of commodiousness, balance, and order, Norman Shaw consciously sought for random effect,

both outside and in. Perhaps there is something a little unguine about the if a house is of one date it should be immediately apparent. And yet there is no suggestion that this mingling of styles was an intentional deception. It was rather that his imagination had been fired by many periods. He had ploughed no lone furrow of inspiration. His sympathies were manifold. And out of this wealth of sympathies came a richness of invention, an exuberance which sometimes a little apt to jar upon a generation whose grasp is less vehement, its domestic work more restrained, please firm. The defect, if defect it be, is the natural outcome of a period of reaction against trite formalism in the direction of a perhaps somewhat hectic romanticism. In Norman Shaw's law of domestic work one finds, dealing with an atmosphere which it was not responsive to, creating a strong co-ordinating motif which is yet sensitive enough not to impose itself unduly. His influence on domestic planning is indeed marked. When he came to London he did not find the genius for planning dead. But he had created a scheme for the Houses of Parliament which has been the model of legislative buildings since. But his domestic plan was in a transitory state with its octagonal vestibules, its symmetry which gets tired out after reception-rooms are done with, its grandiloquence which is not stateliness, its contentment with the crumbs which fell from the Italian table. The work is rapid and unconvincing; showy and highly respectable in the prominent parts of the house; elsewhere slovenly and negligent. Norman Shaw brought a new life and joy into planning. The great hall, or staircase, or gallery is perhaps the most prominent feature. But all considered and worked out with care. The symmetry there is a symmetry of groups and centres. He was wont humorously to describe his method of planning by saying that he drew a room first and then the rest round it. But they were the right ones.

He found an architecture which, for all its undoubted enthusiasm and earnestness, was an architecture of pedantry, stylistic, formal; it seems to have been

mission to substitute for this an art should be vivid, personal, "racy of soil of its birth," architecture as fine, rather than correct, building. And one of his most important contributions to the end was his use of local and characteristically English materials—red brick, quartering, sand-faced tiles, stone-work in the way traditional in the district. He broke away from the frigid panemic stucco, pale bricks, harshly-laid stone of his day, and taught his generation to take pleasure in the colour and texture of homely materials. There is perhaps nothing more striking in the architecture of the last quarter of a century than the way in which his lead in this matter has been followed. Texture, colour, homely variety of material—these have been marked characteristics of the late development in domestic work. Younger men may have gone further; demand has finally created supply, and tiles and stones of good colour and texture are now readily obtainable. But Norman Shaw, Philip Webb, and Nesfield led the way; no debt to them in this can hardly be exaggerated.

In some ways no doubt the influence of Norman Shaw was regrettable, as was the influence of Michelangelo. The early picturesque, the orderly random, the large handling. Smaller men, as Philip Webb, copied the externals, and rioted in Flemish gables, half-timber work, pinnacles, and ingle-nooks. The apparently haphazard plan becomes merely restless jumble hands. Indeed, it was unfortunate that while so much of Norman Shaw's work is big, the demand of the next generation has been primarily for small houses. For this the influence of the Shaw manner was dangerous. It was picturesque and interesting on a large scale becomes fussy and irritating on a small. The over-featured country house, earnestly built but "smelling of camp," and patently designed in all its parts, is an offspring of the movement initiated. But no less may the "baroque" claim paternity from Michelangelo. Smaller domestic architecture, indeed, in which by common consent England holds at the moment a premier position, is only indirectly indebted to Norman Shaw. It was his way by breaking with a frigid tradition, by encouraging the use of local materials, by a high enthusiasm for architecture as the art of fine building, by showing that a house may have individuality. By his ideals, his comprehensive grasp of an architectural scheme, his powers of superb draughtsmanship, he did much to raise the level both of movement and of appreciation. It was the privilege of many public bodies to rely upon his artistic advice, and he was much to kindle in Government departments an appreciation of the importance of architecture. The simple dialogue of his executed works fills more than a column of small type where in this issue, and is an inspiring record of achievements, coming from a gay picturesqueness to a symmetry, from Leys Wood, Kent, to Bryanston, Dorset. As the chief of an open and eminent band of pupils his influence has gone far.

It is not the intention here to touch

upon his personal qualities, his humour and gay conquest of difficulties, the affection he inspired in clients and builders, and in all who came into contact with him in his professional work, his dislike of parade and ostentation, which indeed led him to decline the honour of a baronetcy a few years ago; but rather to lay down, all too hastily and with the imperfect eye of contemporary judgment, the outlines of his contribution to the growth of architecture. While it is no doubt true that we have reached the end of the picturesque reaction against formalism in literature and drama no less than in architecture, and are finding beauty and significance more and more in the direct, the obvious, the fitting, so that the liner and the express locomotive no longer offend our taste, yet the beauty of a house can never quite be the purely functional beauty of the engine, for the demands which it meets are not simply the demands of convenience, of air and sunshine, warmth and shelter. The house, like Aristotle's city state, is not simply for "the living," but "the living well." Those who are to live in it have wants other than material; they are looking not only for the convenience of a house, but the charm of a home. In many ways, partly as a result of the political isolation of the country, and no less under the influence of the character and tastes of a Queen who, in being an Empress, never forgot that she was a mother, the Victorian period laid an exceptional emphasis on the idea of home. To Norman Shaw was largely confided the material expression of this idea; and it was his distinction to have tinged that expression with a romanticism drawn indeed from the Gothic Revivalists, but tempered with the shrewdness and humour of his own personality. Among the eminent men of a generation peculiarly rich in them his name must always hold its own, not only for the work he did, but even more for the work he inspired others to do.

NOTES.

The Genesis of Style.

NOTWITHSTANDING its great advance in organisation and method, the professional education of architects is still in the rear of the movement in general education in that it has not arrived at the stage of questioning the all-sufficiency of the classical tradition. In the general movement the dawn of an ideal of civic education begins to suffuse with a new light the issues of the strife of classicist and modernist, harmonising in its unity their heretofore rival aims of character and efficiency. But in architecture the idea still prevails that the distinguishing character we call style will somehow ultimately be the outcome of the adoption and adaptation to modern uses of one or other of the ancient styles. The free comparative study of these seems to have failed to dispel this idea, though modern practice must surely have shown the hopelessness of it. Style has always been a development largely spontaneous and unconscious. We may plan and construct with a conscious purpose to attain

a definite end with as much efficiency and fitness as we can compass. We may consciously express such structure and fitness for purpose in our building. But the more subtle expression of character, the indefinable common quality of style, comes through the interaction of many individualities working true to the same tradition and environment, with the same materials and methods, for similar ends, and in an atmosphere of frank and mutual criticism and emulation. Very many factors go to the building up of style; and its strength and clearness and beauty correspond with the definiteness and unity of purpose, the nobility of motive, and the intensity of social impulse in the society whose building it characterises. This is powerfully illustrated both in the Greek and the Gothic.

Neglected Architecture.

THE habit of pointing to certain similarities between the civilisation of ancient Greece and Rome and our own, to certain philosophic and intellectual views and practical ways of life common to both, as justifying the modern use of classic architecture, blinds us to much in which we are essentially different. Of many such differences it will be enough here to mention one, to wit, the vast mechanical industrialism upon which our civilisation is based. This has involved an immense number and variety of quite unprecedented buildings—great mills, factories, workshops, and storage and railway buildings—which so far have been, for the most part, regarded as mere utilitarian building quite without the pale of architecture. That is to say, that while looking for the advent of a characteristic modern style we have ignored a wide range of building more distinctive than any other of our time, more near to the very foundation of our social system, which might therefore be presumed to constitute a potent factor in the style of its architecture. To the architectural eye and imagination this is obvious enough. A journey through any industrial district—say out of Liverpool-street by slow train to Woolwich, or in the great ring of cotton towns round Manchester—say Ashton and Stalybridge—will reveal not merely possibilities but pressing invitations, opportunities that cry aloud for the artist touch that could transform them into an architecture of no mean order. Nay, if mass, if efficiency of arrangement and construction or fitness for purpose count for anything, it is often there already in great part. Economic and practical exigencies alone have been considered in their making, and it is only now becoming generally recognised that even these are starved, and industry so much the less efficient and profitable, where the finer requirements and amenities of human life are denied. Generations yet unborn will say of this time: "The men of those days were great and original builders; there were many among them also who had great learning in architecture, men of power to design artistically in the noble styles of the near and remote past. But it was as if they had somehow lost, in great part, the secret of the unity of their art." Let

us but recover that, shape the education of our students to it, and it will matter little what alphabet they start with, whether Greek, Roman, or Gothic—and they are all in a true line of descent—for the language they shall come to speak cannot but be modern. And with the growth of more generous and inspiring social impulse that language or style will put on beauty no less than those of old, yet as distinctive as the structural forms and purposes it clothes.

The San Francisco Exhibition.

IN a letter to the *Times* of the 19th inst. Mr. W. D. Caröe gives a forecast of the splendours of the great exhibition to be held at San Francisco in 1915. Having visited the superb site quite recently, and having examined the scheme and plans so far prepared, Mr. Caröe is in the position to write authoritatively, and we are glad to read that "architects will be interested to know that what has justly been called the 'gingerbread' of exhibition design, known so well by all of us, is being studiously avoided, and a classic dignity sought in its place." This is an age of exhibitions, and the incentive they give to commerce and the opportunities they offer for international courtesies are widely appreciated, while if they are conceived in a big spirit and carried out with due regard to the fine effects which may be obtained from the disposition and grouping of finely-designed temporary buildings they arouse an interest in the work of the architect and the constructor which makes for the common good. European exhibitions may be small in scale in comparison with those possible in America, but Ghent next year promises to excel the achievements of Brussels in 1910, while the great exhibition of Chicago will apparently be eclipsed by that at San Francisco. The huge sum of 1,000,000, (not dollars) has been guaranteed by the citizens as a start, and every State in the Union and the Federal Government itself are contributors. We hope that Great Britain will be represented by an architectural court or pavilion worthy of our position in the world of commerce and the arts.

An ordinary general meeting of the Royal Institute of British Architects was held on Monday at No. 9, Conduit-street, Regent-street, W., Mr. Reginald Blomfield, A.R.A., President, in the chair.

Deceased Members.

The minutes of the last meeting having been taken as read,

Mr. E. Guy Dawber, Vice-President, said he regretted that he had to read a long list of losses which the Institute had suffered by death

since the last meeting of the session, as follows:—

Sir Lawrence Alma Tadema, O.M., R.A., elected an Hon. Associate in 1877, Hon. Fellow in 1901, Royal Gold Medalist in 1906.

Sydney Smirke, Fellow, elected in 1888.

Thomas Arnold, Associate, 1867, Fellow in 1904, and placed on the retired list of members in 1904.

G. Tunstall Redmayne, Associate in 1872, Fellow in 1877, and placed on retired list in 1902.

Henry Hall, Associate in 1872, Fellow in 1887.

J. T. Bressay, Fellow in 1877.

G. Friend, Fellow in 1888.

W. F. Unsworth, Associate in 1882, Fellow in 1891.

P. E. Massey, Fellow in 1901.

E. B. L'Anson, Fellow in 1880.

C. Enoch Grayson, Fellow in 1886.

C. H. Rew, Fellow in 1905.

J. S. Paul, Associate in 1886.

Mr. Dawber said he desired to move the following resolution:—

"That the Royal Institute of British Architects do place on record its great sorrow with the loss it has sustained in the loss of its distinguished Fellow, Sir Lawrence Alma Tadema, and offers an expression of condolence to the family in the sad bereavement."

He also asked the meeting to pass a vote of sympathy and condolence with the family of the late Mr. Smirke, whose generous contributions to the Institute Library, extending over many years, would be greatly appreciated.

Also a vote of condolence to the family of G. Enoch Grayson, who might be considered the *doyen* of Liverpool architects, who, after some fifty years of practice, retired on the last day of 1900. He had been a President of the Liverpool Architectural Society, and had served on the Council of the Institute and the Practice Standing Committee. The sympathy of the Institute would be extended to the son of the deceased, Mr. Haswell Grayson.

Mr. Dawber also moved a vote of sympathy to the sister of E. B. L'Anson, who was a great friend of the Royal Institute of British Architects and who came of a long and distinguished family of architects, not fewer than three generations—he being one—having occupied and carried on their practice in the same office in the city. At the time of his death Mr. L'Anson was a Vice-President of the Surveyors' Institution, and his father was at one time President of the Royal Institute of British Architects.

Mr. Hubbard seconded the various motions, which were carried in silence.

The Secretary, Mr. MacAlister, announced that the following candidates have passed the Statutory Examination and have been granted by the Council Certificates of Competency to act as District Surveyors in London:—

Sidney Walter Bensted, Associate.

Benjamin Chalkin, Licentiate.

John Doveston, Associate.

Lawrence Alexander David Shiner, Associate.

BATH: A COMPARATIVE STUDY.

Mr. J. L. Ball then read a paper on "Bath: A Comparative Study," of which the following is an abstract:—

It was as a Roman sanatorium that Bath emerged from the region of fable. The remains of the Roman baths—a small fragment only of the *Thermae* which, with Temples and Gymnasias, once covered more than 7 acres—were, nevertheless, the most considerable relics of Roman architecture in Britain; and to the student of that architecture, striving to piece together his odds and ends of knowledge, most valuable. It was not easy to explain the spell which Roman architecture cast over us, its defects were so obvious, its virtues less obvious. What the Romans were always looking for was not perfection of any kind, but power, and this easy tolerance of inconsistencies in their architecture went far to explain its vogue, its wide adaptability. Nothing was rejected that might tend to make it more flexible, more adaptable to all uses. For the first time architecture stepped down from its lofty isolation as an art sacred to the temple and the palace, and became in a certain sense popular. The coarseness, too, of Roman architecture was not an accident but an essential of it, a masculine grossness and predominance, which also had a place in art. For this hardness, this coarseness of fibre in it, was not a negative quality only, as implying no more than the absence of refinement; it was an energy, a faculty; so that while Roman architecture was often clumsy and unimaginative it was never puerile

or trifling. And coarseness here had an intimate and immediate connexion with endurance that it became really a sort of exaggerated emphasis of strength. Here, in Bath, violence and the hand of time had not obliterated, nor much impaired, their massive basements. What stonework was this which alone of all the masonry of Bath, showed evidence of decay? What was the secret of the concrete, this mortar, made without Portland cement, yet still hard and impenetrable as rock? The conspicuous durability of Roman architecture made most later work seem temporary in the comparison, and added pathos to its ruin.

Nevertheless, by reason of its idealism, the robust heterogeneous architecture had left a large impress on the world for all time. And we felt that the ideals of the Roman people centred very much in the city; the ideal life with the was the urban life. And this instinct of their moulded and coloured their conception of architecture, so that they thought of it not principally as domestic, in the modern sense, nor as religious, but as civic; as the heritage of Roman citizenship and the emblem of Roman order, as the decorum and piety of civil life. Therefore they founded cities, and laid them out with a wise provision, and adorned them with noble monuments. They did not wait until a hundred thousand people had congested themselves in squalid alleys, and then began to talk about town planning.

For a city which was the seat of an ancient bishopric the mediæval record in Bath was scanty. It might almost seem as though, in its quaint partnership of the two cities, the illustration of the Gothic phase of architecture had been left to Wells. Not the cathedral only, but the whole aspect of Wells, preserved the spirit of the Middle Ages. In those narrow streets, gabled houses, the little market-place, the gateways and closes, the cathedral with palace as college—in the ecclesiastical air of the place and in a certain neat compactness which it had and in the gossip and leisure of little town life there still lived for us something of the atmosphere of mediæval art. But nothing of this atmosphere existed in Bath, where the abbey church stood alone, in a sort of isolation, the last word of Gothic art in a city of the Renaissance. Bath Abbey was begun in 1499, replacing earlier structures, was partly ruined at the Dissolution, and partly rebuilt between 1597 and 1618. Thus it belongs entirely to the decadence of Gothic architecture and had for us something of the mournful interest of a survival. For by the middle of the XVth century the drama of mediæval art was played out. That architecture which we see at Wells Cathedral in the flush and animation of a wonderful youth, we found at Bath Abbey in the last stage of a no less wonderful decline, beautiful still, with the beauty appropriate to winter. For indeed periods of decadence and death had their appointed place in the great cycle of art, just as periods of youth and prime had each as necessary, each came with its own special order of impressions, its own special gift for the imagination. And in Wells Cathedral, throughout, not the sculpture only, but every line of the architecture, was intense with life; life triumphant, life containing death. But in Bath, in this city of pagan memories, it was the pagan sentiment which found expression in the last words of Gothic art. In Bath there was a curious felicity and smoothness of technique. The vaults were the best of vaults, the proportions, at least of the interior, faultless. We felt that the end was achieved, the fancy, the invention, the experiment, of three centuries of Gothic art, seemingly inexhaustible, had come by inevitable steps to this, and terminate here in this chill perfection.

The Roman city, the mediæval city, of Bath were gone, or survive only in profoundly interesting fragments. But the famous Renaissance city of the XVIIIth century had a different claim on our regard—it exists. We still walk the streets, still pass in and out of the buildings which were associated with a crowd of brilliant and attractive people, and with creatures of the imagination hardly less real. And in speaking of the XVIIIth-century architecture of Bath—we need here say it in that room and to that audience?—he included also the work of Brydson in the XIXth; for, by the turn of his genius, and by his faculty of identifying himself with his subject, Brydson rivalled, perhaps excelled, his predecessors, and shared their fame. What then, was the precise value to us of the particular phase of the Renaissance which Bath presented? The question was important, for no architect

been more abundantly praised, or more fully blamed, and it merited neither one. What should attract us in art, we ought to look for in it, what alone made it valuable to us, was the promise of life. The Renaissance of the XVIIIth century had no claim to creative genius, we must look in it for the expression of great pride of dominion, the ecstasy of the *bus life*; nor for passion, nor for mystery; it was all social, domestic. It was the architecture of an age which was quick and bold, but not very imaginative or profound. It represented, it was even part of, the learned life of its age; a culture singularly cool, impassioned and fastidious; devoted, in culture and art, to a certain classic idealism; pursuing an ideal correctness even in trivial things. It was the architecture of chambers and courtly phrases.

This Renaissance city of the XVIIIth century, the spirit of Roman decorum was in it; its streets and open places, and the use of its public and private edifices, were of interest; and we had an architecture which was sober, devoted to the classic ideal, with little of the romantic in its mood. Yet with all this, and with much of grace and interest, there were mingled in this architecture some characteristic defects. A certain conformity marked it, as though some hidden force were obstructing its development. It offered a clear field to the classical machine, yet when we compared the architecture of 1800 with that of 1700 we found little progress or variety. On the other hand, there was a sleepy conformity to type, and any considerable variation was essayed in variation proved degenerate; the conventional defect of XVIIIth-century Renaissance being, in fact, a defect of variability. In architecture there was the tendency to uniformity, but the degree of variability differed widely in different schools. Gothic architecture, Wells Cathedral for example, showed a flexibility, a readiness to "sport," which was astonishing; we could imagine it capable of variation almost without limit. Other schools of architecture were variable in different degrees. Here in Bath, in the classical Renaissance of the XVIIIth century, we reached the extreme of the degree of variability.

Though the classical Renaissance was limited in the number of attributes which were often ascribed for variability; an attribute of Roman architecture too, but which becomes more evident in the Renaissance and more complex conditions of life, he meant adaptability. There was hardly any kind of building which Renaissance architecture had not adapted, from the greatest to the smallest, from the basilica of St. Peter to the small shops which we saw in the streets of Rome.

When we came to compare this architecture of mild and rather homely sentiments with the architecture of passion and genius—Wells Cathedral and Gothic architecture generally—the value of adaptability became evident. Gothic architecture, with all its leading variability, its intense and flame-like variation, was wholly without adaptability. Domestic architecture—architecture, that is to say, in which a definite sentiment of domesticity, of homeliness, was expressed—was in a quite special sense to the Renaissance. Mediaeval architecture had no place, the epic solemnity of its mood, for a domestic architecture, the little domestic architecture that we find in us from the Gothic period was that of a somewhat arid and cheerless ideal. It was, as it were, the alluring prospect of a lost domestic architecture of the Middle Ages; what we really found at Wells, for instance, was the fortified castle of the Bishop—a military stronghold—the *Vicar's*—a house of celibate vicars—choral of the cathedral—works of interest indeed, but of an interest not properly domestic. It was only as we reached the end of the mediaeval period, the XVth century, that we came upon an architecture potentially domestic in feeling; in the XVIth century, long before the Renaissance of architecture had changed, the Renaissance was already influencing its spirit. From beginning onward one might say that the Renaissance, the work for which was reserved, was to bring the influence of architecture into the home of the plain citizen, to use in terms of architecture an expression of the domestic ideal. And so in these larger and more homely houses of Bath—and in how many other places!—and especially perhaps in the houses, we had not only the finished thought

of XVIIIth-century architecture, but the true measure of its originality; for it was just here, where the Roman model failed them, that the artists of the time became various and inventive. The cultured simplicity of these interiors—these dainty parlours and staircases—was admirable; and one was conscious sometimes of an almost feminine quality in the delicate proportions and cameo-like reliefs.

Mr. A. Mowbray Green,

in proposing a vote of thanks to Mr. Ball for his paper, said as to scale Mr. Ball was not alone in thinking that the buildings of Bath lacked the true dignity of scale. The point was an important one, but was not the matter explained by the desire of the designers to conform to the local surroundings? To have overloaded Bath with buildings on a large scale would have given it an air of depression. Bath had its environment, and to that environment the XVIIIth-century builders did ample justice.

Mr. L. March Phillips

seconded the vote of thanks, and said that Mr. Ball had remarked that the Roman Renaissance was the idea that had inspired Bath, but the Renaissance in Europe was composed of two streams, and there was a Roman Renaissance and also a Greek Renaissance, and often in Italy and in France and in this country, in the XVIIIth century, there were forms of classic Renaissance which were not Roman at all—forms which the Romans would not have sympathised with and which were really Greek in feeling. All through the Renaissance of the XVIIIth century, all through Georgian times there was a note of restraint, of the consciousness of the value of smooth surfaces; and the share which Greece had in the Renaissance ought to be distinguished from the share which the Romans had. He thought that architecture would become a humanly interesting subject for people if they could have lectures like Mr. Ball's put into their hands. The President had said that architecture was the Mistress Art, but however that was, it could be said that it was the Mistress Industry; it combined and took to itself much of the industry of the country. If they separated architecture from life they had a craftsmanship and artisanship in the country which was more or less mechanical, wanting dignity and a consciousness of its own work. If they united architecture again with life they dignified life again, and labour. He thought it would be good if they were tending in that direction, and in order to do that he thought the whole subject of architecture should be infused with the spirit they had found in Mr. Ball's lecture.

Professor Lethaby

said that Bath was a wonderful city, and what he feared was that we did not sufficiently value it as a national asset. There were many nice things in England which were too good for us and which we could not live up to, and which were consequently more or less lost to us. Euston Station, for instance, was so good in a way that we did not know how to make use of it; the central hall was almost a waste place. We did not know how to make use of a thing which was architecturally fine. What he wanted to suggest was whether it was possible to do something for the appreciation of Bath—a place which cried aloud for some national recognition. It was a place that should be made a University town—of a western University. At Bath there were wonderful buildings more or less prepared for something of the kind. Prior Park, for instance, was one of the most wonderful things in England, and he was shocked to see how it was running down; it was too fine, too big, too good for us, and he wondered if something could be done to get some national help for Bath, which could very well be the city for an agricultural college for the West of England.

Mr. G. Hubbard

said it occurred to him that perhaps architecture did not influence our lives quite as much as we imagined. It seemed to him that every age had its own particular architecture, and that that architecture did truly express the feeling or culture of that particular period. If that was so, it was the life and culture of the period which influenced the architecture, rather than the architecture influencing life. Take Greek architecture as being the standard of perfection; it was a standard of perfection so far as it did absolutely and actually represent the culture of the period. If the culture was

altered the architecture must be altered accordingly. As to ourselves to-day, he took it that we were not particularly cultured, and we were not as sincere as we might be, and that, as a consequence, our architecture was not as perfect as it might be. Bad as our architecture was, he thought it really expressed very accurately our low standard of civilisation. No doubt if we could go back to the pristine ages when Bath was built, we should find ourselves living up to a very much higher standard than some of us live up to to-day. If they took architecture in its broadest sense as being an expression of culture, Gothic architecture was an expression of faith, and when faith was the strongest in the country, Gothic architecture was at its highest, and Gothic architecture failed when the faith of the country failed.

The President,

in putting the vote of thanks to the meeting, said the last speaker had hit the nail on the head when he said that our architecture represented what we were worth. That was more or less the case, but he was not so despondent as Mr. Hubbard seemed to be—things were not so bad, and there were signs of progress. It was interesting to have a paper on the inner meaning of architecture, for that was what Mr. Ball had attempted to do, and after reading dry text-books, as they had to, it was very refreshing to have such a delightful paper. At the same time the paper was open to one or two criticisms. In regard to Roman architecture Mr. Ball had, he thought, taken a sound historical view, but he did not think he quite did justice to Bath as a great city, for XVIIIth-century Bath was really a great conception. The sagacity and forethought with which the town was laid out was remarkable, and there was genius in it. It was not only the first thing of its kind which had been done in England, but it was a city which could hold its own with great Continental cities. The dimensions of Bath would hold their own with such a city as Nancy, which was a sort of *locus classicus* in civic design, and we ought not to ignore our own. Then as to the XVIIIth century, he did not think that Mr. Ball quite appreciated the undercurrents which were going on at the time, and it was not quite sound to decry the XVIIIth century as a sort of mechanical affair. However, the paper was one to which they might call the attention of students, because the author had tried to penetrate through the screen of facts to the spirit that lay behind them; but he was sure Mr. Ball would agree with him when he said that, on the other hand, the only means of realising that point was through knowledge of the facts.

The vote of thanks was heartily agreed to, and Mr. Ball briefly replied.

The next meeting will be held on December 2—a business meeting.

MARBLES USED IN GREEK, ROMAN, AND BYZANTINE BUILDINGS.

The following is the second half of the paper on "Marbles Used in Greek, Roman, and Byzantine Buildings," read before the last meeting of the Architectural Association by Mr. J. A. Marshall. Some notes of the discussion which followed are also given:—
"Brecchia Africana."—One of the most interesting and noble-looking of the brecchias of

antiquity is known to the Italians as "Africano," though the ancient quarries have not been discovered.

The entolosing magma varies from pale greenish-grey to nearly black; the calciferous fragments, white, grey, pink, and black, are subangular, and appear to have been derived from some earlier formation of variegated marble. The fragments are sometimes split across, and present other signs of dissolution. In places the paste is spathic or streaky, suggesting a viscous material, due to heat or thermal waters. It is sometimes strewn with fine detritus, or jewelled with small bright red fragments.

When excavating the site of the *Basilica Esikha*, Signor Boni found fragments of "Africano" columns, 3 ft. in diameter, that belonged to the nave, while a corresponding series, smaller in size, belonged to the upper story. According to Pliny, the columns of this basilica were of Phrygian marble, so it was quite a surprise to find that in the course of time they had, by some mysterious process, changed into "Africano," notwithstanding the legend that the columns had been taken down in the 14th century and used for the first basilica of S. Paul, outside the walls.

From this discovery it would seem that Pliny, like many of the novitars to be found in his encyclopedia, was not infallible. The modern name, "Africano," is merely an indication of the dark colour peculiar to this breccia, but it is quite in keeping with the obscurity that surrounds this part of our subject.

An unfinished column of "Africano," 27 ft. long and 5 ft. 6 in. in diameter, was found near the *marmorate*; it is now in one of the courts of the Vatican. Nearer home, in the "Græco-Roman" gallery of the British Museum are three columnar pedestals with the greenish-grey ground; and others with the black ground are in the "Archaic" and "Ephesus" rooms. "Africano" was used for strips and borders in

the paving of the *Basilica Julia*, and a slab of it, 16 ft. long, is *in situ* at Ostia, where it forms the threshold of a temple of Hadrian's time.

Many fragments of "Africano" have been found among the ruins of Aquileia, an important Roman colony on the north coast of the Adriatic. "*Breccia Corallina*."—About thirty years ago the site of Aquileia must have been a prolific hunting-ground for the collector of antique marbles, but in 1883 nearly 60 tons of fragments were removed to Venice for the restoration works at S. Mark's.

Among the various marbles found at Aquileia one of the most beautiful is the "*Breccia Corallina*," from quarries in the neighbouring province of Dalmatia.

The typical variety suggests a white calcareous rock fractured and crushed; the interstices are fine, and filled in with coral-red cement. The fragments are delicately flushed with pink, non-crystalline and greasy to the touch. In a coarser variety the reddish paste is more assertive, the fragments are scattered and less pure in colour. Two beautiful shafts of the most delicate kind help to support one of the ambros at S. Mark's, Venice; and small columns of "*Breccia Corallina*" have been found in the *peristylum* of the *Atrium Vestæ*, Rome. The marble decoration of this building is mostly, I believe, of the time of Septimius Severus. At the end of the 11th century A.D., Rome was becoming richer in many costly marbles, and probably "*Breccia Corallina*" was one of these new and choice materials.

Marmor Celticum.—Among these later arrivals I think we must place the *Marmor Celticum*, first described, I believe, by our Christian writer of the 15th century.

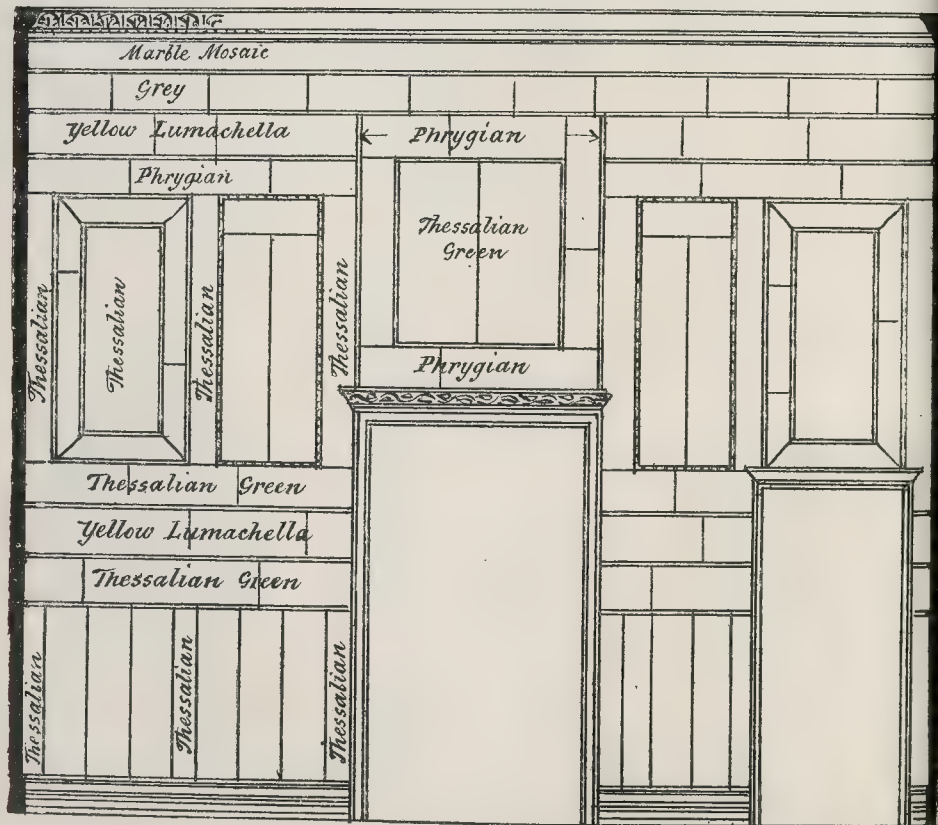

The marble came from the western limits of the Empire, and is believed to be identical with the black and white breccia found in Southern Gaul, on the northern slope of the Pyrenees.

I cannot refer you to any instance of its use by the ancient Romans, but a sepulchral

inscription has been found in Gaul commemorating a superintendent of the quarry, who lived during the reign of Septimius Severus. The structure of the marble suggests a compact and intense black rock, shattered and broken into fragments, and invaded by a perfectly crystalline calcareous paste that crystallised on cooling. The fragments are cracked and generally attended by minute detritus, eroded from the edges. Fine columns of *Marmor Celticum* are to be seen in Grado Cathedral, and others support the ciborium in the Church of Sta Cecilia, Rome. Two beautiful shafts, with amethyst-tinted magma, enrich the little shrine of the crucifix, in S. Mark's, Venice, and others adorn the main portal of the façade.

Marmor Taurinum.—This name is generally understood to include two species, a red and black. The red, popularly known as "*Rosso Antico*," has been identified with a species found in the southern part of Laconia, near the promontory marked "*Tauraron*" in the classical atlas. Taurian marble is mentioned several of the classical writers, and, according to the Greek geographer, Strabo, the quarries were ancient in the 1st century B.C., but whether it was the red or the "black Taurian" stone mentioned by Pliny, that was mostly quarried, I cannot say; the black has not, I believe, been identified, and I will not weary you by repeating the conjectures of experts, since the discovery of the celebrated *Niger Lapis* ten years ago.

The red Taurian marble of even colour, with close texture, and so frequently met with in the museums, was selected by the Romans for the mouldings of internal decoration, and for statuettes and small reliefs. This typical variety of "*Rosso Antico*" could only be got in comparatively small pieces, and it can perhaps be said to fairly represent the general character of the formation to which it belongs. Flow structure and concretion, scarcely seen in typical "*Rosso Antico*," are distinct features of other varieties, and it seems strange that

Mosque, Constantinople: Diagram Illustrating Use of Marbles.

figured red and white "cipollino" marble by the Byzantines at Constantinople, and which certainly suggests a geological formation, is so seldom met with among the antique marbles of the best specimens of "Rosso Antico" that are of are certain reliefs and statuettes in the museums of Rome and Naples—Mycenean, like purple porphyry—and if you are to be in the "tribune" of the Church of Prassede, Rome, you will doubtless have been by ascending these steps of "Rosso Antico" once coveted by Napoleon. Falling on you might during your luncheon-hour at a little pedestal in the, now familiar, "room" of the British Museum. A carved fragment in the "Archaic" room of the largest of the Mycenaean tombs seems to me to closely resemble a variety of the same red.

Marmor Alabastrum.—It is outside the scope of this paper to describe those felspathic rocks, gneisses, and porphyries, quarried in the province of Egypt and sent to Rome during the Empire; but we can scarcely overlook the calcareous marble known as *Marmor Alabastrum*, that came from the more level part of the province near Thebes.

Like the metamorphic limestones that so conceal their origin in a deep obscurity, *Marmor Alabastrum* was made by a process which anyone can see in operation to-day. It is merely a concretion of carbonate of lime due to infiltration of water through fissures and veins formed in limestone rocks.

In pure, the material is white or creamy, but during the process of incrustation solution is generally coloured by foreign matters that follow the sinuosities of the veins in course of formation. The structure of alabastrum is generally crystalline, either

fibrous or granular; when fibrous the grouping is often radiant, endeavouring to throw the mass into spherical concretions.

Deposits of alabastrum, as might be expected, often contain patches of breccia; the calciferous solution has enveloped the detritus of another rock, or it may be of alabastrum itself, and cemented the whole together. The Oriental calciferous varieties are much harder than the gypseous of Italy and this country, and they vary more in transparency and colour.

Historically considered, alabastrum as a decorative material is more venerable than marble; this is mainly due to the fact that the earliest civilisations happened to be in countries where marble was scarce or unknown, while alabastrum was plentiful. Apart from its well-known use by the Egyptians and the Assyrians, it was found in the prehistoric remains of Orchomenos, Mykenae, and Crete. The colossal winged figures from Assyria in the British Museum are impressive examples of brecciated gypseous alabastrum. Many columns and fragments of the Oriental banded kind, ranging from the colour of honey to that of dark treacle, have been found in Rome. Two columnar pedestals of alabastrum are in the "Mansoleum" room of the British Museum; and a magnificent Egyptian sarcophagus, ethereal in its translucency, is in the Soane Museum.

Marble Decoration of the Romans.

Having now roughly followed the circuit of the Roman Empire, as indicated by some of the principal quarries where calcareous marbles were got, the question as to how the Romans used marble for decoration will naturally occur to you. Unfortunately, the evidence of existing examples is practically wanting; a few columns, and fragments of architraves, skirtings, and pavings are all that remain *in situ*, and it is

probable that even some of these vestiges belong to late restorations. If we turn to Pompeii we shall find still less of actual marble decoration, though an echo of it may be seen in some of the mural paintings. When the city was hastily restored after the earthquake of A.D. 63, the readiest methods of decoration—stucco and painting—were adopted. Of course, every house of importance had its *impluvium* of marble, no other material being so suitable; but the pavings were mostly of coloured cement, with simple lines and powderings of marble tesserae. There are very few marble columns in the city; like the walls, the columns were generally stuccoed and painted. The painted decoration, as I have said, is often a reflex of marble incrustation. This sometimes suggests work of the *opus sectile* type, especially in the case of the low dado, which retained the severity of style derived from a marble prototype often when the upper part of the wall was treated in that light and fantastic manner popularly known as "Pompeian."

In Rome itself, from the early days of the Empire, marble was gaining an ascendancy over painting. The traditions of Hellenistic art reflected in the frescoes of the "House of Iulia," on the Palatine, and in those at Pompeii, lingered on for about a century, then marble became supreme.

Pliny laments that in his day the art of the painter was giving way to that of the marble-worker; "for not only," he says, "are walls now covered with marble, but the marble itself is carved out or marquetted to represent objects and animals of various kinds."

Seneca asserts that the bathers of his day would consider themselves shabbily treated unless "the walls shone with large and precious roundels; unless on every side laborious and varied inlay, like a picture, did not border them."

Santa Sophia, Constantinople: Diagram illustrating Use of Marbles.

Statius, in describing the splendour of a certain bath, finishes with an artful thrust at the plumbers of Rome:—"Its walls of purple Phrygian marble were enriched with the golden Numidian; it was effulgent with glass mosaic, and the very water was so happy in going through silver pipes it would not run away!"

Pliny, the younger, describes his summer retreat with rare artistic touches, and in his amiable way pays the plumbers a high compliment:—"Beyond is a walk interspersed with the soft and twining acanthus, where the trees are also cut into a variety of shapes."

At the upper end is an alcove of white marble, shaded with vines, supported by four small Caryatian pillars. From the bench, the water gushing through several little pipes, as if it were pressed out by the weight of the persons reposing themselves upon it, falls into a stone cistern underneath, from whence it is received into a fine polished marble basin, so artfully contrived that it is always full without ever overflowing.

When I sup here this basin serves for a table, the larger sort of dishes being placed round the margin, while the smaller ones swim about in the shape of little boats and waterfowl.

Under these aquatic conditions we can imagine Pliny chiding the cruel with all the ardour of a schoolboy.

Leaving the country for the capital, we shall find, on the Palatine and in the Forum, a few suggestive scraps of pavings, skirtings, and wall linings that are with difficulty kept in position and protected from the frost of winter.

On the Palatine a great deal still remains buried that will see the light some day; and even now excavations are proceeding on the site of Domitian's Palace. Years ago more than half the plan was disclosed, and many fragments of columns and marble incrustation found. These included several of the marbles I have described. The *triclinium*, or dining-room, of this palace is often mentioned by the writers of the time. Here nature and art (in the decoration, I mean) were brought into requisition. Two sides of the apartment were almost entirely open to conservatories, with marble fountains and niches for statues, so that the Emperor and his guests could see from their couches the water falling in cascades over marble steps amid verdure and flowers. The alcove for the Emperor's table is still paved with *opus sectile* of purple and green porphyry, and the marbles of Numidia and Phrygia; this, however, may be a restoration.

Undoubtedly, of all the public buildings of Rome, the *Therma* presented the most splendid examples of marble decoration, though the best preserved of these show scarcely anything now but bare brickwork and concrete. Splendid as it must have been, the decoration of the *Therma* of Caracalla and of Diocletian represented a craving for luxury and wealth that ultimately deprived the Romans of all powers of refined appreciation. In the Baths of Caracalla some of the paving was formed of thin slices of porphyry and marble cut to patterns, with flowing lines and leaf-shaped ornaments, an elaborate form of *opus sectile*. As examples of pictorial *opus sectile* in marble produced in the declining years of Roman art, we may note the two panels in the Capitoline Museum, taken from a basilica, built about 317, on the Esquiline, to commemorate the victory of Constantine over Maxentius. The panels are about 6 ft. by 4 ft., and both represent, with considerable technical skill, but without the slightest variation in design, a tiger attacking a bull. The tigers are of yellow "Numidian" marble, inlaid with stripes of green porphyry; the bulls are white shaded with grey; the background is green porphyry; and the ground supporting the animals is banded Oriental alabaster.

Judging from sketches made by the architect Sangallo, in the XVth century, the interior decoration of the basilica must have been most noteworthy as a *tour de force* on the part of the marble-cutter.

Little as we know about their marble decoration, and unrestrained as some of it probably was, I think we may conclude that the Romans did not fall into the modern error of associating it too intimately with joinery, the aesthetic law of contrast in this connexion being, no doubt, complied with by the use of textiles and brocaded hangings.

Byzantine Marble Decoration.

In the XVth century A.D. decorative art in Rome had reached its lowest level. At the

beginning of the century Maxentius, the rival of Constantine, began that great Basilica in the Forum that was probably finished by the Christian Emperor. According to Professor Lanciani, the eight columns of white marble that ostensibly supported the vault came neither from Greece nor Italy, but from far-off Proconnesus, an island in the Propontine Sea, near Constantinople. The columns were fluted in the classic manner, and one of them now stands as a lonely outcast in the Piazza de Sta Maria Maggiore. The marble when fresh is bluish-white; it is coarsely crystalline and banded with a pleasing grey of various shades. I know of no other instance of its use in Rome, and it would be interesting to learn how it came to be used for the Basilica.

This is the marble said by Vitruvius, and Pliny after him, to have been used in the decoration of the Palace of Mausolos, more than six hundred years before the Basilica of Constantine was built.

From the time of Constantine Proconnesian marble became as important to the builders of the Eastern Empire as the white marbles of Greece and Italy had been to the builders of the Western.

As you know, the first churches followed the simplest type of pagan basilica, in preference to the grander type exemplified by the Basilica of Maxentius. The simpler type, with a colonnaded interior, just sufficient to support a wood roof, was easily and quickly erected, especially when the columns were taken, as they often were, from some dismantled building of pagan Rome.

Of these early churches in Rome very little is left beyond the columns, and the only one I care to draw your attention to now is the Vth-century Church of S. Sabina, where the original austerity remains undisturbed and most impressive. I have mentioned the antique fluted columns of Hymettian marble in the nave, but not the continuous stretch of *opus sectile marmoreum* in purple and green porphyry on a white marble ground over the arcades.

We must not linger in Rome, but hasten to Ravenna, where, in the Vth and VIth centuries, decadent Italian art was infused with "a ray of beauty from the East."

Among the marbles to be seen in the Ravenna churches the white with grey veining, from Proconnesus, is most prominent, but another favourite for bands and panels was a strongly-marked red-and-white foliated species, like that found in Laconia. In structure it closely resembles the Greek marble of Carystus, hence it is popularly known as red "cipollino." The sinuities of its banded formation are remarkable, and when the slabs are "opened out" the patterns are very striking, the whites are candid, but the reds seem to be suffused with the bloom of newly-gathered plums. The marble was also used at the same period in Constantinople, and

we shall meet with it as second-hand material at S. Mark's, Venice.

Apart from the Proconnesian columns of the nave arcades and fragments of ambrosian parapets, very little of the marble decoration is left in the basilicas of Ravenna, but, judging from a few slabs of Proconnesian plating that have escaped removal, I should say that the aisles and apses generally had a dado of the material. From the Basilica of S. Apollinare in Classe, most of the marbles were carted away in the XVth century for that church at Rimini, enclosed by Alberti. Fortunately the "cipollino" monoliths of the nave could not be removed without bringing down the church, and it was worth walking six miles on a frosty Sunday morning to see them and the glowing mosaics of the apse.

The domed polygonal Church of S. Vitale, the city, is, I regret to say, the abode of gods and evil geni; the former, represented by pure Byzantine art, belong to the lower part, while the latter, in shameless nudity, hover in the dome. I will therefore ask you to rivet your attention on the lower part, where in the restoration of the plating the old simple design I take it, has been followed. The walls of the ambulatory and the piers defining the angles of the octagon have a high "Proconnesian" dado, and on the sides of each pier are panels of red "cipollino," separated by bands of white edged with notched fillets of a type peculiar to Ravenna. In this refined scheme we get a hint of what was then being done in the far capital of the East.

Close to the Cathedral of Ravenna is a modest-looking octagonal structure, apparently not this is the famous Baptistery, erected, strange to say, in the first half of the Vth century. Entering directly from the Cathedral precincts, the visitor is scarcely prepared for the sudden outburst of splendour that forms a canopy to the venerable-looking font in the middle of the floor space. Four sides of the lower store disappear in the concavity of small apses devoid of their original decoration; but the five semicircular spaces of the alternate sides are filled in with superb examples of *opus sectile marmoreum*, the main lines of which are rigidly opposed to the curve of the enclosing arch. The materials are chiefly purple and green porphyry, beautifully inlaid with white linear ornaments that suggest embroidery.

Assuming the *opus sectile* was not designed for its present position, we need not hesitate to regard its introduction, in lieu of mosaic, as a clever and successful expedient.

Up to the present we have seen but a faint reflection of Byzantine art; for the art itself shall have to fight our way into Eastern Europe, where it appeared at the beginning of the VIth century so completely developed that we might imagine it to be of spontaneous origin, did not believe in the theory of artistic evolution.

From what is known of the marbles used in the Romans, and with the aid of that remarkable description of the Church of Sta Sophia Constantinople, written by a Byzantine poet in 563, there has been no great difficulty in identifying most of the marbles that still encircle the crown of Justinian's efforts.

To what extent the builders of that church availed themselves of second-hand material we shall never know, but we may assume that the idea of bands and panels for the plating of the nave was derived from Rome. Whether the superb monoliths of Thessalian green, 25 ft. 6 in. high, came from Ephesus, or those of Proconnesian white, in the galleries, came from Cyzicus, need not concern you; but if the porphyry columns of the exedrae were placed on pedestals because they had been sent, by lady friend, a little too short, it is worth remembering as a lesson in unaffected design. I do not attempt to describe in detail the decoration of a church I have not seen, but merely draw your attention to a few, as I imagine, of the salient features. The bands of the plating of the nave are generally lighter than the panels, but just above the skirting of the ground floor and that of the galleries is a well-defined band of Thessalian green. The use of alabaster translucent and golden, for the lighter bands, is remarkable; no doubt it gives a rich mellowness to the plating, and it may have softened the brilliance of the gold that is said to have been applied to the sculptured parts of white Proconnesian marble.

Although the possibility of a lavish application of gold to the sculptured parts cannot be overlooked, in view of certain literary evidence it has not, so far as I know, been proved, and the traces of gold and blue on the minor features

Detail of Marble Decoration from Arcade in S. Mark's, Venice.

land other Byzantine churches cannot be the question. The striking feature of the lower story is the use of black and red panels, with carved arches, that repeats in a measure the richness of the arcades.

The arches of the upper arcades are devoid of carving, but a frieze of inlaid marble on the wall spreads its flowing pattern in brown and white over the spandrels; while roundels of purple and alabaster enhance, by contrast, the delicacy of the inlay. Though entirely medieval, the casing of the arches rather suggests solid arcaded lintels.

The panels of the name plating are mostly of Egyptian green, and a black with white veins, but may be a streaky variety of *Marmor*.

There is also there a slab of purple porphyry or red marble which enlivens the design, and a touch is given to the plating throughout by the notched fillets that edge the panels and the arches.

The plating of the main piers in the aisles is formal; the panel system disappears, and the bands of Thessalian green and red "cipollino" slabs from Phrygia are alternated with others from Thessaly, only separated by thin fillets. The flat moulded slabs of the arches and frieze clearly express their official nature.

The artistic purpose of the responds separating the nave from the nave is seen in those that are more, suggestive than real, that reflect the light and the colour of the columns.

The plating of the galleries is of the simplest kind, like that at S. Vitale, Ravenna. The panels of *opus sectile marmorum* on the walls of the "Bema," and about the royal way, are also reminiscent of those in the Basilica of S. Mark, Venice.

S. Mark's, Venice: Internal Decoration.

Turning to the western shores of the Adriatic, in the fifth century, we shall find a picture not at all in a flourishing condition; in the following century the proto-Byzantine style of Italy was altogether extinct. Italian architects were thus left to their own devices, and the result was a mixture of Italian and Byzantine elements, architectural development chiefly depending on the former, decorative on the latter.

Keeping parapets, ciboria, capitals, and episcopal thrones, there is but little marble decoration of this period to interest us; the creation of a new style was in progress; the transformation of the Italo-Byzantine into the Baroque.

In renovating the IXth-century basilicas Lombardic architects retained the Italo-Byzantine marble enrichments, and adapted them to the new conditions. Sculptured capitals, from screens and ambos, were set in the columns were multiplied for external use; and arcades; and triangular slabs of variously coloured marbles were applied to the friezes, as at the Cathedral, Murano.

The Italo-Byzantine work at Torcello, inferior to the proto-Byzantine work at Venice, cannot be overlooked by the English architect who has felt the inspiration of "The Islands of Venice."

Torcello, as everywhere in Italy, the work of time has been checked and its marks obliterated. The white marble columns of the cathedral, with their capitals of native workmanship, seem to have withstood the ages; but, looking at the screen, the ambo, and the episcopal throne, we are haunted by the thought that these rare relics of departed splendour have been taken down and re-erected more than once. The Phrygian column of the "iconostasis," however, still retains its matchless beauty.

Turning to Venice, preferably by gondola, look on the latest example of Byzantine architecture in Italy with renewed interest, for, in any of the other churches I have mentioned, the Cathedral of S. Mark has its own as well as the interior cased with marble. This peculiarity is mainly due to the

"Opus Sectile" in Purple and Green Porphyry and White Marble.

fact that the Greek architect who planned the building had no hand in its decoration. He certainly did not dream of casing the outside with marble; though no doubt he assumed that the interior would be so treated, probably in the manner of those churches in Greece and the Far East that exhibit fully-matured schemes in strict conformity with the structural lines of the building. This unity of purpose was not, however, destined to be realised; and, as Ruskin has said, "the church of S. Mark became rather a shrine at which to dedicate the splendours of miscellaneous spoil than the organised expression of any fixed architectural law or religious emotion."

When the structure was finished in 1071 agents were sent everywhere for marbles for the paving, but thirteen years later this elaborate tessellation was still unfinished. The Venetian arches do not, I believe, throw much light on the progress of the interior wall plating; they relate more to the mosaic and the decoration of the exterior.

The wall plating was probably delayed, and in the meantime the columns, the gallery parapets, and the screens, ambos, and ciboria from the earlier basilicas would be the most interesting features of the interior, excepting perhaps some of the mosaics.

The columns are mostly slender shafts of Proconnesian marble, sometimes suggesting in their veining the transverse markings on the stem of a silver birch-tree; but in the shadow of the aisles are clustered some venerable and sturdy shafts of grey granite, probably brought from a Byzantine church in Sicily for the earliest basilica at Venice.

Although S. Mark's is a church of two stories, the marble plating of the interior rises nowhere higher than the parapets of the galleries. The arrangement of the slabs is generally artless, without any definite scheme beyond that imposed by using second-hand material in the simplest possible way; and it could not be more opposed to the expression of organic construction. The slabs are merely fixed side by side, in tiers, like vertical strips of boarding, with the veining "opened out."

For the main piers and the spandrels of the arcades Cyprian green is used; and for the walls the plating is, in some places, entirely of Cyprian green, and in others entirely of Proconnesian white.

Looking beyond the columns of the nave we see on the walls of the aisles the rich effect of studied design. Instead of monotonous ranges of narrow slabs, the long stretch of plating, up to the string at the level of the capitals, is arranged in seven upright divisions, defined by different marbles; the greens of Cyprian and Thessaly, the white of Proconnesus, red "cipollino," and a red "lumachella." Above the string the white Proconnesian frieze is enriched with the well-known series of mosaic panels that suggest enamelled plaques of the XIIth century. These may have been inserted after the removal of the gallery floors, otherwise they could hardly have been seen. Where the ends of the floor beams once rested on the walls there is now an arcaded cornice of red Verona marble; this is also continued along the inner side of the gangways to receive the arcaded balustrades.

Comparing the arcades of S. Mark's with those of Sta Sophia, Constantinople, and the Sicilian Norman churches, the Venetian example seems to suggest a compromise in the manner of its decoration; for, instead of the arches being entirely cased with marble or covered with gold,

the conditions seemed to necessitate the use of both materials, the mosaic being confined to the underside of the arches by the marble architraves.

In the Church of S. Luke, Phocis, the plating of the arches is also so intimately associated with the mosaics that the two can scarcely be considered apart, but in this instance the decorators were faced with a more difficult problem.

Time will not permit us to linger over those minor features of S. Mark's that add so much to its interest; but before leaving the interior the little chapel of S. Isidore, at the end of the north transept, has a special claim on our attention. Finished in 1355, it exhibits the characteristics of Venetian art at its best. Below the string at the springing of the barrel-vault, gleaming with gold, the side walls are plated with large upright slabs of Proconnesian marble, alternated with narrower strips of purple porphyry, and the green breccia of Thessaly. An unmistakable Venetian touch is seen in the little piscina, with its Arabic arch, and roundel chiselled into a Byzantine fancy. Contrasted with this simple and flat decoration is the vigorous expression of the Pisan school, at the east end of the chapel, where the sculptured tomb of the saint occupies a recess behind the altar.

Besides the typical antique marbles used at S. Mark's, I would draw your attention to others from the Venetian territory, which, no doubt, were specially quarried for the building. Various breccias, shell marbles, "broccatello," and a mottled green, like the serpentine limestone of Prato, are used throughout the interior for the seating, and for borders to the general plating. These local marbles, though not unimportant in the decoration of S. Mark's, became much more prominent during the progress of the Venetian style, and in Verona and the cities of Tuscany they were exclusively used for external decoration in a way quite original.

The "lumachellas" are, of course, not metamorphic or holocrystalline, but masses of comminuted shells enclosed in a calcareous cement that may be either pale yellow, red, grey, or black.

The "broccatello" also contains organisms in the shape of ammonites and belemnites, sometimes clearly defined, though generally the mass is confused and mottled; the colour varies from yellow to red. These limestones were got chiefly from the hills around Verona. The quarries were worked by the ancient Romans, who, in the time of Diocletian, selected a flesh-coloured variety as a building material for the amphitheatre at Verona. Examples of the red "broccatello" of Verona are in the Victoria and Albert Museum, notably some well "heads" from Venice and a monument from Verona.

The most typical of "broccatello," however, is that found near Tortosa, on the east coast of Spain. Its bright yellow organisms and deep-red paste at once suggest the rich gold brocade after which it has been named.

I do not know that this particular kind of "broccatello" was used at S. Mark's, though, at a later period, during the Spanish rule, it appeared in Naples, where some fine examples are to be seen. In this country you will find large specimens in the Wallace Museum; and if you can shut your eyes to the *Baroque* surroundings there you may think of the Greek physician, Dioscorides, who mentioned the marble of Tortosa nearly two thousand years ago.

S. Mark's, Venice: External Decoration.

The façade of S. Mark's is bleached, and in many places the original tinting is obscured by corrosion and "the golden stain of time"; yet, when seen from the opposite end of the Piazza, the building presents a delicate suggestion of opalescence, heightened by contrast with the deep gloom of the porches. As you get nearer your attention is focussed on the four bronze horses that once stood in the *agora* at Chios, and you feel that the art of the Grecians is eternal.

You try to imagine the church first as it stood, for two centuries, without any decoration, and then when the lower story, in the XIIIth century, was marked with the spoils of conquest, while the upper parts remained venerable-looking and bare.

You examine with interest the details familiarised by Ruskin half a century ago—the "lily" capitals, the "vine in service," the storied archivolts, once seemingly wrought in gold, the clustered columns that served as ballast for the galleys of the fleet, and the strange assortment of sculptured slabs of various ages that decorate the plainer surfaces like pictures on a wall.

Finally, when you look on that later fantasy of the upper story you realise that the exterior of S. Mark's was a reflection of the wealth and power of the Venetians, and that it stands alone, not only in the methods of its production, but in its final results.

Limiting our attention to the XIIIth-century renovation of the lower façade, as most relevant to our subject in point of date and purity of style, we note, firstly, that the main structural lines, due to the plans of the Greek architect, were followed, but the organic decoration, due to Lombardic influence, was entirely disregarded.

Before the renovation, the central porch rose unrestrained, as it does to-day, but, for the new scheme, it was widened and thus made more important. The impost slabs, at the springing of the arches, follow the original levels, but the novel scheme of the XIIIth-century decorators required something more than a thin shelf to separate the upper range of columns from the lower, so an extra shelf was raised on a blocking course or frieze, which, like the seating of the basement below, gives rigidity to what may be termed the columnar revetment. Only in the shadow of the central porch are the upper columns placed directly on the thin slabs, without the intervening frieze. The lavish application of columns to the piers may perhaps be regarded as an elaboration of Lombardic or Romanesque tradition, but the omission of arcading is, I think, without precedent, unless we admit the treabated portals of Arles and S. Gilles.

To the XIIIth-century renovators are due those elegant extensions of the main façade that give a sense of security at the angles of the building. Respecting the plating, we note, where it is not obscured by columns, how it has been made interesting beyond the intrinsic beauty of the marble by using it as a background or setting for sculpture and panels. Plain unbroken spaces are avoided by some conceit strictly opposed to the natural lines of the architecture; if the space is a spandrel, it has a panel or a niche in the middle of it; if a tympanum, the curve of the arch is opposed by straight lines; if rectangular, it is inlaid with discs, panels, and borders, like a pavement. Some of these compositions are artistically beautiful, others are ingeniously clever; though it is probable that many of the older sculptured slabs occupied corresponding positions on the brick fronts of the XIth century, just as Lombardic panels are found decorating other churches of the Lagunar cities. The panels are invariably surrounded by borders of red or green marble, and the superficial character of the plating around them is candidly expressed by the use of narrow upright slabs. It is also indicated on the arches, where the thin edges of the soffit slabs project to receive those on the front; this also applies to the sculptured archivolts. The influence of Byzantine refinement is also indicated by the absence of heavy mouldings, and the substitution of dentilled strings, archivolts and notched filets.

The main salient angles of the exterior are finished with a solid and fluted strip of red marble, flush with the plating; this feature, elaborated into a twisted shaft, was invariably adopted to emphasise the angles of the Gothic palaces of the city.

The columns present a miscellaneous collection of marbles, but their disposition on the

building shows that they were selected in some cases for their colour. Thus the central porch is made regal by shafts of purple porphyry, contrasted with others of white marble, and these support slender shafts of black and white breccia, now mellow with age. On each side of the central porch, facing the Piazza, are shafts of Thessalian green, and the Greek or Proconnesian white, supporting others of white only. The disposition of the remaining columns is somewhat promiscuous, though it may be noted that those on the right of the main façade and on the return front facing the south are of richer marbles than those on the left and north; indeed, the south front, though restricted in length by a remnant of the old Ducal Palace, was always more important than that facing the north, and to understand it we must imagine it in the XIth century, when the Zeno Chapel was a porch, opening on to a canal, that surrounded the walls and towers of the Palace. The two isolated Byzantine pillars, close by, seem to reflect in their lapidario way the mooring-posts of the old canal.

The interior of S. Mark's was the last in Italy to be plated with marble in the simple Byzantine manner, but the innovation, from the Byzantine point of view, of casing the exterior became an established practice. This reversal of the old order of things was due to developments in architecture, and to the rise of the various schools of painting. In the course of time marble decoration assumed more and more the forms of solid construction, its legitimate application was lost sight of, excepting a very brief period at the end of the XVth century, when the Lombardi of the Renaissance attempted to revive it.

Norman Churches of Sicily.

It now only remains for us to glance at that peculiar phase of Byzantine influence on decoration to be met with in the churches of Sicily, built during the Norman occupation.

The result of a fusion of Byzantine and Saracenic traditions, this decoration is unlike anything we have yet seen. Apart from the richly-inlaid ambos, screens, and pavings of these churches, the marble plating is invariably limited to a high dado on the walls. Above the dado and the gilded capitals of the columns the walls and arches are entirely covered with mosaic.

The distinguishing feature of the plating is an Oriental or Saracenic application of geometrical patterns in glass and marble mosaic, a type of inlay repeated at Salerno, Ravello, and elsewhere, for pulpits, etc., and closely allied in style to the work of the "Cosmati" school of Rome.

The most beautiful example of Siculo-Norman art in Palermo is the Palatine Chapel, built by King Roger II. in 1143. The chapel is small, and so are its windows, but when the eye has mastered the prevailing gloom the effect is gorgeous, the mosaics scintillate, and the deep stalaetite ceiling of the nave has a lurking splendour of purple, peacock-blue, and gold. Behind the columns of Egyptian granite and Carystian marble we seem to see on the aisle walls a hanging and valence with appliqué enrichments; this is the dado and frieze wrought in glass and marble mosaic, on a ground of white Proconnesian marble; and, as if to emphasise the general delicacy of the incrustation, large slabs and roundels of porphyry, bordered with mosaic inlay, are inserted at intervals below the frieze.

Of the same date, and similar in its decoration, is the church known as "La Martorana," in the same city.

After the mysterious beauty of these little churches the spacious and brilliantly-lighted interior of the Cathedral of Monreale is quite surprising. Built at the end of the XIIIth century by the last King of the Norman dynasty, in Sicily, this church is more transplanted in its decoration than the earlier churches in Palermo; yet this is not so evident in the marble decoration as in the art of the mosaic-worker and the sculptor. Indeed the high dado all round the church differs only from the earlier work in having no slabs or roundels of porphyry, the plating being entirely the greyish-white of Proconnesian arranged in narrow slabs, with intervening strips of mosaic edged with plain white heading. The deep frieze, inlaid with mosaic of "arabesque" and varied pattern, is also repeated. The vertical lines of this dado adapt themselves to the curve of the apse as naturally as a curtain hung on the wall. The mosaic is threaded with thin lines of cream-

coloured stone that soften the harshness of the vitreous tesserae, and have the same artistic value as the strips of pearl used in the inlay of the Arab work in Cairo, about a century and a half later."

Mr. A. E. Henderson,

in proposing a vote of thanks to the author, said that, knowing as he did a great many of the buildings which had been mentioned, it made him wish to revisit them, because he realised now how little he knew of them. He would like to study them again with the eyes and knowledge of Mr. Marshall. The author had refrained from mentioning any of the beautiful examples of marble in London, but they knew that within a few hundred yards of the Architectural Association they were to be seen. At Westminster Cathedral they could see the marbles mentioned by Mr. Marshall, and with a better knowledge of those marbles they would get to love the building more than they did even now. He would like Mr. Marshall to issue a guide to them. He was much impressed when he first read about the removal of columns from place to place, how porphyry quarried in Egypt was taken to Baalbek, then used in some temple at Rome and lastly given to Justinian for Santa Sophia. We would like to know whether these columns were at Constantinople before the architect designed the building, or whether he first designed the building. He thought in all probability the columns were on the spot, at any rate the architect knew of them. Mr. Marshall had referred to the difficulty of moving columns in Rome, and perhaps it was not generally known that the reason why Cleopatra's Needle was on the Thames Embankment was simply because the surveyor for the Metropolitan Board of Works would not guarantee the safety of the sewers if it were moved to the British Museum. The author had not told them what he considered the best surface for marble, but his (the speaker's) opinion was that it should not be brought to a wax polish. It should be left almost at its best; but if it was brought to a highly-polished surface it looked tawdry. Some alabasters, however, could bear almost the highest polish. The Verde Antico they saw before them was too highly polished, but that part of it which had been exposed to the atmosphere was far more beautiful. The weathering of marble was always interesting. In the archaic temple at Ephesus, which Mr. Marshall referred to, he came across some crystallised sand, which proved to be nothing but disintegrated white marble. The temple was built near the sea, and the marble had been in the damp for centuries, and it was probable that the crystalline formation had been going on, and so it had disintegrated. Curiously, however, the outer surface, which had been worked, was often perfectly hard, and it was the inner material which had decayed. Mr. Marshall had dealt with the history of marble, but had not told them of the best way of using it in design. He hoped that the author would favour them later with a paper on the design of marble surfaces for walls and buildings. They studied the old buildings, but, of course, they did not represent the modern view of things. The old buildings were more a matter of history, and times were changed, now we had wallpaper, hangings, and pictures. Nowadays they wanted to decorate walls in some fashion which would please their clients and also please themselves.

Mr. W. S. George,

in seconding the motion, said that for three or four years he had been in close contact with Greek and Byzantine buildings. Mr. Marshall had inadvertently suggested that the Greeks did not use any other than white marble, but they did in certain buildings use black. The author also rather carelessly doubted on the use of colour on marble, and suggested it was only done to hide the grey streaks in what was otherwise white marble. He had seen a good deal of Greek work newly dug up, and had no doubt but that Greek work right into the Hellenistic period was coloured. If one went to the Acropolis Museum one would see that the putting of colour on marble was quite the right thing. Colour was put on from the archaic period and went right on into the Hellenistic period. They had the sarcophagus of Alexander as an example. He would plead for the use of colour on marble wherever possible, as it was the highest test of its capability. It must, of course, be put just in the right place and very carefully used, but where it could be used it was au-

ARCHITECTURAL SOCIETIES.

Hampshire and Isle of Wight Association of Architects.

grace. When they passed to Byzantine one was conscious of great change. Greek aimed at high perfection both in design and finish, but the Byzantine workmen often far from perfect, and in San Sophia were many pieces of design none of them passing. In looking at the work of these artists one must recognise that the art was historical rather than always a bit of design. He was quite sure that the lines used colour on their carving, and the little notched fillets were painted red. On the white marble they quite used colour and gold. Motion having been carried,

Marshall, said he had only touched on the of the subject, but he hoped it would starting-point for some of the younger ers to make further inquiries. He agreed marble should not be polished to its highest e. He would leave the polish just sufficient w the crystalline structure of the marble. ould like to know whether the marble or the archaic temple at Ephesus differed hat used in the latter temple.

Henderson said it did. It was slightly than the latter, but they were both local s.

Marshall had not overlooked the black frieze used e Greeks, but he hardly considered that example of the use of coloured marble. s paper he meant to imply that they ed the work because it allowed them to use tian marble whether it had grey markings

George said the statues were not covered etely with paint. There was a great deal e marble left.

Marshall hat was a matter not perfectly known. s suggested that the temples had a lighter put on to take away the harshness of the e. The point as to the application of e to the sculptured part of San Sophia had e been proved; but very probably gold sed on the raised parts. He thought his ad been long enough without him ing out into modern methods of working e and design.

President announced that the next ing will take place on November 25, a paper entitled "The Prosaic in an ect's Work," by Mr. Horace Cubitt, B.A., will be read.

TO THE WESLEYAN CHURCH HOUSE, WESTMINSTER.

first visit to this building was paid by chitectural Association at quite an early e of its construction. Subsequent visits ited it structurally almost complete, and gain during decoration. The fourth and visit on November 16 gave an opportunity ding the finished result of a building ection has been followed with interest e architectural world at large. It comes e rare class of worthy additions to London's marks.

recent and extensive have been the ptions which have appeared that it seems s to recapitulate points of planning e design, which must be familiar to all's of the technical Press, but it must be ed with what satisfaction architects ally welcome the creation of an important e in which the aesthetic motive is e, coherent, and consistent, and the vity yet subservient to the main con-

series of sensations produced by travers- e main entry to the large hall is one of e architectural experiences to be had e—A low and severely treated vestibule ding into the spacious, lofty, and sumph- hall with its dignified stairs, contrasted tly by the wide, low ante-hall and foyer, e final climax of the great domed hall, e void what one feels confidently to e rated effects which cannot fail to impress ot insensitive beholder.

Great Hall seen bare in the murky light ul November afternoon perhaps appears ut peopled and under artificial light it ave a finer effect. A large party of ers greatly appreciated the visit and eckards' kindness in himself attending.

A meeting of this Association was held at Winchester Castle on the 19th inst., Sir William Portal presiding. Twenty-five new members were elected, and arrangements for meetings at Portsmouth (December 17), Bournemouth (January), and Southampton (February) were discussed. After viewing, at the President's suggestion, the ancient Sally-port of the Castle, the party proceeded to the Cathedral, where they were met by Mr. T. G. Jackson, R.A., who conducted them round the building inside and out, and returned with them to the Castle. An address on the objects of the Association by the President was followed by one by Mr. Jackson on the work at the Cathedral, and in the course of discussion the parlous condition of Sta Sophia was described. The Association, although only founded this year, has already a representative membership in the county, Southampton alone having sixteen members.

Aberdeen Architectural Association: House Drainage.

Mr. D. T. Byres,burgh Surveyor's Department, Aberdeen, was the lecturer on Saturday last week at a meeting of the Aberdeen Architectural Association. Mr. Harbourn Maclean presided, and called on Mr. Byres to give his lecture on "House Drainage," pointing out that the subject was one of great practical interest to architects and others.

Mr. Byres, in the course of his lecture, said it was incumbent on all who were architects, house proprietors, or occupiers, to recognise it as their duty, as it would be to their interest and benefit, to continue to aim at getting as perfect a system of drainage as possible. Efficient drainage need not necessarily be more costly than bad drainage, he contended, for the days of rough irrigation were now a thing of the past in this part of the country. Mr. Byres then gave a very practical address, which was illustrated by a large number of lantern views of pipes, etc., and also by the exhibition of a number of models.

Edinburgh Architectural Association.

On Saturday last week a party of about fifty of the members of the Edinburgh Architectural Association visited the new Freemasons' Hall and offices in George-street. The party was received by Mr. A. Hunter Crawford, the architect of the new building, who explained the general arrangements and accommodation in the various floors. After having seen the building, the company was entertained to tea by Mr. Crawford. Mr. A. Lorne Campbell, President of the Association, proposed a vote of thanks to Mr. Crawford, and took the opportunity of intimating that the Council of the Association had decided to make him an honorary member, to mark their appreciation of his past services to the Association. The party afterwards visited the new Hall and offices of the United Free Church, which were not completed when the Association visited the building a year ago. Under the leadership of Mr. J. A. Arnott, Lic.R.I.B.A., the new Presbytery Hall and the offices and committee-rooms on the various floors were inspected.

Reports of meetings of other architectural societies are held over until next week on account of the pressure on our columns.—Ed.]

GENERAL NEWS.

Appointment: Admiralty.

Mr. W. J. Clarke, Superintending Civil Engineer, Devonport Dockyard, since 1901, has been appointed as Assistant Director of Engineering and Architectural Works to the Admiralty, vice Mr. T. Sims, promoted.

Association of Austrian Architects.

It is announced that Mr. John W. Simpson, F.R.I.B.A., and Mr. Leonard Stokes, F.R.I.B.A., have been appointed corresponding members of the Zentralvereinigung der Architekten, Vienna.

The Board of Architectural Education, R.I.B.A.

The Board of Architectural Education of the Royal Institute of British Architects announce that the designs submitted by the following students who are qualifying for the Final Examination have been approved:—

Subject V.—*Design for Art Gallery*.—Messrs. H. Charlton Bradshaw, J. Carey, A. D. Clare, G. Davidson, A. E. Davidson, N. S. Dixon

W. E. Foale, E. Gee, F. Jenkins, T. T. Jenkins, S. Stevenson Jones, F. O. Lawrence, B. A. Miller, B. Newbould, A. N. Shibley, S. Soper, A. Thomson, W. H. Thompson, A. Wilson. *Design for a Village Church*.—Messrs. H. R. Atchison, P. D. Bennett, G. F. Charlewood, Allan L. Freaker, H. W. Hallas, H. J. Higgs, Robert M. Love, A. E. Lowes, E. A. L. Martyn, F. James Maynard, A. Nisbet, A. J. Sparrow, Wm. Voelkel.

Architectural Association Athletic Club.

A dance of the A.A. Athletic Club will be held at the Wamcliffe Rooms (Hotel Great Central) on Monday, December 2, 9 till 2.30. Tickets, to include supper and refreshments, can be obtained for 8s. 6d. each from the Hon. Secretary, Mr. Philip E. Webb, 19, Queen Anne's-gate, Westminster, S.W., and Mr. G. D. Gordon Hake, 9, Park Mansions, S. Lambeth-road, S.W.

The New Mayors: London Boroughs.

Mr. Charles Fitzroy Doll, F.R.I.B.A. (1901), has been elected Mayor of Holborn; Mr. J. P. Brogan, electrical engineer, Battersea; Mr. H. G. Norris, M.W.B., estate agent and builder, has been elected, for the fourth time, as Mayor of Fulham; Mr. G. W. Holtzapffel, C.E., as Mayor of Hampstead; Alderman G. S. Elliott, M.A.B., L.C.C., and M.W.B., Islington (seventh time); Alderman J. Williams, timber merchant, Lambeth; Alderman H. C. Handover, builder, Paddington; and Alderman A. D. Dawney, engineer, Wandsworth (fifth time).

Sites for New Schools, London: Session 1913.

Application will be made to the Board of Education for an order to enable the London County Council to put into force the powers of the Lands Clauses Acts with respect to the compulsory acquisition of lands and properties as sites for new schools. The proposed sites, in number 93, are distributed in the metropolitan boroughs of Battersea (7), Bermondsey (5), Bethnal Green (3), Camberwell (3), Deptford (4), Finsbury (1), Greenwich (3), Hackney (8), Hammersmith (5), Islington (10), Kensington (3), Lambeth (3), Paddington (5), Poplar (12), St. Marylebone (1), St. Pancras (2), Shoreditch (2), Stepney (10), Stoke Newington (1), Wandsworth (3), and Woolwich (2). The individual areas range in extent from about 68,407 ft. at Clapham-common (North-side), and about 64,590 ft. in Isdonia and Adolphus streets, Deptford, to about 1,720 ft. in Emily-street, Paddington. They comprise the sites and buildings of the United Methodist Free Church, Kensal Green, the Goldsmiths' and Jewellers' Asylum in Holcroft-road, Hackney, and Crawford-street, with forty-five houses in the Crawford-street district, St. Marylebone. Plans may be seen at the County Hall, Spring-gardens, S.W.

Exhibition of Etchings and Lithographs.

Mr. Joseph Pennell has accepted the invitation of the Fine Art Society to exhibit at their Galleries, 148, New Bond-street, a representative and practically complete collection of his etchings and lithographs, including the new series of the latter depicting the Panama Canal. The private view will be held on November 29 and 30, and the exhibition will remain open during December. Complete sets of the Panama Canal series have already been acquired by the authorities of the Victoria and Albert Museum, by the United States Government for the Library of Congress, and by the Isthmian Canal Commission, for preservation as a record of the work of construction.

Art Treasures for South Africa.

Mr. Max Michaelis has purchased from Sir Hugh Lane the forty-six pictures of his well-known collection of XVIIth-century Dutch masters, in order that they may form the nucleus of a national gallery in South Africa. The gift comprises examples of Frans Hals—his "Portrait of an Old Lady," signed and dated "1644"; Jan Steen; Van Dyck—his whole-length portrait of John Oxenstierna, Count of Sodermore; Snyder (the "Concert of Birds"); and Jacob Ruysdael. There is also Rembrandt's "Portrait of a Young Woman," which in 1880 was sold for rather more than 6,000*l.* at the dispersal of the Demidoff Gallery. The paintings by Ruysdael are the "Mountainous Landscape" and the "Hill of Benheim"; the two by Jan Steen are his "Continence of Scipio" and "Dancing Dog," with a likeness of the artist. It is expected that the collection will be exhibited in London before it is transhipped to the Cape.

Planning of Delhi.

In Friday's Parliamentary Papers Mr. King asked the Under Secretary of State for India whether the report of the committee appointed to advise on the site and planning of the new Delhi was a unanimous report signed without reservations by all the members of the committee; whether the report would be published; if its publication was not intended, whether the report recommended that the new Government buildings be erected in the Italian Renaissance style of architecture; and whether this advice would be followed.

Mr. H. Baker replied that the report was unanimous and without reservations. It was confined to the selection of a site for the new capital and had nothing to do with the style and architecture of the buildings. The question of publication must stand over until the Town Planning Committee had completed their inquiries.

The Old "Devil" Tavern, Temple Bar.

After an inaugural dinner of the Poets' Club recently an interesting paper was read by Mr. Ernest Rhys upon "The Apollo-room at the Devil Tavern." The tavern had for sign St. Dunstan pulling the devil's nose with his tongs or pliers. The Apollo-room adjoined the Old Devil; there was, next to Dick's, close by, a young [or Little] Devil tavern; it was renowned for the symposia, when Sir Wadlow was landlord, of Ben Jonson's sodality for whom he composed his *leges convivales*, and is familiar by name to readers of Pope, Steele, Addison, and Swift. The tavern gave place in 1788 to Child's place, by Child's (old) banking-house, wherein were preserved the bust of Apollo, and the tablet of the *leges*; inscribed in gilt letters over the door were Jonson's lines beginning with: "Welcome all who lead or follow, to the oracle of Apollo." The room gave a name to Apollo-court on the opposite side of Fleet-street, just within the Bar, by the (old) Cock Tavern, which the court lighted, and in it were sold, on March 18, 1703, the jewels of La Belle Stuart, Duchess of Richmond. In the gallery was rehearsed the music of the Laureates' Court-day odes.

Byzantine and Romanesque Architecture.

The Cambridge University Press will publish very shortly "Byzantine and Romanesque Architecture," by Mr. T. G. Jackson, R.A. This work, which will be in two volumes, will contain an account of the development in Eastern and Northern Europe of Post-Roman architecture from the IVth to the XIIIth century, with more than 300 illustrations, mostly from the author's sketches. It is attempted not merely to describe the architecture, but to explain it by the social and political history of the time. The description of the churches at Constantinople and Salonic, which will have a special interest at the present moment, is followed by an account of Italo-Byzantine work at Ravenna and in the Exarchate, and of the Romanesque styles of Germany, France, and England.

MAGAZINES AND REVIEWS.

THE *Burlington Magazine* opens with an article on Iberian Sculpture by Jose Rijoan, who discusses those strange herds of stone oxen, sometimes granite, sometimes limestone, that are found upon the high plateau of Castile and elsewhere, and which have been for ages the subject of folklore and tradition in Spain. It is agreed that they belong to the type of the Chaldean Bull. It turns up in Crete. The rock surfaces in some parts of the Maritime Alps are scored over with ox-like forms that resemble at first sight some strange hieroglyphic. Its actual path from the Mesopotamia to the Far West has never been clearly identified. The Minoan discoveries at Knossos threw a strange light upon it. Pictorial representations belonging to this period of young girls turning somersaults over bulls' backs have identified themselves with the modern Spanish bull-fight, while they at the same time throw light on the legends of Theseus and the maiden tribute of Athens to the Minoan monster. The man-headed bulls that stand before the Palace gate of Sargon present the Iberian bull in yet another form. Did he originate in that old Babylonian empire before it fell to Nimrod, the son of Cush, whom we read of in the book of Genesis? A far-distant pastoral race must

once have shepherded this monolithic flock. The writer further discusses the "Lady of Elche" head from the Louvre, concerning which many theories have been rife. In the opinion of the writer, "its author was a Spaniard, an Iber; its style alone is Greek, but its soul, the same Iberian soul everywhere, could not be a variation by any foreigner." A number of mutilated female figures were found some time ago at the Cerro de los Santos in the province of Almeria among the ruins of a building that had the form of a small temple *in antis*, statues which are thought to be "ex voto" like the Ionic female figures called Horai of the Acropolis and other Greek sanctuaries." The Elche head is far superior to these in workmanship. Nevertheless an interesting restoration has been attempted by placing this head upon one of the Cerro remains, and this reconstruction is represented in a coloured plate.

The *Connoisseur* for October (which we received too late in the month for notice) opens with an article on Mezzotints from a private collection. Whatever this art may owe to Prince Rupert and the Dutch School, the group of artists who practised it in England made it one entirely their own. The names of Valentine Green, John Raphael Smith, James McArdell, and Richard Houston have made the English school of engraving for ever famous. The shortcoming of the mezzotint process lies in the fact that very few copies of first-rate excellence are obtainable from the plate; little conception can therefore be formed of the resources of this art from the impressions usually met with. The *Connoisseur* is always ready with suggestions for the modest collector. On this occasion it offers "English Brown Ware and Stone Ware" and "Snuffers." Good specimens of these wares are not readily met with which can boast a greater age than some fifty years or so. Doultons, we believe, still produce the old patterns which were once familiar objects among the household utensils, as jugs and children's mugs.

Snuffers may still be picked up for a shilling a pair. Many of the steel examples are of fine workmanship and often of the most ingenious mechanism. There is a type possessing a shutter which pushes the fragment of smouldering wick into the box and secures it there, so rendering the snuffers immediately serviceable for renewed use. A columbarium-shaped snuffer-box, which is illustrated, is both attractive and unusual. Though not referred to, one meets with small tongs of a similar style of workmanship and resembling pivot pattern sugar-tongs, for the purpose of extinguishing the candle.

The November number contains an article on "Robert Adam, Hepp white and Sheraton." How far Robert Adam influenced the cabinet-makers of Soho or how far he was influenced by them is a nice matter. Adam was at least as much gifted with business capacity as with a power of original design. He gathered round him the most skilful draughtsmen and designers. A perusal of the collection of drawings at the Soane Museum bear evidence of this. Details by his own hand are singularly unworkmanlike. To his attainments in speculative building whole acres in the West-end bear testimony. Styles are evolved, although under circumstances that are exceptional a genius may anticipate if not create them. Inigo Jones may be accounted a genius of such kind, but we should hesitate to say the same of Robert Adam. The collector of unadorned trifles is presented with a review of old "Fire Mark" wall tablets. In character these are reminiscent of the old cast stove back, though in design they are crude for the most part.

The *Studio*—an especially good number—opens with an article on that remarkable artist, Anders Zorn. Zorn is perhaps best known in this country by his etchings. Dr. Axel Gauffin, who writes the article, is rather concerned with his painting. But whichever it be, Zorn's extraordinary command of op-art effects are alike displayed, and his great effort is the accomplishment of the nude figure under powerful sunlight. This is followed by an illustrated article on the work of Mr. Muirhead and followed by one on "Open-Air Museums in Norway." The success of these is chiefly due to the efforts of M. Sandvig, who established one at Lillehammer in 1888. The simplicity of the old Norwegian house, both in construction and arrangement, lends itself to happy restoration. It belongs in a sense to all time, and escapes any suggestion of the "side show" which may beset an effort in this

direction. Indeed the principles of this old-world building construction, with the timber frame walls, each 3-in. plank notched into the other at the corner, is still practised in the village. The old *ramloft-stue* showed virtually an arrangement of rooms that belongs to an own simple plan of hall or living-room, a smaller room at the end with the *solar* it. The *ramloft* corresponds to the *solar*, and the roof-tree of the example referred to the author bears the date of 1565. The elevation of the *ramloft* above the main roof gave a distinctive style to these ancient houses.

Mr. Joseph Pennell illustrates in lithograph "The Wonder of Work on the Panama Canal." That these drawings are able, goes without saying. Yet it is just this sense of wonder which we miss, the sense with which Muirhead Bone, for example, invests his conception of a great constructive enterprise. The *Art Annual* is devoted to a review of the work of Mr. Joseph Farquharson, A.R.A. *Brickbuilder* (Boston, Mass.) contains some noticeable examples of modern brick architecture in America, while the *Architectural Record* continues its summary of English American Churches, those old-time Georgian creations that compare so strangely with the twenty-storied "Trinity Building" in the same number.

THE LONDON COUNTY COUNCIL.

THE usual weekly meeting of the London County Council was held on Tuesday in County Hall, Spring-gardens, S.W., Mr. Chylesmore, Chairman, presiding.

Loan.—The Finance Committee recommended and it was agreed to make a loan of 6,000l. to the Poplar Borough Council for electricity undertaking.

The Late Mr. Norman Shaw.—The death of Mr. Norman Shaw was referred to by the Chairman of the Council, who said that many valuable voluntary services had been rendered to the Council by Mr. Shaw in connexion with various improvements and as assessor in the County Hall Competition. Other references were made by several members of the Council and a vote of condolence with the family of the architect was moved and carried.

New Western Road.—The Improvement Committee presented a report dealing with the negotiations which had taken place between the Road Board and the Council with reference to the proposed new road from the western end of West Cromwell-road to Brentford Hill street, and the Committee recommended that the offer of the Road Board to contribute 10 per cent. of the actual cost of a western approach road from King-street, Hammersmith to Cromwell-road should not be accepted. In view of the limitations laid down by the Board. After some long discussion the Chairman of the Committee proposed that "the Council feels great difficulty at the present time in embarking upon the very heavy expenditure necessary for the construction of the proposed western approach road, and that, without prejudice to the present proposal, the Road Board be approached with a view of ascertaining whether they would be prepared to co-operate with the Council in the execution of other improvements of great value to the traffic of London."

This proposal was agreed to, and a further proposal was then made to the effect that the improvements referred to should include "pressing improvements" in the County of London. This was also agreed to and added to the Committee's proposal.

Cinematograph Theatre.—Drawings have been submitted by Mr. F. H. Adams for a cinematograph hall proposed to be erected at the Commercial-road, Stepney.

ILLUSTRATIONS.

Parliament Buildings, Winnipeg.

THE final competition for the Parliament Buildings, Winnipeg, was limited to Messrs. E. & W. S. Maxwell (Montreal), Messrs. Sharp & Taylor (Toronto), Messrs. Brown & Vallance (Ottawa), Messrs. Clemens & Portnall (Sask.), and Mr. F. W. Simon, B.A. (England). Mr. Leonard Stokes, B.A., was the assessor. The successful bidder was declared to be Mr. Simon, whose design we illustrate in this issue.

King's College Hospital.

Illustrations of the new buildings of King's College Hospital, Denmark-hill, are in connexion with the article beginning on page 609.

MEETINGS.

FRIDAY, NOVEMBER 22.

Technical College Architectural Craftsmen's Association.—Mr. J. Allan, jun., on "The Manufacture and Moulding of Concrete Blocks." 7.45 p.m.
Institution of Mechanical Engineers.—Mr. J. S. Anderson on "Vapour-Compression Refrigerating Machines," and Mr. John H. Grindley on "Contribution to the Theory of Refrigerating Machines." 8 p.m.

SATURDAY, NOVEMBER 23.

Architectural Association.—Mr. A. N. Paterson on "The Influence of the French Influence on British Architecture." 7.30 p.m.
Royal Sanitary Institute.—Provincial sessional meeting, when a discussion will take place on "Town Planning in Relation to the Development of the Yorkshire Coalfield." To be opened by Mr. Dunne, M.B., D.P.H. 11 a.m.

MONDAY, NOVEMBER 25.

Architectural Association.—Mr. Horace Cubitt on "Prospects in an Architect's Work." 8 p.m.
Surveyors' Institution.—Mr. E. M. Konstam on "Values Fixation." 8 p.m.
Institution of British Decorators.—Mr. S. Jennings on "The Decoration of Small Rooms." 8 p.m.

TUESDAY, NOVEMBER 26.

University of London (British Museum).—Mr. Kaines Smith on "Art and Religion."
Royal Society of Arts (Colonial Section).—Professor W. H. Warren, LL.D., M.Inst.C.E., M.Am.Soc.C.E., Dean of Faculty of Science and Chief Professor of Engineering, University of Sydney, on "The Hardwood Timbers of New South Wales." 4.30 p.m.
The Institution of Civil Engineers.—"Mechanical Handling of Coal for British Locomotives," by Mr. Charles John Bowen Cooke, M.Inst.C.E. 8 p.m.

WEDNESDAY, NOVEMBER 27.

The Institution of Municipal Engineers.—Mr. W. V. Ball on "The Effect of Recent Decisions upon the Arbitration Clause." 8 p.m.
Edinburgh Architectural Association.—Associates' meeting. Demonstration in ironwork at the works of Mr. Thomas Hadden.
Royal Society of Arts.—Mr. Harold Cox on "Political Economy as a Code of Life." 8 p.m.

THURSDAY, NOVEMBER 28.

The Institution of Electrical Engineers.—8 p.m.
The Concrete Institute.—Mr. J. M. Theobald on "Bills of Materials for Reinforced Concrete Work." 7.30 p.m.
Society of Antiquaries.—8.30 p.m.
Sheffield Society of Architects.—Mr. J. C. P. Toothill on "A Visit to Bath."
University of London (Victoria and Albert Museum).—Mr. Kaines Smith on "Decoration of Buildings: Metal-work." 3.30 p.m.

COMPETITION NEWS.

A list of current competitions is printed on page 629.

New City Hall, Winnipeg.

Unlike the competition for the Parliament Buildings, Winnipeg (the successful design for which is illustrated in this issue), the competition for the City Hall is restricted to architects who are British subjects and have resided in Canada for at least one year immediately prior to when the conditions were issued. The premiums are \$5,000, \$3,000, and \$2,000. Mr. Leonard Stokes, F.R.I.B.A., is the assessor.

Working-Class Dwellings, Belfast.

The Corporation of Belfast have invited designs for 126 houses of two apartments each, and 126 houses of three apartments each, the

sum available being 23,000l. Premiums of 25l., 15l., and 10l. are offered for each of the two sizes of dwellings. The assessors are Mr. Henry Seaver, of Belfast, and Mr. H. A. Cutler, M.Inst.C.E., the City Surveyor.

A Town-Planning Competition.

Premiums are offered by the Institution of Municipal and County Engineers for laying-out a town as a seaside pleasure resort, with a present residential population of 50,000, and with additional accommodation for 100,000 visitors. The premiums are, to members and Associate members of the Institution, 10 guineas, 7 guineas, and 5 guineas; and to students of the Institution, 5 guineas and 3 guineas. The conditions of the competition are published by the Institution at 11, Victoria-street, S.W.

Elementary School, Beckenham.

The designs in this competition are placed as follows:—First premium, Messrs. H. T. Buckland & E. Haywood Farmer, Norwich Union Chambers, Birmingham; second premium, Mr. W. J. Hayle, 13, St. James'-row, Sheffield; third premium, Messrs. Bivan & Fletcher, George-street, St. Helens. Mr. A. W. S. Cross, F.R.I.B.A., was the assessor.

CORRESPONDENCE.

Teachers as Adjudicators.

SIR,—I should be obliged if you would permit me to raise a point with reference to the letter of your correspondent who signs himself "Already an Associate."

I have no intention of attempting to reply more than to say that everyone will agree that work submitted as a Testimony of Study for the final examination of the R.I.B.A. should be what may honestly be described as a genuine contribution of the candidate, and

Parliament Buildings, Winnipeg, Manitoba: Detail of Staircase Hall. Winning Design.

By Mr. F. W. Simon, F.R.I.B.A.

to point out that only the evidence of those who submitted the designs referred to could satisfy the suspicions of your correspondent as to this.

But what arouses my interest in "Already an Associate's" letter is his views as regards the modern design and his pre-supposed assumption that everyone is agreed as to the importance of individual expression.

Unfortunately for modern architecture, I regret to have to admit that his views are shared by the great majority of his profession. If it were not for the miserable productions of those who seek to express their uncultured individuality, prizing this before all else, including good design, we should not be faced with the wretched conceits and affectations which at present disfigure the same efforts of our predecessors in their unappreciated desire for unity and composition in our streets.

Without answering for those who are responsible for the teaching in the Liverpool School of Architecture, but speaking from knowledge, I may say that the creed that is there firmly established demands the suppression of individuality, absorption of interest in a common ideal, and the attainment of knowledge derived from a common source. S. D. ADSEAD.

The Architects and Surveyors' Approved Society under the Insurance Act.

SIR.—It is doubtful if architects and surveyors, or those employed by them, have fully realised the effect of the Insurance Act, or the way in which it will in the future affect them. When the benefits payable under the Act come into force and those employed fall sick, and find (as is bound to happen in many cases) that their employers decline to pay the usual salary, the trouble will begin.

The principal reason for the formation of the "Architects and Surveyors' Approved Society" is to keep in the profession the funds supplied by architects and surveyors, and those employed by them, instead of allowing them to be distributed amongst the miscellaneous membership of the ordinary Approved Society. That it was wanted is proved by the daily growing membership. But, in addition, we believe that many members of both professions have long felt that they would like to see some form of provident or benevolent fund available for those clerks and assistants who may, through no fault of their own, fall on evil days, but the difficulties of starting such a scheme and administering it fairly have hitherto stood in the way of its foundation. Now, however, that new conditions have arisen, the Insurance Act has made the necessity of some such scheme greater than ever for the reason above mentioned, and the same Act has created the necessary machinery for administering and organising such a fund by means of the honorary members of the Society, who subscribe 10s. 6d. per annum.

The Architects and Surveyors' Approved Society have now under consideration various suggestions and proposals for administering the annual sum which is provided by the subscriptions of honorary members, and it is hoped that the professions will widely support this fund. It is proposed to work in harmony with the existing architects and surveyors' benevolent societies, which all exist for the principal rather than the assistant.

All communications, subscriptions, or suggestions will be welcomed, and should be sent to the Secretary, at 18, Tufton-street, Westminster, who will submit them to the Sub-Committee now dealing with the subject.

No active steps will be taken in the actual administration of this fund until definite proposals have been submitted to the Councils of the Royal Institute of British Architects, the Surveyors' Institution, the Architectural Association, the Society of Architects, and the Quantity Surveyors' Association, who are represented by their Presidents and Secretaries.

GEORGE CORDEROY,
A. GODDARD,
IAN MACALISTER,
H. D. SEARLES-WOOD,
C. MACARTHUR BUTLER,
MAURICE E. WEBB
(Members of Sub-Committee).

[Several letters from our readers are unavoidably held over.—Ed.]

FIFTY YEARS AGO.

From the *Builder* of November 22, 1862.

THE PROPOSED ARCH OF TRIUMPH, PARIS.—The proposed *Arc de Napoleon III.* is to be erected near the "Barrière du Trône," and will be of enormous size and cost. According to descriptions which have appeared, it will be raised over a fountain of colossal proportions, and will be built in the Classic style. Over one side of the arch will be a figure of "War, triumphant and victorious"; and over the other its antitype, "Peace, grateful and laborious." The whole will be on a much larger scale than the triumphal arch at the end of the Champs Elysées. It will be flanked with twelve columns of the Composite order in coloured marble, and bearing twelve bronze warriors, each holding a shield. These warriors are intended to represent the twelve marshals of the empire, as well as the different *corps d'armée*. They are also to signify that the army eternally guard "France," who is seated on the summit of the building. She is

attended by "Glory" and flanked by four "Fames." On the capital of each of the twelve pillars is the following inscription:—

TO THE EMPEROR NAPOLEON III.
TO THE ARMIES OF THE CRIMEA, OF ITALY, OF CHINA, COCHIN CHINA, AND ALGERIA,
1852—1862.

The central monument, which is beneath the arch, is raised above three great basins that surmount each other, and each of which is smaller than the one immediately beneath it. They have in the centre a group of sea-horses and lions' heads, from which issue *jets d'eau*. On the top is another "Glory" holding a crown for the "victorious French soldiers."

* * Michelangelo's "Moses" remains as evidence that Pope Julius once conceived the idea of bequeathing a mighty mausoleum to his own memory. This futile enterprise wasted half the sculptor's lifetime, and he refers to it as the "tragedy of the Julian Tomb." We know of nothing that exists to tell the tale of Napoleon III.'s imperial project. Paris can, however, boast of four triumphal arches, not unworthy of her great name. The Porte St. Denis was erected in 1672 to commemorate the victories of Louis XIV. in Flanders and Holland. Designed by Blondel, it is in many respects the finest of the group.

A few years later the Porte St. Martin was built by Bullet in honour of the successes in Franche-Comté and the defeat of the Triple Alliance. The Arc de Triomphe du Carrousel, signalling the victory of Austerlitz, followed in 1806, together with the Arc de l'Etoile, or, to give it the name originally intended, the Arc d'Austerlitz. Two more were then contemplated, in dedication, respectively, to the causes of Religion and Peace. These were not persisted with, and the latter indeed would have proved itself a little too previous. It is interesting to note that the Porte St. Martin is decorated with sculpture upon the bases of the piers, a practice which the French sculptor has since pursued. A recent and striking instance may be seen upon the pylons of the Bridge Alexander III.—Ed.

THE ETON COLLEGE RAILINGS.

The Bucks Archaeological Society have passed a resolution protesting against the further removal of the iron railings in the Eton College cloisters, and asking the Earl of Rosebery, the President, to use his influence and good offices towards this end.

KING'S COLLEGE HOSPITAL, DENMARK HILL, S.E.—MR. WILLIAM A. PITE, F.R.I.B.A., ARCHITECT

CONSTRUCTION & ENGINEERING REVIEW

KING'S COLLEGE HOSPITAL.

THE transfer of King's College Hospital from Lincoln's Inn to Camberwell is rapidly nearing the realisation of an enterprise of sufficient importance to arouse interest of all classes of the community. During the past few years the Press and professional organs have occasionally reflected the public of the steady growth of this project, but the time has now arrived in the history of its construction in some substantial idea may be formed of its magnitude, whether viewed as an institution meeting the crying needs of a densely-populated neighbourhood or as a striking architectural addition to a district re-built of a distinctly gloomy nature.

Before describing the new buildings it may be out of place to give some particulars of the old hospital. In the year 1339 Council of King's College, realising that medical teaching was essential for the complete education of its medical students, took steps for the formation, in the parish of St. Clement Danes, of a public hospital for relief of poor, sick, and infirm persons. The hospital was started in a building on the side of Carey-street, formerly the workhouse of the parish, and a lease of the building was taken from the Guardians of the Poor of the Strand Union and the Churchwardens and Overseers of the Poor of St. Clement Danes.

The workhouse buildings were converted into a hospital by Sir Robert Smirke. A sum of £25,000 was expended in this work, and accommodation was found for 120 patients, housed, however, in wards, which, though regarded as palatial in those days, were of cramped dimensions compared with modern notions.

The hospital thus established was found to be a real need, but complaints were made as to the position it occupied, so much so that in 1841 a Sub-Committee of the Local Government reported that the then site of the hospital "operated disadvantageously to its permanent well-being," owing to the difficulty of approach and remoteness of the site, the thoroughfares, and the vicinity of present buildings to the burial ground to which it abutted. Subsequently the site of the hospital increased so rapidly that it was found requisite to obtain additional land.

In 1848 the hospital authorities were able to acquire the adjoining property, known as the Grange Inn, and 26 and 27, Clement's-lane. This property was shortly afterwards demolished, and a movement was made to in the freehold of the hospital, which included the converted workhouse, with a view to rebuilding. In 1850 the freehold was transferred, subject to a fee farm rent of 240*l.* annum. The land thus acquired comprised

an area of 6,960 ft. super., representing a price of nearly 9*d.* per foot rental—a good figure in those days for land, situated as that was in the heart of a slum area far worse probably than the Tabard-street area in another part of London, which is about to be cleared.

Further land was necessary to enable a hospital large enough for the needs of the locality to be provided. The district was one of the most densely populated, and it was among the worst in London. The courts, alleys, and streets were close, foul, and filthy, and it was described as being "not merely a rookery, but a nest of rookeries."

This need of extension was so well recognised by the Governors of the hospital that they applied for and obtained an Act of Parliament enabling them to purchase land compulsorily, and it was determined to erect a new hospital, together with a chapel for divine worship. The site being acquired, a large hospital was proposed to be erected and plans were prepared, the architect being

Mr. T. Bellamy, and the building was arranged to be erected in three blocks, the total amount of the contracts for which exceeded 50,000*l.* for the structure.

By the year 1900 it had begun to be felt that the changes in the locality all tended to deprive the hospital of much of its usefulness. The building had no frontage to any important arterial thoroughfare with its large traffic, and the approaches to the hospital from the Strand and Holborn were so tortuous and indirect, especially for vehicular traffic, that a considerable detour had to be made. Added to that, the advance in sanitary knowledge and the practice of hygiene had operated to cause the buildings to be far behind modern ideas. A report of the hospital surveyor pointed out that a large outlay was needed to modernise the sanitation, and that there was insufficient free space available for the purpose. The site, being surrounded by public streets, could not be extended.

The site of the new hospital comprises 12 acres, and is admirably situated on Denmark-

WARD PAVILION NO. 5.

King's College Hospital, Denmark-hill.
Mr. W. A. Pite, F.R.I.B.A., Architect.

ll, having a fine outlook over Ruskin Park
wards the south, thus possessing an un-
interrupted view over a beautiful stretch of
trees and grass on rising ground. This
unrivalled situation is not possessed by any
other London hospital. This site was pre-
sented by the Hon. W. F. D. Smith.
The buildings which we see to-day, the
outcome of a design by Mr. William A. Pite,
R.I.B.A., won in competition, were com-
menced about four years ago, and the seal of
royal approval on the scheme was conferred
when King Edward VII. laid the foundation-
stone on July 20, 1909, an act which unhappily
proved to be the last of its kind that his
Majesty performed.

Viewed externally the buildings form an
imposing group. The main front, dominated
by it is by the administration block and
linked on either side by the lower buildings
the out-patients and medical school,
powerfully suggests the principle of "central-
isation," the keynote of the hospital plan.

The blocks already roofed in and nearing
completion are the out-patient, casualty, and
dining departments; the administration
block and chapel, with linen department
under; the two three-story ward blocks,
named respectively the King Edward VII.
and King George V. blocks; the central
atrium, placed below ground and between
two two-story ward pavilions; and the major
portion of the main hospital corridor, nearly
100 ft. in length, which forms a backbone to
the whole lay-out.

The blocks now in course of erection com-
prise the remaining two-story ward pavilions,
a large special ward block, operating theatres,
and the pathological block, which includes the
laboratories and mortuary. The above-men-
tioned blocks, together with an isolation
department not yet commenced, will be ready
for occupation in a year's time.

The casualty department is conveniently
situated on that portion of the site first
approached from the main thoroughfare,
near the hill. Here accident cases can be
dealt with with dispatch and removed with a

- N Kitchen Department under.

NOTE.—Nurses' bedrooms over the East, West, and Front Blocks. Servants' bedrooms over the Centre Block.

minimum of time and difficulty to the wards
immediately behind. Close at hand is the
bathing and massage establishment, and a
department fully equipped for electrical treat-
ment. To the right of the casualty block is
situated the out-patients' department, of which
the prominent feature is its spacious waiting-
hall surrounded by consulting-rooms. The
out-patients after having received their treat-
ment leave the hospital by way of the
almoner's department and dispensary.

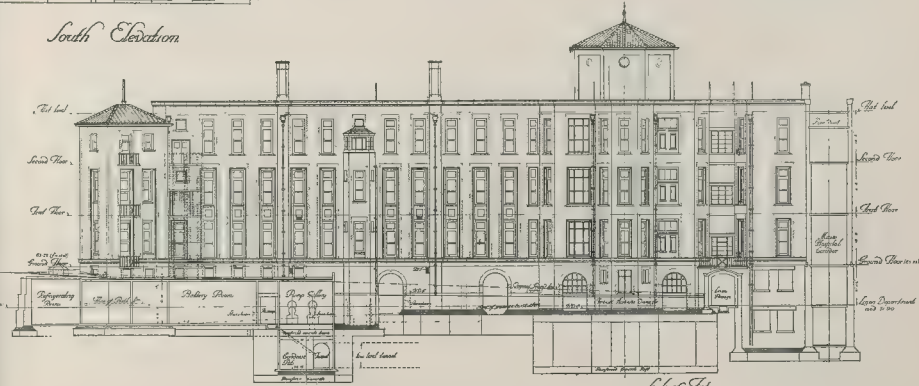

The administration block, six stories high,
provides accommodation for the entire staff
and kitchen department.

Perhaps no part of the hospital has had
more thought expended upon it than the ward

pavilions. The combination of technicalities
resulting from the great advances of recent
years in medical and surgical science make
the task of the hospital architect one of
increasing difficulty, but the result attained
in this important section of hospital equip-
ment can scarcely fail to be appreciated not
only by doctors and nurses, but by patients.
The several pavilions are ranged parallel to
one another, and project from the main
hospital corridor at intervals during its entire
length; they are carefully set with due regard
to aeration and sunlight, and each floor is
provided with a sheltered sun balcony capable
of receiving several beds and commanding an
uninterrupted view of Ruskin Park.

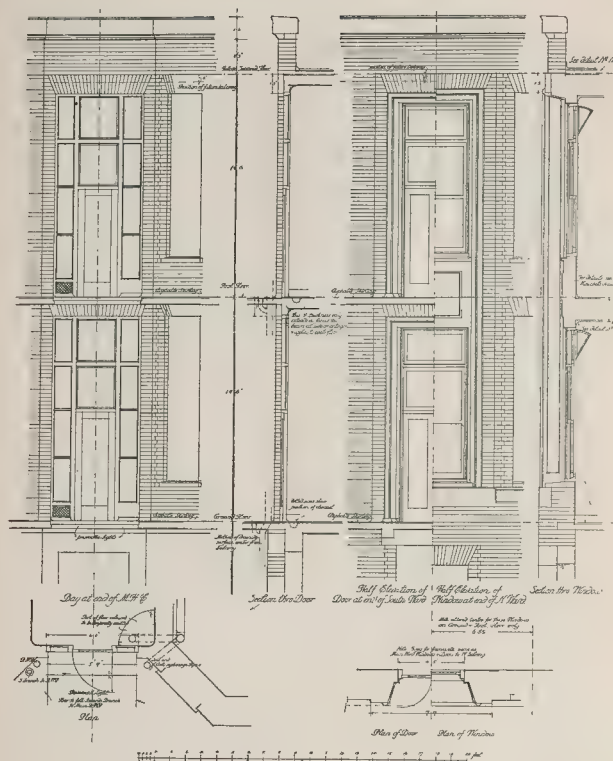

South Elevation

East Elevation

Ward Block No. 5.

Details of Ward Pavilion No. 9.

Direct ventilation without draughts is secured by the use of "Austral" windows, the frames of which are placed flush with the inside wall-surfaces, thereby preventing any unnecessary lodgment of dust. This constitutes a new and valuable development in hospital detail.

A chimney with some architectural claims marks the position of the power station in the centre of the site. This contains boilers for the generation of steam for heating and hot-water supply. The engines are of the Diesel type, and are employed in providing the electrical supply.

The two-storied operating blocks, serving electric bed-lifts, are reached from the hospital corridor on its northern side, the larger one being for general surgical cases, while the smaller contains gynaecological, septic, and clinical theatres.

The Medical School, which enjoys a well-earned reputation, will form the corresponding block to the out-patients', which will resemble and balance in general effect. This important section of the hospital, comprising library, museum, and lecture theatre, is to be erected from the proceeds of a special fund now being raised.

It is worthy of mention that a large portion of the work illustrates the extensive use of reinforced concrete on the Hennekelly system, a material eminently suitable for large buildings where economy and resisting qualities are among the primary considerations. Portland stone and red brickwork with red dressings form the principal elements of the simply-treated dignified elevations.

In conclusion, it should be stated that the present buildings will furnish 366 beds, which is 142 in excess of the hospital which they supersede, but when fully completed the number will be increased to 600. King's College Hospital, therefore, is destined to rank among those monuments which serve to illustrate the civilisation of our times.

The contractors for the work are Messrs. Foster & Dicksee, Ltd., of Rugby, and the clerk of works Mr. Thomas Simpson, who acted in a similar capacity at St. Bartholomew's Hospital.

The whole of the engineering work, other than the structural and sanitary work, has been carried out from the designs and under the supervision of Professor D. S. Capper, the Committee's Consulting Engineer, Messrs. Kirkland & Capper, 17, Victoria Street, S.W.

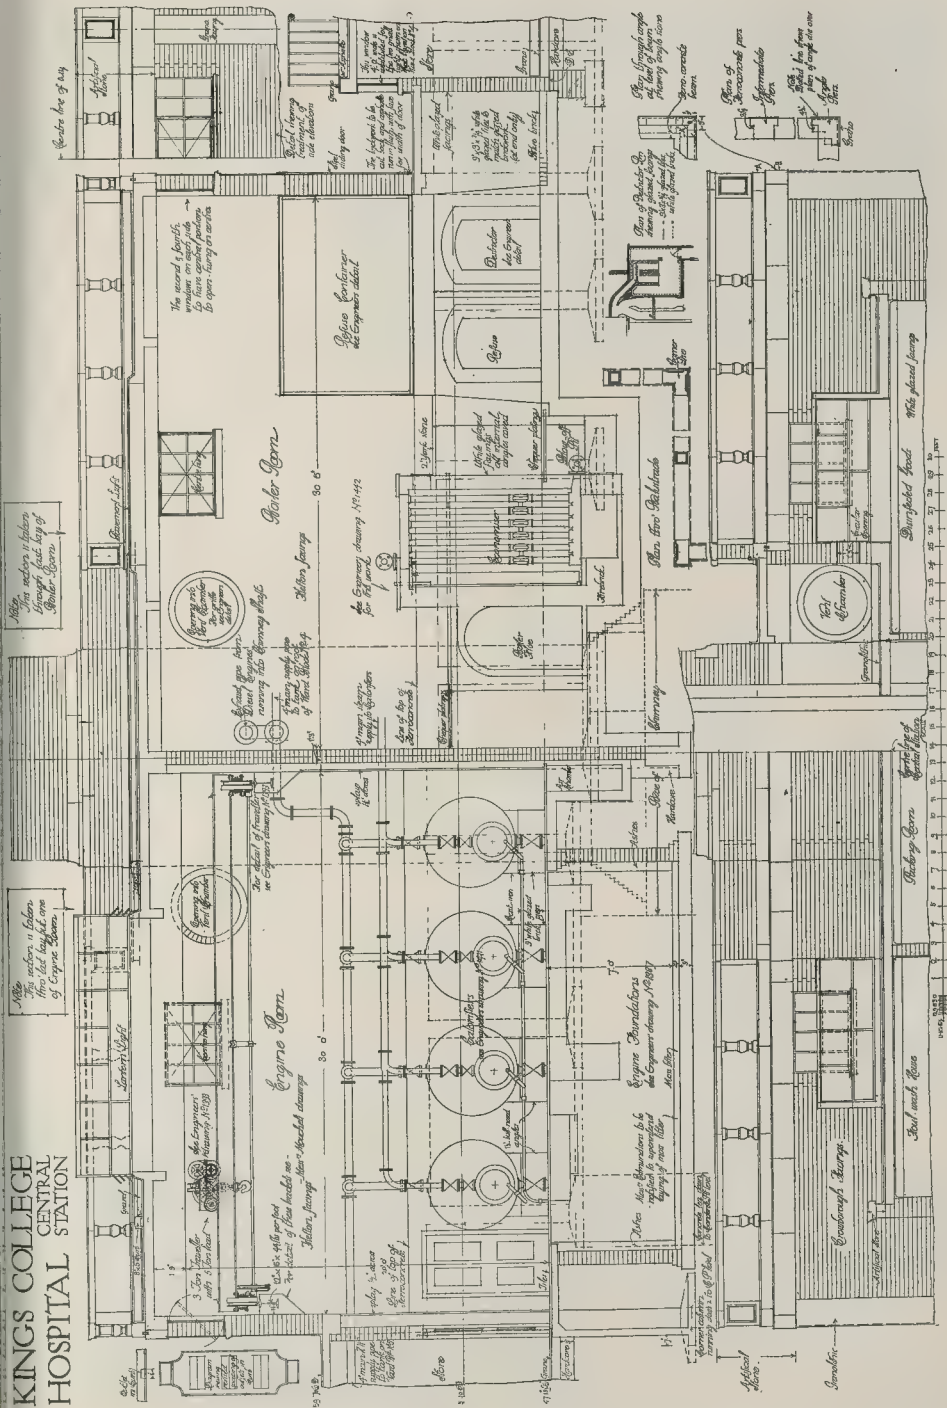

All the lifts are of the push button type and are being installed by the Otis Elevator Company, Ltd., 4, Queen Victoria Street.

The electric lighting has been executed by Messrs. Duncan Watson & Co., Ltd., of Bolding & Sons, and Edmundsons, Ltd., under the direction of the Consulting Engineer to the hospital.

The Teale Fireplace Company, Cookridge Street, Leeds, have supplied the double ward stove which we illustrate on page 617. It is known as the "Derby Economiser" type, with double fire descending flues and ventilating arrangement for the admission of fresh warm air. The stove is covered with glaze tiles and the base is formed in iron, the finished with polished stone or marble. Details are provided at the sides giving access to the flues.

Ward Pavilion No. 9. Details of Central and South Balconies.

Details of Annexe Roof. Wards 4 and 5.

the interior so that the flues can be swept. The cold air supply is carried in fireclay tubes under the floor, and provision is made for cleaning these out from end to end.

The asphalt in connexion with the building has been executed by the Limmer Asphaltic Paving Company, Ltd., of Caxton House, Westminster, S.W., and the work executed comprises the whole of the vertical damp courses, flats over the out-patients' block, administration blocks, ward blocks, etc. The paving to the main waiting-hall and the corridors in the out-patients' block is covered with the company's special asphalt, which is pleasing in appearance and affords an excellent foothold. The dome over the entrance-hall and the beam to the lantern lights are in ferro-concrete, and the whole of this work is covered with this company's Montfort's System asphalt. It is interesting to note that, notwithstanding the extreme heat of the summer of 1911, the circular work on the dome and on the circular ventilating pipe-trunks show no movement nor any tendency to "creep." The work still to be done comprises the asphalt to the roof of the central station, sun balconies, etc., and also the paving of the courtyards with the company's Lithofast block paving.

The freehold site of the old hospital, over an acre in extent, and the existing buildings are offered for sale or to be let on a building lease, or alternatively an offer is invited for the retention of the existing buildings, subject to alterations to meet modern needs.

Tenders are to be given by December 18 this year to Messrs. Weatherall & Green, the hospital surveyors. Vacant possession will be given at the end of next year.

TWO NEW DOCK WORKS.

THE following are abstracts of two papers read at the ordinary meeting of the Institution of Civil Engineers on the 12th inst.:-

New Dock, Methil.

"The Construction of the New Dock at Methil," by Mr. B. Hall Blyth, jun., Assoc. M. Inst. C.E.

"Methil is the principal port for shipping coal on the east coast of Scotland. Before 1887 it had no dock accommodation, but in that year the first dock was opened, and a considerable quantity of coal was shipped. Every subsequent year showed a very large increase in the shipments, and before many years the North-British Railway Company,

who had purchased the first dock from Mr. Erskine Wemyss, of Wemyss Castle, built a second and larger dock, which was finished in 1899. For a few years these two docks were able to cope with the coal traffic, but lately, with the great increase in the output, the accommodation proved inadequate, and it was determined to build still another dock, which would be sufficient in every way for the trade for many years to come. Plans for this new dock were prepared by Messrs. Blyth & Westland, of Edinburgh, and the contract for its construction was let at the end of 1907 to Messrs. Robert McAlpine & Sons, of Glasgow.

The new dock is situated to the east of the two old docks, and is 16½ acres in extent, with a depth of water of 32 ft. at high water of ordinary spring tides, and gates 80 ft. wide. It is approached by a channel 120 ft. wide and 1,800 ft. long, running along the outside of the sea-wall which enclosed the two old docks. This channel and the dock are situated almost entirely on the fore-shore, and are enclosed by a sea-wall, running along and outside low-water mark, from the land end of the existing pier or breakwater to a point near the mouth of the River Leven. This wall is nearly a mile long; it is built for three-fourths of its length of concrete, and continues with a pitched slope where it is well above low water. The entrance to the present docks, which is well protected, is used for the new dock, a part of the existing pier having been removed across the line of the new channel.

The whole area reclaimed by the sea-wall amounts to 44 acres, the excavation for the dock and channel being used to level up the rest of this area to quay-level for siding accommodation for the dock.

For loading the coal, the dock is equipped with hydraulic hoists, of which there are six at present; but provision is made for three more when they are required. With all these hoists and those in the old docks, no difficulty will be found in shipping 10,000,000 tons of coal per annum.

The sea-wall was the first work started, the idea being to build this wall and use it as a coffer-dam to enable all the works inside to be done in the dry. The wall was constructed on a bag-work foundation up to 2 ft. 6 in. above low water, and from that point to quay-level of block work and mass concrete *in situ*. The width of the wall was originally 8 ft. at the top, i.e., quay-level, with counterforts every

25 ft., and a backing of 20 ft. of rubble the excavations. This, however, was carried out, as no suitable rubble was in the excavations, and the wall was of concrete, 17 ft. thick. The height of wall varied according to the level of bottom. At the north end it is about 10 ft. high to quay-level, and at the south end maximum height of 40 ft. Quay-level is above high water, and the parapet of wall is 10 ft. above that level. For the 400 yds. from the south end of the side of the entrance channel and the sea-wall parallel, and they were built together, making the wall in all 27 ft. wide at quay-level.

Two and a half years were required for building of the wall. During the first years very bad weather was experienced, very little progress was made. Frequent storms and rough seas delayed the work, often washed away the temporary staging and roads. Difficulty was also experienced in shifting the sand overlying the rock. This was in some cases as much as 11 ft. deep, all of it had to be removed before the work could be put in. The bag-work was put in position by divers. Goliath cranes were employed for building the wall at north or shallow end, and derrick cranes at the south end.

After two bad years a very fine summer in 1910 enabled the wall to be finished, more than 800 lineal yds. being constructed in six months. The wall was closed in Oct. 1910, and after the parapet was erected a bank of soft material was put in along inside the water was pumped out, and the wall was found to be practically watertight.

Along the front of the old breakwater the sound end of the old sea-wall 50 concrete blocks had been thrown pell-mell to break up the seas and protect the wall. Some of these had to be moved to allow new wall to be built, and were then repositioned outside the new wall. After the completion of the new sea-wall more of these blocks were made and placed along the front where the wall is on a curve concave to the sea, so now the wall is protected in this way practically from the south end to opposite dock gates.

The gate entrance and the excavation of the dock and the dock walls were then immediately proceeded with. The gate entrance was built of concrete, the side walls being of freestone. The hollow quoins, the paths, and sill-face were granite. In a few months this work was all completed and ready for the erection of the gates. The excavation in the dock, amounting to 570,000 cubic yds., and the dock walls, which were built of concrete with granite copes, and were over 6,000 ft. long, were all finished in ten months. The excavations throughout the works were in soft unformed rock, but most of it required blasting before being lifted by steam cranes. Once the dock was finished a concrete coffer-dam of blocks was built across the entrance to keep it dry while the water was allowed to rise in the dock. When the water in the dock was well advanced the entrance channel was started. A coffer-dam was built at the outer end and one in the centre of channel, to enable all the work to be carried out in the dry.

The principal work in the channel, besides the excavation, was the underpinning

Economiser Type.

A Teale Fireplace in King's College Hospital.

pletion of the east side wall, which had been built only from ground level along with sea-wall, and the erection of the great timber jetty along the whole of the west end of the side wall and the dock gates. The sides of the channel were taken out to a width of $1\frac{1}{2}$ to 1, and the jetties were erected on the slopes. The old sea-wall across the end of the new channel was removed, the old pile being used for forming a paved apron at the back of the sea-wall to carry any water coming over the sea-wall during storms. The fairway outside the new channel was deepened by dredging.

The contract for the hydraulic hoists, pipes, valves, and dock gates was carried out by Messrs. Sir W. G. Armstrong, Whitworth, & Co. A large hydraulic power and electric station was erected at the north-west corner of the dock.

The main access to the dock for coal is from the north, and a yard capable of storing 100 tons of coal has been laid down about a mile from the dock. The coal coming from the west has to be brought to the dock and shipped at a higher level, and arrangements to the existing docks and the railway lines round them will have to be made when the new dock is open for traffic. The total cost of the works will be about £1,000,000. Messrs. Blyth & Westland were engineers for the works, and the author acted as resident engineer.

Port Talbot Docks.

Alterations and Improvements of the Port Talbot Docks and Railways during the last Decade," by Mr. William Cleaver, M.Inst.C.E.

The author points out that experience of the maintenance and working of large engineering undertakings sometimes indicates certain details in the original designs which proved to be not altogether suited to their purpose, and that the modifications which would be necessary would often afford valuable information if published. He thereupon submits an account of the more important alterations and improvements carried out under his supervision during the last ten or twelve years at the Port Talbot Docks and Railways. After giving a short history of the undertaking, he proceeds to describe in detail channel training works, sand suction dredging, the design of suction nozzles, lifting discharge pipes, pontoons, etc. Channel maintenance by means of sluicing is dealt with, and in connexion with this the fallacy of river scour is explained. Details are given of a dam or groyne built in the river to prevent the very scour which was originally intended to prove beneficial, and also the effects of the erection of the dam in raising the river bed, restoring bridge foundations, reducing dredging, etc. Improved dock moorings, designed by the author, are described, and also the strengthening of existing moorings.

Mention is made of the use of reinforced-concrete structures at Port Talbot Docks, and the general results of the experience gained,

Dome at King's College Hospital, showing Mastic Asphalt made by the Limmer Asphalt Paving Co., Ltd.

as well as the specific reasons for the adoption of this material at Port Talbot.

The paper then describes the present methods of dredging in dock and the deposition of the spoil for reclamation purposes, and gives particulars of other methods tried previously with the same end in view.

Details are given of the laying by diver of what is believed to be the first extensive submerged high-pressure hydraulic mains and returns in this country. The new electric and hydraulic power station is described. An account is given of the damage done to the breakwaters, etc., by the great storm of December 16, 1910, and the steps taken to repair the work and to prevent similar damage in future are described.

Reasons are given for the provision of new lock gates, and the necessity for having additional sluices arranged in them, and a new method of fixing fender chains for the protection of the gates from collision is also described. The author gives reasons for his view that the usual aprons in front of sluice culverts, etc., are inadequate, and also refers to the necessity of substantial dock drains. The paper concludes with particulars of the methods adopted by the author for the prevention of subsidence in railway embankments, and also of special repairs carried out on a brick arch viaduct without interfering with the traffic.

MANCHESTER MAIN DRAINAGE.

A QUARTER of a century ago the area drained by the main outfall sewers of Manchester was only 5,934 acres, while in the present day the drainage area is 15,369 acres.

Roof and Culverts at King's College Hospital, showing Mastic Asphalt made by the Limmer Asphalt Paving Co., Ltd.

The inadequacy of the existing system of sewers has long been recognised, but it has not been generally known that, despite the provision of more than two hundred storm overflows into the rivers Irwell, Medlock, Irk, tributary streams, and the Ship Canal, the sewage in certain districts has backed up into house drains during heavy rains, and that in some cases, although perceptible flooding has not occurred in buildings, the foundations have become literally saturated by leakage from the drains.

Undesirable as this state of things may be, the pollution of the rivers and Canal is equally so, and in order to obviate both of these evils a new system of main drainage has been designed by Mr. T. de Courcy Meade, M.Inst.C.E., the City Engineer, and sanctioned by Parliament.

The undertaking is the largest of its kind in the country apart from the main drainage system of the metropolis, and will provide for the drainage of at least 38,000 acres with the population of nearly one and a half millions; while it is believed that if additional districts, that may hereafter be included within the city boundaries, are able to deal locally with part of their storm waters, the area served by the new sewers may be considerably extended.

The estimated cost of the works is 1,000,000l., and it is anticipated that their completion will "make Manchester one of the best drained and in that respect the most sanitary city in the kingdom."

Under the new scheme the overflow of storm water into the rivers and Ship Canal will not take place until the ordinary flow has been diluted at least six times, and the effluent will carry few impurities, as the bulk of these will have been removed previously at the Davyhulme Sewage Works.

The most striking feature of the undertaking is the series of main sewers, the cross-section of which is larger than that of the London tubular railway tunnels. These sewers are being constructed by tunnelling, in order to minimise surface disturbance and consequent interference with traffic, and are lined with hard bricks set in Portland cement.

Up to the present the ground penetrated has been hard and dry, but if water-bearing strata should be encountered the work will be continued by the shield method.

In addition to the main sewers, the scheme includes an important improvement of the River Medlock. A central brick channel is being constructed to carry the normal flow of water, with sloping banks on either side forming a larger channel for flood waters.

Three contracting firms are now actively engaged on the works in Hulme, Moss-lane East, Rusholme, and Clayton, these districts requiring relief from storm waters more urgently than other parts of the city.

Gorton will be the next district to receive attention, and the system will be extended gradually until it provides for the needs of the entire city.

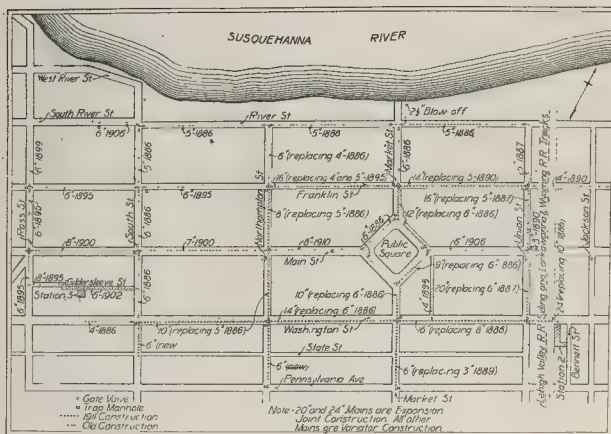

Fig. 1.

CENTRAL HEATING IN AN AMERICAN CITY.

ON various occasions we have referred to the advantages of central heating, not merely in connexion with isolated buildings or groups of buildings, but as applied to entire districts or towns.

In the present article we give some practical details of the comprehensive system installed in the city of Wilkes-Barre, an important manufacturing centre on the north branch of the Susquehanna River, in Pennsylvania.

More than a quarter of a century ago some 2 miles of public supply steam heating mains were laid in the city by the Wilkes-Barre Heat, Light, and Motor Company, since merged into a larger corporation under the style of the Wilkes-Barre Company, by whom the system has been thoroughly modernised and extended so that to-day the underground steam mains represent the collective length of 5 miles.

After having been in service for more than twenty-five years, the original mains not unnaturally gave indications of deterioration, and their capacity was so taxed by increasing demands that it was necessary to convey the steam at unduly high pressure in order to ensure supplies to consumers.

As described by Mr. Donald M. Belcher in a recent issue of the *Engineering Record*, the extensions undertaken last year by the Wilkes-Barre Company include the construction of new mains, ranging in diameter from 6 in. to 24 in., capable of permitting exhaust steam from the electricity station engines to be utilised for heating purposes.

Fig. 1 is a plan showing the principal pipe lines in the steam distribution system as remodelled.

Method of Protecting Pipes.

The new pipe lines are of wrought-iron throughout, and all joints except those with special fittings are made with long couplings of heavy pattern.

The pipes are very adequately protected to minimise loss of heat in accordance with the methods generally adopted in American central heating systems, as shown in Fig. 2.

A double spiral winding of asbestos paper was first applied and held in position by copper wire ties. Then the pipes were encased by cylindrical lagging, 4 in. to 5 in. thick, formed of tongued and grooved strips of wood, and leaving an annular air space of 1 in. between the asbestos-covered pipes and the lagging, the latter being bound with $\frac{1}{8}$ -in. galvansied-steel wire, wound spirally under high tension and embedded into the wood. The casing is coated outside with asphalt and lined inside with bright tin plate. Guides and rollers, spaced about 8 ft. apart, are provided to keep the pipes in correct position and to permit movements caused by expansion and contraction.

Outside the lagging a sheathing of 3-ply tarred paper was placed as a protection for the upper part of the pipe line.

The efficiency of the protection in respect of heat losses may be judged by the statement that tests show the loss from condensation to be less than 5 per cent. of the amount of steam supplied.

Expansion Joints and Fittings.

To provide suitably for the effects of expansion and contraction two types of fitting were employed—the ordinary expansion joint and a special type of expansion joint described as a "variator." The variator consists of an outer casing or body having at each end a corrugated copper diaphragm with a centre hole into which is fitted a special movable piece attached to the end of the steam main. The two diaphragms are spaced at such distance apart as to permit the pipes to expand into the body of the variator without coming into contact with each other, and the body is securely anchored into the brick walls of the chamber provided for reception of the expansion joint.

In lines where variators are used the pipes are laid in 50-ft. lengths, one end anchored into brickwork and the other end free to expand or contract. In special positions, variators having only one copper diaphragm are used, one end providing for expansion and contraction, and the other end acting as an anchor.

All special fittings are enclosed in water-tight brick chambers, packed with shavings as insulating material.

Ordinary expansion joints, as applied to the 24-in. main in Washington-street and the 20-in. main in Union-street, are placed in brick inspection chambers. Joints of this type provide for the expansion and contraction of pipe sections about 125 ft. long.

The chief advantages of the variator type of expansion joint are its automatic action and the elimination of packing. Therefore, it obviates the need for periodical attention and the cost of access manholes.

Main Pipes and House-Service Branches.

The mains were laid at the average depth of about 6 ft. below street level, thus ensuring ample safety from mechanical injury and protection from climatic extremes.

Fig. 2.

In order to facilitate the flow of condensed water, the mains were laid at the minimum gradient of 2.4 in. in 100 ft., and steam provided where necessary for the removal of water, these traps being fitted in chambers. All the trenches and chambers are drained by 4-in. earthenware pipes.

All house-service branches are taken from the top of the variators or anchor fittings, branches varying in size from 2 in. to 4 in. diameter, and being protected similarly in main pipes.

Steam pressure is reduced as required by a reducing valve inside the building, and return pipes are connected with a steam discharging into a cooling coil whence water, condensed, is delivered into the drain. The coil is enclosed and the heat imparted to the water in the coil is utilised for warming air.

Steam supplies commence in September and are continued to June in every year. Charges to consumers are usually based upon the number of cubic feet in the building warmed, but those desiring to be charged on a meter can adopt this arrangement, the meter recording the quantity of water returned to the cooling coils.

At the present time about 250 consumers taking regular supplies of steam for heating purposes, their experience being that the system of public supply is economical and labour-saving.

As reconstructed, the central heating system of Wilkes-Barre is capable of being operated under the low pressure of 5 lb. per square inch when supplying 90 per cent. of the available sources of consumption along the mains provides for considerable extension of districts hitherto unsupplied.

The total cost of the new mains, including trenching, pipe-laying, repaving, and incidentals, varied with the dimensions of the pipes as follows:—

Diameter of Main.	Nature of Faving.	Cost per 100 feet.
6 in.	Brick	\$ 3.00
8	"	1.30
10	Asphalt	1.60
12	"	1.13
14	"	1.18
16	Brick	1.18
18	Asphalt	1.19
20	"	2.86
22	"	2.11
24	Brick	3.82
	"	4.15
	"	5.18

The original and the new mains were laid by the American District Steam Company, North Tonawanda, New York State, and the removal of the old mains and the reconstruction of the house-service branches having been carried out by the Wilkes-Barre Company under the direction of Mr. Donald M. Belcher, A.M., Soc. C.E.

HEAT LOSSES FROM IRON BUILDINGS.

WITH the object of determining the coefficient of heat transmission the tests on corrugated iron sheets an elaborate investigation has been conducted at the works of the Green Fuel Economiser Company, at Marston, New York State. The building in which the tests were made is 225 ft. long by 4 ft. wide, with the average height of 32 ft. It is covered with corrugated iron without lining of any kind, but precautions were taken to render the building as air-tight as possible. Calculations made by the formulae of Professor Grashof, Dr. Rietschel, Professor Woodbridge, for single window gave results which were fairly in agreement, the values of the coefficient of transmission ranging from 0.955 to 1.000 British thermal units per square foot per hour for the difference of 1 deg. Fahr. between the interior and exterior temperature.

From the results obtained during the tests it was found that the average rate of heat transmission per square foot per hour for a difference of temperature was 1.000 units as computed from the heated surface employed, and 1.33 heat units as calculated from the amount of steam condensed in the air heater.

Making allowance for the corrugation of the sheets, the actual surface of the metal is about 135 times the superficial area

the walls and roof. Therefore the values stated become 187 and 182 heat units respectively.

Consequently it appears that for buildings of this kind the coefficient of heat transmission may safely be taken at 2 British thermal units per square foot of actual surface or degrees difference of temperature.

ENGINEERING NOTES.

Sewage Sludge Disposal. The plant devised by Dr. J. Grossmann, of Manchester, for the disposal of sewage sludge was opened at Oldham recently. By Dr. Grossmann's process about 1,000,000 tons of valuable manure capable of recovery, and at present running to waste, could be produced in this country, and 50,000 tons of phosphates, 50,000 tons of potash salts, and nitrogen equal to 100,000 tons of phosphate of ammonia taken back to the land. These constituents have an intrinsic value of about 2,500,000*l.*, and would be available for manuring at least 3,000,000 acres of land. The plant at the Oldham Sewage Works is capable of dealing with all the sludge produced from the whole population of Oldham. The settled sludge is pumped into special draining tanks, in which it is reduced to a slimy consistency. From those tanks it is moved by mechanical means into a receptacle below, from which it is taken by bucket elevators to the top of the building into a storage tank. From this storage tank it is distributed into six hoppers, each of which is connected with a drying machine, which it automatically feeds. These drying machines, which are bricked in and heated by coal, contain an internal arrangement, driven by gearing and pulleys, by means of which the sludge is automatically moved from the inlet to the outlet, and the movement is adjusted in such a manner that by the time the sludge arrives at the outlet it is completely dried. Each dryer has placed underneath it a distillation rectort. In this it is automatically mixed with a little acid and moved along towards the outlet of the machine, from which the finished manure is automatically discharged. The building in which the plant is housed is 20 ft. by 45 ft. and 30 ft. high.—*The Times.*

Diesel Pumping Engines (Metropolitan Water Board). The remarkable progress of the Diesel internal-combustion engine during recent years is further marked by its adoption on a large scale by the Metropolitan Water Board, who are thus leading the way in applying this type of motor for pumping public water supplies in the United Kingdom. The Board are about to install at Cricklewood three 4-cylinder Diesel engines, each of 200-horse-power, and a similar set at Portis Green. The engines driving pumps capable of lifting 12,000,000 gallons daily to a height of 250 ft. At Dartford a Diesel engine will be employed for driving a pump capable of raising 50 gallons a day to a height of 520 ft. The Diesel engine, now made by various firms in this country, represents a decided advance upon former ideals. The inventor set himself the task of attempting to realise, within the limitations of practice, an approach to the "Carnot cycle," and in order to attain his end became necessary to adopt a degree of compression much higher than that previously used, and it was required that the charge should be compressed to the maximum pressure at which the motor was to be operated, and that this pressure should not be exceeded by gases generated during combustion. In this engine the high temperature produced by compression of the air is sufficient to ignite the combustible, and it is only necessary for the fuel to be injected into the heated air to ensure its ignition and combustion.

New Reinforced Concrete Loading Pier at Southampton-Sea. CONSTRUCTION work has commenced for the new loading pier which the Corporation of Southampton-on-Sea has decided to erect under the superintendence of Mr. Ernest J. Elford, M.Inst.C.E., the Borough Engineer. The total length of the pier will be 600 ft., and it has been designed for a working load of 5 cwt. per square foot. The work will be executed on the "Picket System" of reinforced concrete, elected in open competition. Mr. T. W. Seddette, Enfield, N., is the contractor. The contract is for 11,690*l.*

Bridges in the Norwich District.

At a recent meeting of the Eastern Highways Committee the County Surveyor said the damage done by the great storm was being attended to as quickly as possible. The Committee have arranged for the reconstruction of a certain number of the smaller bridges in ferro-concrete, and for the reconstruction of Coltishall Bridge in ferro-concrete. Ingworth Bridge is to be reconstructed in steel. At the present time for the purpose of the Local Government Board loan they were instructed by the Local Government Board to prepare plans and estimates for four different types of bridges. The larger bridges would be either in ferro-concrete or in steel. With the two extra assistants who had been allowed him, no time was being lost in getting the plans and surveys made. In the meantime temporary bridges had been made all over the county, and he did not think there was much inconvenience to traffic except in the case of Coltishall, where there was a foot-bridge.—Mr. Sancerot Holmes said the Chairman of the Board, Sir George Gibbs, and he, with Mr. Killick and the County Surveyor, had made a tour of inspection. They saw every important bridge that had been damaged and every important road that had been washed out. Careful notes were taken of what was seen; and Sir George intimated that his Department was prepared to meet the county generously with a free grant of money. The amount of money which the Road Board would grant and the actual way in which it was to be applied was still under consideration. There was every hope that when the plans had been fully considered the Road Board would see their way to grant some considerable assistance. In making this tour of the bridges it became evident that a great cause of the disaster was that the foundations of the old bridges were inadequate, and were not carried down to a sufficient depth. The new bridges would not have these defective foundations.

The Melting-Points of Fire Bricks.

In the subjoined table we give the results of tests conducted by Mr. C. W. Kanott in a paper contributed to the *Journal of the Franklin Institute*. It should be noted that in every case the melting-point was taken as the lowest temperature at which a small piece of the material could be distinctly seen to flow.

Material.	Melting-Point, Deg. C.
Fireclay brick.....	1555-1725 (mean 1640)

The British Engineers' Association.

The British Engineers' Association, which was incorporated on April 26 of this year under a certificate from the Board of Trade, and was brought into being for the purpose of promoting the interests of British engineering firms in China, has developed considerably since that date. While Germany and the United States and certain other of Britain's competitors already have associations of this sort this is the first attempt made by British manufacturing engineers to convert that dead-weight of influence which must exist in an industry which pays more than 2,000,000*l.* a week in wages into an active practical force for the furthering of their interests abroad. This Association now comprises a large number of the best engineering firms in Great Britain. Already the Association has made arrangements for the collection of first-hand information on the subjects which affect engineering interests in China, and is issuing it in the form of confidential reports to its members at frequent intervals. A feature in the policy of the British Engineers' Association is the encouragement of the education of Oriental engineers in the British language and on British lines, whether by British engineering schools in the countries concerned or by facilities at the educational establishments and in the engineering works of Great Britain. At the present day the Germans are spending 100,000*l.* on the erection of German engineering schools in China, and are paying very large sums,

amounting to as much as 1,000*l.* each, for selected Chinese, who are to be educated in Germany for ten years, first as Germans and afterwards as engineers. The Association is devoting its attention exclusively to China at the present day, because that is the country where, above all others, British engineering interests are in most urgent need of support. When thoroughly organised to cover the ground efficiently the Association will turn its attention to any other country where British engineering interests may be suffering. The offices of the Association are at Caxton House, Westminster, and the Secretary is Mr. Stafford Ranscane.

Loan Periods for Reinforced Concrete.

Writing to the *Times Engineering Supplement* relative to the attitude of the Local Government Board to reinforced concrete, Mr. J. S. De Vesian, M.Inst.C.E., adduces further facts and arguments which deserve to be taken into serious consideration by the head of the Department mentioned. As the chief of a firm by whom some 1,500 reinforced concrete structures have been carried out in this country, and on most of which not one penny has been spent in maintenance, Mr. De Vesian naturally considers it hard that loan periods for such works are usually limited to ten years, while periods of thirty years are readily granted for timber-structures. Referring to structural steel, the writer points out that the life of bridges in that material over salt-water estuaries may be under twenty years, whereas reinforced concrete should be practically everlasting, and its first cost in bridge work is from one-third to one-half that of structural steel. Nevertheless, his firm lose many such works for which contracts have been provisionally accepted by local authorities simply on account of the short loan periods offered by the Local Government Board. Other firms of engineers making a speciality of reinforced concrete have to put up with similar losses, which are doubtless as annoying to them as they are pleasing to structural steel firms. Apart from personal considerations, however, Mr. De Vesian brings forward the point that another result is that "the community has had to spend many thousands of pounds in capital and many hundreds of pounds in maintenance charges in order to obtain the longer loan period for an inferior article." We hold no brief for either material, but cannot avoid the conclusion that the Local Government Board are entirely wrong in placing unnecessary and unfair obstacles in the way of a form of construction which extended experience, including that of important Government Departments, has proved to be worthy of entire confidence.

A Modern Timber Railway Viaduct.

Among other damage caused by the floods in Norfolk was the destruction of the railway viaduct, including three brick arches of the Great Eastern Railway between Fornett and Flordon. In order to rebuild the river piers it was necessary to dam the stream above the site and to construct a temporary timber channel to carry the water past the excavations. Owing to the impossibility of obtaining prompt delivery of steel for the new girder spans, the latter were built in timber at the works of the railway company. This reversion to an obsolete form of construction was one of the results attending recent strikes directly and indirectly affecting the steel industry.

Large Testing Machines.

In a paper read at the Congress of the International Association for Testing Materials Professor Gaetano Lanza gives particulars of machines for testing full-size members in various parts of the United States. The subjoined list includes only those with a capacity of 600,000 lb. and over:—

	Capacity.
American and Steel Wire Co., Pittsburgh	600,000
Pa. timore and Ohio Railroad.....	600,000
Pennsylvania University.....	600,000
Pittsburgh Testing Laboratory.....	600,000
Pressed steel Car Co., Pittsburgh.....	600,000
Illinois University.....	600,000
West Virginia University.....	600,000
Wisconsin University.....	600,000
Lehigh University.....	800,000
Watertown Arsenal.....	800,000

The loyal toasts having been honoured, the President gave the toast of the evening, "The Builders' Benevolent Institution." He said the Institution had now been in existence sixty-five years, and was the only charity of its kind existing in London. The good work that had been done in the past must still go on, and to ensure this funds must be forthcoming. This annual dinner was the only occasion when a general appeal was made throughout the building and allied trades, and it was on the result of this appeal that so many poor and unfortunate men and women had to depend for the pension that the Institution set out to provide. He felt they would all agree that no one worked harder than the present-day builder, and as a rule when success did come it was because nothing had been left undone. The modern builder had to be a man of many parts, combined with an unlimited supply of tact and common sense, but, like many other

trades and professions, the man was not always fitted to the part. Nature had not always endowed him with those gifts both physically and mentally that were required to make success, and even with these combined the fortune of war sometimes went the wrong way. Therefore some had of necessity to go under, and for these unfortunate brothers he appealed. A large sum had to be made up to enable them to continue the benefits for another year. There were many good and generous-minded men connected with the building industry of London, and to them he appealed. Some might plead bad trade, over-competition, cut prices and little or no profits, all of which was to a great extent true, but, after all, what was given in a good cause was only lent and was rarely, if ever, missed, and so long as the Builders' Benevolent Institution existed it should and must be supported. He thought that those builders who had not hitherto supported the cause should now come into line until the Builders' Benevolent Institution was looked upon as something they must all subscribe to as regularly as the postman's Christmas box. It should be brought home to all that it was a duty they owed to themselves, and not leave quite so much of it to their kind friends to whom they were already so much indebted, the merchants and allied trades. The Committee of the Institution was composed of hard-headed, clever business and professional men such as Messrs. Bolding, Stirling, H. Northcroft, B. Carter, James Holliday, Frank May (who was the Hon. Treasurer), and others, and such well-known names as these in the building world were sufficient to guarantee that the funds were economically distributed and that no leakage of any kind could exist; and not only this, but real sympathy was expressed by them all in distributing and managing the funds to the various old and unfortunate people, both men and women, who came to the Institution for pensions and other assistance. There were some sixty odd pensioners on the books relying solely on these funds to keep the wolf from the door, or what was even worse to a great many—the workhouse.

Mr. F. G. Rice, Past-President, then proposed the toast of "The President," giving eloquent expression to the valued work of the President on behalf of the Institution and to the manner in which he had thrown his heart into the cause.

As Mr. Harold Begbie said:—"Man lives, and toils, and dies," "That other men may build upon the labour of his years," and that was what a President of an Institution like theirs did. Might he (the President) be as successful as he (the speaker) was in finding a successor.

The President, who was received with musical honours, briefly and suitably replied.

Mr. Arthur Bartlett, President of the Institute of Builders,

then proposed the toast of "The Architects and Surveyors." Having remarked on the pleasure it gave them to see so many architects and surveyors present that evening, he said that the presence of these gentlemen was doubly welcome, because it showed that they took a very great interest in the welfare of the building trade—an interest on the part, not only of new friends, but of architects and surveyors who had supported them for so many years. He ventured to think that at the present time the work of architects had attained a very high degree of excellence, and he thought that this was exemplified all round in modern buildings which were being executed. Not only that, but he thought that the attention which architects had to give to these works showed what a great amount of study they had to give to the preparation of their designs. Architects had not only to design their buildings, but they had to know all about construction, about engineering—electrical engineering, civil engineering, hydraulic engineering—heating and ventilation, and in fact they must keep in touch with the latest developments in science and invention and in the production of new materials, etc. Moreover, they had to know a great deal about law and be experts in large

numbers of details. How architects managed to acquire the knowledge necessary to carry their professional work was a mystery to him and he did not envy them. He had one complaint to make, however, and that was of the growing tendency to specify so many specialists and sub-contractors. That really a very serious problem, for it threatened practically to wipe out the builder, and if practice were extended it seemed to him that specialists would be appointed for everything. He could not help thinking that with all the experience builders might be entrusted to a little plastering or joinery at a pinch, so far had things gone that the latest seen to be the arrival of the digging specialist. He did not understand why this should be, why the architect should be so anxious to get the builder trouble, for all builders seemed to exist for now was to draw cheques, certain cases the introduction of a specialist was necessary, but he did not think that need to be carried to anything like the extent it is. Builders would in the end be nothing more than financial experts, get prices from a series of sub-contractors add them up, take 10 per cent. off the top, and send that in as a tender, and, of course, was a difficult thing to make a living in that way. Surveyors were always very sympathetic toward the building trade, and builders out of very many difficulties, and it was shown in the last few weeks in regard to Insurance Act, for they had appointed a Committee to consider the question of the bearing of the Act upon their work and had decided to include a clause in their specifications to cover the extra cost of insurance.

Mr. Guy Nicholson, F.S.I.,

replied for both architects and surveyors. In the course of his remarks he said they were all suffering from the effects of low prices, and the evil was increased at the present day, that vicious "Ltd." In past days if a cutting times too fine he ultimately passed through the hands of the Official Receiver; but nowadays while he had to do the same thing, he appeared again and did not seem to be repeating the experience. He used to think that if they had, say, six good firms and had limited competition, that that gave the best result and that they got respectable prices, but his faith had been rudely shaken, for prices were got from leading firms now which came to realise what a tremendous reserve capital those firms must have to draw up to meet their losses. Everyone was hit, round; if work was taken at too low a price it increased the difficulties of the architect or the surveyor, for if an estimate were properly priced and there were comparatively extras on a work the client did not mind so much as when he got a lot of extras to 10 per cent. below prime cost. Extremely low estimates led to a great desire for extras, for was perfectly natural when a man was faced by a loss at the end of a job to want to make it up somewhere, and he looked to architect and surveyor, somehow or other to get him through, forgetting that if he helped this way the architect and surveyor would have a very uncomfortable time with the client possibly leading in the end to an arbitration. Arbitrations were good things for the profession, but not much good to anyone else. In this matter of low prices public bodies were perhaps the worst offenders. They were very particular what wages should be paid to workmen, but they were not so particular about the wages paid to those who put the workmen—that did not seem to matter. These public bodies seemed to think that some miracle they would get the best class of work for the lowest prices. It was going to a bootmaker and trying to get 7s. 6d. a pair of boots equal to a pair worth 25s. Public bodies put their work out to competition, and they were beginning to do the same thing with architects and surveyors. They did not dream of advertising for consultants to conduct their legal cases at the lowest price. He wished that the highest class of builders would make some sort of agreement among

themselves not to tender below prime cost, it seemed to him that they were going on in vicious circles, and that the burdens of Institution like the Builders' Benevolent Society were less able to subscribe. As to subcontractors, he had been speaking to an architect on the subject, and that architect said: "On my last contract the contractor asked me not to give the hot-water work to a specialist, and I took his advice and gave it to him, but ever since I have been afraid to meet the architect."

Mr. J. T. Bolding then read a list of contributions towards the funds of the Institution, the grand total being over 1,000*l.*, including 40 guineas from the President and 100 guineas from the Institute of Builders.

Mr. H. H. Bartlett proposed the toast of "Vice-Presidents, Trustees, Committee, and Stewards," and in the course of his remarks he said he did not suppose there was a charitable institution in London whose funds were administered at such a low cost as they were in that Institution. Payment was made to those who gave their time so willingly and so carefully to the work, and every case was considered on its merits, and help was given only to the right people, especially referred to the work of Mr. May, of the Trustees, and Mr. Bolding, one of the Trustees. No one had given so much time as Mr. Bolding to the work: what he did was well done and for the good of other people.

Mr. Bolding replied, and referred to the splendid reports of the President on behalf of the Institution. As to the Committee, they always gave great care to the various cases that came before them, and no unworthy candidate ever received a pension. The only anxiety the Committee had was that so much depended on the liberality of those who attended that evening, for they always had the fear that they might have to dispose of invested funds, thereby reducing the stability and income of the charity, but so long as they got gentlemen like Mr. Minter to act as their President there need be little fear for the future.

GENERAL BUILDING NEWS.

FREEMASONS' HALL, EDINBURGH.

The new Freemasons' Hall, Edinburgh, which has been erected on the site of the old hall, was designed by Mr. A. Hunter Crawford, of Messrs. Hunter Crawford & Williamson, architects, of Edinburgh, and the cost of the building has been about 40,000*l.* The most important part of the building is the main hall, which provides accommodation for 700 people and is 54 ft. by 64 ft., and the walls of which are covered with a soft grey Eclair marble. A large organ has been erected in this hall at a cost of 1,500*l.*, and has a carved oak front designed by Messrs. Scott, Morgan, & Co. The building also includes board-room, offices, committee-rooms, museum, library, smoking-room, kitchen, etc. Electric lighting is used throughout, and the figure of St. Andrew over the front doorway was executed by Mr. H. S. Milner, A.R.S.A., and is in Pasturehill stone from Cumberland.

BUILDING EXTENSION, HEATON.

The additional premises which have been erected for Messrs. F. Beavan & Son were designed by Messrs. Marshall & Tweedy, architects, of Newcastle. The building is four stories high and is surmounted by a glass dome. The floors are connected by electric lifts, and the fittings throughout are of light metal. The lighting is by electricity, and the heating on the low-pressure hot-water system. The firms engaged on the work are:—Contractor, Mr. Alex. Peingie, Gateshead; Messrs. Henry Walker & Son, Ltd., Newcastle; installed the heating system; Messrs. Falconer, Cross, & Co., the electric lighting; and Messrs. Smiths, of London, the electric clocks.

NEW WORKS, GLASGOW.

New works and offices are to be erected for Messrs. John Wallace & Sons, Ltd., at a cost of about 20,000*l.*, from plans prepared by Mr. William Baillie, architect, of Glasgow. The works will consist of machine and fitting shops, foundry, store, pattern, paint, and new shops, and the buildings will cover about 2 acres of ground.

TRADE NEWS.

Under the direction of Messrs. Thomson & Jones, architects, Glasgow, Boyle's latest

"air-pump" ventilators have been applied to Free Church College, Glasgow.

The Electric Palace of Varieties, Belper, is being ventilated by means of Shorland's patent exhaust roof ventilators and special inlet ventilators, supplied by Messrs. E. H. Shorland & Brother, Ltd., of Failsforth, Manchester.

WATER SUPPLY, PETERHEAD.

The tender of Messrs. M'Adam & Son, contractors, of Aberdeen, has been accepted for the construction of the new reservoir at Forehill at the sum of 6,936*l.* 11*s.* 6*d.* The engineer of the works is Mr. W. D. Ironside, of Aberdeen. The capacity of the new reservoir will be about nine million gallons, and it is intended to have the basin ready for containing water by next summer.

DUDLEY BUILDING TRADE.

The bricklayers, carpenters, and labourers in the building trade at Dudley have jointly approached their employers with a view to securing advances in wages. The bricklayers and carpenters ask for an increase of 3*d.* per hour and the labourers 1*d.* per hour. The employers will discuss the matter at a Conference, and it is generally expected that the requirements of the men will be favourably considered.

BUILDING TRADE PROPOSALS.

Following the failure in the recent ballot to bring about an amalgamation of the building trade unions, the Parliamentary Committee of the Trade Union Congress propose, it is stated, that a central fighting fund shall be established, controlled by executives representing the subscribing societies, and leaving complete autonomy to each union so far as friendly benefits are concerned.

APPLICATIONS UNDER LONDON BUILDING ACTS, 1894 to 1909.

At Tuesday's meeting of the London County Council the following applications under the London Building Act were dealt with. (The names of the applicants are given in parentheses):—

Lines of Frontage and Projections.

Bethnal Green, North-East.—Illuminated sign in front of Nos. 62, 64, and 66, Green-street, Bethnal Green (Mr. F. E. Harris for Picture Amusements, Ltd.).—Consent.

Hamstead.—Retention of glass screens to a porch and wooden balustrading over the bay-windows and porch at No. 23, Belsize-avenue, Hampstead (Messrs. F. Troy & Co., for Mr. J. C. Biggs).—Consent.

Kensington, North.—Re-erection of the Latimer-road Mission building, Blechynden-street, Kensington (Mr. F. Warman for the Ragged School Union).—Consent.

Kensington, South.—Erection of a porch at No. 123, Church-street, Kensington (Messrs. Chatterton & Sons for Admiral Slade).—Consent.

Lewisham.—Erection of a one-story shop in front of No. 55, Ennersdale-road, Lewisham (Mr. R. Coppin for Mr. J. Strickland).—Consent.

Lewisham.—Erection of Nos. 211 to 221 (odd numbers only), inclusive, George-lane, Lewisham, and of a building on the northern side of George-lane (Mr. F. E. Wright).—Consent.

Lewisham.—Erection of porches, bay-windows, oriel-windows, and sham half-timber work to ten houses on the north-western side of Beckenham-lane, London (Messrs. R. Sawyer & Son).—Consent.

St. George, Hanover-square.—Erection of a projecting sign at No. 20, Conduit-street, Regent-street (Messrs. Waring & Gillow, Ltd.).—Consent.

Southwark, West.—Erection of a fascia in front of the one-story shop at No. 47, London-road, Southwark (Mr. P. H. Adams).—Consent.

Strand.—Projecting iron and glass shelter in front of Nos. 3 and 4, Coventry-street (Messrs. Gilbert & Constanduros).—Refused.

Wandsworth.—Retention of bay windows, porches, sham half-timber work, and barge-boards to three houses on the eastern side of Oakley-road, Streatham (Messrs. J. S. Quilter & Son for Messrs. Chapple & Utting).—Consent.

Whitechapel.—Addition to the Alexandra wing of the London Hospital (Mr. J. G. Oatley).—Consent.

Width of Way.

Hammer-smith.—Erection of buildings on the southern side of Harrow-road, Hammer-smith (Messrs. J. S. Quilter & Son).—Consent.

Width of Way and Lines of Frontage. **Marylebone, West.**—Erection of an addition to No. 27, Grove End-road, St. Marylebone, next to Garden-road (Messrs. C. Smith & Son for Mr. F. Hodgson-Roberts).—Consent.

Marylebone, West.—Addition to the "Three Arts" Club, No. 194, Marylebone-road, St. Marylebone, to abut upon Marylebone-road and Northumberland-street (Mr. C. Stanley Peach for the Governors and Managing Committee of the Three Arts Club).—Refused.

Worwood.—Two greenhouses on the northern side of Water-lane, Brixton (Messrs. G. Beard & Sons).—Consent.

St. George, Hanover-square.—Projecting feature at the Berkeley Hotel, Berkeley-street, Piccadilly (Mr. R. Griggs for the Berkeley Hotel Company, Ltd.).—Refused.

Width of Way and Space at Rear.

Hammer-smith.—Re-erection of a building on the northern side of King-street, Hammer-smith, to abut upon the eastern side of Dimes-place (Mr. J. W. Hawkins).—Consent.

Lines of Frontage and Construction.

Battersea.—Erection of a temporary wood and iron motor shed at the rear of No. 33, Spencer-road, Wandsworth Common, next to North Side (Mr. T. Wilson).—Consent.

St. Pancras, South.—Retention of an advertisement hoarding at Nos. 155 to 165, Euston-road, St. Pancras (Mr. H. B. Price for the Borough Theatre Billposting Company, Ltd.).—Refused.

PROJECTED NEW BUILDINGS IN THE PROVINCES.*

ASHFORD.—Proposed baths; Mr. William Terrill, Surveyor, Urban District Council Offices, Ashford.

Barnoldswick. Plans have been passed as follows:—Fifteen houses, Harrold-street, for Mr. Sandy Harmer; twenty-six houses, Colindale-street and Bracewell-street for Mr. J. Downs; four houses, Dam Head, and five shops, Gisburn-road.

Beverley.—School, Mill-lane (3,800*l.*); Mr. Frederick Singleton, builder, Blenkins-street, Hull.

Blackpool.—Two shops and four houses, Whitgate-drive, for the Industrial Co-operative Society.

Bolton.—Extensions to cottage homes (12,253*l.*); Mr. J. Cocker, builder, 35, Walkden-road, Walkden, Manchester. Conversion of Towneley's House into receiving home (3,055*l.*); Mr. W. Cunliffe, builder, Stanley Works, Deane-road, Bolton.

Bredbury.—Extensions to premises for Messrs. Bridson & Fowler, Ltd., flour mill machinery manufacturers.

Brierley.—Twenty houses for the Hodrold Coal Company, Ltd.

Bromborough.—Extensions to premises of Associated Enterprises, Ltd., Bromborough Port Estate, for Messrs. Lever Brothers, Ltd., Port Sunlight; warehouse for the Knowles Oxygen Company, Ltd., Walsall-street, Wolverhampton.

Bromley.—Alterations and additions at Isolation Hospital; Architect, Guardians' Offices, Park House, Bromley.

Buckburn.—School; Mr. G. Bennet Mitchell, architect, 143, Union-street, Aberdeen.

Castleford.—Proposed additions at school (1,200*l.*); Rev. W. A. Hewitt, Vicar, Parish Church, Castleford.

Castlereagh.—Fifty houses; Messrs. Gibson & Boyd, builders, care of the Clerk, Rural District Council Offices, Castlereagh.

Chester-le-Street.—Additions to offices for the Pelton Colliery Company, Ltd., Milbura House, Newcastle-on-Tyne.

Clayton-le-Moors.—Proposed additions to Sunday school for the Trustees.

Clydebank.—Fire-station and copper store for Messrs. John Brown & Co., shipbuilders.

Coalville.—Mortuary; Mr. L. L. Baldwin, Surveyor, Urban District Council Offices, Coalville.

Cockley.—Additions to works for the Chaddeley Manufacturing Company.

Coppor.—Church (5,880*l.*); Six Chapels Nicholson, architect, 2, New-square, Lincoln's Inn, W.C.

Crewe.—Parish hall off West-street; Rev. W. Scholus, Vicar, St. Barnabas Church, Crewe.

Cullen (Banffshire).—Proposed poor house (1,000*l.*); Surveyor, Parish Council Offices, Cullen.

Dalmarnock.—Electricity generating-station; Mr. W. W. Lackie, Electrical Engineer, City Hall, Glasgow.

Darlington.—Additions at workhouses (560*l.*); Mr. C. H. Leach, Clerk, Guardians' Offices, Darlington.

Denby.—Eight houses, Over-lane; Messrs. Harris & Hunt, builders, Marehay, Ripley, Derby.

* See also our list of Competitions, Contracts, etc., on another page.

Denton.—Extensions to premises, Wilton-street, for Messrs. Wilde & Booth, felt hat manufacturers.

Dorset.—Schools, Portland, Uphill, and Underhill; County Surveyor, Shire Hall, Dorchester.

Dover.—Post-office, Priory and Newbiggin streets; Messrs. Ellis Brothers, builders, New Romney. Six houses, Ashby-avenue; Mr. G. Munroe, builder, Union-road, Dover.

Dudley.—Proposed rebuilding of works for Mr. John Buckles.

Dukinfield.—Proposed Sunday-school for the Trustees, Baptist Church, Dukinfield.

Co. Durham.—Schools, Blackhall Mill, Atherley, Fishburn (4,600l.), and Peases West; also enlargement of Ferryhill Station School (3,955l.); Mr. W. Rushworth, Architect, Shire Hall, Durham.

Durham.—School, Chilton-lane (3,000l.); Mr. W. Rushworth, Architect, Shire Hall, Durham. Bath house at Asylum (364l.); Mr. T. Coates, jun., builder, 50, Hallgate-street, Durham.

Eastry.—Children's homes off Gore-lane; Mr. F. S. Cloke, Clerk, Eastry Guardians' Office, Sandwich.

Fareham.—Chancel and organ chamber (2,458l.); Vicar, Holy Trinity Church, Fareham.

Farnworth.—Church school, Kearsley Moor; Mr. F. R. Freeman, architect, Smalley's chambers, Bolton. Fire-station (2,200l.); Mr. R. W. Cass, Surveyor, Urban District Council Offices, Farnworth.

Fleet.—School (200 places); Mr. D. T. Cowan, The Castle, Winchester.

Foggington.—Proposed school; Mr. J. E. Young, County Education Offices, Devon.

Forden.—Conversion of workhouse into lunatic asylum; Mr. G. A. Hutchings, Surveyor, County Hall, Welshpool.

Grays Barton.—Church institute; Mr. H. W. Sheffield, architect, Wallingborough.

Glasgow.—Works, Paton-street, for Messrs. John Wallace & Sons, Ltd., agricultural engineers, Graham square, Glasgow. Alterations and additions to premises, corner of Paisley-road West and Stanley-street, Kinning Park, for the Savings Bank of Glasgow. Four houses, Mount Annan-drive, Mount Florida; Messrs. Robert Sproul & Son, builders, Bank-street, Cambuslang, Glasgow. Three houses, Netherpton-road, Mount Florida; Mr. Richard Henderson, architect, 121, St. Vincent-street, Glasgow. Buildings, Hyde-park-street, for Messrs. Bilsland Brothers, bakers, Glasgow. Church, Newlands, for the Merrylea Established Church; Mr. P. McGregor Chalmers, architect, 55, Bath-street, Glasgow.

Glass Houghton.—Seven houses for the Co-operative Society, Glass Houghton.

Headingley.—Adaptation of Oak House into flats; Mr. W. Towers, Surveyor, City Hall, Leeds.

Hednesford.—Proposed school; Mr. J. P. Gardner, Education Offices, Cannock. Helensburgh.—Two houses, West Argyle-street; Messrs. T. & J. Low, architects, 18, Hamilton-street, Greenock.

Highbury.—Premises, Church-street, for the Highbury Social Club and Institute.

Holyhead.—Golf house (1,700l.); Mr. J. Hughes, builder, King's-road, Holyhead.

Huddersfield.—Proposed additions at hospital (1,500l.); Mr. D. J. Bailey, Clerk, Colne and Holme Joint Hospital Committee, Yorks Bank-chambers, Huddersfield.

Hyde.—Proposed vicarage; Vicar, St. Mary's Church, Newton.

Ipswich.—Proposed goods depot (50,000l.); Mr. John Wilson, Engineer, Great Eastern Railway Company, Liverpool-street Station, E.C.

Kirkburton.—Six houses; Mr. Fred. Hobson, Surveyor, Urban District Council Offices, Kirkburton.

Langrish.—School; Mr. J. Taylor, surveyor, The Castle, Winchester.

Lees.—Proposed additions to premises for the Rome Mill Company, Ltd., cotton spinners, Springhead, Oldham.

Letchworth.—Proposed fifty houses (800l.); Surveyor, Parish Council Offices, Letchworth. Levenshulme.—School (2,000l.); Vicar, St. Peter's Church, Levenshulme.

Lincoln.—Tuberculosis dispensary, Bank-street; Mr. R. McBrae, Engineer, Town Hall, Lincoln.

Liverpool.—Theatre; Messrs. Naylor & Sale, architects, Market-place, Derby.

Langsamlet.—Tower to church; Mr. Glen-climbing Moxham, 39, Castle-street, Swansea.

Lowestoft.—Proposed concert pavilion at Sparrow's Nest; Mr. G. H. Hamby, Surveyor, Town Hall, Lowestoft.

Lymington.—Cottage hospital; Mr. H. Benjamin, architect, 14, High-street, Lymington.

Margate.—Proposed new buildings, rear of East Cliff House; Mr. W. T. Hatch, Engineer-

in-Chief, Metropolitan Asylums Board Offices, Embankment, E.C.

Markse.—Isolation hospital; Mr. H. D. Woodcock, Surveyor, Rural District Council Offices, Guisborough.

Meltham.—Offices at Spink Mire Mills for Messrs. Quarumby & Sykes, Ltd., rag merchants.

Middleborough.—Dispensary; Mr. S. E. Burgess, Surveyor, Town Hall, Middleborough. Millfield.—Engineering works, Diamond Hall site, for Messrs. H. C. Davis, Ltd., mill and factory furnishers, Holmside, Sunderland; pottery, Diamond Hall, for Mr. W. L. Patison, Newcastle.

Newcastle.—Theatre, Tosson-terrace; Mr. P. L. Brown, architect, Pearl-buildings, Newcastle.

Northfleet.—Four houses, Downs-road, for the Gravesend and Milton Waterworks Company.

Nuneaton.—Alterations at infirmary; Mr. C. Blakeway, Clerk, Guardians' Offices, Nuneaton.

Oakengate.—Warehouses adjoining railway for the Co-operative Society.

Paisley.—Reconstruction of part of works for the Gleniffer Soap Company, 3 and 4, Lonend, Paisley.

Pembroke (Ireland).—Houses, Ringsend and Sandymount (12,000l.); Surveyor, Urban District Council Offices, Pembroke.

Petersfield.—Alterations to infirmary (620l.); Mr. A. J. Mackarness, Clerk to Guardians, High-street, Petersfield.

Pinvin.—Sixteen houses; Messrs. Dicks & Waldron, architects, Market-street, Eversham.

Portsmouth.—Boiler-house and chimney-shaft at workhouse (2,560l.); Mr. E. H. Mitchell, Clerk, Portsmouth Guardians' Offices, Southsea.

Rastrick.—Proposed church (5,000l.); Vicar, St. John's Church, Rastrick.

Rattray.—Church, Balmoral-road (2,500l.); Mr. Lake Falconer, architect, Bank-buildings, Blairgowrie.

Raunds.—School (6,107l.); Mr. Robert Marriott, builder, Higham-road, Rushden.

Rotherham.—Congregational church, Kimberworth-road (2,800l.); Mr. J. Totty, architect, Moorgate-street, Rotherham.

St. Stephen's.—Houses (566l.); Mr. W. Petherick, builder, Nottermills.

Sale.—Council offices (7,000l.); Mr. William Holt, Surveyor, Urban District Council Offices, Sale.

Southampton.—Convenience, Bitterne Park (780l.); Mr. J. A. Crowther, Engineer, Town Hall.

South Kirby.—Five houses for the South Kirby, Hemsworth, and Featherstone Collieries, Ltd., Ropergate House, Pontefract.

Springhead.—School, off Higher Turf-lane, Austerlands; Mr. W. V. Dixon, Secretary, West Riding Education Offices, Wakefield.

Stourport.—Picture-house, Lichfield-road, for the Stourport Electric Company, Ltd.

Swinton.—Technical school, Cromwell-road; Mr. W. T. Postlethwaite, Education Offices, Swinton and Pendlebury, Lancs.

Tenterden (Kent).—Proposed school; Mr. W. H. Robinson, architect, Caxton House, Westminster, S.W.

Thirsk.—School (100 places); Mr. J. C. Wrigley, Secretary, North Riding of Yorks Education Offices, Northallerton.

Troon.—Extensions to laundry for Messrs. R. S. Wilson & Son, House, St. Madden's-street (700l.); Messrs. Muir & Co., builders, Troon.

Twickenham.—The following plans have been passed:—Additions to No. 64, Cole Park-road, for Messrs. Catherine Brothers, Ltd., additions to Red Lodge, Strawberry Hill-road, for Mr. E. Benfield.

Tynemouth.—Two schools; Mr. J. W. Linton, Education Offices, Tynemouth. Priory Church (7,000l.); Mr. A. E. Plummer, architect, 13, Grey-street, Newcastle-on-Tyne.

Warsop.—School; Mr. A. Greenwood, builder, Mansfield.

Wellington.—Institute (5,500l.); Mr. J. L. Holland, County Education Offices, Norton.

Whaley Bridge.—Sunday-school; Vicar, Christ Church, Whaley Bridge.

Whitechurch (Cardiff).—One hundred houses, Rhubina Garden Suburb, near Whitechurch, for the Housing Reform Company, Ltd., 3, Park-place, Cardiff.

Whitley Bay.—Enlargement of Pavilion Theatre for the proprietors.

Winchester.—Picture palace opposite General Post Office for Messrs. J. & J. Simpkins.

Wolverhampton.—Firemen's house; Mr. G. Green, Engineer, Town Hall, Wolverhampton.

Wresle.—Church, for the Vicar, St. John of Beverley Church.

Yorks.—Schools, Newton Hill and Althofts; Mr. J. Stuart, County Hall, Wakefield.

Ystradgynlais.—Sixty houses; Surveyor, Urban District Council Offices, Ystradgynlais.

INTERCEPTING TRAPS AND HOUSE DRAINS.

SIR MAURICE FITZMAURICE presided Tuesday evening over the adjourned ordinary meeting of the Royal Sanitary Institute at Buckingham Palace-road, to discuss further the paper read the previous week by Mr. H. P. Boulnois on "The Report of the Departmental Committee on Intercepting Traps and Drains."

Mr. C. H. Shenton considered the report so overwhelming against intercepting traps that it was a waste of time to go on discussing the merits of the trap, and they ought rather to consider how to apply the teachings of the report, because it would certainly have to be applied.

Mr. Cooper (Wimbledon) questioned evidence on which the Committee based their conclusions as to the non-dangerous character of sewer-gas. He also exhibited a plan showing how the drains were dealt with in some parts of Wimbledon, and remarked that one of the largest builders had told him that he had trouble with stoppages whatever where the drains were dealt with in this way.

Mr. Johnson (Wimbledon) pointed out that the blocking of intercepting drains was largely due to misuse, and if they were to condemn apparatus on that ground they would have to condemn drains.

Mr. Walter Jennings said that competent authorities had practically agreed that danger lurked in the smaller private drains rather than in the larger public sewers, while great importance and attention had hitherto been paid to the disconnection of private from the public drain, little or no had been given to the disconnection of water closets from soil pipes or house drains. He submitted that it was the duty of sanitarians to make secure the first line of defence, and remove the house impregnable to any incursion from the house drains before considering the main sewer, which, although great, was admittedly of secondary importance.

The discussion was continued by Mr. Porter, Mr. Scott Moncrieff, Mr. Mallet, Mr. F. O. Smith, Mr. A. J. Martin, Mr. Cotton, Mr. Gorinot, and Mr. Frith.

Mr. Boulnois, in reply, said that after a long discussion they appeared no nearer conclusion than when they started, but the discussion had been very useful. He thought the intercepting trap would have to go, but if so, the question was what precautions would they take beyond those they had already taken? First of all, their sewers must be constructed of proper size, with proper self-cleansing gradients and with sufficient ventilation. The drains must be connected at the proper level with the sewer in order to avoid splashback, which was a very important thing. They would also have to be exceedingly carefully made to avoid leakage. The soil pipe must be more carefully constructed and connected with the drain, and all sinks, baths, rain-water pipes, and waste must be disconnected and trapped.

The water-closet must be doubly sealed. The again, if the intercepting trap was to be done away with he thought iron pipes would come into almost general use, and personally believed in them thoroughly. It was only question of 25 or 30 per cent. more cost, and there was a sense of security about an iron pipe which had less joints and was stronger, which would make him happier to live in a house fitted with them than in one with stoneware pipes. What he hoped, however, was that they would get a better flush, for the present two gallons allowed was absurd. They ought to have a four-gallon flush, or three gallons at the least. Suggestions had been made that the Institute should further investigate the matter, but what more could they do after the report of the Departmental Committee? They might send a circular to all the authorities, and they would receive replies from half of them in favour of the trap and as many against. He thought they must accept the conclusion that the trap, although not absolutely condemned, was found in places to have caused trouble, and that therefore in future there must be a permission by-law, and the Local Government Board would have to withdraw their prescription and it must be left to the officials responsible for each town to do what they pleased on the merits of each case. At the same time, no one could deny that the people of this country were healthier than they were and that there was far less zymotic disease.

METROPOLITAN ASYLUMS BOARD.

At the fortnightly sitting of the Metropolitan Asylums Board on Saturday last week the following matters were dealt with:—
East Cliff House.—It was decided that the Works Committee be authorised to engage an architect for the purpose of reporting as to the accommodation which could most advantageously be provided on the site at the rear of East Cliff House.
North-Western Hospital.—It was agreed to ask the approval of the Local Government Board of modified proposals for the provision of additional isolation accommodation at this hospital. The first proposal was estimated to cost £2,600, but no estimate is given of the modified proposals.

METROPOLITAN WATER BOARD.

The following matters were dealt with at the monthly meeting of the Board held on November 11:—
Central Offices.—The General Purposes Committee reported having had their attention called to the site and buildings of King's College Hospital, Portugal-street, which, they pointed out, would afford ample accommodation not only for the existing staff, but for future requirements, and it was decided that a further report on the matter be presented at the next meeting.
Land at Littleton.—It was decided to purchase 589½ acres of land at Littleton, required in connexion with proposed new reservoirs, at 1,000, per acre, exclusive of timber.
London Building Act.—On the recommendation of the Works Committee, it was agreed to apply to Parliament next session for powers empowering the Board from the operation of the London Building Acts in respect of all buildings, structures, and works other than dwelling-houses.
Cottages.—An estimate of 1,000, was approved for the provision of cottages at the North Green Pumping-station, and it was decided to invite Messrs. J. Chessum & Sons to carry out the work at a schedule of prices.

LEGAL COLUMN.

Gas Company's Rights to Break up Streets.

In the case of *Schweder v. Worthing Gas Light and Coke Company*, which we noted the *Builder*, December 15, 1911, it will be remembered that the plaintiff, who owned land at both sides of a lane which was used as a public thoroughfare under the control of the Worthing District Council, obtained a mandatory injunction against the Gas Company, the defendants, because they had laid a main through a part of the roof of a tunnel which he had constructed under the road to connect the two portions of his property. Under the *Works Clause Act, 1847* (which was incorporated by the private Act of the Company), by sect. 6, power is given to the undertakers to break up streets, sewers, drains, or tunnels, and by sect. 7 they must not lay down or place any pipe into, through, or against any building, and by sect. 10 they must make good and reinstate. In that trial the Court found this to be a "building" and not a "tunnel" within the meaning of the Act, and it was further held that even if the structure was a "tunnel" the defendants were in default for not properly reinstating the erection. Under sect. 7 the undertakers cannot lay any pipe on land "not dedicated to public use" without the consent of the owner. The findings above set out rendered unnecessary for the Court to decide whether the land beneath the highway was dedicated to public use. The top of the subway was about 5 in. below the road surface. The mandatory injunction was suspended, and the Gas Company now proposed to lay the pipes only 1 in. below the surface, supported by pillars of concrete, and in a second action the plaintiff took this further point that the land beneath the surface of the highway was "not dedicated to public use." The Court, however, in this case decided against him, on the ground that sect. 6 applied to a road dedicated to the public, and that the limitation imposed by sect. 7 did not apply to the facts of this case, or override the provisions of sect. 6. It is to be observed that the two sections are by no means inconsistent, as, sect. 6 gives power to break up streets, etc., whereas sect. 7 relates to private structures and private land undedicated to the public.

Trade Union Law.

The case of *Dallimore v. Williams & Jesson*, which we noted in the *Builder*, May 5 last, has

been carried to the Court of Appeal, and raises an interesting point under the Trade Disputes Act, 1906.

The action was brought by an employer against certain officials of a trade union, who, it was alleged, had induced his employees to break their contracts with him; it was also brought for libel and slander. In the result the jury gave a verdict for the plaintiff as against both defendants for £500, on the ground of conspiracy and the inducement to break the contracts, and for 1000, against one of the defendants for libel. The slander was ruled by the Judge not to have been made out. In the Court of Appeal practically only one point had to be considered, which was whether on the question of conspiracy, etc., the defendants were protected by sect. 3 of the Trade Disputes Act. In answer to one of the questions left to the jury by the Judge they had found that there was no trade dispute in contemplation or existence, but he had directed them that, under the Act, a trade dispute must be a dispute between an employer and his workman or between the workmen, and not, as in the present case, between a trade union and the employer. The Court of Appeal held this to be a misdirection, and a new trial was ordered.

The definition of "trade dispute" in the Trade Disputes Act, sect. 3, subsect. 3, is "any dispute between employers and workmen, or between workmen and workmen which is connected with the employment or non-employment, or the terms of the employment, or with the conditions of labour of any person; and the expression 'workman' means all persons employed in trade or industry, whether or not in the employment of the employer with whom a trade dispute arises." In the case of *Conway v. Wade* (the *Builder*, August 7, 1909) the House of Lords, whilst considering the question as to whether a jury were justified in the circumstances of that case in finding that no trade dispute was in contemplation or existence, had not to decide the exact point raised in this case of the parties to a dispute. Under the above definition of "trade dispute," and the parties to such a dispute, it may some day be argued that where the dispute is between a union and employers or workmen the union is not "a person employed in trade or industry," and that agency for the members as workmen must be strictly proved.

In connexion with the decision of the Court of Appeal in the above case two other points may be noted. One of the findings of the jury was that the acts complained of were done out of spite; but the Court held that an element of malice would not deprive the defendant of the protection of the Trade Disputes Act if he could show he acted in contemplation or furtherance of a trade dispute. The finding of the jury on the question of the libel was left undisturbed, apparently on the ground that the interviews granted to the Press by the defendant could not be deemed to have taken place in furtherance of the trade dispute; but the respondents' Counsel was not called upon to argue this part of the case, and no detailed judgment was delivered upon it. The question whether sect. 4 of the Trade Disputes Act applies to libels, so as to prevent the founders of a trade union from being liable for libel, is one of extreme importance. If the libel is published in contemplation or furtherance of a trade dispute the Court of Appeal have held the section to apply (see *Vacher & Sons v. London Society of Compositors*, the *Builder*, April 12 last). Lord Justice Farwell, however, strongly dissented, and it is to be hoped that the point may one day come before the House of Lords. Since the above passage was written, the House of Lords have heard the appeal in *Vacher's* case, and decided that sect. 4 applies to libels, and that under that section the tort need not have been committed in contemplation or furtherance of a trade dispute for the protection of the section to apply.

The decisions of the Trade Disputes Act certainly tend to show the difficulties and uncertainties involved when special privileges are sought to be conferred on a limited class.

Claims for Abandonment of Undertakings.

When a statutory undertaking has been promoted, and persons have entered into agreements on the basis of the undertaking being carried through, on its abandonment it is sometimes difficult to ascertain whether or not a claim can be substantiated against the Parliamentary deposit.

In the recent case *re West Yorkshire Tramways Bill, 1906*, the applicant was the leaseholder on a long term of years of certain property, including a shop and house on a corner site. He agreed to sell part of this tion or furtherance of a trade dispute for the Tramway Bill. The Bill was passed and the above premises were assigned to the tramway company. By one of the sections of the Act it

was provided, for the protection of the Urban District Council, and unless otherwise agreed in writing between the Council and the tramway company, that before the tramway was opened certain street widening operations should be carried out. The applicant had another triangular piece of land behind the premises he had disposed of, and had the street-widening scheme been carried out he would have had a corner building site. Whereas, on the abandonment of the scheme for the tramway, his site was left blocked by the buildings he had disposed of. The Court disallowed his claim against the deposit on the ground that any diminution of value was due not to the abandonment of the tramway scheme, but of the collateral street-widening scheme. The law on this subject was very clearly laid down by the Court of Appeal in the case, *Southport and Lytham Tramroad Act re Hesketh*, which will be found noted the *Builder*, January 20, 1911. The test to be applied is, does the breach of covenant complained of necessarily follow from the abandonment of the undertaking? Or is the case such that, although the undertaking is abandoned, the covenant could still be performed? In the case under discussion it was held that the tramway scheme and the street-widening scheme were not so connected as the abandonment of the tramways did not necessarily cause the street widening to be also abandoned.

LAW REPORTS.

KING'S BENCH DIVISIONAL COURT.
(On Friday, last week, before Mr. Justice CHANNELL and Mr. Justice AVORY.)

Metropolitan Water Board v. Johnson & Co. Defendants' Appeal.

A POINT of the utmost importance to builders, involving the legality of a duplicate charge for water used in building operations, was discussed in this appeal by the defendants (who are builders), from a decision of Judge Woodfall, in the Westminster County Court.

Mr. Danckwerts, K.C., and Mr. McKiehlwait were for the builders; Mr. Clavell Salter, K.C., and Mr. Goodland representing the Water Board.

Mr. Danckwerts said the money involved in the case was only 14s. to 15s., but the matter in dispute was constantly cropping up, and it was regarded as of the utmost importance that it should be decided by the High Court. The War Office who were interested in the case, considered it one of very great importance. Messrs. Johnson & Co. were really nominal parties—the real party being the Secretary of State for War. Messrs. Johnson & Co. had a triennial contract with the War Office in connexion with the barracks at Hounslow. It was entered into between the War Office and the builders, whereby the contractors agreed, for three years, to do any job required at the barracks, according to a schedule of prices and terms.

Among the things the War Office agreed to supply to the builders was any water which might be necessary to carry out the job, whether it was building or repairs that was being done. They agreed to supply this water free. In this particular case the job that came along was a sitting-room and bedroom for the nursing staff at the barracks, and the contractor started on the work. The War Office had a supply of water by meter from the Water Board for domestic and non-domestic purposes, and, in accordance with their contract, they supplied the builders with water which they had received by meter and paid for.

Mr. Justice Channell: Does this case depend on special rights of the Crown, or is it similar to the case of any ordinary person, taking water from the Metropolitan Water Board, who may allow a builder to use it when he wants to add another story to his premises?

Mr. Danckwerts said it was the same in either case, and what was complained of was that the Metropolitan Water Board took up this position; they said, in effect, "We are very superior people—we have a special privilege of insisting upon a builder taking water for any job he does, upon particular terms. We don't care whether we have been paid by the War Office or not; we insist upon second payment by the builder, on special terms."

In order to make that clear (proceeded Mr. Danckwerts) the Water Board wrote this:

"I am informed by the District Engineer that you are using the Board's water for building purposes at the above-named site, and I shall be obliged if you will fill in and return the enclosed form of application for a building supply in order that an account may be prepared and sent to you for payment."

A similar letter was sent the next day to the Officer Commanding at Hounslow Barracks, and he was called upon to compel the builders also to pay. The latter part of the communication was couched in these terms:

"I am acquainting you with the fact that, as the Water Board will not be prepared to make any allowance from your meter supply," and so on.

In other words, said Counsel, "We don't care whether you pay or not; the builder must pay." Later, the request was repeated with more solemnity, and so forth, by the Water Board's solicitor, and the County Court action was the ultimate sequel.

Counsel added that, in sects. 16 and 17 of the Water Board Charges Act, 1907, there was a provision inserted specially to meet this difficulty of the builder. It said that the builder who required a supply of water should be entitled to a supply by meter as though he were an occupier of the premises. He (Mr. Danckwerts) contended that the builders in this case were justified in refusing to pay for water which the War Office was already paying for and had contracted to supply to the builders free.

Mr. Clavell Salter, replying for the Metropolitan Water Board, said there was a provision in the Act, which they freely availed themselves of, enabling the Water Board to supply water by a contract made *ad hoc*, which was so in this case. This water was supplied by meter under contract with the War Office, who were to pay in practically the same way as an ordinary consumer. No particular consumer was dealt with specially; they were all classed together as "domestic" or "non-domestic," "by meter" or "without meter." The builder was an important consumer, but a very unprofitable one compared with other consumers. He did not, in connection with his jobs, take a permanent supply, which went on from year to year with a minimum of office expense and a maximum of profit. His supply gave the maximum of trouble in the office for the minimum of profit, and the Legislature had thought fit to deal especially favourably with the Water Board under sect. 17, and, he suggested, it was for the reason he had given. The Water Board could not compel the builder to take their supply. If he took and used and consumed water, of which the Water Board had a monopoly to supply in the metropolis, he must pay for it. There were two points involved in this case. There was the very important point which both parties were very desirous of having determined, viz., whether the supply was to be done—whether a meter consumer could lawfully allow his meter supply to be used by a builder upon his premises. That was the main point. Then there was the minor point of whether the absence of request by a builder—i.e., where the builder had refused to send in a request for a supply—enabled him to escape all liability to the Water Board for payment.

Mr. Justice Avory: Your first point is decided against you by this statute?

Mr. Clavell Salter: I don't think so.

Mr. Justice Channell: If your first point is good, the second does not apply. If the ordinary occupier cannot supply the builder, then the builder will have to "require it."

Mr. Clavell Salter said he would argue the first point, which was the main one in the case. "What I contend," he said, "in regard to sects. 16 and 17 of the Act is this—That what Parliament has said about builders is this: as soon as you get a builder, within the area of supply, who 'requires'—which, I submit, means 'needs to take'—"

Mr. Justice Avory: You say it does not mean "makes a requisition"?

Mr. Clavell Salter: I say that and the statute says:—Whenever you find a builder within the limits of supply who needs to have a supply on his building job, then he is to be dealt with in the manner prescribed in sect. 16, which gives rights and liabilities of the consumer in this way; it says, with reference to the duty of the Board to supply water: "The Board shall, at the request of any owner or occupier of any premises, who requires, for use on such premises, supply water by measure."

After further argument Mr. Justice Channell said, in view of the general importance of the question raised in the case, the Court would take time to consider its decision.

Judgment was accordingly reserved.

KING'S BENCH DIVISIONAL COURT.
(Thursday and Friday, last week, before Mr. Justice CHANNELL and Mr. Justice AVORY.)
Coststone Decoration Company v. Chessum & Sons: Defendants' Appeal.

In this case Messrs. Chessum & Sons, builders of Finsbury, successfully appealed

from a decision of Judge Rentoul in the City of London Court.

Mr. J. A. Scott appeared for the appellants, and Mr. J. B. Eames for the respondents.

Mr. Scott said Messrs. Chessum & Sons were well-known builders. The claim in the case arose in respect of work done by the Coststone Decoration Company to the boardroom of a cinematograph theatre in Oxford-street, W., belonging to the Cinematograph Theatre Company, Ltd. Messrs. Chessum & Sons were the general building contractors of the theatre, and the Coststone Decoration Company subcontractors. The amount in dispute was small—only 20*l.* in fact—but the case involved an important question as to whether a subcontractor was to be paid on an architect's certificate. The County Court Judge found in favour of the plaintiff company on the grounds (1) that, after the work in question was done, Messrs. Chessum & Sons accepted a certificate from the architect (Mr. Ward) to a certain amount, on the assumption that they would pay the subcontractors; and (2) that the Coststone Decoration Company were, in fact, subcontractors. Counsel said he would submit that the work in question, which related to a mantelpiece, was entirely outside the contract, because the architect said it was within the prime cost items, as there was a provision in the contract for 100*l.* for hearths and stoves, and he read that as including the mantelpiece.

Mr. Eames replied with arguments in support of Judge Rentoul's finding, and the hearing was adjourned.

The judgment of the Court was delivered on Friday.

The action (said Mr. Justice Channell) was brought in the City of London Court by a firm who made mantelpieces to recover the price of a mantelpiece which they supplied on the order of the architect, and which was put into a building which Messrs. Chessum were erecting under a contract with the cinematograph company. The plaintiffs said they had a contract in the nature of a subcontract with the defendants, and that question turned almost necessarily on the terms of the main contract, and the facts in a particular case. Consequently decisions in similar cases were not really of much value. At the time this case was coming before the County Court there was a case before the High Court, in which Messrs. Chessum & Sons were the defendants, and Mr. Justice Hamilton, as he then was, gave a decision which the Court of Appeal, by a majority in three Lords Justices, reversed. The one dissenting Lord Justice agreed with the decision given by the then Mr. Justice Hamilton. So there was a very fair division of opinion in the matter (continued Mr. Justice Channell), but the decision stood in favour of the plaintiffs in the other case (Messrs. Ramsden & Carr). So far as he could understand the facts in this case, they were no more favourable to the Coststone Decoration Company than they were to Messrs. Ramsden & Carr. Mr. Scott had called attention to some points of difference—not very considerably different—but the case that had come before the Court of Appeal seemed to be an authority upon which, possibly, they ought to decide the case now before the Divisional Court. But he thought one should give his reasons. Although there might be—and, personally, he thought there was—evidence of a contract between these parties that the defendants should pay the plaintiffs if and when they were paid by the company or its liquidators, there was no evidence of any contract on other terms than those. That was the conclusion to which he (Mr. Justice Channell) had come. It depended partly on the clause about subcontractors in the main contract, and he thought there was no doubt that a clause might be framed which would, in itself, give the architect authority to create privity of contract between the contractor and the so-called subcontractor. But one must look at this clause, and it was interpreted by Mr. Justice Hamilton (now Lord Justice Channell), who clearly did not think it could be considered that the act of the architect in giving the order then and there created privity of contract between the builders and the persons supplying the articles.

Either before or after the order of the architect there must be a "coming together" of the subcontractor and the contractor to create this privity of contract. That seemed to have been decided both by Mr. Justice Hamilton and by the Court of Appeal.

"I would only add," continued Mr. Justice Channell, "that, if there is any authority to the architect to create privity of contract, it must be upon terms and conditions consistent with those in this contract. I read the words 'consistent with this contract' to mean 'corresponding with this contract.' 'Consistent,' perhaps, is not the most appropriate word that could be used. I think you cannot carry

out the intention of the parties unless you take the meaning on the word 'consistent' to apply to 'corresponding.'"

His Lordship added that he saw nothing in this case but a contract for the builders to pay what the contractor was paid, with the suggestion that the builders had been paid a particular sum, or money that should be allocated to it, but he did not think that was before the Court. In the Court of Appeal he did not think the Judges found anything about payment, and, as he and Mr. Justice Avory understood the facts, there was no claim of money "had and received." Personally, his view was that, if the builders had been paid they would have to pay the plaintiffs, but it was not a judicial decision, because the point was not before the Court. He could do nothing in the evidence to bring these parties together and to make Messrs. Chessum & Sons liable to pay unless they had been paid. He thought the case was probably covered by authority of the Court of Appeal, and that Judge at the City of London Court probably thought his decision was governed by the decision of Mr. Justice Hamilton. As far as he could see, there was no evidence here of any liability on the part of Messrs. Chessum & Sons to pay unless they had been paid. Consequently the appeal must be allowed.

Mr. Justice Avory, agreeing, said the plaintiff company could only recover on one of three grounds:—(1) That the defendants had received the money in question, and plaintiffs were therefore entitled to recover it as money "had and received" for their use; (2) on the ground that the architect was the agent of the builders to make this contract and give the order for the mantelpieces; or (3) on the ground that there was an implied contract by the defendants to pay. On the first point he thought the County Court Judge was right in refusing to decide the case on that ground, and on the second and third points he agreed with everything that had fallen from Mr. Justice Channell. It appeared from him, from looking at the report of the case of Messrs. Ramsden & Carr v. the same defendants, in the Court of Appeal, that both these points were decided in favour of the plaintiffs in favour of the present defendants. Therefore he agreed that the appeal should be allowed and judgment entered for the defendants, with costs.

On the application of Mr. Eames (for plaintiffs), leave to appeal further was granted.

KING'S BENCH DIVISION.

(Before the LORD CHIEF JUSTICE and a Special Jury.)

A 40,000*l.* Theatre Site:

Wallrock & Co. v. Hoffman.

HIS LORDSHIP on Thursday, November 14th, heard an action brought by Messrs. Samuel Wallrock & Co., auctioneers and estate agents of Maddox-street, Regent-road, against Mr. Paul Hoffman, architect of Capel House, N. Bond-street. The plaintiffs claimed damages for alleged false representation and breach of warranty, which was denied by the defendants who pleaded that any representations he made were true at the time he made them.

Mr. Shearman, K.C., who appeared for the plaintiffs, said Mr. Samuel Wallrock was very familiar with an island site in St. Martin's lane, W.C., which was thought to be suitable for a theatre. He got into communication with Mr. Hoffman, who told him that the Irving Theatre Syndicate would purchase the site if it could be obtained for 40,000*l.*

The plaintiff asked Mr. Hoffman to negotiate with the owners of the property on the site to obtain their contracts of sale. He also went to the plaintiffs to the effect that previous to his going to the site and liked it, and that the purchase was arranged to be negotiated at 40,000*l.* could be paid over. Mr. Wallrock at once set to work and obtained all the contracts of sale, with the exception of one, but the purchase, for some reason or other, fell through and plaintiffs had lost 1,500*l.* commission.

Mr. Samuel Wallrock gave evidence and said he understood that the London Building Construction Company were interested in the matter. He had considerable difficulty getting the contracts of sale, and when they were obtained they were sent to the solicitors for the Irving Syndicate. He was paid given to understand that the negotiations would go through for 40,000*l.* if the freehold could be obtained for that price.

For the defence, Mr. Home Williams, K.C., said there was no case against defendant.

The Lord Chief Justice said there was evidence of warranty to go to the jury, but there was a charge of misrepresentation and case had better not be withdrawn.

Mr. Hume Williams characterised the charge of fraud as groundless, for, he said, the statements made by the defendant were true when he made them. He was given to understand that the Syndicate would purchase the site for £15,000, but for some reason, which had not been disclosed, the negotiations were not successful. That was not the defendant's fault; in fact, he lost money on the failure of the Syndicate to purchase as well as the site.

Mr. Hoffman, in his evidence, said he knew that £15,000 was in the hands of the Syndicate, and it was thought the other could be raised by a mortgage from a probable builder of the theatre or a bank.

But, asked Counsel, you seriously do not suggest that a firm of builders would finance the scheme before they were sure the promoters had the money to build the theatre?—and we had verbal options for the purchase of the site at the time. Witness added that a firm of builders had been negotiating with and were prepared to go on with the matter.

Sir William Dunn, surveyor, said he had great experience in valuing property, particularly in the central parts of London. Mr. Hoffman came to him and asked him if he thought the site was worth £40,000, and he replied in the affirmative, adding that it was a very valuable freehold. He was of the opinion that if the Syndicate had £15,000, the remainder of the money could be obtained by a mortgage.

Mr. Shearman: Did you say that anybody could lend a large sum of money for the purchase without a building being put on it?—yes, and I certainly think they would. I did not value the site as a theatre site, but regarded it as a valuable freehold.

Mr. E. G. Hemmender, K.C., M.P., the chairman of the Syndicate, said he saw no difficulty in raising the money required, and he had the Judge and Counsel the name of a firm of builders who were prepared to advance the money. There were many reasons why the purchase did not take place, but one was not the lack of money.

The jury negatived the allegation of fraud, and the Lord Chief Justice held that there was no contract on which the plaintiffs could sue. Judgment was consequently entered for defendant with costs.

LONDON COUNCILS.

Barnes.—Plans have been approved for taking-up Gilpin-avenue. The Surveyor has been directed to prepare plans, etc., for taking-up Cowley-road. Sanction has been received from the Local Government Board to the borrowing of £200 for paving various streets in the district. Plans have been passed by Mr. G. W. F. Bates, for four houses in Roger Richmond-road, and for Messrs. Atney, Combe, Reid, & Co., for additions and alterations to "The Two Brewers," High-road, Mortlake.

Clapham.—Plans have been passed for Messrs. Godfrey, Giles, & Co. for four houses in Woodville-road, also for Mr. Alfred Roberts for additions to Messrs. Harvey's premises in Woolwich-road.

Hackney.—A portion of the footway on the eastern side of Clapton-road is to be flagged. The following plans have been passed:—Messrs. R. Coles & Sons, conversion of building, adjoining Mallard-street, Hackney Wick, to warehouse; Mr. D. S. Barclay, forty houses, Lealdale-road, and twelve houses, Lingwood-road, Clapton Common; Mr. J. Hamilton, alterations at factory, Abbott-street, Kingsland; Messrs. J. Hamilton & Son, saw-mill, boiler-house, timber store, offices, two houses, etc., Lee Navigation Cut; Mr. E. Jones, factory, 67, Dalsion-lane; Mr. P. G. Shon, factory and workshop at London India Works, Felstead-street, Hackney Wick; Messrs. J. Garey & Son, alterations and additions at premises of Victoria Provision Company, Chelmer-road, Homerton.

Hampton.—The Middlesex County Council has been informed by the District Council that they are not satisfied with the method employed in carrying out the recent works of repair on the main road; and they are to lay request the County Council to lay wood-laying in that portion between Garrick Villa and the Grammar School.

Hem Hempstead.—Application is to be made to the Local Government Board for sanction to the borrowing of £600, for carrying out improvement works in High-street. The Highways Committee have been instructed to report as to the cost of making-up Cowper and Mill roads. It has been decided to purchase a portion of the Wood Farm Estate for the erection thereon of about fifty-eight cottages. **Holborn.**—The tender of the French Asphalt

Paving Company, Ltd., has been accepted for paving the carriageway of Fox-court at 3s. per yard super. for 6-in. concrete foundation, and 9s. 5d. per yard super. for 2-in. compressed brickwork.

Islington.—Electricity mains are to be extended at an estimated cost of 150l. **Kensington.**—Estimates of 1,432l., 1,482l., 546l., and 494l. have been approved for making up, as new streets, the extension of Kelfield-park, Wallingford-avenue, Kingsbridge-road, and Balliol-road, respectively. The London County Council are to be informed that, subject to certain stipulations, the Council have no objection to a proposal by Mr. H. W. Currey, 37, Norfolk-street, Strand, W.C., to form a new street from Barby-road to Del garno-gardens. Repairs are to be carried out to several footways in the borough at an estimated cost of 310l.

Marblebone.—The paving at the Council's Wharf is to be reinstated, a portion with redressed granite setts and another portion with concrete foundation, and floated, at an estimated cost of 150l. An application from Messrs. Selfridge & Co., Oxford-street, W., to widen and deepen the existing tunnel beneath the carriageway of Somerset-street, has been granted.

Shoreditch.—The Law Committee of the Borough Council report having considered a letter from the Local Government Board, enclosing a copy of a letter received by the Board from the London County Council with reference to the latter's application for the Board's decision under the schedule of the Working Classes Act, 1903, that a housing scheme is not necessary in respect of certain working-class dwellings which the County Council are authorised to acquire in Minter and Nicholas streets, under, and in connexion with, the Education Acts. The County Council's application, the Committee states, was originally before the Council in September last, when it was decided to oppose the application, as a rehousing scheme was necessary. The London County Council, in their letter to the Local Government Board, in reply to the Borough Council's opposition, stated that they had made special inquiries as to the amount of vacant working class accommodation of a somewhat similar character within reasonable distance to the houses in Minter-street, and they forwarded to the Board particulars of such accommodation. After considering these particulars, the Committee are of opinion that, whilst the first portion of the London County Council's schedule (referring to properties in Hoxton) tends to weaken the London County Council's case, inasmuch as only a small percentage of these properties are of the class occupied by one or two families, and which class the Councils are anxious to retain in the borough, the second suggestion, that accommodation can be found in the neighbouring boroughs for the persons to be displaced, renders the position of the County Council in the matter almost untenable inasmuch as by such suggestion they propose to drive out of the borough families for whose children the schools are to be enlarged. These expressions of opinion are to be conveyed to the Local Government Board in support of the Council's previous opposition.

Stoke Newington.—Electricity mains are to be extended at an estimated cost of 219l. **Tottenham.**—The District Council have passed plans for Mr. S. E. Child for eight houses, Elm Park-avenue, and for the North Metropolitan Electric Power Supply Company, Ltd., for a substitution in Cornwall-road.

Waltham Cross.—The tender of the Improved Wood Paving Company, Ltd., 46, Queen Victoria-street, E.C., has been accepted, at 469l. 18s. 5d., for carrying out 725 yds. super. of wood-block paving (soft wood) in Church-street, Waltham Abbeys.

Wandsworth.—A letter has been received from the London County Council, stating that the Council have decided to carry out the widening of a portion of Upper Tooting-road, Balham, at an estimated cost of 650l. The tender of Messrs. J. Morten & Co., Ltd., has been accepted at 759l. for paving a portion of Southcroft-road, Streatham. The footpaths are to be kerbed with Cornish granite, and paved with Aberdeen adamant. The following plans have been passed:—Mr. J. J. Naylor, laundry, Oaklawn, Atkins-road, Clapham South; Messrs. Dowsett & Jenkins, additions to St. Andrew's Church Hall, Guildersfield-road, Streatham; Mr. J. Parsons, erection of premises, 177, High-street, Wandsworth; Mr. J. Copp, twenty-four houses, Cricklade-avenue, Streatham; Mr. W. Simmonds, three houses with shops, Mitcham-road, Tooting.

Wansstead.—The following tenders have been received for making-up roads mentioned:—Mr. T. Adams, Wood Green, N. (a) Wood-

lands-avenue, 1,294l. 10s. 4d.; (b) Sultan-road, 181l. 10s. 8d.; (c) Mornington-terrace, 146l. 3s. 6d. Mr. G. J. Anderson, Poplar, E. (a) 1,190l. 16s. 2d.; (b) 149l. 13s. 5d.; (c) 129l. 15s. Mr. F. J. Coxhead, Leytonstone (a) 1,993l. 9s. 3d.; (b) 353l. 11s. 9d.; (c) 224l. 5s. Messrs. W. & C. French, Buckhurst Hill (a) 1,157l. 14s. 4d.; (b) 147l. 19s. 3d.; (c) 150l. 19s. Mr. D. T. Jackson, Barking (a) 1,251l. 3s. 2d.; (b) 190l. 4s. 3d.; (c) 140l. 3s. Mr. J. Jackson, Plaistow (a) 1,279l. 15s. 2d.; (b) 203l. 14s. 9d.; (c) 170l. 6s. 10d.

Westminster.—Repairs are to be carried out to the carriageways and footways of four roads at an approximate cost of 256l. In reply to a letter from the Engineer of the London, Brighton, and South Coast Railway Company, requesting that the road surface to be constructed in connexion with the reconstruction of Ebury Bridge, may be kept as shallow as possible, and suggesting that some depth could be saved if the Council were disposed to dispense with the use of wood-blocks and substitute either asphalt or roadmetal, the Works Committee have decided to state that they are unable to agree to any other carriageway pavement than wood-blocks 5 in. in depth, upon 4-in. concrete, laid upon a substantial and satisfactory subfoundation. The tender of the Improved Wood Paving Company, Ltd., has been accepted, at 301l. 14s. 2d., for paving the roadway between Poland-street and Noel-street, with combined strip paving. The Public Health Committee recommend the Council to establish, at an early date, a tuberculosis dispensary.

Woolwich.—Repair works are to be carried out to footpaths and passages in various parts of the Borough at a cost of 188l. Sanction has been received from the Local Government Board to the borrowing of 1,050l. and 560l. for the provision of an underground convenience in Beresford-square and a convenience at the Royal Victoria Gardens, North Woolwich, respectively. The Works Committee report having been approached by the Improved Wood Paving Company, Ltd., Queen Victoria-street, E.C., in regard to the laying of a small area of their wood-block paving in a portion of Footscray-road adjoining the Sidcup boundary, where it could be compared with the experimental lengths of various forms of paving which have been laid under the jurisdiction of the Road Board in that road just within the Sidcup district, and offering to provide and lay free of charge an area not exceeding 500 super. yds. of creosoted wood-block paving (3 in. by 7 in. by 4 in.) on a concrete foundation, to be provided by the Council, and to lay a further area of 600 super. yds. for the payment of 6s. per super. yard. The Borough Engineer has also been in communication with the Praed Road Construction Syndicate, Ltd., Victoria-street, Westminster, S.W., who also desire to lay a length of their paving in this road, with the result that the company offered to lay a minimum area of 1,000 sq. yds. complete of their patent asphalt macadam in two layers, 2½ in. and ¾ in. thick, respectively, when properly consolidated, providing all material and doing all work in connexion therewith, for the price of 5s. per yard super., which includes a free maintenance for a period of five years, this price to hold good for 6,000 yds. or more if hereafter required. After carefully considering the matter the Council have decided to accept the above offers. Plans have been passed for Mr. A. L. Edwards, 19, Raglan-road, Plumstead, for seven houses in Cleanthrus-road, Plumstead, as have also plans for Mr. A. H. Jennings, 7, Woolwich-road, Belvedere, for eleven houses in Cantwell-road, Plumstead.

OBITUARY.

Mr. R. Norman Shaw.

We greatly regret to announce the death on Sunday, 17th inst., at his residence, No. 6, Ellerdale-road, Hampstead, N.W., of Mr. Richard Norman Shaw, R.A. Mr. Norman Shaw was born in Edinburgh on May 7, 1831, and was educated in that city. In the Royal Academy Schools he won the Gold Medal for Architecture, with a travelling scholarship—in testimony whereof he dedicated to the Royal Academy in 1858 his "Architectural Sketches from the Continent," containing one hundred plates; in 1882 he contributed to "Architecture—A Profession or an Art?" He was an assistant of G. E. Street, R.A.; in December, 1877, he was elected a Royal Academician, and retired in December, 1909. He was a younger son of a family, being of opinion that membership should be regarded rather as a recognition of talent in the earlier stage of an artist's career.

In October, 1898, he served as British representative upon the jury who met at Antwerp

* All these applications are in the stage which opposition to the grant of Patents upon them can be made.

List of Competitions, Contracts, etc.

For some Contracts still open, but not included in this List, see previous issues. Those with an asterisk (*) are advertised in this number: Competitions, —; Contracts, iv. vi. viii. x.; Public Appointments, xix.; Auction Sales, xxiv. Certain conditions beyond those given in the following information are imposed in some cases, such as: the advertisers do not bind themselves to accept the lowest or any tender; that a fair wages clause shall be observed; that no allowances will be made for tenders; and that deposits are returned on receipt of a bona-fide tender unless stated to the contrary.

The date given at the commencement of each paragraph is the latest date when the tender, or the names of those willing to submit tenders, may be sent in.

* * It must be understood that the following paragraphs are printed as news, and not as advertisements; and that while every endeavour is made to ensure accuracy, we cannot be responsible for errors that may occur.

Competitions.

NOVEMBER 25. — **Newcastle-on-Tyne.** — SCHOOLS. — Limited to local architects. Particulars from the Education Office, Northumberland-road, Newcastle-on-Tyne.

NOVEMBER 25. — **Langside, Glasgow.** — BRANCH LIBRARY. — Assessor, Mr. Alex. N. Paterson, R.S.A. Premiums, 50l., 30l., and 25l. Particulars from the Town Clerk, City-chambers, Glasgow.

NOVEMBER 30. — **Balham.** — SWIMMING-BATH. — The Wandsworth B.C. invite designs. See advertisement in issue of August 16. Particulars from P. Dodd, 215, Balham High-road, S.W.

A "THOROUGHLY UP-TO-DATE SOCIETY."

FOLLOWING on the address of the President of the Royal Institute of British Architects we have had the address of the President of the Society of Architects, himself a Fellow of the Institute. We do not propose to make any comparison between the two addresses which are available for those who are interested, and, probably, Mr. Tubbs made out the best case possible for the existence of the Society of which he is the official head. Almost in every centre where a corporate body has attained the power and prestige of the Royal Institute a group of men have dissociated themselves from its tradition and formed an independent organisation for the expression of their views. The origin of the Society of Architects was probably due to the same cause. Its principal object, according to its Presidential addresses, for many years has been, and still is, the promotion of an Act of Registration. Broadly speaking, that policy has been its main *raison d'être*. It has not, however, made any appreciable progress in Parliament with the various Bills which it has promoted; but we do not doubt, and have never doubted, the good faith of the Society in its

Registration policy. We do not propose to touch upon principles involved in the question of Registration, which have been sufficiently discussed, beyond saying that, whether the policy be advisable in the higher interests of the profession or not, whether it is ever likely or not to succeed in Parliament in view of the vested interests of other professions which will be represented in opposition on the floor of the House of Commons, we may be certain that no Act of Registration will bring about the architectural millennium as predicted by its more ardent supporters. But our purpose in referring to the address of the President of the Society of Architects is not to raise the question of Registration, but to refer incidentally to one or two other points. Those who have either heard or read it will no doubt be a little surprised at the concluding remarks of Mr. Tubbs, in which, after pointing out that Licentiates of the Institute can only become Fellows after submitting themselves to the test of examination, he goes on to say: "How Licentiates feel about this I do not know; but possibly some, or even many, of them would rather be corporate members of a progressive and thoroughly up-to-date society, making for reform all the time,

than merely non-corporate members of the senior body."

We are at a loss to understand how Mr. Tubbs, either in his position as a Fellow of the Institute or as the mouth-piece of another society, could lend himself to that statement, the purpose of which is certainly obvious, and even susceptible of harsher criticism. We hold no brief for the Royal Institute of British Architects, but, so far as a forward policy is concerned, we doubt that in its history the members have often heard expounded a more progressive and authoritative programme from the Presidential Chair, touching so wide an area of architectural art, education, and practice, than that placed by Mr. Blomfield before its members at the opening meeting. The amusing part of the business is that, while Mr. Tubbs is offering a bait which would enable Licentiates to become corporate members of another society without subjecting them to the test which the Institute imposes, he is also promulgating a new system of architectural education; he is concerned with "eliminating those who do not show sufficient artistic ability to become successful practising architects of the high standard that the future

will demand!" It is generally recognised that architectural education has in the past suffered from lack of the co-ordination and system which have operated in other countries. The main tendency of architectural effort for the last fifty years has been directed towards the solution of this very difficult problem. Its solution in the end may be discovered, as Professor Lethaby has suggested in one of his inspired observations, in the recognition of architecture in a sort of morphological aspect in which we "will start from the simple cell and relate to it the most complex structures." A good deal might be said about that, but it has little to do with our present point. Any solution of the educational question is fraught with numerous difficulties, except that perhaps of Mr. Tubbs. "A Special Committee," he tells us, "are already actively at work on the details of a scheme for the establishment of architectural ateliers in the United Kingdom on the lines of those which are so successfully carried on in Paris." Nothing could be more simple—the importation of the latest confection from M. Worth or the Rue de la Paix is, as it were, on the counter; a *mannquin*, or a graduate of the Beaux-Arts, will show you how well it fits. That is all! But is it all? The Beaux-Arts system of training has answered very well in France; but it was of slow and perfectly natural growth, which followed on the foundation of l'Académie Royale by Louis XIV. or his Minister, Colbert. It is not in any sort a transplantation. Its growth is indigenous to the soil and the genius of the French nation, a logical, Latin race. In the Latin races there is also a certain quality of egotism, so far as artistic matters are concerned, which impresses the world, but to which men nourished on British soil are to a great extent strangers. Almost in every phase of creative expression—in architecture, in poetry, in drama, in painting, in romantic literature—the British race has, however, excelled. Is it even necessary to mention names—Shakespeare, Inigo Jones and Wren, Coleridge and Wordsworth, Reynolds, Turner and Constable, Charles Barry, Elmes and Cockerell, Fielding, Scott, Dickens and Thackeray, and so on? Through the force of native genius it has always come through, after its modest, instinctive fashion, to the finest and most individual interpretation of life, which is called art known to the world. In science it has given us a Darwin, a Lister, and many another. In the realm of archaeology and archaeological research it has contributed men of as eminent gifts as any other nation. Since the Renaissance, British architects have been among the first to extend our knowledge of the subtleties which existed in classical architecture: the pioneer spade-work of Stuart and Revett, Robert Adam, Inwood and Penrose was not second in importance to that of the men of any other country and of their time. Education in its highest sense is not, after all, altogether a matter of the schools: it is often a matter of personal idiosyncrasy. In architecture certainly many instances could be cited.

It may be argued that men of the type we have mentioned existed in spite of

our educational system. It could just as well be argued that they existed because of it. But we are free to acknowledge that what may answer in regard to the individual may not answer in regard to the system of training of a whole profession. No body of men has realised this more seriously than the Royal Institute of British Architects, or devoted more time and careful thought to its solution. So long ago as 1887 a Conference was held on the subject, the members of which had before them the programmes which then prevailed in other countries. For the last twenty-five years it has elaborated and conducted a system of examination in architecture. Within quite recent times it has formed the Board of Architectural Education, composed of representative men in architecture, with a view of further developing the educational system. The work of that Board is still in its initial stages, and, while the character of the men of which it is composed is a sufficient guarantee that no hasty and ill-digested scheme will be adopted, it also ensures that enlightened progress will follow in the footsteps of their labours. In any case, we are not inclined to take a pessimistic view of the result of the work which has been undertaken in this country on behalf of the education of architects. On the contrary, we consider that in capacity and enthusiasm, and to a large extent in scholarly equipment, we possess a fine body of students. The average quality may not be high—is it ever in any profession or art?—but the quality of individual students—the quality, that is, of the select few, on whom rest our hopes for the architecture of the future, does not occasion in us any fear that we shall be outpaced, even in monumental compositions, by our Continental brethren. The work of the Institute in the past is to-day bearing fruit. So far as the establishment of the atelier system all over the country is concerned (for Mr. Tubbs' scheme is apparently a wholesale affair), we wonder if his Committee realises the atmosphere which exists in a French atelier? How many fluent advocates of schemes of this kind have, we wonder, ever crossed the doors of a French atelier or sought counsel from English students who have been trained in Paris? Such inquiries might probably prove illuminating. It must not be thought, from what we have just said, that we have any objection to the atelier phase in an architectural curriculum as it exists in France. We only wish to point out that its adoption, unrelated to a general scheme and borrowed from another country, denotes a curious misapprehension of the French view. Instead of "making for reform," it is more calculated to make for reaction and a bizarre kind of dilettanteism.

We will only touch on one other point in the address of the President of the Society of Architects. We do not know what the members of the Council of the Institute think of the suggestion that they should be left to perform the "ornamental" work of the architectural profession and relegate to the Society matters which are called its "business side." But what other society could so well look

after the various material interests of architects as the chartered body Conduit-street, whose members, it may be safely said, are responsible for the most important architectural work carried out in the United Kingdom. We have on more than one occasion referred to the kind of criticism which regards with suspicion the business qualifications of anyone who does not first of all proclaim that he is a business man. The Institute has, in any case, Standing and other Committees established for the purpose of dealing with the business issues of the profession which from time to time arise. But not the higher aspects of architecture and its professional and material aspect integral parts of the same organism? You cannot separate the two without damaging the whole structure. And as a mere business proposition would perhaps be interesting, if it were worth while, to compare the position which make for real practical progress in the art and practice of architecture which have been raised in the recent addresses at the Royal Institute of British Architects and the "thoroughly up-to-date Society." we have said, the latter Society may have a useful purpose to fulfil but it is indiscreet for it to indulge in ill-digested programmes. It has to a certain extent influenced the Institute in regard to the policy of Registration. That body has, in any case, formed an influential Committee, committed to the consideration of the question and the promotion of a Bill likely to have some chance of conciliating the various interests involved in the matter before it has the remotest chance of succeeding in Parliament—a method of procedure which is surely eminently practical and "businesslike." But the Society is not content with this simple approach to a complicated measure; it must needs proceed, willy-nilly, with its own Bill, which has not the shade of shadow's possibility of getting further than the blocking stage in the face of the opposition that will certainly be brought against it. Child's play of the kind may be amusing, but it serves no useful purpose, either in the high interests or the merely practical politics of architecture.

NOTES.

Too Conscious Art.

IN these days we have as architects, become so sensitively self-conscious Art that it is expedient, for our very Art's sake, that we should occasionally have the truth brought home to us that beauty in architecture, as in all else, must draw sustenance from roots well grounded in the everyday matter of fact of practical life. In this consists the interest and value of such papers as the one read by Mr. Horace Cubitt at the Architectural Association last Monday evening. We are constantly being reminded of our high calling as artists. But in practical experience this is susceptible of two interpretations. Firstly, the architect as the arranger, the orderer, the constructive artist, who, out of many materials and sometimes conflicting factors and

ditions, creates a unity that not only sets all practical requirements, but vivifies the intellect of efficiency, and induces upon the sensuous and deeperhetic faculties of the mind feelings of assurance and satisfaction in its perfect form and fitness. Secondly, architecture regarded as an art of free expression; beauty is directly aimed at otherwise than through the development of organic periods, the architect thereby tending to become a kind of glorified house-creator and art—in detachment from critical and utilitarian exigencies—rather more or less anemic conceit. In the first beauty is organic, in the second a decoration or clothing. Power of design that discriminates the architect from other constructors. But, as things are, is apt to limit design to a function which, however scholarly and cultured, is superficial—to what a well-known writer on economics called, somewhat too temptuously, "the otiose function of a designer." The power of design is structural as well as aesthetic. It does the fact that the architect is indeed be artist and designer a fuller sense preclude other essential functions. If he be versed in valuation and cost of buildings, in holding law and contracts, light and air, drainage, artificial lighting and heating, ventilation, etc.; if he survey buildings, and carry out other functions of the surveyor, he is still within his own proper field, for, being architect, he is *ipso facto* surveyor. He is not merely a draughtsman, designer of plans and façades, but also the supervisor, the surveyor of the construction of buildings. So far from such things being derogatory to his art, they are, where not essential, certainly accessory to it. The complete architect must be of necessity at least conversant with them all, though not a specialist in any one. He is the organiser of many specialists. Out of many prosaic and material elements his ideal is to produce unity, a building that "rhymes well": it gives to others some glimpse of beauty attendant upon perfect order and fitness.

THANKS to the influence and financial support of Lord Hythe, the School of Engineering at Oxford University has been in existence for five years, and has quite emerged from the experimental stage. It is now proposed to erect and equip a new engineering laboratory to meet the growing requirements of the School on its site near the north-west gate of the University Park and conveniently near existing buildings for both engineering and chemistry. Some question has recently been raised as to the propriety of adopting the site mentioned, on the ground that the new laboratory will encroach upon and mutilate the Park. This view is combated by Dr. Warren, President of Magdalen College, in a letter to the *Times*, where it is pointed out that the ground was originally required for the erection of additional buildings needed by the University, and that the proposed site for the engineering laboratory was actually selected by the governors of the Park themselves. While

opposed to the wanton disfigurement of any place, we cannot agree with the proposition that well-designed additions to the architectural beauties of Oxford should be regarded as an eyesore. Moreover, it does not seem unreasonable that Convocation should be asked to permit a comparatively small corner of the Park to be used for a portion of the purpose for which the entire area was originally purchased by the University.

Reinforced Concrete Calculations.

In his Presidential address to the Concrete Institute, reported in this issue (page 655), Mr. E. P. Wells devoted attention to several points of practical character, quite deserving the attention of architects. On the subject of mathematical computations Mr. Wells emphasised the undesirability of placing too much reliance on highly-refined calculations and the desirability of exercising common sense in connexion with simple formulae known to give absolutely safe results. There is a good deal to be said for this view, for while the tensile resistance of steel is constant the strength of concrete varies, not only with the human factor, but increases day by day after its deposition, and in some cases becomes very much greater than the value taken as the basis of calculations. Hence all formulae are rendered empirical, however scientific be their theoretical derivation, while, for the same reason, elaborate calculations afford results that represent nothing more than approximations.

"Halle of John Halle," Salisbury.
From a Sketch by Mr. Leslie Barefoot.

This building, in Canal-street, with its fine timber front, was originally erected as a dwelling by a rich wool merchant about 1470. It was restored in 1851, and is now used as a shop.

National Physical Laboratory.

So valuable is the work conducted at the National Physical Laboratory, from the scientific as well as the commercial point of view, that we sincerely trust a generous response will be made to the appeal issued by Sir William White and Dr. Glazebrook for additional funds. In order to provide for the adequate continuation of work new buildings and equipment are required at the estimated cost of 35,000*l.*, towards which the Treasury are willing to contribute 15,000*l.* Of the balance, 11,710*l.* has been secured mainly through the generosity of the late Sir Julius Wernher, leaving 3,290*l.* to be obtained for buildings in order to comply with the Treasury conditions and 5,000*l.* for scientific equipment. When one looks round the world and finds that in every other country of importance establishments of the same kind are liberally maintained by Government it is indeed humiliating that our National Laboratory should be compelled to make appeals to private generosity.

RICHARD NORMAN SHAW, R.A.

By PROFESSOR BERRESFORD PITTE.

To the student they were wonderful days in the early seventies, when Norman Shaw, like a magician, raised the spirit apparition of mediæval semblance in the midst of the most serious endeavours to secure recognition for Gothic architecture as the proper style for the expression of our most modern wants.

Savage had essayed at St. Luke's, Chelsea, to show that for ecclesiastical purposes, and at Westminster Hospital for civil, Gothic excelled Classic in its adaptability, and the incessant teaching of Pugin and Ruskin, as of the works of Scott and Street, argued that Gothic was a living architecture equally quick in a railway-station as in a church, or in a town hall as in a country house, asserting that the modern spirit found a truer note in Christian than in Pagan art.

It may be doubted if Norman Shaw realised more than an artist's irresponsible joy in re-creating the mediæval charm which he attached to each of the series of half-timbered granges and glorified farms that he erected and illustrated. The purpose of applying Gothic details to modern buildings to interpret the XIXth century in the terms of the XVth he frankly abandoned, and by him the charms of mediæval simplicity of aim were simulated in accidental glazing, by crude building materials, archaic glazing, and other accessories.

He spirited us away from the present, and we were conducted in an instant into the past. "Dear old England" could indeed be lived in again; "Merrist Wood," "Leyes Wood," and many other country houses up to "Cragside" and "Dawpool," were all realisations of an artist's ideal which the more serious-minded Revival architects had not attempted. The glamour also pervaded the delicious drawings which illustrated the exteriors, set in sweet foregrounds of shrub and rock; the wavy tiles, the plain lattices, and the spotted brickwork entirely harmonised with our patriotic enthusiasm and perfected hopes of domestic architectural happiness. But we knew all along that behind this artistry there had been solemn and steady progress. Shaw had early obtained the Royal Academy Travelling Studentship by a formal Classic design; had published a folio book of correct lithographs of Gothic Continental studies, and had, in a partnership with William Eden Nesfield, produced domestic Gothic designs which were second to none in freshness and

beauty. Was there not, too, during this partnership a perspective published of a competition design for Bradford Exchange in the glorious early Continental Gothic, with a great external frieze drawn by Albert Moore, and, by himself alone later on, a clever church at Lyons, correct and interesting, preceding the more remarkable one at Ilkley by a few years?

In all this he progresses onwards; to march with the rest seemed all that he desired before the veil fell and the phantasy was revealed to him that to be new and modern was behindhand, and to be ancient and mediæval was ideal. Hence the use of apparently decaying laths curving the lines of the tile-courses, the dotted brickwork, accidentally obscured windows, crooked passages, and sudden levels.

Still, the master was sanely up to date; the plans worked amazingly, the construction was alternately excessively ingenious and simply natural; an artistic craftiness of scheme was associated with the picturesque exterior that made both elevation and plan amazingly consequent and fascinating; and, though the whole was mediæval, it was alive.

Norman Shaw's work could well have concluded the History of the Gothic Revival and left his name among its great ones, but he was then only in his early prime, and the spirit that worked within him was quicker than the content of that movement. Whether New Zealand Chambers will remain for Macaulay's antipodean visitor's residence when his time comes we cannot say, as that depends upon the endurance of its concealed construction; but the triumphant bursting of the bonds of the old Metropolitan Building Act was achieved in that *tour de force*, not of Gothic art, but of modern antiquarian craftsmanship of design. That purity of style and avoidance of debasing Renaissance infection, which were the sheet-anchors of Revival virtue, were abandoned, and something that might, in the picturesque symbolism of the jargon of the school, have been called licentiousness was publicly invoked. The Gothic game was up with Norman Shaw, and he applied the freedom and adaptability of all the architectural experiments and ignorancies of the early undeveloped and unscientific English Renaissance to modern building. The saving element, as before, lies in the exquisite humour of the artistic appeal to picturesque sentiment alone. The "Swan House," the "Clock House," and others on the Chelsea Embankment violate many constructional proprieties, though they remain standing; but "Lowther Lodge," Barings' Bank, and other solemn examples in Queen's Gate, from north to south, gradually accept simpler forms of constructive appearance—that is to say, they avoid puzzles, and charm the world by their breadth and simplicity.

During this period Norman Shaw created a school of modern domestic building which became wide enough to be national. He led the way from the Middle Ages through the early to the later Renaissance, compelling modern requirements as he went along to conform to ancient appearances. Time loves change and movement, and he changed and moved, but always in front. No architect led him. He had affinities and sympathies with the leaders in every branch of decorative art, but none could equal his full stride, even when he seemed to slow down into beautifully commonplace building. The smaller houses at Bedford Park and Melbury-road, as well as the larger ones in Hampstead and on the Cadogan Estate, can all be discerned as his by the excellence of their simple qualities.

New Scotland Yard may well be said to stand by itself. Entirely fresh, and unjustified by precedent among official buildings, it is as rightly architectural in scheme as the Houses of Parliament or St. Thomas's Hospital, but is much more satisfactory upon its riparian site, and increasingly impressive as the fashion of its

style passes into the architectural history. One feels that it is independent in its solid qualities of the accident that it seemed artistic to the men who first liked it.

Then the latest phase of pompous Renaissance dignity and richness of line—"Bryanstone" in the country and the "Gaiety" group in town, followed by the great Quadrant scheme and the Piccadilly Hotel. In old age he was as great in surprises as in his youth. There seemed to be hardly any architectural sensations to which Norman Shaw could not give effect in plan, elevation, grouping, or detail. Each phase found its master in his hand and was brought into service.

It is yet soon to estimate the permanent value of Norman Shaw's work; it may be that the relation of his designs to the current from which they emerged may be forgotten, the charm of his published drawings may remain only with collectors, the fragrance of his genial humour, only partially embodied in much interesting and characteristically prolific correspondence, may evaporate with the passing of a generation, but New Scotland Yard, at least, must remain awhile, midway between Westminster and Somerset House, seated upon the Embankment in monumental dignity as a fair embodiment of a man and a movement which cannot be overlooked in any distant survey of English architecture of the latter half of the XIXth century.

THE PRIORY CHURCH, CHRISTCHURCH.

THE Secretary to the Society for the Protection of Ancient Buildings wrote to the *Times* of November 21 with reference to the restoration of this church. Mr. T. G. Jackson, R.A., has given us special permission, with the concurrence of the Bishop of Winchester, to publish his statement in reply to the charge of vandalism. The words of the original note are printed in parenthesis in small type, and Mr. Jackson's comments follow in each case.

(1) "The great mediæval church of Christchurch, Hampshire, is well known, and any damage done thereto must be considered little short of a national calamity. A faculty from the Bishop of Winchester, dated March 9, 1912, gave power to the Vicar and Churchwardens to carry out certain well-defined alterations to the internal fittings of the church. In his printed appeals the Vicar stated:—'There will be no destruction of ancient work,' and 'no ancient work will be interfered with.' In spite of such assurances, and under cover of the Bishop's faculty, which gave no consent for it, much ancient work has been interfered with in a disastrous and unnecessary manner. The north transept has been much pulled about, a great quantity of new stone has been inserted in the west wall, to the destruction of original Norman work."

The work in the north transept consists in removing a modern gallery which was never used and the stairs that led to it, also the removal of some pews with glass screens that blocked the beautiful arches of the two eastern chanceries, also the removal of the modern deal pews below the gallery and the repair of the floor which had been broken up for the flooring to these modern pews. New floors have been laid, and the transept is seated with oak. The effect of this has been to restore to the interior view of the church the north transept, which was completely blocked up with high pews and galleries, and to expose the two chanceries, which are now accessible from the transept.

(2) "Portions of arcading that remained in that wall have been 'restored,' and Norman shafts from elsewhere have been mutilated and inserted."

The arcade is not restored, but the missing colonettes have been replaced. The whole of this arcading was mutilated to make way for the modern deal pews. I directed the replacing of the colonettes with new stone.

But the foreman, without my knowledge, used some old shafts, once apparently of the church, which were found lying in crypt. This I should not have allowed. I suggested their removal, but he thought this unnecessary under the circumstances.

(3) "On the eastern side of the transept a stone wall has been built, blocking up stairway leading to the eastern chapel, the north channel aisle."

This wall formerly existed, and half is old work. It was continued on the lines in order to enclose the transept, the eastern part of the church and support the glass screen which the Vicar and Churchwardens consider necessary to exclude draughts.

(4) "New stairs have been inserted below the arch opening, from the said crypt to the transept."

The original levels of the transept and chanceries being preserved, steps were, of course, necessary. Before the present there were deal steps forming part of the paving that has been removed. The steps are of stone.

(5) "The Norman arch leading from the transept to the north channel aisle—one of the few vestiges left of the Norman choir—has been much tampered with, its northern half having been, without any necessity, practically refaced with new stone, and the plaster original stonework destroyed."

This was a more serious matter. The arch has been tampered with. It has not been touched at all. The pier next the chantry on the west was badly crushed and split and been cut into by the beams of the gallery. It was in a very dangerous state, and a great deal of work was done to save it. It has now been met with new bonding stones where the old was crushed, and has been grouted with cement and, I believe, made secure. It was a very difficult and delicate operation.

(6) "The opportunity of resetting the caustic tile pavement of the north transept (recently discovered) has been neglected, many of the fragments removed to the vicarage or left on rubbish heaps."

My instructions have been that every fragment of the old tiling which was discovered on the removal of the deal floor should be laid in the original place. The tiles were sadly broken and most of them imperfect, but enough remains to be of great interest. Mr. West, the Curate, is taking care of the drawings of them.

(7) "These are but a few examples of damage wrought in the last few months, many examples in the last few years may easily be cited. Work on the church is still proceeding. . . . These vandalism (quite apart from the damage done to a glorious national monument) call for the strongest public denunciation, and yet the Bishop of Winchester is proposing to visit Christchurch on the 1st inst. to give his official benediction to the work."

What the examples which are not cited may be we are left to imagine. All work I have done hitherto has been of nature of structural repair. The timber which exists above the plaster groining the nave—an interesting structure of the XIVth century—has been secured instead of being removed, as had formerly been proposed. The tower, of which the parapets were insecure, has been repaired and masonry cleaned from plants which had done serious damage, the facing stone being in some cases forced more than an inch out of the wall. The south wall of the nave which had given way has been underpinned, and a drain is formed. The slating of the roof has been put to rights. The groining of Lady Chapel had suffered by the expansion of the iron bars and cramps with which it had been put together and the spring stones of several of the bays, especially the

he west end, were split; and their condition was such that they might have slipped and brought the whole vault to ruin. They have been very carefully repaired by inserting new springs in the place of those that burst, and the ceiling has been roughly repaired where necessary elsewhere.

"Besides the foregoing, a scheme may soon be set on foot to restore the Lady Chapel by means of a large sum of money left for the purpose by one whose connexion with Christchurch was of the slightest. It is no exaggeration to say that in the case of a building like Christchurch its value decreases whenever money is spent upon it for purposes other than repair. Here, nevertheless, is a case involving the expenditure of thousands of pounds on restoration which will do little to depreciate its value as a national monument. Surely it is time that the nation should provide proper protection for its treasures and antiquities."

On this last matter I know nothing.

It seems to me that the objections made to the foregoing extracts are captious and reasonable. They are taken almost verbatim from a letter sent me some time ago by a gentleman who lives at Christchurch.

I am not aware that the Society for the Protection of Ancient Buildings has done the work or done more than adopt the letter. . . . The repair of the porch, which was in a dangerous state, has now been secured according to my plan, which was approved by the Society of Antiquaries.

(Signed) T. G. JACKSON.

THE ROYAL SOCIETY OF PAINTERS IN WATER-COLOURS.

At a winter exhibition of the Royal Society of Painters in Water-Colours provides a gay and fanciful array of pictures, a pleasant variety of patterns, if it contains little more than average interest and skill. Much of the work suggests the rapidity of execution which is more or less essential in material, and much of it also rapidity of observation, which is not perhaps the thing as depth of observation. In the sketches, for instance, of David Cox we find the first two qualities, but in them I do not find the third quality. When we begin to consider the work of particular artists, the general mass of painting on the wall we find that many of the artists—Mr. Lee Sims and Mr. Napier Hemy, for instance—are successful in obtaining precisely the same effect which their work in easel painting has. Mr. Sims's formula, which aims at the expression of light poetic ideas, would seem perhaps to lend itself particularly to the purposes of the water-colour medium. But, whatever the medium, we are grateful for the expression of the artist's decorative, imaginative outlook of the artist in modern painting. Mr. Napier Hemy's sea-pieces are faithful transcripts, in which are caught the spirit and swiftness of the current and the breeze. Mr. Robert W. Lee, on the other hand, readily adapts his point of view to the water-colour touch by numerous bright examples which he contributed to the exhibition. The art of Mr. Clausen stands a little apart. He is a subjective rather than the other painters. His transcripts or formulae in fantasy are in his way. He certainly does not take interest in the photographic resemblance of things. His drawing, for instance, of the East Door of the Parthenon from Within, "moonlight," may not be a good architectural drawing, but it is no clumsy or architectural form as are so many painters' drawings which attempt to depict architecture more precisely. The art of Mr. Lee Sims, in any case, that of temperament, not that of the camera. Take again the strong, rugged sketch of Ludlow Castle, which the aspect of the building and the aspect of Nature take on, a wind-swept

and weather-beaten garb—an obviously sentimental view, you may say; and so it is in a way, but the artist's feeling for style, his personal vocabulary in colour, are not those of the cheap sentimentalist. Mr. Walter Bayes is what one may call a quiet painter; he makes no charge on your emotions, you leave him with a certain impression of delicacy and charm but a little cold, with an impression of artistic theory rather than of artistic vision and impulse. He is a painter, as you might say So-and-so is a grammarian; that is, he understands the syntax of his art. But he is more than that, and in his two pictures at this exhibition, as in those which we have seen elsewhere, we feel that there is in his work a good deal of artistic vision, of an unaccommodating kind, as well as esoteric artistic theory. So far as architecture is concerned there is much of interest, including a large and outstanding view of the south-east angle of Ely Cathedral (painted for the Municipal Art Gallery at Birmingham), by Mr. Rooke, and numerous subjects by other artists from scenes in Italy. Mr. Reginald Barratt shows various pictures associated with the Piazza and St. Mark's at Venice; but in none is he so successful as in his delineation of the decorative detail of the base of the great flagstaffs which face the cathedral, the best drawings, from this point of view, at the exhibition. Mr. Walter Crane shows the spectacle of an aviation meeting drawn after the somewhat quaint precision of the earlier manner of Mr. Walter Greaves, while the strength and lucidity of Mrs. Laura Knight's art are well represented in "By the Sea," in which human sentiment and the sentiment of Nature are brought into some kind of relation.

THE KENSINGTON FIRE.

It would not be fair to those most concerned to say that the lessons of the Clapham Junction fire and other disastrous fires in drapery establishments have been neglected. Nevertheless, they have not been properly learnt—a point which is sufficiently illustrated by the facts brought out in evidence given at the Coroner's inquest on the recent fire in the premises of Messrs. John Barker & Co. at Kensington.

Like other large drapery establishments that have not yet been rebuilt in consequence of fire, the buildings occupied by the firm were not in conformity with the present state of the law as set forth in the London Building Acts, and were not suitable for the conduct of a business characterised as dangerous by the Coroner who inquired into the Clapham Junction fire. The proprietors had evidently recognised the necessity of providing safeguards, for they had installed four means of escape from the upper floors in the form of a staircase, two iron ladders, and a rope ladder; and, as one witness stated, the place was "overrun with fire appliances." We must point out, however, that even the most lavish expenditure in this direction is absolutely futile unless expert advice is obtained for guidance in the selection and installation of safety appliances.

It is satisfactory in a measure to learn from the evidence of at least three witnesses that loss of life might have been avoided if the girls who perished had retained their presence of mind. But this would have been due to the gallant efforts of the London Fire Brigade, and not to the means of escape provided by the firm. For instance, we learn from the evidence of the head fireman to Messrs. Barker & Co. that "the box containing the rope ladder was burned, and the ladder had dropped down, so that it was never used," and from the evidence of Mr. Chatfield Clarke, F.R.I.B.A., that the escape appliances were mostly on one side while the fire attacked the premises from the other side. Again, it is made clear by the evidence

that the numerous fire appliances did not include automatic alarms or automatic sprinklers, both of which are of inestimable value in the early stages of fire. We thoroughly endorse the recommendation of the Coroner's jury that buildings of the class in question should be fitted with automatic fire-alarms, and regret that automatic sprinklers were not included, for these begin to operate at once and long before aid summoned by alarms can arrive on the scene.

The fire appears to have started in the kitchen, where a boiler fire had been banked up for the night. In itself this should have occasioned no risk; but from the evidence of Mr. Dyer, London Fire Brigade, we find that the flue passing from the boiler up through the roof was lined with wood at the top—an arrangement once more demonstrating the point that the lavish provision of fire appliances is not sufficient, and that proper advice is necessary as to the safety of fittings and apparatus throughout the building to be protected. Compliance with the principles of fire-resisting construction as embodied in the London Building Acts is certainly not less important than the supply of fire appliances, but we may suppose that the directors of Messrs. Barker & Co. believed so strongly in the efficacy of the latter that they did not hesitate to continue the use of the upper story as sleeping quarters for some of their staff, and for the same reason delayed attention to the structural alterations proposed by the London County Council.

Events have proved that the firm were not justified in either course of action. Both Colonel Fox, London Salvage Corps, and Mr. Hanson, District Surveyor, expressed the opinion that it was unsafe for people to sleep in the building, and Mr. W. E. Riley, London County Council, said that if the suggested alterations had been made at the time of the fire, the inmates would have been able to escape. He also stated that an immense number of similarly dangerous buildings have to be dealt with in London, and we gather from his evidence and that of Mr. Milborne, a director of Messrs. Barker & Co., that the County Council are not taking very peremptory action to ensure prompt compliance with the law.

It is quite easy to realise that business firms may wish for time to consider extensive alterations involving heavy outlay, and to appreciate the considerate motives influencing the officials of the County Council. But it is equally manifest that persons engaged in dangerous trades must be awakened to a sense of their responsibilities, and, if necessary, compelled to give prompt attention to statutory obligations.

On this aspect of the question we may refer to the letter from Mr. E. O. Sachs, printed elsewhere in our present issue and also in the *Times* of Tuesday last. It will be seen that Mr. Sachs is strongly impressed with what he considers to be the apathy of the London County Council in enforcing the provision of the London Building Acts relative to fire protection.

We can quite understand the anxiety displayed by our correspondent, and agree with him that it is very desirable that the provisions of the Acts as amended in 1905 should be applied to all buildings coming within their purview, with a minimum amount of delay. At the same time, it must be admitted that the task placed on the shoulders of the County Council is one of enormous magnitude—a point made clear by the letter printed in the *Times* of Wednesday from Mr. A. T. Taylor, Chairman of the Building Acts Committee.

Although thousands of cases have been dealt with since the Act was passed in 1905, it is admittedly the fact that many thousands remain for attention, the policy of the County Council, as outlined by Mr. Taylor, being to deal with dangerous cases as they become known, and the remainder by a gradual process, so as to avoid a general

structural disturbance throughout the whole of the metropolis.

At the same time, it is manifest from Mr. Taylor's letter and the evidence of Mr. Riley that the County Council are unable to put administrative machinery into operation for the purpose of enforcing immediate compliance with the comprehensive requirements of the new Act all over London, and that the completion of the work, so far as concerns existing buildings, will probably occupy a long period of time. Therefore, without in the slightest degree implying any reflection upon the Building Acts Committee or the Architect's Department of the London County Council, we are unable to regard the situation with entire complacency, and trust that prompt measures will be taken to deal with dangerous cases, particularly where the premises are occupied in part for dwelling or sleeping purposes.

An ordinary general meeting of the Architectural Association was held on Monday at the Rooms of the Association, Tufton-street, under the Chairmanship of Mr. Gerald Horsley (President).

The Secretary announced that the Athletic Club dance would be held on December 2 from 9 till 2.30 at the Wharncliffe Rooms of the Hotel Great Central, and that tickets could be obtained at the office, price 8s. 6d. each.

The following new members were elected:—Mr. S. G. A. Cockle, Dovercourt; Mr. G. N. Mackenzie, Westminster; and Mr. R. M. H. Philp.

The President called attention to the very interesting exhibition of sketches, plans, etc., of London districts on the walls of the room which, he said, would repay study; and also to the exhibition of the works done in the Schools during the past term in the gallery, which, he said, gave an excellent idea of the work being done.

The Late Mr. Norman Shaw.

The President said it was his melancholy duty to refer to an event which was profoundly affecting them at the present time—he meant the great loss which all architects had sustained in the death of Mr. Norman Shaw. Mr. Norman Shaw was one of their Vice-Presidents about 1857. It was impossible for him to say how much they were indebted to Mr. Shaw, whose influence on architecture had been profound. Modern architecture, as they know it to-day, was really due to Mr. Norman Shaw's creative influence. Supported as he was by other men of his time, who recognised his great genius and ability, he had taken the lead in the direction in which their architecture had been progressing in the last few years. He moved that a vote of condolence be sent to the relatives of the deceased gentleman.

The motion was carried in silence.

The Late Mr. T'Anson.

The President said he had also to ask them to pass a vote of condolence to the relatives of the late Mr. E. B. T'Anson, who had been a

member of the Association for many years, and whose work in the City of London and other places was well known to most of them. He was a man who was universally respected by all who knew him.

THE PROSAIC IN AN ARCHITECT'S WORK.

Mr. Horace Cubitt then read the following paper:—

"It will, of course, be admitted that an architect should be competent in all branches of his work. To such end we have now a most elaborate system of architectural education; and, apart from this, we are all, in some measure, students to the close of our days. But there is a tendency for study to be very largely confined to subjects which readily appeal to the imagination, and in consequence other subjects of less interest, but of very great importance in the work of an architect, tend to be rather neglected.

The statement that an architect should know his work must not, however, be construed to mean that every architect must be competent in regard to all classes of work that architects undertake to do. There are many branches of work occasionally carried out by architects which are not, in the correct sense of the term, architectural work. There is, for example, the valuation of property. It will surely be admitted that, although a scale of fees for this work is quoted in the Institute's Schedule of Professional Charges, a member of our profession when engaged in valuing property is acting not as an architect, but as a surveyor. The same applies also to the work of preparing quantities. An architect when executing such work is surely, for the time being, a surveyor. Other important instances where work frequently undertaken by an architect is in reality that of a surveyor are the measurement of the area of a building site or building estate, and the settlement of dilapidations. No suggestion is made that an architect should not be conversant with many subjects which come within the term "surveying." It will often be very helpful to him in his practice if he is able to undertake work of this nature, although in the larger towns he will do well to leave such subjects as the valuation of property and the preparation of building quantities to surveyors who specialise in these subjects. But such knowledge is in no way essential, whereas it is obviously of primary importance that an architect should be thoroughly acquainted with the carrying out of all matters that correctly come within the scope of the term "an architect's work."

True Architectural Work.

It may be said that it is difficult to know where to draw the line between true architectural work and surveying work that is undertaken by architects. But there is really no difficulty at all. An architect, as the designer of building work, should obviously be acquainted with all branches of knowledge that affect the work of design—using the word design in the correct sense of the word, and not restricting it as is so often done to the conception and elaboration of ornamental features. Beyond this his knowledge need not extend. It will be seen that ignorance of the various branches of work already mentioned will not handicap in the slightest the designer of building work. With valuations and dilapidations he is clearly not concerned, and his design will probably gain rather than suffer in execution, if the survey of the site and the preparation of the quantities are undertaken by some other person.

But an analysis of the process by which a design is evolved will show that there are other branches of work of very great importance to the designer, which are frequently incorrectly classed as belonging not to architecture, but to surveying or engineering. These branches of work, which cannot usually be mastered without considerable application and study, do not appeal to the majority of architects and architectural students. Hence, the wish and the thought being in the proverbial relationship, there is a tendency to regard a knowledge of such subjects as not essential to the equipment of an architect. Why, it is in effect said, should we waste on these prosaic subjects valuable time which might be better spent in gaining a fuller

knowledge of art? But can this attitude be justified? A designer when called upon to deal with an architectural problem is required to have a knowledge not merely of proportion, architectural detail, and the customary methods of construction, but of the practical requirements, restrictions, and possibilities that affect the work on which he is engaged. The evolution of a design is such an intangible process of catching and weaving together, and elaborating ideas, as to arise in the brain that the designer works freely and satisfactorily only when he has a thorough grasp of everything which materially affects his work. But, it may be said, this is expecting too much of a designer; surely it will be permissible for him to get the opinions of specialists on certain points, and then, if necessary, modify his design accordingly. Imagine a composer of organ music being compelled towards the end of his composition to call in a specialist in organ construction with a view to modifying his score where, as with his advisers considered it unplayable, he imagines such a man producing a modification of a possible much finer work because of his lack of knowledge of the capabilities of his instrument. An architect who in matters vitally affecting his design relies on the advice of specialists instead of making himself conversant with all the subjects concerned is acting in a completely similar manner, and runs a similar risk.

The Building Law.

Let us consider the chief of these subjects that are thought by many to be too unimportant and too prosaic to be worth the close and thorough attention of the exponent of the students of architecture. Take, for example, the comprehensive requirements of the building law in our larger towns, and more particularly in London. Here we have an elaborate code which very materially affects the construction of every building. Consider an ordinary domestic building on an ordinary site, and it will be found that the position, height, construction of the building will be materially controlled by the requirements of the building law or by-laws. The building, for instance, must not extend beyond the frontage line; it must have the required amount of air space at the rear; it must, if situated in London, extend above the diagonal line; its walls must be of specified materials of specified thickness; its system of sanitation must be designed and constructed throughout in accordance with specified requirements. All these points are met with in the design and construction of a building of ordinary everyday class. In dealing with special buildings further requirements are entered. Large public buildings, for instance, are required to be planned so as to provide reasonable means of escape in case of fire, and to be of fire-resisting construction throughout. London the means of escape requirements apply to a very large class of buildings, and there are also special constructional requirements affecting warehouses, shops, dwelling-rooms above, tenement buildings, etc.

These numerous and far-reaching requirements have a very considerable influence on the buildings that we design. Possibly of such requirements are open to criticism. If so, by all means let us have ample opportunity to get the offending requirements rescinded or amended. But the bulk of requirements will doubtless withstand the force of criticism, and in any case we are bound to conform to all requirements existing at the moment, whether good or bad. Seeing this is so, surely it is not unreasonable to suggest that it is the business of every architect to have a good working knowledge of requirements in the district in which he practices. But what percentage of London architects are well acquainted with the London building law?

It is becoming to be a generally accepted axiom by modern writers on architecture that the study of any style is of value in proportion to the pains taken to understand the spirit of which the architectural form the outcome. A consideration of Greek architecture will show a thorough appreciation of just limitations to have been one of the predominant characteristics of Greek designers. It may seem rather venturesome to suggest that the modern exponents of

Geo-Grec should, as one of the principal axes of their work, take to a study of the building law. Yet I cannot imagine a Greek architect commencing to design a building while having but a hazy idea of the requirements governing his work. In fact, a Greek architect with hazy ideas on any branch of his work is almost inconceivable. The clearest intellectuality of his age could not brook a kind of half-knowledge which to-day is prevalent.

Result of Ignorance of Requirements.

But it will doubtless be said—remarks to this effect are of everyday occurrence—that it is impossible for the average architect to become familiar with requirements so comprehensive in character as those applying in London, and that, after all, there is no real need for the architect to bother his head so much about such matters; if he goes through the District Surveyor or the London County Council officials will soon put him right. In regard to the first of these two assertions, it must, of course, be admitted that detailed knowledge of every single requirement is out of the question. Neither is such knowledge necessary to any person; for the sake of any requirement every careful person will consult the exact text of the Act by-law in question. But a general knowledge of the requirements is a very desirable acquisition, and is not a matter of very great difficulty. But close attention and study is, of course, required; it is not possible to become well grounded in any subject without concentration, and the London Building Acts cannot be mastered in a spirit of absent-mindedness.

As regard the assertion that the administrative officials will prevent the architect from transgressing any requirements, this as a simple statement may be accepted at once, at least for the implied suggestion that their action will operate favourably rather than otherwise in regard to the building in question, such a desirable result will not occur in one case out of twenty. What most frequently happens is that the architect who is not well acquainted with the building requirements evolves his design without much regard to such requirements. When he has succeeded in obtaining a satisfactory design on his client's standpoint, and there are immediate prospects of the building work being commenced, he submits his plans to the local surveyor. If he is lucky perhaps only a few small modifications will be necessitated, but not infrequently he has the mortification to find that his building as planned contravenes a very important requirement—it extends in front of the general building line, it has not the requisite open space at the rear, or the means of escape in case of fire are inadequate, or in some other important respects it is contrary to the building requirements. What is to be done? The client is patient to get the building started. The architect has not the heart to spend a bad deal of time in reconsidering his plan in the light of his new and dearly-ought experience. The local surveyor is principally concerned in obtaining a compliance with the requirements. If this can be done without impairing the efficiency of the building he is admittedly pleased, but if it is not he philosophically and rightly reflects it is not his fault. All things tend to set in many cases is practically the inevitable. The pruning-knife is requisitioned, the design is ruthlessly lopped and carved, and there to make it conform to the requirements. The architect henceforth is convinced that all by-laws and building requirements are made solely for the exasperation of the profession. It never enters his mind that he is to blame for not having made himself acquainted with the requirements affecting his work.

Law as to Rights of Light.

The mention of the procedure of cutting back a building brings us rather naturally to the subject of the law regarding rights of light. This, like the building law, is often considered to belong rather to the domain of a surveyor than that of the architect. It is the great evil which this branch of the law has on the erection of buildings surely does it among the most important practical branches of an architect's study. The owners could not have erected every year of which heights, and thus to some extent the

character of the elevations, are governed by the rights of light of neighbouring buildings. Architects should surely know to what extent they are able to build when concerned with a site thus subject to serious restrictions. Although the cases decided by the Courts are legion, yet, thanks to the decision of the House of Lords in the often-quoted case of *Colls v. Home and Colonial Stores*, the law on the subject is not unduly complex, and is within the understanding of any person who cares to give a little time to the study of it. An architect ought to have a reasonable acquaintance with the law on this subject, so that he can tell whether he is keeping within safe limits or whether the building that he proposes to erect is one of those on the borderline between what is and is not permissible. In dealing with a site subjected to rights of light it will often be necessary to make the maximum permissible use of the site, a borderline case being in such instance the obvious primary objective of the architect. Then, in the subsequent negotiations with representatives of the dominant neighbouring owner or owners he can feel his way, and, if necessary, make some little concessions in order to dispose of any opposition that may be encountered. In matters of this kind an architect will surely produce a better building if he has a sufficient knowledge of the subject to enable him to act independently, and is not compelled at every stage to go to an expert for guidance.

Law of Contracts.

A great deal of attention has recently been given by the profession to the law of contracts as affecting architects. It is undoubtedly a very important subject, although from the standpoint of architecture it may be considered to be of less vital interest than the subjects of the building law and the law as to the rights of light. For it is quite conceivable that an architect might erect a succession of fine buildings under forms of contract of hopelessly unsuitable and inadequate character. Or an architect might possibly delegate the whole of his work of this nature to his solicitor, and his buildings might be none the worse. But it is obviously not to the interests of the profession, and thus indirectly not to the interests of architecture, for architects to gain a reputation for lack of business ability; neither is it desirable to allow any of our legitimate work to fall into the hands of lawyers. The law of contracts as affecting both the building owner and contractor, and the architect and client, is therefore a necessary subject of study for practising architects and for aspirants to the profession. There is also one special aspect of the study of various legal branches of our work which should not be overlooked. Familiarity with the interpretation of the law as expressed in the judgments of the Courts tends to produce an appreciation of the just value of words. In the majority of building cases, except to some extent those regarding rights of light, the decision depends almost entirely on the construction of a clause in a statutory requirement or contract, or in the interpretation of a judgment in a previous case. It is impossible for a person to give much attention to legal decisions without acquiring, unconsciously perhaps, a clearer form of literary expression. The value of this is, of course, considerable, having regard to the amount of correspondence which an architect's practice necessarily entails. Also it may be not unfairly contended that the habits of precision thus established are no inconsiderable asset in the practice of what has been termed the most sane of all the arts.

Construction.

We now come to the question of construction. As regards those branches of the subject which are embraced within the work of the main building trades, the modern architect has generally a very sound knowledge. Indeed, in the case of brickwork, carpentry, and joinery it is not too much to say that many architects know much more of the technique of these subjects than the average mechanic. And that this is so is one of the hopeful signs in modern architecture. But how about the important matters in the erection of a large building which it is the custom to include in the general term "engineering"? Here it is quite the exception to find that the architect is sufficiently familiar with the work

to be able to design and control it in all its details. He usually is compelled to place such work, and thus to some extent his own reputation, in the hands of specialists. To a certain degree this action is justifiable. So many special matters are encountered in the construction of most large modern buildings that it is quite impossible for an architect of other than most exceptional attainments to be thoroughly well acquainted with them all. There is, however, a distinct line beyond which an architect ought not to go in delegating his work to specialists. If the special work is such that it can have no material influence on the general design and construction of the building, the specialist may be employed. Such matters as the technical details of electric lighting and hot-water heating of ordinary buildings may not unreasonably be delegated to specialists, for if this is done the resulting work will often gain by the arrangement. But, on the other hand, if the work is such that it affects the design of the building, the architect cannot rightly delegate it to anyone.

Structural Design.

There is one subject of vital importance in architectural work which comes within the latter category. This is the subject of structural design, within which may be included at one extreme the formation of the simplest type of cottage roof, and at the other such undertakings as the conception and elaboration of a dome like that of St. Paul's or a bridge like Waterloo Bridge. Most modern architects are exceedingly inconsistent in their treatment of this subject. So long as the problems to be solved are of a similar character to those which have been dealt with by members of his profession for centuries past, the average architect has no hesitation in applying his mind to them; but, given problems of a new character, and the use of new materials, he at once says, "These questions are beyond my ability and experience; I must call in the engineer." As a result, the services of the architect are often dispensed with entirely, or, when he is employed, we obtain structures that are the design of two persons working from entirely different standpoints. If, as usually happens in the case of a bridge, the engineer is responsible for the initial scheme, the work of the architect, if he is not ignored altogether, is restricted to the application of ornamental features—or features that are intended to be so—to the engineer's design. The thought that the chief beauty of a bridge is in its general lines rarely appears to occur to either party. On the other hand, in the case of a large structural feature of a building, the architect first evolves the design, paying principal attention to the question of appearance. When complete, he turns it over to the engineer with a request that he shall settle, in all details, the form of the construction. Perhaps a few hours afterwards the same architect solemnly and—absurd as it may seem—in all honesty holds forth to students on the well-worn text that construction is the basis of all true design.

The reason for this failure on our part to place on a truer basis the more advanced branches of modern architectural design is undoubtedly a strongly-rooted dislike of the study of this to most architects—uncongenial subject of structural design.

Teaching in Architectural Schools.

It will be of interest to take note of the attention which is given in the several architectural colleges and schools to the subjects dealt with in this paper. The subjects of the building law, the law as to light and air, and the law of contracts are usually classed with a few other branches of work under the heading of professional practice. Outside London it appears, from such information as is available, that practically no instruction is given in these subjects in architectural schools. In most London schools a certain amount of attention is given to the building law, but apparently it is only in the Architectural Association schools that a general course of lectures on professional practice is given. Having regard to this, it may seem rather uncharitable to adopt a critical attitude, but criticism cannot be disarmed by the mere provision of a course of instruction without reference to the value of the course. A policy of declining to teach certain subjects is perhaps more capable of

defence than one of arranging a course, which, on the face of it, is too short to enable the subjects to be taught properly. The policy of reserving these lectures to the student's fourth year is also open to criticism. By the establishment of the course it is presumably conceded that the subjects included are ones of which an architect should have some knowledge. But under the present arrangement a student completes three years' training before he is officially informed that such subjects exist. Proper knowledge of any subject can only be obtained gradually; years rather than months are usually required. It therefore seems to be more than probable that the value of a course of lectures on professional practice, delivered to students towards the end of their training, would be greatly increased if students in their first year were brought in some way into touch with the elements of this important part of an architect's work. Doubtless this criticism can be met with the retort that during a period limited to four years it is impossible to teach everything. The problem of the training of the embryo architect is certainly a difficult one, and it must be admitted that A.A. Schools afford about the most level-headed architectural education that is given anywhere.

Unity in Architectural Studies.

In most architectural schools throughout the country the subject of structural design is in part taught under such titles as "mechanics of structures," "theoretical construction," "graphic statics," etc. But the teaching is usually confined to the dry-as-dust mathematical side of the subject. Other classes are held in which is taught the science of ordinary building construction, and there are, of course, yet other classes in what is termed "architectural design" where the treatment, however, is usually restricted to questions of planning and to the design of elevations on approved historic lines. One feels compelled to ask why it is not possible to teach the subject of architecture by dealing with a building from all standpoints—the planning, the construction as determined by mathematical calculations and ordinary practice, and the treatment of the constructional features in such a manner as to produce real and virile architecture. There are certain cases where we are instructed not to let the right hand know what the left hand does, but there is no authority for applying this precept to architectural education.

It is hoped that sufficient reasons have been produced to justify the statement that the various subjects in our work, which are usually stigmatised as dull and uninteresting, are nevertheless of very considerable importance. If this is so, it surely follows that they should be given a place in the forefront of an architect's studies. In no art, profession, or business is it contended that if certain studies are uninteresting they should therefore be neglected. In any case, if the established members of our profession demur at pursuing these studies themselves, they may not be unwilling to see them made compulsory in the case of students. This would afford still further grounds for the older men to expatiate on the increased educational advantages under which the present generation of students pursue their studies.

Reputation of Title of Paper.

The time has now come when the title of this paper may be thrown overboard. These subjects as a whole are not prosaic. Of course, a good deal depends on the general outlook of the individual. There are persons—you find them principally on the Practice Committee of the Institute—who look upon the law of contracts as a highly enthralling subject. Up to the present I have not been touched with this enthusiasm. The building law, however, exercises a certain attraction. In studying the details of this subject there is always the zest of exploration. New uncertainties are always inviting investigation. The modern geographical explorer is beginning to have rather a bad outlook. Before very long the world will be so well explored that there will be nothing fresh for him to discover. But the person who takes as a field of exploration such a subject as the London building law need have no fears in this direction. As soon as he becomes reasonably familiar with the various by-paths

he will find that the County Council have amended the law and there are fresh points for him to investigate. The subject of rights of light is by no means uninteresting, and should appeal to two distinct classes of architects. Those who like a battle of wits will find ample opportunities for a display of their abilities in the negotiations which are so often involved. Those who are interested in such subjects as geometry and optics may usefully devote time to the study of the effect of obstructions on the varying degrees of light received by ordinary buildings in thickly-populated districts.

That the subject of structural design can possibly be considered prosaic is a most serious reflection on our modern method of training. The Roman architects and engineers who erected the mighty *thermas*, aqueducts, bridges, and amphitheatres, which are still the wonder of the world, obviously did not consider the subject of structural design dull and uninteresting. The Gothic builders, it may be assumed, took as keen a delight in the logical scientific construction of their buildings as they did in the execution of the mouldings and carving with which such construction was embellished. Coming nearer to our own time, it is only reasonable to suppose that the "great mathematician" expended as much thought and labour on the fine structural scheme for the dome of St. Paul's as he did on the design of any other feature in the building. It is necessary for us to realise that structural design is not a mere matter of calculations and formulae. These things, however necessary they may be, are but means to an end, such end the achievement of a living architecture, founded, as was the case with all the historic styles, on the basis of logical construction."

Mr. Max Clarke,

in proposing a vote of thanks to the author, hoped that more opportunity would be given to the junior members to speak by allowing them to propose such resolutions, as it was well for them to make a commencement in a place where they were more or less at home. Mr. Cubitt had had the audacity to come and tell them they were not conducting their business in a proper manner, but whether he was right or not was a matter of opinion. When they had a paper of that kind the hall was not half filled, whereas on other occasions when the subject of discussion was supposed to be of more interest it was crowded. This was exactly what Mr. Cubitt had been telling them, viz., that these matters which he was pleased to call prosaic did not appeal to the younger generation, or perhaps also to the older. If he had his way he would never deal with a light and air case or make a survey of a property or a schedule of dilapidations, but he had to live by architecture, as he exposted others in the room would have to, and if a young man sat in his office and declined the chance of doing these things when a client came along he would lose that client for ever. He disagreed with the author in several details. He believed one of the first things a man should learn was how to measure a piece of ground and also how to be able to take the levels of the ground. The practice of architecture was very much in the clouds. They were all hoping for the chance of building a palace, but very likely it would result in their getting a cottage to build, and probably they would be faced with the difficulty of having to build it for 150l. If the architect was not able to survey the ground for the cottage he would never be able to build the palace. He also disagreed with the author about the quantities. It was becoming more or less the practice with busy architects never to write a specification themselves, but if the young man could not write a specification for a cottage, he would not know how to build the palace, and unless he learned something about it at the Architectural Association he did not know where he could acquire the knowledge. He must know how to write a decent specification which the contractor could understand or else he would not be competent to design a building. He believed in excellent draughtsmanship, which was the first thing to be learned, and in that he included design. Unless they could make a good design they could never get any prizes, and prizes were a sort of advertisement for architects. Architects were unable to advertise like some "dentists" in the newspapers, and so had to resort to some other method, and prizes were a sort of advertisement for them in the junior stages. In the next stage the architect got

a competition which he hoped to be able to carry out. If they were able to write a real specification there was no great difficulty in getting from that stage to the stage preparing quantities. They might never do it, but it was a good plan to know something about it, because then they would know better how construction was done than in any other way—they would get a better grip of the whole building if they knew what was provided to make it. One dreadful thing about architects was the "extras." There had been many cases in the papers lately in regard to these, and he understood they would see more shortly. They were unfortunate for the architect and the client, and he did think they would crop up if the architect knew exactly the amount of money being given and if they told the client honestly what thing would cost, and not go into a thing some did, with a light heart, hoping it would come out all right in the end. Some of them were becoming very litigious, and the Council seemed to uphold them more than in the past. When they got a good practice they would be able to pay people to do the things which were distasteful to them, but until then they would have to do them themselves. This raised an awkward question of whether they could the client to pay for this expert assistance and if the architect was responsible for payment of the electric lighting and sanitary experts, and so on, he would find little for himself. He disagreed with the author about the District Surveyor. Those officials had no right to express opinions about practice and only gave advice by courtesy and on the goodness of their hearts. Mr. Max Clarke proceeded to refer to the contract form of the Royal Institute of British Architects which said, the Practice Committee was seeking to revise. The present form did not safeguard the architect and client in regard to the architect's Liability, and it was better at present time not to use that form, and he amended in this particular. Probably of the students realised the advantage of being enjoying as compared with the available when he was a young man, but the pursuit of architecture required a great amount of energy, and he wondered why they did not devote too much time to football clubs, and dances. The older men did not think about these things, but it was with the younger generation then it was nice. He did not agree that the younger were all hopelessly lacking, because he had what went on in the Institute examination from time to time, but what did surprise him was to see how they dealt with so many subjects. Many of those who went in for the examination were very clever, but there were others who were stupidly was hopeless. In regard to majority, however, he considered they reflected credit on the teaching of the Architectural Association.

Mr. A. G. Horsnell

seconded the motion, and said he really did not think the subjects touched upon were prosaic. In the grasping nature of subjects in light and air cases, ancient lights and things of that sort, there was fine material for a study of human character apart from law, but really he did not think it anything to do with architecture. Architecture was quite a different matter, but, of course, such things came their way and they could them, they did so. No doubt some architects were slacker on certain subjects than on others but one could always get advice on matters they did not know thoroughly themselves.

Mr. Louis Jacob, F.S.I.,

considered that whether the matter dealt with by the author were prosaic or not, they were most important to an architect starting practice. These were things which the client himself knew something about, and which was able to appreciate far more, unfortunately than a beautiful design. That was particularly unfortunate from the architectural point of view, but important from the view of practice. He disagreed with Mr. Max Clarke that the District Surveyor only gave an opinion on a matter of courtesy, because a clause in the Building Act said that drawings were to be used as evidence against a person, and therefore he took it that if an architect submitted plans which were wrong in some respects those facts ought to be pointed out to him. Apart from that, he thought the architect would always find it desirable when his scheme was

liminary stage to talk over the matter with various officials concerned in a friendly way, and he would get more information as to the law and the regulations than if he spent many hours studying the law and the by-laws himself. The law on all these matters wanted codifying. He himself started to do this, but he found it was a gigantic task that he had to drop it. The inference had been made to the Councils case, but he believed that decision had been considerably modified by the case of "Kine v. Jolly." He strongly advised them never to send their conditions of contract to a solicitor, and if it came to an arbitration let it be before surveyors. Of course, with regard to the Royal Institute of British Architects' form of contract, the awkward thing was that directly they began to alter it the builders said it was a form agreed on by the Institute and the master builders, and it ought not to be altered. With regard to structural design, if they were constantly engaged in building houses, and then perhaps in ten years they had to build a factory, they found the engineers' formulae rather a nuisance. He could not help wondering when Mr. Cubitt introduced the Gothic builders if they used this formulae. He did not think he showed that they did.

A. O. Collard

He thought the paper might have been better titled "The Mosaic in the Architect's Work," after all, the word prosaic did not apply to architecture. In the dictionary it meant something dull or uninteresting. He was afraid that many papers on architectural subjects were dull and uninteresting, but the work itself was interesting in every branch of it. He thought the author was absolutely right in insisting architects not to undertake the disposition of property or the preparation of conditions, for they were a distinctly different kind of work, involving many differences of opinion and taking up so much time that the architect could not be supposed to have time for it. They had often heard discussions about many papers on architectural subjects, but he implied, and Mr. Cubitt seemed to concur, that there was a difference between the architect and the surveyor. Most of them to-day were quite ready to drop the word surveyor altogether, and merely call themselves architects, proving that the greater included the less. He did not think the author's illustration of a composer was quite a happy one, because that case disaster could occur only to the composer, but in the architectural profession many people were involved, and the result might be disastrous. He did not think any architect's present need go through the process of being described by Mr. Cubitt. If he was important he had only to prepare a scheme and pencil and take it to the local Council or District Surveyor, and it could be amended before the architect got himself into a tangle and his client into expense. He thought Mr. Cubitt was a little severe on those who might be associated with engineers, for the architect welcomed being associated with the engineer. He did not think any architect was not aware before that to most architects the question of structural design was unimportant, for he had found it the most interesting part of their work. It had sometimes occurred to him that the question of professional practice ought to be dealt with in an earlier stage of the curriculum at the Association, but he was not at all sure about it. By the time they reached the fourth year their minds were more open to the serious subjects which had to be dealt with under the head of professional practice, and he found that students took in a kindly manner to subjects which probably they had not told were uninteresting. He could assure Mr. Cubitt that under the curriculum running at present there was scarcely a moment to spare for any work outside what was being actually done, whilst if any of the present work were done away with he did not think the curriculum would be as beneficial as it was.

The President

He seconded Mr. Collard's remarks as to the curriculum of the Association. When the President came in the fourth year he was generally the daytime in an architect's office, and he brought into touch with those points of professional practice which came more or less to all architect's work. Consequently he was rested in knowing more about these matters, in the excellent course of lectures they had been able to gain knowledge. Such questions and quantities were special subjects which

could engage the whole lifetime of a man, and it was much better for architects not to deal with them. He also supported the suggestion as to consultation with the District Surveyors, who were most courteous, and would spend much time in trying to help their professional brethren. If there was one subject which interested the student it was structural design, and he was taught from the first that structural design was at the root of his design. That was dealt with extremely thoroughly within those walls.

The motion having been carried,

Mr. H. Cubitt

said the argument of Mr. Max Clarke was that the architectural schools should teach in such a way as to produce not an architect necessarily, but an architectural practitioner. He did not agree, and he purposely separated the items of work so as to rule out those which in his opinion could not be called part of an architect's training. They were part of a practitioner's training, but they did not necessarily come into that of an architect. He thought they ought to know enough about quantities to prevent them from undertaking them, although he agreed that the knowledge one gained in learning quantities was most instructive. The real point, however, which he wanted to emphasise was that of structural design. They were told that students were trained in and took delight in structural design, but that was so why did an architect when called on to design a steel-frame building call in an engineer to do the steelwork for him? Surely steelwork was structural design, and if they designed a building in such a manner as was suitable for stonework, and then made it a steel building designed by someone else, he did not see how they were producing proper architecture. When dealing with the construction of a building, whether of ordinary character or of steel or reinforced concrete, they ought to be able to design that construction, and not merely make elevations and plans and let the construction get muddled through afterwards, which was what happened nowadays. He thought the training of students should be such that they did not relegate to the engineer matters which were for the architect. He did not see why an architect should not design a bridge. An architect was usually thought competent to design such a structure as a grain silo, so why not a bridge? It was not until the beginning of the XIXth century that architects were deprived of this branch of their work, and they now seemed willing to accept the position of not being able to design in the higher branches of structural design. To his mind this was deplorable. He thought they could get to a certain degree of knowledge so that they would understand construction not in a limited number of materials, but in all materials.

The President announced that the next meeting would be held on December 9, when papers entitled "The Practice of the Crafts in Modern Building" would be read by various members (combined meeting with the Art Workers' Guild). There would be also, if it could be arranged, a meeting on December 14 to deal with the question of the Territorial Army.

THE ARCHITECTURAL ASSOCIATION CONVERSATION.

The writer of a recent article in the *Spectator*, entitled "New Country for a Hunt," in which the dinginess and remoteness from the rest of civilised London of the Architectural Museum were somewhat unkindly used as a text, would have been astonished at the appearance of the Museum on Thursday, the 21st, on the occasion of the Architectural Association's Annual Conversation. He would also have come away with the impression that the present tenant of the Museum is an unusually active and enterprising Society.

The premises are as good as any in London for an occasion of this kind. The central hall, with the walls of its galleries lined with casts, formed a pleasantly mysterious meeting-place for some 400 guests. The decorations, the music, and the casts were an excellent contrast to the more serious enjoyments provided in the rooms adjoining the galleries on each floor.

On the top floor was an exhibition of this year's School work, and was notable for the work done during the first few months of the new third year course in the Day School under

Mr. Robert Atkinson. This course is a necessary development of the Association's educational policy, which should give the student a better grasp of the principles underlying architectural design than has hitherto been possible in the short space of two years, during which a great part of his time must be given up to acquiring a knowledge of drawing, history, and construction.

On the first floor gallery was an interesting collection of photographs by the members of the Sketching and Debating Society and some tapestries kindly lent by Messrs. Morris & Co.; but the principal attraction of the evening was an exhibition of prints, plans, and drawings of London in the large room of the first floor—London as it was, as it is, and glimpses of the future. This collection was limited wisely, and divided into three sections—"The River from Greenwich to Chelsea," "St. James's Park," and "Regent-street from Waterloo-place to Primrose-hill," or, as someone aptly put it, "Nash, from the Athenaeum to the Zoo." The last of these sections was by far the most comprehensive, and was largely obtained from the collection of Mr. Arthur Ashbridge, who hung them himself in an easily-understood sequence. Nash's design for the lay-out of Regent's Park was shown in a note worthy original water-colour drawing which we do not remember seeing before.

The prints of Regent-street and the Quadrant, with Nash's complete elevation and plans, are at the present time especially interesting. These were amplified by photographs of various portions of the street as altered to meet the present-day needs of the shopkeepers, with the designs for the new street by the late Mr. Norman Shaw, and with Mr. Henry Tanner's design for Oxford-circus. We could not help being struck afresh by the apparently irreconcilable views of the architects and shopkeepers, and perhaps still more by the fact that Nash's street, though altered and mutilated in its lower portions still maintained until the last a uniformity of design which preserved the main effect he was aiming at almost if not quite unspoiled.

At the Regent's Park end of the scheme it would have been interesting to see some photographs of the new Bedford College, and at the other end some of the new Waterloo-place. The various schemes for the rearrangement of Piccadilly-circus, though generally known, might with advantage have been added to the series for the sake of completeness.

The River is so large a subject that it would have been impossible to have illustrated it at all completely in the space available, but enough was given to lead us to hope that the London Society will deal with it more exhaustively on some future occasion. Most of the exhibits had been seen before at different times, but it was particularly interesting to see them grouped together in this way.

Amongst the drawings not shown before was an excellent view by Mr. Raffles Davison of the south side of the river from the Savoy Hotel. The first of these drawings is called "Derelict London," and it shows accurately and without a trace of exaggeration the wasted opportunities of the finest site in Europe. It also shows very clearly the possibilities of a short cut from Westminster to the City to relieve the traffic on the north side. Drawings by Mr. Brower, lent by the *Builder*, and Mr. Berrington, emphasising the derelict condition of southern London, were also included.

The proposals embodied on plans and views by Messrs. Barclay Niven and Raffles Davison for removing Charing Cross and building an Imperial Senate House on this side of the river were interesting attempts to tackle the problem, though hardly within the realms of practical politics at present; but everyone will agree that some definite schemes should be laid down soon for the treatment of the whole area before isolated properties are acquired and built upon without any thought for the whole.

Mr. Colcutt and Mr. Berrington lent some suggestive drawings of various schemes of a similar nature which will repay study. An interesting set of plans in this section by Mr. Arthur Crow deals with the problem to be created at the Post Office end of Newgate-street by the influx of traffic from the new St. Paul's Bridge. St. Vedast's Church, as our readers know, is threatened with demolition in the future if the Post Office is rebuilt as at present proposed, and a new road to the east is found necessary later on. The London Society have done well in bringing this matter

Shop Front, Scarborough.

Messrs. F. C. Moscrop-Young and E. B. Glanfield, Architects.

before the public, and we understand the whole question is now being considered in responsible quarters.

A well-known plan of the Palace of Whitehall, in 1670, giving the allocation of the buildings, should be mentioned, and also an unpublished plan of the same subject about 100 years later, lent by Mr. Brooke Kitchen.

The St. James's Park section consisted of plans and views of the Park lent by Sir Aston Webb, R.A., the Institute, and the proprietors of the *Graphic*. It was mainly historical with the exception of some suggestions for dealing with the eyesore at present existing at the opening between Trafalgar-square and the new Admiralty Arch. Part of the Coronation hoarding still remains to cover the raw edges of the partly-demolished buildings. An interesting photograph of the Mall, taken from a balloon shortly after the present alterations, led one to think that much valuable information might be obtained by a survey of the whole of London by similar means.

In the limits of a short notice it is impossible to mention more than a very few of the exhibits, and we have confined our attention largely to those which deal more expressly with the possibilities rather than the actualities of London, with the object of emphasising the value of the work which the London Society can do. It was a happy thought of the Council of the Architectural Association to place their rooms at the disposal of the Society for their first exhibition.

SHOP FRONT AT SCARBOROUGH.

The design of this front was influenced by the clients, Messrs. Archibald Ramsden, Ltd., who desired a large window space for the display of pianos. An attempt has been made to accomplish this without impairing the structural appearance in any way. The front is in American pine finished with "Satinette." The carved trusses were executed by Messrs. Martyn & Co., of Cheltenham. The architects were Messrs. Moscrop-Young & Glanfield, Licentiate and A.R.I.B.A., of Brook-street, W.

IMPROVEMENT SCHEMES, READING.

Reading Corporation have decided to promote a Parliamentary Bill empowering them to reconstruct Caversham Bridge, to erect a new vehicular bridge near Caversham Lock, and to effect other works of improvement to the enlarged borough at a total cost of \$3,000.

ARCHITECTURAL SOCIETIES.

Nottingham Architectural Society: Jubilee of the Society.

The members of the Nottingham Architectural Society celebrated the jubilee of the Society on the 12th inst., when a Conversazione was held at the Exchange Hall by permission of the Mayor of Nottingham. Drawings were shown of architectural works lent by the members. The members and friends were received by the President and Miss Sutton. The special designs on the souvenir programme were the work of Mr. F. W. C. Gregory, a member of the Society.

The Presidential address by Mr. Ernest R. Sutton, F.R.I.B.A., was a review of Nottingham's architectural history during the last half-century. In the course of his remarks the President said fifty years ago that night a few Nottingham architects met at the Public Offices by the kind permission of the Mayor, Richard Birkin, when it was decided to create the Nottingham Architectural Society. From its very inception it was a fine healthy child, and found many admirers; it began at once to make its presence felt in the world of art and science. It was most gratifying to know that they still had with them three of the original members—Mr. Robert Booker, Mr. W. A. Heazell, and the President's father. Proceeding, the President said: "I should like to take this opportunity of expressing on behalf of the profession our appreciation and gratitude to those who were the original founders of the Society. The work was done in an admirable manner and the foundations they constructed have proved worthy on which to build the prosperity of the Society. The Society was formed for the promotion of uniformity of practice and for the advancement of the profession of architecture and the various arts and sciences in connexion therewith. I should like to point out that our Society also takes a leading part in all questions of social reform. Take, for instance, the Early Closing Bill, 1912. This matter was receiving the attention of our members as early as 1871, for I find on looking through the 'Minute Book' that at a meeting held in April of that year the architects of Nottingham, on the request of the assistants and pupils, very generously agreed to grant a half-holiday one afternoon in each week, but they made this stipulation, that one clerk must remain in the office so that it shall not be considered closed. Now let us take a hurried survey of our own city. It is a city we all

love, and I may be allowed to quote the Bis of Birmingham: 'We all long for Nottingham to be in every sense an example to others, it certainly is in many respects.' I regret to architecture can hardly be said to be one of strong features, though we must not forget have one grand masterpiece just outside city boundary. I, of course, refer to Woll Hall, built in 1580.

And what of the progress and development of our city during the period under review? It seems difficult to realise that we had electric installation for light and power in 1878. In November of that year it was used for street illumination in the town on occasion of an entertainment at the Mecham Hall, five lamps being utilised outside building. . . . It was not until 1881 the University College came into existence, was opened by the late Duke of Albany. School of Art was erected in 1883; and Castle Museum was opened in 1878. As indicating the steady growth and usefulness of our Society, just permit me to remind that since 1862 the membership has increased from twenty-two to over ninety. The first Conversazione was held in 1864. During the past half-century the Society has tributed 116l. to the Benevolent Society, to the Nottingham Art Society for promotion of lecture courses, and 44l. 3s. 4d. has been for the Victoria Hospital Fund, whilst many small sums have been subscribed from it to time to various charitable undertakings.

Changes in the Style of Architecture.

In the last fifty years we have witnessed many changes in the style of our architecture. In 1862 the Gothic revival was at the zenith of its popularity, and it received its death-blow as a style suitable for public buildings, on completion of the Law Courts. At this time the pioneers of the profession turned their attention to our English Renaissance, reviving the details of the architecture from Elizabeth and King James I. and all their varieties to time of Queen Anne. Still later a mysterious style evolved which gained for itself the coquettish title of 'the New Art.' Coming to the present time we are now revelling in the Gothic in all its severity. Yes, during these years we have been educating our taste in historical styles, trying first one and then another, mixing them sometimes, and giving a Jacobean lining to a Georgian gown. What revival or new style shall we find we turn over the next page of our history? Who can tell? We must wait and see. In the sphere of design—and I take it is the proper sphere of architecture—there is a very marked change in the spirit that abroad to-day compared with that which inspired or depressed the builder in the middle of the XIXth century. We all know to our depths architecture had fallen; we cannot know, for these buildings of the fifties exist, and will not die, and until a Society founded with the express object of preserving them they assuredly will not be destroyed. But the very thoroughness with which average Englishmen turned his back on anything rational or graceful in design for a few who retained some remnants of sense, feeling into a camp of their own. The Gothic revivalists, these pioneers did great things. Barry and Pugin raised the Houses of Parliament above the level of the Thames. Sir Charles Barry essayed a bold composition at the Law Courts, and Gilbert Scott—though his low medieval design was often more destructive than protective of the work itself—churches of not ignoble proportions or character. The effort of these men must be judged with due regard to the temper of the public and the opportunities of their time. The revivalists taught us that it was necessary to study proved masterpieces before we could form any artistic aspirations or seek to express them. Their gospel had to be preached by us, we could have Pearson's work at Truro, Scott's Cathedral at Liverpool, or the fine concept of Bentley's Byzantine pile at Westminster.

Men of the Period.

But what of the men who have graced the ranks of the profession during the past years? It would take long to recount you all the deeds by which they have attained to uphold the architectural standard ever we confined ourselves to those who fought and fallen in the first line. Many names will live and many more have entered for us in the fact that their personal efforts

laid the foundation for much that comes easily to us to-day. One man was in 1862 whose influence is still very much felt in the building world.

His name was Alfred Stevens, and, though by profession a sculptor, he had a wonderful power in the design of architectural work. In 1864 J. L. Pearson built the Church of St. Peter, Vauxhall, the first modern church designed throughout in brick and stone. Pearson was a great artist. Truro was fortunate in him the designer of its cathedral, and many of his churches such as Daybrook are known for their fine proportions and accuracy of detail. It is strange to think that Gilbert Scott was Pearson's senior only six years, for he seems to have been content more closely with an earlier period.

He had done a large proportion of his work before the date of our foundation, and we must remember that Pearson outlived him by nineteen years. At this time Butterfield was still alive, Ewan Christian, both builders of churches. George Edmund Street, the author of the old Law Courts, Sir Arthur Blomfield, and Edward Waterhouse—the latter had a wide practice and left his mark in almost every large building, including our own city—these were all eminent architects who worked strenuously for a fine ideal. They were quickly followed by men of equal sincerity, though working in a different style—Nesfield, Mountford, Norman Shaw, and others.

We come to men who are still practising, such as Sir Aston Webb, Sir Ernest George, Sir Burnet, Mr. John Belcher, Mr. Reginald Ashfield, and their many colleagues. We feel the delicacy of touch and loftiness of conception has been attained which were perhaps denied to the hard-worked business men of earlier date.

Past and Present.

There is, I think, little doubt that to-day can build better than fifty years ago; our materials are better, our cement clings more tenaciously, our bricks and tiles are better, and our whole system of steel construction has made the dream of 1862 a practicality in 1912. Timber is harder to get in rounded form, but the world's markets have turned up to us an extraordinary variety and quantity of materials, and for the best work the finest stuff is forthcoming. But are we making better use of our wider opportunities than our predecessors who worked without the aid of the rolled steel joist, and who had not the joy of the telephone and the typewriter in their office? If there has been any gain on our part, I shall hasten to say that the last two instruments of torture are wholly accountable for it. Both ancient and modern times have agreed to glory in architecture, for its effects chiefly and for its methods construction only in a lesser degree. And is not a principle which has held good for thousands of years appeal to so mature a delicacy as our own, which already boasts a belief? There is scarcely a modern movement that does not require our help to solve practical difficulties or to invest it with portance and becoming dignity. And now when the Government is becoming interested in cognisance of the value of our profession, are we schemes innumerable to replan our towns and villages, to plant garden cities, all our centres of industry, and to teach men and women that their homes can be beautiful, their surroundings healthful. Mr. Burns, with his Town Planning Act, has the official seal on a wide movement, and will not be the fault of the architect if it is not lead to great results. The increased activities of public bodies and the awakened interest in worthy buildings combine to give wider opportunity than architects of the last few years have ever known. And I sincerely hope that the Nottingham Architectural Society may witness a great revival in art which will eclipse its past history, and may Nottingham get a lion's share in the honour and the prizes.

Just one word to our junior members and to those who are about to join our ranks—see that you rally round the Society, keep your standard efficiency high, and place your ideals on a steady plane; see that the Society is never engaged in a selfish, mean, or ignoble battle. And when you unfurl the banner for inspection on the centenary celebration of the Society may it bear scars only obtained in fighting for that which is worthy of a noble profession."

Mr. A. N. Bromley conveyed the thanks of those present to Mr. Sutton for his interesting address and to those ladies and gentlemen who had so ably entertained them.

Manchester Society of Architects.

The third meeting of the students of this Society was held on November 19, with Mr. T. H. Hill in the chair. Mr. C. B. Howcroft read a paper on "Medieval Construction." Mr. Howcroft traced the various elements of medieval construction from its earliest phases in Roman work to its fullest development in the XIVth century. The lecturer noted that, whilst the development up to the XIVth century was purely on constructional lines, from that date until the end of the XVth century the mediaeval builders devoted themselves to the cultivation of the "purely æsthetic."—This gave rise to a somewhat animated discussion, in which the æsthetic value of the dying buttress was severely criticised. The opinion of the meeting was that the excessive height of the interiors was detrimental to the dignity of the exteriors.

THE SURVEYORS' INSTITUTION: LAND VALUES TAXATION.

The paper read by Mr. E. M. Konstam before the Surveyors' Institution on the 25th inst., in which he criticises the evidence offered by the "Land Values Group" before the Departmental Committee on Imperial and Local Taxation, is one of considerable interest. In this paper Mr. Konstam did not discuss the probable incidence or the financial effect of the proposals of the Land Values Group, nor the results to be attained by a system of land values taxation—"single tax" or otherwise; but he confined himself to considering, on the evidence submitted before the Departmental Committee, whether any practical suggestions had been put forward. "The question this evening, then, is whether land values taxation, strictly so called, is practical politics or is practical in any sense." It certainly is very unfortunate that the subject of taxation, and especially taxation of land values, one of national importance, should be made the object upon which a series of quack nostrums should be tried. An experimental Budget involving new principles of taxation, which, as we showed in our article on the Inland Revenue Report (the Builder, October 11), has already proved an entire failure, seems to have opened out a field for discussion, and every quack in the land at the expense of the national credit is anxious to prescribe his Utopian

remedy. Mr. Konstam describes the position well when at the close of his paper he says: "It would be a mere waste of time to examine proposals so crude, so ill-digested, and so shadowy as these, were it not that they claim to embody the only scientific system of taxation, that they pretend to be a cure for all our social ills, and that they are supported by an energetic and expensive propaganda. But the chief excuse for this examination lies in the danger—of which indications have not been wanting—that the Government may fall back upon the vague but enormous promises of the Land Values Group for their next election cry."

Mr. Konstam, in the course of his paper, shows the justice of the above criticisms on the proposals put forward by the Land Values Group before the Departmental Committee, but reasoned arguments seem of little avail if the object of proposed methods of valuation and taxation is solely to raise political capital.

The Government at the moment accept responsibility for the appointment of a secret commission to inquire into the question of land reform and kindred problems, but profess to have no powers to control its methods or prescribe its procedure. What can be more destructive to credit than semi-official "fishing" inquiries of this subterranean character?

From the observations contained in Mr. Konstam's paper on the proposed amendments of the Budget called for by the Land Values Group it only becomes more and more apparent how ill-advised that speculative measure was and how unlimited may be the price to be paid for it.

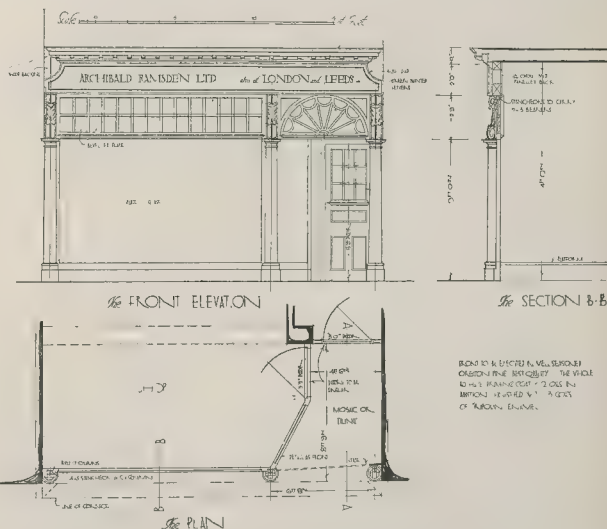

GENERAL NEWS.

Professional Announcement.

Mr. Frank L. Pearson has changed his address from No. 12, Mansfield-street, W., to 22, Ashley-place, Westminster, and his new telephone number is Victoria 2998.

The Late Mr. R. Norman Shaw, R.A.

At the funeral at Hampstead Parish Church, on Thursday last week, were present, amongst others:—Mrs. Norman Shaw and her sons; Sir Edward Poynter, F.R.A.; Sir Aston Webb, R.A.; Mr. T. G. Jackson, R.A.; Sir W. Goscombe John, R.A.; Mr. W. Hamo Thornycroft, R.A.; Mr. A. Hacker, A.R.A.; Mr. Frank Dicksee, R.A.; and Mr. Briton Rivière, R.A.; Sir Ernest George, A.R.A., and Mr. Ernest Newton, A.R.A.; Mr. Leonard Stokes; Mr. W. A. Pitt; and Mr. J. J. Joass; Mr. E. T. Tanner for Sir Henry Tanner; Alderman William Woodward, Deputy-Mayor of Hamp-

Detail of Shop Front, Scarborough.

Messrs. F. C. Moscrop-Young and E. B. Glanfield, Architects.

stead; and Mr. R. F. Norton, K.C. The vault is near to the grave of Constable in the old churchyard.

The Royal Sanitary Institute.

The Right Hon. Earl Fortescue (Lord Lieutenant of the County of Devonshire) has consented to accept the office of President of the Twenty-eighth Congress of the Royal Sanitary Institute to be held at Exeter from July 7 to 12, 1913.

London University: Studentship in Archaeology.

At a meeting of the Senate last week was gratefully accepted an offer made by the Society of Antiquaries, London, to found and maintain a studentship in archaeology in memory of Sir A. Wollaston Franks, K.C.B., F.S.A., etc. The studentship, to the value of £50. per annum, and tenable, in special circumstances, by the same person for two years, will be awarded annually in pursuance of an adopted scheme, to enable a student to conduct research work in the archaeology of the United Kingdom.

Stafford House.

In the House of Commons Mr. King asked the representative of the First Commissioner of Works whether he had information that Stafford House had been purchased by a gentleman who intended to offer it to the nation; whether a definite offer had been made; and whether any information could be given on this matter. Mr. Wedgwood Benn replied that the First Commissioner regretted that he could not make any statement on the matter at present.

Planning of Delhi.

In the House of Commons Mr. King asked the Under-Secretary of State for India whether it had been decided to adopt the Italian Renaissance style of architecture for the official buildings at Delhi; and whether the adoption of an Indian style of architecture, as more consonant with the traditions, craftsmanship, and climate of India, had been or would be considered. Mr. H. Baker said the answer to the first question was in the negative. No decision would be taken without giving full weight to the considerations mentioned.

Mr. King also asked if the Under-Secretary of State could state when he expects the report of the Town-Planning Committee which is considering the building of the new Delhi; and whether this Committee will report on the style of architecture to be adopted. Mr. Baker replied that the Committee will reassemble next month, and will report after the inquiry, which is expected to take about two months, has been completed. The question of the style of architecture is outside the scope of the Committee's inquiry.

Widening of St. Martin's-le-Grand.

The City Corporation, at a recent meeting, had before them a report from the Improvements and Finance Committee submitting a plan for widening St. Martin's-le-Grand to 80 ft. and Gresham-street between Aldersgate-street and Foster-lane to 50 ft., on the rebuilding of the old General Post Office. They recommended that, subject to the London County Council's agreeing to contribute one-half the net cost, the two thoroughfares should be widened accordingly. The value of the land to be acquired for the improvement would be settled by arbitration. As the matter was pressing, the Post Office authorities requested the Corporation to come to an immediate decision.—Mr. Sewill moved that the matter be remitted to the committee to complete without delay.—Mr. Douglass Mathews as an amendment suggested that the consideration of the report should be deferred until a printed statement embodying plans and cost of the proposed improvements and the expected relief of traffic from west to east was in the hands of the members.—The amendment was rejected and the committee's report was adopted.

Irish Garden City Scheme.

In the House of Commons recently Sir Thomas Esmonde asked the Chief Secretary to the Lord Lieutenant of Ireland if he would use his influence with the Irish Local Government Board to have the inquiry into the proposed garden city scheme for Gorey, county Wexford, held as speedily as possible; if, on reconsideration of the fact that there is no opposition to the scheme, the Local Government

Board was still of the opinion that an inquiry was necessary; and if, pending the inquiry, the Local Government Board would authorise the payment by overdraft with the district councils' treasurers for the site of the proposed scheme.

Mr. Birrell replied that an inquiry could not be dispensed with as the scheme of the district council involved the provision of house accommodation (seventy-six cottages) as well as the purchase of land in respect of which a provisional agreement had been already entered into with the owner. The Local Government Board were not empowered to authorise payment for the land by an overdraft from the councils' treasurer or otherwise in anticipation of the scheme being sanctioned. As to the inquiry, the Board could not give precedence to this case over others.

Old Dee Bridge, Chester.

During the course of excavations connected with the execution of the new hydro-electric works on the River Dee it was discovered that two foundations piers of the Old Dee Bridge were in an unsatisfactory state. This picturesque structure, which crosses the river from Bridge Cote at the end of the street of the same name, dates from the XIIIth century, and the Corporation wisely decided to adopt measures for its preservation. On the recommendation of Sir Francis Fox, all loose material will be removed, and interstices between the stones filled up with cement grout. An invert 9 in. thick in blue brick laid in cement mortar will also be constructed with an apron as a protection against scour.

Defective Roofing Tiles.

The Science Standing Committee of the Royal Institute of British Architects invite members of the Institute and others interested to forward particulars of instances of defective roofing tiles which have come to their notice. It is desirable where possible that such particulars should be accompanied with samples of such defective tiles, with any remarks upon the nature of the defects and their cause, also giving information as to the make of the tile, i.e., hand-made or otherwise, with its place of origin, and any remarks upon the nature of the material from which the tiles were made.

Celluloid Dangers.

Our readers will remember that after the fatal fire in Moor-lane we made some suggestions (see the *Builder*, August 9 last) as to desirable precautions in stores and workshops for celluloid. The Departmental Committee appointed by the Home Secretary to inquire into the precautions necessary in the use of celluloid have now commenced their inquiry and will be glad to receive evidence. It is intimated that persons desirous of giving evidence or of submitting information to the Committee are requested to communicate with the Secretary, Mr. C. G. Markbreiter, of the Home Office.

Translation of an English Book.

The "History of Architecture on the Comparative Method," by Mr. Banister Fletcher, published by B. T. Batsford, has been translated into the Russian language. This undertaking has been accomplished by M. Robert Boker, of St. Petersburg, who is a member of the Imperial Society of Russian Architects.

The Pierpont-Morgan Collection of Ivories at Victoria and Albert Museum.

The Board of Education announce that the collection of ivories exhibited on loan at the Victoria and Albert Museum by Mr. Pierpont Morgan will be withdrawn at the end of the first week in December.

CORRESPONDENCE.

Teachers as Adjudicators.

SIR,—May I be permitted to again trespass on your space in order to clear up a misunderstanding which apparently has arisen from my former letter on this subject?

Professor Adhead, in his reply, refers to my "presupposed assumption that everyone is agreed as to the importance of individual expression," etc. After carefully re-reading Adhead's can't I fail to see how Professor's such views as he attributes to me.

The demolition of arguments set up by an individual for the exercise of his own powers

of debate is never a very difficult accomplishment, and a criticism of "those who to express their uncultured individualizing this before all else," can have no bearing on the point I raised. Professor Adhead agrees with my views that the Testimonies Study should be the unaided work of candidate, and he points out that "one evidence of those who submitted the design referred to" could satisfy my suspicion. Quite so; but may I also point out that statement does not in itself constitute evidence? And I venture to think that, in absence of such evidence, Professor Adhead would experience much difficulty in convincing most people that the same simile could have resulted had these designs been prepared *en loge* instead of "under supervision."

As to the fresh point regarding the view of "uncultured individuality," there can be no two opinions. There is, however, something as "cultured individuality," and the pure scholarship of a Bramante or Donaldson cannot be said to have been of a comparable value to the cultured individual of a Petrucci or a Norman Shaw? By the way, it is not a peculiar coincidence that Professor Adhead's somewhat slashing criticism of exercise of individuality in architectural design should appear in the same issue as your obituary notice so appreciative of the individuality and its influence—of the late Mr. Shaw?

With Registration, the accepted policy of Royal Institute of British Architects; it is not then ever incumbent upon the examination to make these examinations a test of individual's ability rather than a portion of educational exercises. Were the examination a real test of individual ability they would incidentally serve to demonstrate the value of any system of education whether based on a creed which "demands the suppression of individuality" or not.

Should it come to pass that several candidates educated on the system referred to, and working *en loge*, actually should produce designs similar as the ones in question, then I would most emphatically assert that the "suppression of individuality" had been carried to such an extreme as to render real progress impossible, however much it might assist in the "dying" of students up to a certain degree of scholarship.

ALREADY AN ASSOCIATE

SIR,—Your correspondent "Already Associate" implies that the designs published recently for a ballroom, and accepted by the Testimonies of Study by the Royal Institute of British Architects, were done under "supervision" of the Professors of the Liverpool University. He even suggests that "supervision" amounted to "material assistance."

As regards my own design, I may say that it is over two years since I was a student of the University.

My design was purely my own, and whatever similarity there might have been must be attributed to the influence of my training in school of which I was a student.

ERNEST PRESTWICH

["*We have received a letter from Mr. H. Bradshaw, of Liverpool, making a similar disclaimer.—Ed.]

The Presidential Invitation to Associates.

SIR,—The Presidential invitation to Associates qualified to become Fellows has become quite a homely feature in recent Presidential addresses. This invitation persistently implies a far more optimistic outlook than the really warrant. Apart from the question as whether the Fellowship is invested with honour it deserves, are we sure that the necessary qualifications are so closely within reach as our Presidents believe?

The recently proposed inquiry into the Associate membership of the Royal Institute to discover the relative proportion of those qualified for the Fellowship has not, apparently, been proceeded with by the present Council. Estimate of the probable percentage of the possible candidates for higher honours has been stated. When that estimate has been made, and the figures found to correspond with the official view, will any further inquiry be proposed to assess the utter impossibility of the hypothetical minority ever attaining the qualification necessary for the Fellowship? Doubtless many Associates would not be

declare their lack of qualification, and are naturally repugnant of a clear statement of their position, knowing the prospects of the future and ceaselessly endeavouring to find a mental compromise which will afford them some place.

It is an easy matter to conclude that the whole of the membership of the Royal Institute is on an equally favourable professional footing with those we are brought into daily contact with. The conditions necessary for successful practice, or possibilities of practice, are evidently those of business opportunity, social position, and recognised ability. How often are these conditions completely divorced! We know that at least 30 per cent. of the students at a well-known architectural school are only heard of in after life as assistants, whilst some of the happy majority are practising before they leave. Those of us who have wandered from office to office during a long range of professional experience are aware of the large number whose opportunities are confined to competition work, in which, even if successful, the final line is unsecured.

The enormous number of assistants (among whom the Royal Institute is well represented) who are employed in municipal offices and by large corporate bodies, should invite some consideration as to the possibilities of future candidature for the Fellowship. How many of us are glad to find a final refuge in offices whose architectural reputation is only in the level of average private practice, and rarely, if ever, take a flight beyond? These few reflections may, perhaps, modify the very generous views of the potentialities of professional success so often held by our residents in their efforts to encourage the younger members of the Royal Institute.

ERNEST J. DIXON, A.R.I.B.A.

Fire Protection in London and the London County Council.

SIR.—The Coroner in summing up at the inquesting fire inquest on Thursday, 21st inst., reported to have spoken as follows:—
“The calamity made one wonder how many our buildings in London were in the same condition as they were told Messrs. Barkers’ premises were; how the many negotiations are going on, and how many buildings were sitting before the necessary alterations were to be made?”

I wish to take the earliest opportunity of publicly replying to these questions. There are upwards of 50,000 buildings in the metropolis at the present moment to which the London Building Act Amendment Act of 1905 has not yet been applied.

Although this Amendment Act has been in force now for upwards of seven years, the Superintending Architect of the London County Council, giving evidence before the House of Commons Committee on the London County Council General Powers Bill (1912) in June last, stated that only 2,330 buildings had been scheduled for action at that date, and that the Building Act Committee of the London County Council had only considered 1,203 of those cases. Of these 1,203 cases only 527 had at that date been satisfactorily equipped by the provision of suitable means of escape, and the balance were in what might be termed a state of negotiation.

That so few buildings (527) should have been put in order out of approximately 50,000 cases in the long period of seven years is a matter of grave import, but the balance should not in any way be attributed to the Superintending Architect nor his officers, but specifically to the London County Council in its corporate capacity, which does not give its Building Act department either the necessary means, the necessary staff, or the necessary encouragement to carry out the requirements of the Building Act Amendment Act energetically and promptly. It is not for me to go into the reason why the County Council should apparently have been adverse to allowing its officers to carry out their obvious duties, but the fact remains that directly the responsibility for lives lost in such buildings as the Barker establishment must fall on the shoulders of the authorities rather than on building owners, who, owing to the Council’s own apathy, practically consider the Amendment Act of 1905 a dead-letter.

Thus the short reply to the Coroner’s question that quite an enormous number of buildings in the metropolis are in the same condition as

the one which was under review at the inquest—that but very few negotiations are going on as to remedying this state of affairs, and that quite 50,000 buildings are waiting for the necessary alterations to be made.

It is to be hoped that the Barker fire will awaken the London County Council to its duties in this particular matter. With the necessary staff and facilities, and with the diligence which the County Council occasionally applies to other departments of its work, the outstanding 50,000 buildings should be put in proper order within the next five years.

EDWIN O. SACHS.

Should the Names of Assessors be Known to Competitors?

We have received the following “Open Letter” addressed to the Royal Institute of British Architects:—

GENTLEMEN,—I earnestly appeal to you to use your influence to bring to an end the evil custom of publishing the names of assessors in architectural competitions before the designs are sent in to be judged. The practical outcome of publishing the names beforehand has been to prevent many from competing who have felt unable to sympathise with the taste and ideals of the assessor. But the greatest evil of all is that men are induced to design up or down to the assessor’s level; not setting out to do what they honestly feel to be the very best they are capable of, but for the sake of the reward to prostitute their powers by endeavouring to appeal to the taste of the assessor. Let no competitor know who is to be his judge, and you at once remove a powerful inducement to unfaithfulness. It is a fearful tyranny that imposes any style on a designer.

Conditions and requirements and moral law are enough data from which to produce the noblest architecture if properly attended to, assuming, of course, some degree of native refined sensibility. But when any style is imposed upon the designer the conditions and requirements that ought to control him are made subservient to the style. The poor plan has to be squeezed like a Chinese foot, and the honest expression of needs is sacrificed to the conventional commonplace of symmetry. The supposed leaders in the profession by this system can impose upon the British public the deadly dull imitations of the style they affect, hence we have seen public buildings arise one after the other with the same trail of the serpent over them all. No healthy national style can be artificially grown in this way.

C. F. A. VOYSEY.

Competition Results.

SIR,—I should be much obliged if someone would be kind enough to state what is the customary method regarding competition results.

I submitted drawings in a recent competition, but up to the present time I have had no notification of any sort as to the result, although (by chance) I have seen the awards published in a weekly paper.

I should have thought that the competitors, after spending much time and thought on the work, ought to be the first to receive individual notification of the assessor’s selections.

A RECENT COMPETITOR.

INTERCOMMUNICATION COLUMN.

Effect of Great Heat on Stone.

SIR,—Replying to your correspondent’s query re above in your issue for November 15, p. 576, we beg to state that great heat on sandstone would produce lime, which the first shower of rain would cause to fall in powder. On the other hand, great heat on sandstones would cause little effect, provided the sandstones were dry, whereas if it is moist it is likely to burst to pieces. When the Safe Deposit Company building was about to be erected we had several kinds of sandstone tested by placing them on the bridge of a furnace; the heat being applied too suddenly caused most of the stones to explode, the coarse grained standing the best. However fine grained, sandstone will stand great heat if thoroughly dry, as may be seen from the fact that it is sometimes used for lining furnaces.

SAUEL TRICKETT & SONS.

BOOKS.

Building Construction (Advanced and Honours Course). By C. F. MITCHELL and G. A. MITCHELL. Seventh edition, revised and enlarged. Illustrated. (London: B. T. Batsford. Price 5s.)

THE rapid evolution of materials and methods of construction alike that have taken place since the issue of the sixth edition of this well-known text-book has necessitated the revision of the whole, and the rewriting of parts in order to bring it once more into line with the best of current practice, and upon the result the authors are to be congratulated, for the book now under our notice forms a complete epitome of all that is most up to date in the building world of to-day. A feature of the work is the full text, which the authors have wisely added, of such matters as the R.I.B.A. revised Report on Reinforced Concrete, the L.C.C. proposed regulations on the same subject, the recent work of the Engineering Standards Committee and similar bodies, all of which adds to the value of the book as a work of reference as well as a text-book. The illustrations, numbering over 800 are clear and thoroughly explanatory, while the calculated examples, which are numerous and complete, are specially selected for their bearing upon current practice. The issue, in short, attains the high standard of its predecessors and of the firm which publishes it.

Practical Mathematics. By EDWARD L. BATES and FREDERICK CHARLESWORTH, Wh. Ex. (London: B. T. Batsford. 1912. Pp. 513. 3s. net.)

COMPRISING a complete course of instruction for technical students, and adapted to the requirements of the Syllabus of the Board of Education Lower Stage Examinations, this text-book will enable anyone who has mastered its contents to follow intelligently any simple technical or scientific subjects he may require to study. The work is one of comprehensive character. No previous knowledge of the subject on the part of the student is assumed by the authors, and, in consequence, the book may be taken up by the mere beginner. At the same time a prominent feature is the thorough manner in which it explains the practical application of mathematical principles to the problems daily encountered by architects, surveyors, builders, and others.

The sections relating to rates of increase, differentiation, and integration will be found of service as an introduction to more advanced text-books on branches of science allied with professional work, and to the use of the calculus for the solution of practical problems.

Like other works by the same authors, this book is very clearly written and well illustrated by diagrams.

Practical Geometry and Graphics. By EDWARD L. BATES and FREDERICK CHARLESWORTH, Wh. Ex. (London: B. T. Batsford. 1912. Pp. 621. 4s. net.)

INTENDED for students in technical and trade schools, and specially arranged to meet the revised requirements of the Board of Education, this book presents in convenient form the fundamental principles of practical geometry and graphics, and shows how these are applicable to some of the problems occurring in practical work.

The book is arranged in three parts, devoted to plane geometry, graphics, and descriptive geometry respectively. In the first part will be found a very adequate treatment of mensuration and calculations relating thereto, an important chapter on loci and loci methods of solving problems, and a somewhat extended chapter on conics. In the second part the general subject of graphics has been developed at greater length than is usual in text-books of the same class, the treatment being such as to enable students to realise the practical utility of graphical methods of solving problems. The use of squared paper, velocity, and acceleration diagrams, simple and harmonic motion, and valve diagrams, are among other subjects thoroughly discussed in the same part.

The work contains a large number of practical exercises with answers, and the numerous diagrams are very clearly drawn and printed. The book is one we have every confidence in recommending to our readers.

ILLUSTRATIONS.

The Work of Mr. Winter Rose.

LL our Plates this week are in illustration of the work of Mr. A. Winter Rose, to whose career reference is made in the article beginning on page 647.

MEETINGS.

FRIDAY, NOVEMBER 29.
Edinburgh Architectural Association.—Associates' annual smoking concert.
University Extension.—Visit to the Tower of London, St. John's Chapel, etc. 2.15 p.m.

MONDAY, DECEMBER 2.
Royal Institute of British Architects.—Business meeting. (1) Election of candidates for membership. (2) Mr. G. A. T. Middleton has given notice of his intention to inquire—(i.) Whether it is true that, while Testimonies of Study for the Intermediate Examination had to be submitted by September 23, those candidates who were relegated were only informed by letter dated November 8 and posted so as to reach even London residents late on November 9, when they were required to furnish alternative drawings by the morning of November 15; and, if so, whether in the opinion of the Examiners this is reasonable. (ii.) Whether the Board of Architectural Education is aware that there are rumours of laxity in permitting candidates to leave the room temporarily during the progress of the examinations, and in allowing communications to pass between the candidates. (iii.) Whether, at the Final Examination, the fact that a candidate is young is of itself prejudicial to his chance of success. Mr. Robert J. Angel has given notice that he will bring before the meeting the question of architects tendering for the preparation of designs, etc., of buildings, and in particular in instance of certain architects who submitted tenders to the Wigan Education Authority for designs, etc., and quantities for the erection of a High School for Girls. 5 p.m.

Royal Society of Arts (Cantor Lecture). Mr. C. E. Darling on "Methods of Economising Heat"—I. 8 p.m.

The Society of Engineers.—Mr. Percy J. Waldram, F.S.I., on "The Deflection of Reinforced Concrete Beams." 7.30 p.m.

London University (Victoria and Albert Museum). Mr. Banister Fletcher on "Gothic Cathedrals of France." 5 p.m.

TUESDAY, DECEMBER 3.
Society for the Promotion of Roman Studies. Professor Havard on "The Coast Defences of Britain about A.D. 400." With lantern illustrations. 4.30 p.m.

The London University (British Museum). Mr. Kaines Smith on "Sources of Art. The City State."

The Institution of Civil Engineers.—Mr. C. J. Bowen Cooke on "Mechanical Handling of Coal for British Locomotives," and Mr. Francis Carnegie on "The Vibration of Rifle Barrels." 8 p.m.

The Illuminating Engineering Society.—Messrs. F. W. Wilcox and H. C. Wheat on "Modern Methods of Indirect Lighting—Their Advantages and Merits" (to be held at the Royal Society of Arts). 8 p.m.

WEDNESDAY, DECEMBER 4.
The Royal Archaeological Institute.—Mr. R. H. Forster, L.B.S., F.S.A., on "The Corbridge Excavations, 1912." 4.30 p.m.

Edinburgh Architectural Association.—Mr. Percy H. FitzGerald, M.A., F.S.A., on "Robert Adam, Artist and Architect." Lantern slides. 8 p.m.

Institute of Sanitary Engineers.—8 p.m.
Society of Antiquaries.—8.30 p.m.
University of London (British Museum). Mr. Banister Fletcher on "Greek Ionic Temples." 4.30 p.m.

University of London (Victoria and Albert Museum). Mr. Kaines Smith, M.A., on "Decoration of Buildings—Glass." 5.30 p.m.

FRIDAY, DECEMBER 6.
Glasgow Technical College (Architectural Craftsmen's Society)—Professor C. Gourlay, B.Sc., on "A Review of Byzantine and Italian Architecture."

SATURDAY, DECEMBER 7.
Aberdeen Architectural Association.—Mr. Thomas Beattie on "Decorative Plasterwork, and the Adaptation of Old Methods to Modern Requirements." Illustrated. 7.30 p.m.

COMPETITION NEWS.

A list of current Competitions is printed on page 662.

Municipal Buildings, Kingston, Jamaica.

The Mayor and Council of Kingston, Jamaica, offer a premium of 100l. for a design or Municipal Buildings in Kingston, Jamaica (B.W.I.), to cost not exceeding 9,000l., to be approved and accepted by them. The buildings must provide all necessary municipal offices and appurtenances and a town hall in accordance with the plan showing the site and indicating the accommodation required, copies of which may be obtained on application to Messrs. Alexander Young (London), Ltd., of 60, Fenchurch-street, London, E.C., on payment of 2s. each copy. The design must be suitable for construction in reinforced concrete. Designs must be sent in not later than January 31, 1913, addressed to the Mayor and Council, Kingston, Jamaica (B.W.I.).

ENGINEERING SOCIETIES.

The Institution of Civil Engineers.

At the ordinary meeting of the Institution on the 26th inst. a paper on "Mechanical Handling of Coal for British Locomotives" was read by Mr. C. J. Bowen Cooke, M.Inst.C.E. Owing to the growth of traffic and the heavier loads which have to be hauled at the present time, it has been found expedient to adopt, at the extensive running-shed of the London and North-Western Railway Company at Crewe some more expeditious method than "man-handling" for loading engines with coal, and after much deliberation the mechanical coal-handling plant described in the paper has been installed. The plant was made by Messrs. Babcock & Wilcox, and is the joint design of the author and that firm. The points to which careful consideration had to be given were numerous, particular attention being paid amongst other points to the impracticability of an appliance capable of dealing with coal between wagon and tender, wagon and stack, or stack and wagon. With regard to this point, the various known types of apparatus limited the choice to one or two types, namely (a) that built by certain railway companies abroad, in which the handling of stock and current coal by gravity-bucket, or belt-conveyer, is combined; (b) some form of power-driven crane and grab-bucket.

The stock in plants of type (a) rarely exceed 3,000 tons and is situated in bunkers, either underground and immediately under the coaling-stage, or above ground and forming part of the coaling-stage. In the latter case coal placed in stock would be handled no less than six times between the colliery and the locomotive-tender, with consequent breakage of coal at each stage. It is found that at nearly all depots in this country where the annual consumption is sufficient to warrant the installation of mechanical handling the stock coal greatly exceeds 3,000 tons, so that this type of plant appears undesirable.

Regarding type (b), a grab-bucket is limited in size by the receptacle from which it picks its load, and when working from an ordinary type of English railway-wagon such an appliance becomes anything but economical in its operation. The maximum size which can be usefully worked is about 44 cubic ft. or 1 ton, little margin being then left for steering between the sides of the wagon. Again, a good deal of the efficiency of a grab-bucket depends on the drop it gets into the material, but when such material consists of large lumps of coal carried in a wooden truck which is liable to damage the efficiency of the grab is reduced in an excessive degree.

THE LONDON COUNTY COUNCIL.

The usual weekly meeting of the London County Council was held on Tuesday in the County Hall, Spring-gardens, S.W. Lord Chylesmore, Chairman, presiding.

The Finance Committee recommended that loans be made as follows:—Lambeth Guardians, 5,889l. for poor law purposes; and Woolwich Borough Council, 1,400l. for sanitary conveniences.

The Kensington Fire.—A report was submitted by the Building Acts Committee on the celluloid

fire which occurred last July in Moor-lau and details were given of the requirements, which notice was served upon the owners, the property some years before by the Council and of litigation which had ensued. The Chairman of the Committee, in referring to the recent fire at Messrs. Barker's, Kensington, said that the building was one of twelve special cases which the Committee had decided to deal with in February last. The firm, however, was not prepared to accept the Council's suggestion and after negotiations the Committee was informed that Messrs. Barker's architects were preparing plans to be submitted to the meeting of the Board, but before that meeting the fire occurred.

In replying to complaints that the Council had not applied the provisions of the Act of 1905 to all the large buildings of London, the Chairman of the Committee went on to say that if it were possible to attempt to put the Act into operation at once all over London there would be such an outcry and stoppage of business that it could not be carried out. The Committee, however, was doing a enormous amount of work, and up to the present they had considered some 1,889 cases out of which over 1,000 certificates had been issued, 619 buildings had been put into satisfactory condition, and in 23,500 cases owners had been warned of their responsibility. The report of the Committee was adopted.

Cinematograph Theatres.—Drawings have been submitted by Mr. C. A. Aish for proposed alteration and extension of the Empire Electric Theatre, Mare-street, Hackney; and by Messrs. Seville & Martin for a new cinema proposed to be erected at Nos. 593-59 Old Kent-road.

FIFTY YEARS AGO.

From the Builder of November 29, 1862.

Voluntary Architectural Examinations.

The announcement which our advertising columns contained some short time since that the first of the voluntary examination in architecture is to take place in January next, will not have passed unnoticed by many readers. This scheme of examinations is an effort for the advancement of the profession made in good faith, and at no small trouble, and possibly pregnant with results of the greatest value.

For many years past the desirability of establishing some test of attainments through which a professional man should pass ere he enters upon the responsible exercise of his duty has been appreciated more and more widely; and in those professions where a large proportion of the objects of preliminary study are entirely matters of fact examinations have been readily established.

* * In 1882 it was determined that an examination upon the lines of the voluntary examination should be made compulsory upon all who sought to become Associates of the Institute. The proposal aroused fierce opposition among many of the most prominent men in the profession, upon grounds that appear very insufficient as one re-reads the long letters to the Times which from day to day filled its columns. The adequacy of "tests" in a general sense was legitimately controversial, and is so still. Competence can be reached only by the path of experience, and this cannot precede an "entrance" examination. But the responsibilities of the architect are many, and an examination as a means of calling attention to these, acts as a safeguard lest an should be, as they have been and still may be overlooked. Medieval conceptions of the architect's functions are no longer tenable while since Rennie, with the scientific training of the engineer, built Waterloo Bridge and Capt. Fowke, similarly trained, designed the additions to South Kensington Museum, a liberal view of constructive possibilities, and an acquaintance with business procedure, cannot be considered as hostile forces in the training of the architect.—Ed.

THE WORK OF MR. WINTER ROSE.

It is always interesting to trace the gradual emergence of one of the younger generation from the comparative obscurity of obscurity to the luminous path of success. Men never secure recognition, and progress, though marked by some shining incidents, stops short of real achievement. In the artistic world this is specially true, and it needs but a glance through a list of winning students to see that the work of the world has not been done inevitably by those who have shown marks of genius in early days. The causes of failure or of creative failure are discovered with difficulty in many cases, but the elements which contribute to fulfilment are seldom unknown. Among the younger architects of the present day is Mr. A. Winter Rose, whose work is a paradox, but whose work is far from so. It is but six years since Mr. Rose won the Travelling Studentship of the Architectural Association, and he is now in the midst of considerable practice. His work, as represented by our illustrations, will be studied, and, with interest, not only in a vein of prophecy, but in prophetic expectancy.

Mr. Rose was born at Cambridge just short of thirty years ago, and educated chiefly at Bedford School. Mr. Winter Rose early felt the call of architecture. In his aspirations he was encouraged by his cousin, Mr. George Shackleton, who had been in the office of the late Mr. J. L. Pearson. Mr. Rose was articled to Messrs. Usher & Sons, of Bedford, and spent much of his time unofficially, with the pupils of Mr. C. E. Mackintosh, who at that time was practising in London. To this source possibly may be traced Mr. Rose's interest in garden design and his powers as a draughtsman. In one of his articles about 1905, Mr. Winter Rose became managing assistant to Mr. W. B. Rice, A.R.C.B.A., of Cardiff. The Cardiff City scheme was then in preparation, but was not in progress, and Mr. Rose engaged in designing chapels built in various parts of Wales: as assistant architect he was concerned with those at Cardiff, Llanthony, Nant-y-fyllon (Maesteg), Pontypool, Llanidloes, and Briton Ferry. After a few years at Birmingham he took a position in the Office of Works in London, and was responsible for the Twickenham Post Office, alterations to the Guildford Post Office, and other work.

Mr. Rose worked with Mr. W. D. Caroe, F.R.S.A., in connexion with the South Wales University College, Cardiff. He was also to a great extent in practice on his own account. He became a student at the Architectural Association, and the year following won the A. Travelling Studentship, his original design being an entrance lodge and gates to a

public park, a wayside inn, and a specimen house at Kew; he sent in also some sketches and measured drawings of Queens' College and of the Senate House, Cambridge. In 1908 Mr. Rose was awarded by the Council of the Royal Institute of British Architects a prize of ten guineas for his competitive drawings for the Pugin Studentship, won that year by Mr. Sidney C. Fellett.

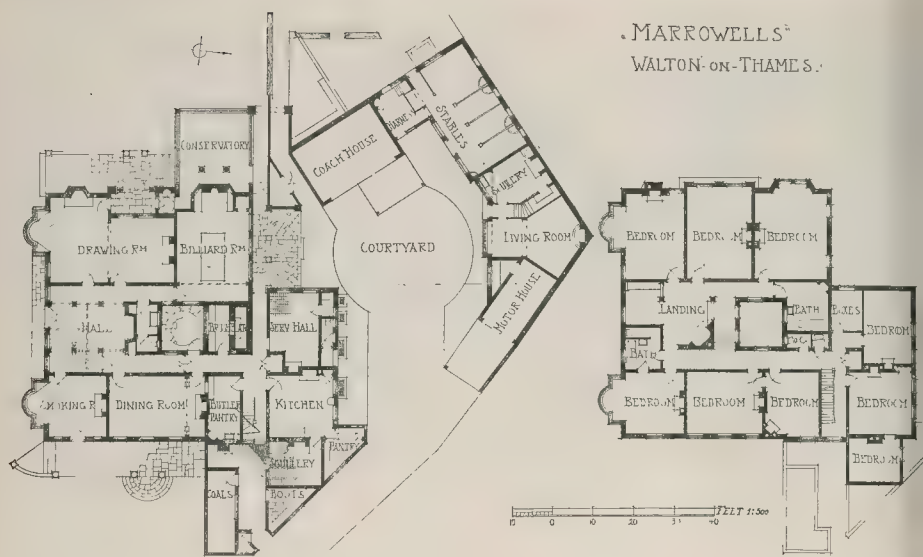

Mr. Rose elected to travel in England to acquaint himself of the A.A. Studentship, and it was during his tour that he became convinced of the possibilities of domestic architecture.

He travelled specially in Norfolk and Cambridgeshire and saw for himself, as a critical student, the memorable work of other days as well as modern products with which he could be little in sympathy. To restore to domestic architecture the dignity and charm of the past, while introducing such modifications of plan and design as were necessary to meet the needs of the present day, became his ambition. He felt strongly, as others have felt, that, in spite of Bacon, houses should be built to look on as well as to live in. His bias was towards the early XVIIIth century, the pro-

Mr. A. Winter Rose.

[Portrait by Reginald Haines.]

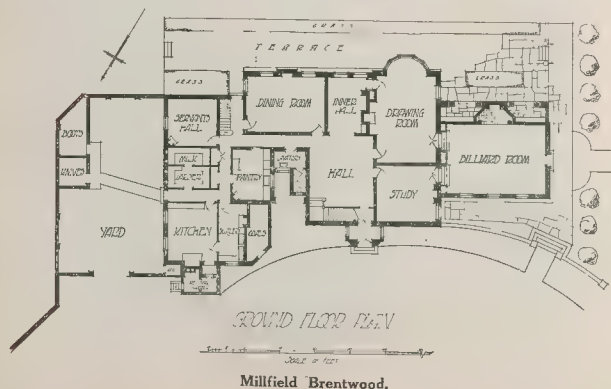

stucco era, and for working purposes his thoughts may be said to have been cast back to the "glorious reign of the most serene our gracious sovereigns lady, Queen Anne," to quote part of the ancient inscription on Petyt House, Chelsea.

Fairly launched in practice by 1908, Mr. Rose in that year exhibited at the R.A. Exhibition his "Design for Church and Manse, Welholme-road, Grimsby," which was one of his few competition designs; it was placed, but never carried out. Two years afterwards he sent a drawing of "Marrowells," Walton-on-Thames. This house, then just completed, stands on a site which was originally part of the far-reaching Windsor Forest. Designed in a manner reminiscent of the many early Georgian mansions to be found on the banks of the Thames between Chelsea and Windsor, its appearance is attractive, not only on account of its general features, but because of its details, such as the hooded doorway, the brick-work quoins, and the conspicuous cornice. The colour scheme was carefully considered. Old tiles of a deep red hue were used for the roof and Surrey bricks of a brighter tint for the walls. The exterior woodwork was painted white, with the exception of the Venetian shutters, which were painted sage-green. The plan above shows the accommodation secured, and the interior work is in harmony with the rest of the building. The garden formed an important attribute to the house, and the illustrations show how successfully architectural character was imparted.

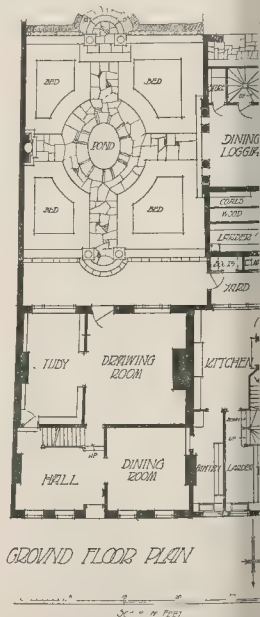

The House at Chatteris in the Isle of Ely (R.A. 1911) looks romantic, judging from the drawing reproduced on one of our Plates. It is in a composite style, and derives some of its character from its Flemish origin. But, in spite of its somewhat alien appearance, local confirmation was found for the design, no doubt, for Mr. Winter Rose is nothing if not an Englishman, and would not care to import any direct suggestion from abroad. Additions to "Millfield," Brentwood, were in progress at about the same time, as the drawings shown at the Royal Academy in 1911 testify; these are also reproduced on one of our Plates. The billiard-room in this house was one of Mr. Rose's experiments in interior design and decoration, the whole, with the exception of the table itself, being his work. The general colour scheme was grey, against which the furniture and crimson curtains set off agreeably; while the permanent features, such as the fireplace recess, with its fluted columns, and the exit to the garden, give dignity to the room. The garden at "Millfield" was laid out also by the architect.

The reconstruction of "Morton House," Hatfield, exercised Mr. Rose's ingenuity to the utmost, but the result is entirely satisfactory. The original house consisted of four rooms on the ground floor, divided by a narrow hall and a staircase immediately in front. The plan on this page shows the new arrangement. The left-hand wall of the passage was taken away and what had been a room became a useful lounge hall, with the new staircase at the end

of it and with exits to the rooms at the end. The space hitherto occupied by the staircase was added to the drawing-room, which communicates with the study in such a way that the two rooms may be converted if when desired by the occupier. The room opens to the right of the hall. Almost the whole of the interior was as part of the scheme for interior decoration. The garden at "Morton House" was in a deplorable state as the house, but transformed into a most agreeable. With a central fountain and brook paths, it is a retreat to be envied, and comparatively small it is a good example of modern walled garden. The plan below that it is bounded on one side part dining loggia, facing which, on the other

Millfield, Brentwood.

Morton House, Hatfield.

Morton House, Hatfield: Part of Hall and Dining-Room.

Mr. Winter Rose, Architect.

fountain, is a niche containing a statue of Etheldreda. Another house in Hatfield, near "Morton House," is "Goodrich House." On one of Mr. Rose's plates is reproduced Mr. Rose's original design, and the block on p. 650 gives a photographic view of the work as carried out. The spire of Hatfield Church is in the background, a street intervening; and Hatfield adjoins the property. The work of Mr. Rose in "Goodrich House" was done in connection with the owner of the property, Mr. W. Speaight, who proved a sympathetic patron. As it stands the house reveals, nevertheless, Mr. Winter Rose's own individuality and his artistry will be recognised throughout. "Cloister Garth" (see Plate), as its name implies, is distinguished by a covered approach, which gives picturesque interest to the house, as it takes the place of the indispensable porch, a useful adjunct to the home. This house was largely influenced by the design, and the architect arranged it cleverly so that it does not interfere with the lighting or the airiness of the rooms. The building is situated at Hatfield in Surrey, and, high up on one of the hills, it is a welcome note of restrained workmanship among much that is "ideal." It is seen that "Cloister Garth" shows a tile-hung and partly brick exterior, a combination which, though sometimes unsatisfactory, does not strike a false note if well handled, as in the present case. This house is on an estate now being developed, and lies under the jurisdiction of the late Mr. William Wood, and Mr. Winter Rose had the advantage of a congenial site to place his building. Among other examples of Mr. Rose's work may be mentioned a farm house at Turvey, near Bedford; a house at Little Court, Buntingford; and a house at Kensale Manor, Saxmundham, and in connexion with a house at Walbersham, Suffolk. In a house built recently at

Marlow for Mr. A. Lys Baldry he departed to some extent from his brick and timber convention and made use of steel and concrete in the construction and details. To Marsh Court, Stockbridge, he added outbuildings

consisting of chauffeur's house, garage, etc., in collaboration with Mr. E. L. Lutyens, F.R.I.B.A., whose lead in the original building was followed as a matter of course.

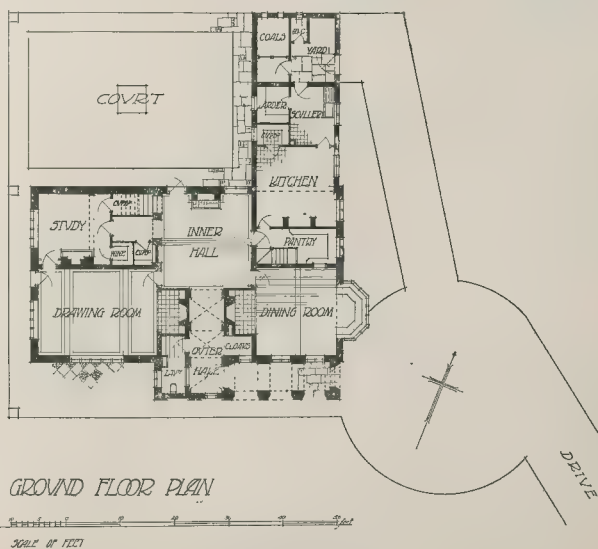

Lately Mr. Winter Rose has been at work on a monumental design for a University, a competition work which for the moment is *sub judice*, but to which we shall refer in due course.

The mention of this and the numerous houses which we have touched upon and in part illustrated are sufficient to show that Mr. Rose is a worker, and, although his piquant fancy and delicate touch have found most opportunity so far for expression in domestic work, his versatility has enabled him to handle ecclesiastical work with marked success.

At the instigation of Miss Tatlock, of Bramfield House, Suffolk, he erected a reredos and altar-table in the Church of St. Andrew, Bramfield, in memory of the donor's grandfather, Peter de Wint. The reredos forms a background to a beautiful rood-screen, and care had to be taken that the new work should combine with the old. Stone of a fine texture, French grey in colour, was chosen for the general architectural work, while for the figures of the four saints included in the design coarser ("Doulton") stone was selected. This was a Gothic excursion, but Mr. Rose carried through the work with taste and judgment, and the result perhaps is more interesting than if the work had been placed in the hands of an architect bound down in temperament and practice to Gothic design.

Enough has been written to show that Mr. Winter Rose in the short time he has been in practice has made his mark and is able to carry out his ideas with common sense and enterprise. His originality has been founded on good English traditions and nothing more praiseworthy could be said. His work so far can only be considered as an introduction to a career of interest to himself and to those who follow the trend of modern architecture. The lessons of book illustration in the "Sixties" seem to have been forgotten, but the impetus given to domestic architecture during the same period has not died out. Mr. Winter Rose is one of the successors of Bodley, Nesfield, Norman Shaw, and Mr. Philip Webb, and with his true instinct for architectural fitness his future seems assured.

It is perhaps no part of our duty to examine the equipment of an architect apart from his office credentials. But F. C. Penrose was no less a personality in our world because he was a rowing Blue, and only a few weeks ago Sir Aston Webb, in welcoming the new President of the Royal Institute of British Architects, referred to Mr. Blomfield's prowess at the wicket and elsewhere. With that official recognition

of "sporting proclivities we have no hesitation in referring to Mr. Winter Rose's devotion to football. For seven years he has been captain of the Ealing Rugby Football Club, and, playing as he has sometimes done for the Eastern Counties, he has won his County Cup. In the field Mr. Rose's place is among the forwards; and it may be fairly anticipated that the lessons of the scrumage will not be forgotten when professional problems call for the exercise of qualities of endurance and of self-sacrifice.

CITY OF LONDON FIRE INQUESTS: THEIR HISTORY, WORKING, AND RESULTS.

On Tuesday last week Dr. F. J. Waldo addressed by invitation the members of the Insurance Institute of London in the Great Hall,

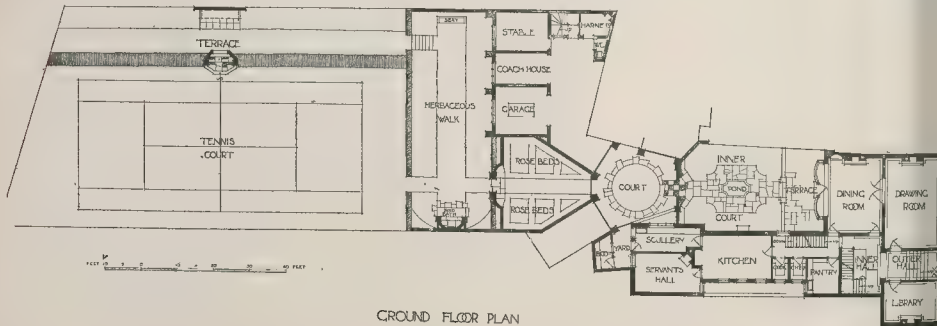

Winchester House, Old Broad-street, E.C. Mr. George E. Mead (of the Sun Insurance Office), President of the Institute, was in the chair. His subject was the History, Working, and Results of the City of London Fire Inquests Act. The office of Coroner, he said, dated from the Norman Conquest, and for a century or so he sat with the Sheriffs and tried all kinds of felonies, but his powers of trial were abolished by Magna Charta in 1215. Amongst his earlier multifarious duties was that of inquiry into non-fatal fires, and this fell into abeyance, according to most authorities, in the fifty-second year of the reign of King Henry III. until the year 1845, when it was revived by the then City Coroner, Mr. Serjeant Payne. During the next six years, without receiving any fees, he held seventy-one fire inquests, of which nine were found to be wilful, thirty-four accidental, and twenty-eight cause unknown. In one case of arson in Southwark

conviction was followed by transport for life. The last of his inquests was held in 1853.

Prior to 1860 Sir John Humphreys, Clerk for Middlesex, held a number of inquiries into non-fatal fires. In 1851, at the instance of the Coroners' Society, similar inquiries were held in various parts of the United Kingdom. Amongst them one conducted by Mr. C. Herford, at Manchester, in 1860, was taken out by the High Court on the score of illegality. After the Herford judgment no more inquiries were held until the City of London Fire Inquests Act, passed in 1888, conferred on the Coroner wide powers of inquiry into cases of fire reported to him by the police or the Fire Brigade service. The method of procedure is for the Coroner and his jury to visit the burnt premises, together with any other persons who may wish to consult. The results of the investigations are laid before the Secretary and Court of Common Council, and the Lord Mayor. Dr. Waldo stated that his predecessor, the late Mr. Langham, held eighty-five fire inquests, while he himself held fifty-three between 1901 and 1912. In the past five years there has been an annual decrease of thirty-six fires as against that of the five years immediately preceding the passing of the Act in 1888. Against the year 1902 47 per cent. of fires were reported as of unknown origin as against 100 per cent. in 1905. Further, in 1911, out of 100 fires reported, in only twenty-two cases the cause of the fire finally remains uncovered. Not only that, but the proportion of big and serious fires has also considerably decreased in the City. The power to hold inquiries acted as a deterrent against arson, and on the insurance companies, was a great boon in its effect, and caused people to be careful with respect to fire in both business and private premises. Altogether the facts of the case favour an extension of the principle of fire inquests to the whole of the United Kingdom, and thereby of restoring to the office of Coroner one of his most valuable and important public functions.

One instance of the value of systematic fire inquests is the attention that has been called to the special dangers attending the storage of celluloid and other inflammable materials in towns, and the defects of various Acts of Parliament which deal with the construction and safety of buildings in relation to fire.

It is interesting to note that the extension of fire inquests is strongly supported by the Association of Professional Fire Brigade Officers, while Lord Gladstone's Departmental Committee reported in 1909: "We have come to the conclusion that the system of fire inquests established by the Act of 1888 has worked well in the City of London, and the benefit of this system ought to be extended to the country at large." On the other hand the London County Council are for an unaccountable reason averse to the proposal of the Departmental Committee, and they or the Home Office should decide which particular cases inquiries are to be placed, and that a special department should be created and charged with the duty of holding fire inquests in place of the independent Coroner, an officer of trust, and with full powers, unfettered, and ready to do his duty solely in the public interest as he enters into office.

Goodrich House Hatfield.

THE BUILDING TRADE.

THE INCORPORATED INSTITUTE OF DECORATORS: THE DECORATION OF SMALL HOUSES.*

The small house has from a decorative point of view been neglected, and this is but the result of the condition things as they exist to-day. Consider the case of a man who occupies a small house in the suburbs which he has perhaps purchased through a building society, and the value of which is from 30% to 40% a year, and his wife are anxious to have their house decorated in good taste, but they have no actual knowledge whatever of the subject. . . . What happens in ninety-nine out of a hundred cases is this. They obtain an estimate from a "builder, plumber, and decorator," who supplies the estimate accompanied with a few pattern-books of wallpaper upon which they spend hours of anxious thought, though, if they but knew it, there are not in the cases a couple of dozen papers in it which worthy of being hung in any home occupied by anyone having the slightest pretensions to good taste. Perhaps they decide to use shabby water-paints, but in any case their selection is almost certain to be bad. In both cases they are groping in the dark, and, having chosen the poorest patterns, must come to a decision practically without taking into consideration the all-important questions of colour and of pictures, to say nothing of the dimensions of the room, its shape, its light, its windows, and the many other conditions which ought to be taken into account for such circumstances. Is it any great wonder, then, that so many small houses are so badly decorated? Now there are in London alone many hundreds of thousands of such houses, including the country, a vast number in aggregate, so that it will be acknowledged that there is plenty of work for the Institute, and if means can be found to carry it out on a practical basis. . . .

Proposed Advisory Committee.

My first suggestion relates to wallpapers, and these decorations, if properly designed and selected, possess so many advantages that they will very probably continue to be popular for centuries to come. They are simple, convenient, and on the whole sanitary, and influence can be brought to bear with the view of improving the design of all classes of paperhangings, especially those which from their price are certain to be used in our "small houses." What practical means can be taken to select the bad designs, or rather to put a stop to their production? My answer is that it can be done by submitting the designs before they are put to a competent authority, which will only give their approval to those designs which in their opinion possessed the necessary artistic merit or came up to a sufficiently high standard, and I need not remind you that this standard by no means necessarily imply an ornate oration or marked novelty. If an authority could, I suggest, be set up by the Institute by appointing from among its members an Advisory Committee to pass designs which should from time to time be submitted to it. As well known, public taste in decoration, and other things, varies considerably in different parts of the country, so that it would probably be found desirable to appoint three such committees; one in London, another say in the north, and a third in Scotland. . . . It is well known that out of every 100 new houses which are brought out year by year less than twenty, and often more, may be regarded as absolute failures. The cost of building the blocks and printing is precisely the same as though the paper had succeeded, but it is clear that the cost of these failures must be distributed over the cost of those which succeed, hence if the element of risk is lessened a considerable saving would be effected. I take it that at least a number of members of the Committee would be actual

buyers of paperhangings, and if they had passed designs they would, when these designs came on the market, no doubt stock them, hence their success would be assured. Then, again, those designs which were approved will be "hall-marked," so to speak, for the general trade, while many of those rejected would probably never be put out at all.

I am well aware that this scheme would take some years before it had a very marked influence on the wallpaper trade as a whole, but if it were started experimentally with, say, 100 designs to commence with, or even less, I believe it would become a permanent feature. The danger at first would be that only designs of expensive papers might be submitted and efforts should be made to include particularly cheaper varieties. It is, as is well known, the custom to print successful designs of an expensive character in future years on cheaper papers, and this course would doubtless continue to be followed.

I claim with all respect that the builders' merchant is not a competent authority to select wallpaper hangings, which requires the services of a trained decorator. The merchant probably deals in ranges, baths, ironwork, bricks, lime, and timber—in fact, everything which goes to make up a building. How, then, can he be expected to be a judge of wall decorations? It may be said that it is evident that his selection of papers sells or he wouldn't continue to select, and this suggests a point which is often overlooked. A large majority of small houses (in London, for instance) are not owned by those who occupy them, but are rented from the owner often on a three-yearly agreement. The landlord, as he is usually termed, in only too many cases, gets his decorative repairs done as cheaply as possible, and the practice is to have a wallpaper pattern-book sent to the tenant from which to make a selection. Hence this tenant, if even he be capable of choosing well, is greatly hampered in getting a good result by the paucity of even moderately good designs. But he is forced to make his selection from that particular book, and the builders' merchant gets his order and imagines that the designs are quite as they should be. In making this sweeping condemnation of pattern-books I by no means include all merchants. There are in London alone a dozen or more whose business is to select designs of merit, but, as things exist, they sell mostly to the better class of customers. If the tenant were a free agent and could choose his paperhangings where he wished it would certainly lead to a great improvement generally. Even at the best, I believe the merchants would be glad to have the advice and assistance of a jury of practical and trained men such as would be provided by the formation of an Advisory Committee such as I have counselled.

Professional Advice.

I come now to my second suggestion, which, briefly stated, is that the Institute should offer to give through its Fellows, for a suitable fee, professional advice on all matters connected with decoration. Architects and other professional men who accept commissions, including details of special work with which they are not very familiar, seek as a matter of course the assistance of brother professionals who have given it a close study. Thus the architect on occasion consults the engineer, and the general practitioner among medical men the specialist.

But what I have at present in mind is the occupier of the small house who has refined tastes, and who recognises the fact that he needs expert advice if he is to overcome the many difficulties which surround the subject and obtain that which he and his good wife so ardently desire—as artistic a home as his means and circumstances permit. Such a man would be very willing to pay a modest fee of a couple of guineas or so to a competent gentleman, who would come down, see the house, the pictures, carpets, and furniture, and on the spot make a selection of wall hangings or choose the colours for the painted work, or for the walls of those rooms which were to be distempered, and leave the whole "cut and dried," to be carried out by the local house painter who, having a safe guide all mapped out, could proceed without difficulty.

A half a day or a little more would be amply sufficient time in which to do such work, and at least some of the selections would answer in other places. A class of clients who would be very likely indeed to avail themselves of such assistance would be the speculative builder, who puts up houses in rows from an architect's designs, but who is often foolish enough to attend to the decoration himself, probably with the aid of some "job lots" of wallpaper he has purchased at a bargain. If he realised how very greatly a good scheme of decoration assists in attracting a tenant or customer—and many builders do realise this to an extent—he would be far from begrudging the few guineas it would cost him to obtain sound advice when he wanted it. . . .

Art Schools.

I approach the third and concluding part of my subject with some diffidence because I realise that there are many difficulties to overcome, not, however, that I believe them to be insurmountable. My suggestion here is that the Institute should endeavour to identify itself more closely with the art schools of the country so far as decorative art is concerned with the view of raising the standard of public taste, including that of the occupiers of small houses, and of producing more practical utility than is the case to-day.

It will, I trust, be fully understood that I have no desire to make an attack on art schools generally, but I venture to assert that the actual practical results fall lamentably short of that which might be expected and are far from being commensurate with the expenditure. Leaving out of the question the work done at South Kensington and at some of the art schools in the principal great cities, the instruction frequently given is, in my experience, only very partially directed toward practical ends, and the students are mostly young ladies who wish to fill in their time with a little fancy designing, a little dabbling in oil and water-colour painting. The men and women who wish to acquire knowledge by which they will earn their livelihood have but little to encourage them. I am well aware that in small art schools the funds available will not permit of the employment of a sufficiently large staff of instructors. I need hardly remind you that it is absolutely essential in teaching all branches of applied art that the instructor be practically acquainted with the industry in which the art is to be employed. Thus the teacher of design for metal-work must be acquainted with the characteristics of the metals in which the designs are to be carried out. Indeed it is not too much to say that he should have actually worked at the trade to some extent. In designing wallpapers it is clearly very necessary to take into consideration the question of repeat and many other practical matters relating to the printing of the papers. Many designs produced by art school students are useless because of this want of knowledge. . . .

A serious and common defect in such designs arises from the fact that the instructor is not a practical man, in this instance is not a practical decorator. This defect is that the designer is far too apt to make the pattern pretty in itself, apparently forgetting that the small piece forms but a very little part of the surface of the wall on which it is to be used; in other words, that the piece will look vastly different when it is repeated many times on a wall expanse measuring at least several yards in width and two in height. The only way, to my mind, to design a paperhanging is to draw the ornamentation for the whole wall of average size and then to cut out a portion of it which may be used as the pattern. Details which may appear coarse in the piece will often look commendably bold in the mass; and details that are delicate and refined in the piece are not infrequently either lost altogether in the mass or have only the appearance of being weak and finicky.

To introduce into art schools a more practical plan of operations would be work well done. And I suggest that this Institute could do it through Committees and on a similar plan to that followed by many of the Master Painters' Association in connexion with the teaching of painters' work. . . .

*Part of a paper read before the Incorporated Institute of Decorators, the Painter, Painters, Builders, etc., on November 25, by Mr. Arthur Seymour Youngs, F.I.B.D.

GENERAL BUILDING NEWS.

DRILL HALL, EDINBURGH.
New premises have been erected in Donald-road for the Lowland City of Edin- burgh Royal Garrison Artillery, from the designs of Mr. T. Duncan Rhind, A.R.I.B.A. The drill hall is 115 ft. by 38 ft., and the roof is carried on steel principals. The build- ing also contains rooms for the officers, orderly- room, recreation-rooms, concert hall, etc. The opening of the premises took place on the 1st inst.

TRADE NEWS.
Under the direction of Mr. J. V. Johnston, A.R.I.B.A., Londonderry, Boyle's latest "air-pump" ventilators have been applied to Picture House, Londonderry. The new Limekiln-leaving Company's shafting patent blocks are to be laid in the adrange, Buckingham Palace. The new billiard hall and picture theatre, network, is being ventilated by means of orland's patent exhaust roof ventilators, applied by Messrs. E. H. Shorland & Brother, Ltd., of Fallowfield, Manchester.

BRITISH AND FOREIGN TENDERS.
A letter has been addressed to the various Metropolitan Borough Councils, embodying the following resolution passed by the Council of the Union Jack Industries League—"The Council of the Union Jack Industries League respectfully urge the Metropolitan Borough Councils to pass a resolution instructing their committees to accept, wherever possible, British in preference to foreign tenders for contract purposes; the continuation of such a policy being a direct encouragement to British labour and a patriotic example on the part of public bodies to private individuals to support me in preference to foreign industries." The letter proceeds—"A similar resolution to this is forwarded to all the Metropolitan Borough Councils last year, and in most instances, accepted by those Councils. May I take advantage of this opportunity to say that complaints have recently reached me from manufacturers supplying the building trade of alarming increase in the importation of foreign materials affecting this trade, and to your Council to bring the subject before your Committee having charge of passing orders and specifications in connexion with the building trade?"

KING'S COLLEGE HOSPITAL.
We are asked to state that Messrs. Doulton & Co., Ltd., are supplying the sanitary fittings of the King's College Hospital, and that these comprise many new designs and important improvements.

APPLICATIONS UNDER LONDON BUILDING ACTS, 1894 TO 1909.

At Tuesday's meeting of the London County Council the following applications under the London Building Act were dealt with. (The names of the applicants are given in parentheses).—

Lines of Frontage and Projections.

Chelsea.—Erection of a church building upon a site on the north-eastern side of Park walk, Chelsea, abutting also upon the north-western side of Camera-square (Sir Arthur Blomfield & Sons).—Consent.

Holborn.—Illuminated sign at the Fisher-street substation of the Metropolitan Electric Supply Company, Ltd., Fisher-street, Holborn (Mr. E. Cunliffe Owen).—Consent.

Islington.—Erection of a building upon a site between No. 2, Blackstock-road, and the "Blackstock" public-house, Blackstock-road, Seven Sisters-road (Mr. H. A. Saul for Miss Farmer).—Consent.

Kennington.—Building on the north-western side of Kennington Park-road, Kennington, upon the site of Nos. 2, 2A, 4, and 6 (Messrs. Walter Jones & Sons for the Commercial Car Hires, Ltd.).—Refused.

Marylebone, West.—Erection of an addition at No. 2, Melina-place, St. John's Wood (Mr. H. W. Bins for Dr. G. A. Gunton).—Consent.

St. George, Hanover-square.—Wood and glass enclosures to the porch at No. 77, Eaton-square (Mr. J. A. Minty).—Consent.

St. George, Hanover-square.—Erection of a roller shutter box at No. 15, Waverton-street, Hill-street, Mayfair (Messrs. Haywood Brothers for Mr. B. G. Raphael).—Consent.

Strand.—Illuminated sign in front of No. 33, Greek-street, Soho (Messrs. Kettner's, Ltd.).—Consent.

Width of Way.

Kennington.—Re-erection of the "Engineers' Arms" beerhouse, No. 103, Wandsworth-road (Mr. A. Dixon for Messrs. Whitbread & Co., Ltd.).—Consent.

Kennington, South.—Retention of a studio building at the rear of No. 17, Pembroke-square, Kennington, with a forecourt boundary (Mr. S. Newcombe for Mr. R. J. Barrett).—Consent.

Kennington, South.—Erection of a green-house at Hill Lodge, Hillside-road, Kennington (Messrs. W. Cooper, Ltd.).—Consent.

Width of Way and Lines of Frontage.

Holborn.—Retention of an illuminated sign at the Tower-street substation of the Metropolitan Electric Supply Company, Ltd., abutting upon West-street, Holborn (Mr. E. Cunliffe Owen).—Consent.

Holborn.—Advertisement hoarding at No. 116, New Oxford-street, Holborn (Messrs. H. & F. Worror for Cleaver's Emporium, Ltd.).—Refused.

St. Pancras, South.—Erection of projecting steps and landing in front of the new chemistry building, University College—Gower-place, St. Pancras (Professor F. M. Simpson for the Committee of the University of London).—Consent.

Lines of Frontage and Construction.

Chelsea.—Showcase at No. 15, Sloane-street, Chelsea (Messrs. Charles Spreckley & Co., Ltd.).—Refused.

Clapham.—Temporary wood, iron, and canvas pent on the forecourt of No. 23, North-cote-road, Battersea, abutting upon Cairns-road (Mr. C. W. Hall).—Consent.

Levisham.—Temporary wooden building in front of No. 11, Aitken-road, Catford (Mr. W. J. Ball).—Consent.

Width of Way and Construction.

Greenwich.—Two temporary wooden sheds at premises, No. 66, Deptford-green, Greenwich (Cheap Wood Company).—Consent.

Islington, South.—Temporary watchman's box at the entrance to the yard of Bean's Express, Ltd., on the western side of Nelson-terrace, City-road, Islington (Mr. H. C. Flack for Bean's Express, Ltd.).—Consent.

Kennington, South.—Erection of a potting-shed of a temporary character in the grounds of No. 1, Holland-park, Kennington (Mr. H. W. Currey for Mr. W. F. Fladgate).—Consent.

St. George.—Temporary wood and iron building at the rear of No. 76, Umberston-street, St. George-in-the-East (Mr. W. J. Fitt).—Consent.

Southwark, West.—Two additional iron sheds at the premises of Messrs. J. J. Spicer & Sons, Redcross-street and Union-street, Southwark (Mr. R. Plumble for Messrs. J. Spicer & Sons).—Consent.

Wandsworth.—Temporary concrete building at Pincocks Wharf, Jew's-road, Wandsworth (Murblo (Partition Slabs), Ltd.).—Consent.

Wandsworth.—Erection of an addition to an existing temporary building, and the erection of a further temporary building upon a site on the western side of Putney Bridge-road, Wandsworth (Mr. W. J. Harris).—Refused.

Whitechapel.—Temporary wood and iron building upon a site on the southern side of Great Prescott-street, Whitechapel (Mr. E. W. Chicken).—Consent.

Space at Rear.

Chelsea.—Erection of a building with an irregular open space at the rear upon a site abutting upon King's-road and Flood-street, Chelsea (Temperance Billiard Halls, Ltd.).—Consent.

Hammersmith.—Erection of buildings upon the site of Nos. 156 and 153, King-street, Hammersmith, with an irregular open space at the rear of one of such buildings (Messrs. J. S. Quilter & Son for Messrs. Batley, Sons, & Holmes).—Consent.

Hampstead.—Erection of an additional story over a portion of Norfolk-mansions, Litho- road, Hampstead (Mr. G. E. Ellis for Mrs. M. A. Ellis).—Consent.

Kennington, South.—Erection of an additional story at No. 1, Astwood-mews, South Kennington (Mr. A. W. Rose for Mr. G. Petrie).—Refused.

Cubical Extent.

Camberwell, North.—Additional cubical extent in respect of alterations and additions at the premises of Messrs. T. Tilling, Ltd., Acorn-street, Camberwell (Messrs. Gilbert & Constanduros for Messrs. Thomas Tilling, Ltd.).—Consent.

Kennington, North.—Erection at the premises of the Pall Mall Depository Company, Ltd., Barby-road, Kennington, of an extension exceeding 250,000 cubic ft. in extent (Mr. W. G. Hunt for the Pall Mall Depository Company, Ltd.).—Consent.

Kennington, South.—Additional cubical extent in respect of the conversion of the second floors of blocks 1 and 2 of Harrods' Stores, Ltd., Brompton-road, Kennington, for trade purposes (Mr. C. W. Stephens for Harrods' Stores, Ltd.).—Consent.

Paddington, South.—At the premises of Messrs. W. Whiteley, Ltd., Queen's-road, Bays- water, the construction of the corridors and lifts between the old and new buildings, the provision of doors of special construction in lieu of double iron doors to openings in the division wall between the new building and the adjoining old buildings, Nos. 147 and 149, Queen's-road, erection of an extension of the third story of No. 157, Queen's-road, the erection of kitchen and restaurant additions at the fourth-floor level of the new building, the erection of a roof garden on the roof of the new building, the erection of a photographic studio (fourth story) over No. 149, Queen's-road (Messrs. John Belcher, R.A., and J. J. Jones).—Consent.

Rotherhithe.—Additional cubical extent in respect of a proposed addition to the premises of Messrs. Champion & Slee, Ltd., Church- street, Tower Bridge-road (Mr. J. M. Kennard for Messrs. Champion & Slee, Ltd., Church- street).—Consent.

Westminster.—Additional cubical extent in respect of additions at blocks F and G of the Army and Navy Co-operative Society, Ltd., Victoria-street and Howick-place, Westminster (Mr. W. J. Falkiner for the Army and Navy Co-operative Society, Ltd.).—Consent.

Formation of Streets.

Brixton.—Formation or laying out of two new streets for carriage traffic between Brixton- hill and Acre-lane, Brixton (Mr. H. B. Michell for the British Land Company, Ltd.).—Consent.

Alteration of Buildings.

Chelsea.—Erection of a studio addition on a flat roof at St. Loo-mansions, St. Loo-avenue, Chelsea (Mr. A. Roberts for the Chelsea Electricity Supply Company, Ltd.).—Consent.

City of London.—Smoke-pipe to a steam- boiler at No. 3, Lime-street, City (Messrs. J. Boulting & Sons for J. P. Restaurants, Ltd.).—Consent.

Width of Way, Line of Frontage, and Construction.

Rotherhithe.—Erection of external steel and concrete gangways to unite Nos. 137, 139, and 139A, with Nos. 170, 172, and 174, Rotherhithe- street, Rotherhithe, over the public way of Rotherhithe-street (Messrs. J. Shelbourne & Co. for Messrs. Fisher's Wharves and Granaries, Ltd.).—Refused.

The recommendations marked + are contrary to the views of the Metropolitan Borough Councils concerned.

PROJECTED NEW BUILDINGS IN THE PROVINCES.*

BALBY.—One hundred and twenty-four houses at Balby and Carr House (25,994.); Mr. A. Thomson, builder, care of the Clerk, Town Hall, Doncaster.

Banbury.—Forty houses (6,572.); Messrs. Bosworth & Lowe, builders, Ashley-street, Nottingham.

Barnard Castle.—Territorial drill hall; Messrs. Wright & Chapman, architects, New-castle; Messrs. R. Wilson & Sons, builders, 1, Victoria-terrace, Barnard Castle.

Batley.—Conversion of houses into offices for Messrs. R. Talbot & Sons, woollen manufacturers, Bullrush Mills, Bradford-road, Batley. Bellevue.—Proposed school (54,000.) for the Edinburgh School Board.

Blackpool.—Alterations to bath (10,000.); Mr. John Banks Brodie, Surveyor, Town Hall, Blackpool.

Blakenhall.—Proposed bath: Mr. G. Green, Surveyor, Town Hall, Blakenhall.

Bolton.—Institute, Bridgman-place (6,000.) for the Lancashire and Cheshire Miners' Federation.

Bowdon.—Proposed hall: Vicar, Parish Church, Bowdon.

Brighouse. Premises, Thornhill Briggs, for the Co-operative Society. Carnarvon.—Housing scheme, Bethel-road and St. Helen's-area; Mr. E. Hall, Surveyor, Town Hall, Carnarvon.

Chalvey.—Buildings at pumping-station (507.); Mr. W. Street, builder, Slough.

Clayton-le-Moors.—Church; Vicar, All Saints Church, Clayton.

Cleckheaton.—Extensions to Mount View Leather Works, for Messrs. H. F. Cockrill & Sons.

Colwall.—Houses; Surveyor, Parish Council Offices, Colwall.

Cornwall.—Sanatorium (10,500.); Messrs. S. W. Jenkin & A. E. Brookes, Surveyors, County Hall, Bodmin.

Crews.—Church (6,000.); Vicar, St. Paul's Church, Earle-street.

Dartford.—Additions at workhouse infirmary (676.); Mr. J. C. Hayward, Clerk, Guardians' Offices, Dartford.

Dartmouth.—Proposed isolation hospital; Surveyor, Town Hall, Dartmouth.

Devon.—Schools, Brixham (2,142.) and Umberleigh (1,357.); Mr. F. J. Badcock, builder, Hazeldene-yard, Ashburton, Devon.

Dewsbury.—Parochial hall (900.); Vicar, St. John's Church, Dewsbury Moor.

Dover.—Extensions to bank, Market-square, for the London County and Westminster Bank, head offices, 41, Lothbury, E.C.

Dumfries.—Housing scheme, King-street (8,000.); Mr. F. Armstrong, Surveyor, Town Hall, Dumfries.

Edinburgh.—Labour Exchange, corner of Riego-street, Lauriston-place, Tollerooss (8,001.); His Majesty's Office of Works, Storey's gate, Westminster, S.W.

Elland.—Cinematograph theatre, Coronation-street, for Central Pictures (Elland), Ltd.

Falkirk.—Billiard-room, Meeks-road (400.), for Messrs. Train & McIntyre, Ltd., whisky merchants, 60, Wellington-street, Glasgow.

Fleckney (Leicester).—Extensions to factory for Messrs. R. Walker & Sons, hosiery manufacturers.

Fleet.—School (200 places); Mr. W. Bailey, Town Hall, Winchester.

Gedney Drove End (Lincs).—Eight houses (1,390.); Mr. W. H. H. Davies, architect, York-row, Wisbech; Messrs. Wilkinson & Co., builders, Elm, Wisbech.

Heigham.—Alterations to St. Phillip's Church School and new school, Dereham-road (448 places); Messrs. H. Ramage & D. O. Holmes, Education Offices, Norwich.

Horden.—Police-station, Mr. W. Crozier, Architect, County Hall, Durham.

Hull.—Hall, etc. (2,250.); Rev. A. C. Carter, Pastor, East Park Baptist Church, Hull.

King's Lynn.—Extensions to baths (1,000.); Mr. J. H. Webb, Surveyor, Town Hall, King's Lynn.

Langholm.—Weaving shed and office, Factory Entry, for Messrs. Reid & Taylor, woollen manufacturers, Langholm Mills, Langholm.

Leeds.—School (5,000.); Trustees, St. Francis Roman Catholic Church, H. H. Beck, Leeds.

Swimming-baths. houses, chimney to laundry, etc. (2,665.); Messrs. H. Atkinson, Ltd., 2, Carlton-street, Leeds.

Leigh-on-Sea.—Addition to St. Clement's Church; Rev. R. S. King, Vicar.

Lewes.—Sanatorium (19,959.); Mr. F. J. Wood, Surveyor, County Hall, Lewes.

Lincoln.—Proposed infirmary; Mr. W. B. Danby, Clerk, Guardians' Offices, Lincoln.

* See also our list of Competitions, Contracts etc., on another page.

Loughborough.—Destructor house (720.); Mr. A. Faulks, builder, 4 and 5, Sparrow-hill, Loughborough.

Maidstone.—School, Tonbridge-road (1,786.); Messrs. Martin & Newman, builders, Curzon-road.

Milnrow.—Theatre for the Milnrow Empire, Ltd.

Mold.—Proposed restoration of Mold Church (8,000.); Rev. E. Jones, The Vicarage, Mold.

Monmouthshire.—Cookery centre, Blaenavon, and school, Cwmfrwdor; Mr. T. G. James, County Education Offices, Newport.

Newbridge (Mon).—Twenty houses for the Bryn Building Club (250. each); Messrs. Jenkins, James, & Co., architects, Newbridge; Mr. G. Smith, builder, Ynysddu, Mon.

Osett.—Extensions at Highfield Mills for Messrs. W. Walker & Sons, Ltd., woollen and worsted yarn spinners, dyers, etc.

Pendlebury.—Alterations to offices for the Worsley Brewery Company, Ltd., Bolton-road, Pendlebury.

Penzance.—Forty houses, Weeth's Field, adjoining Alverton; Mr. F. Latham, Surveyor, Town Hall, Penzance.

Prestwick.—Additions to school, High-street, for the School Board.

Ramsbottom.—Buildings for the Bradford Dyers' Association, Ltd., 39, Well-street, Bradford.

Redditch.—Proposed cinematograph theatre, Alcester-street, for Mr. C. H. Baines, of London.

Rochdale.—Headquarters for Prudential Assurance Company, Holborn Bars, E.C.

Roscrea.—Fourteen houses, Moneygall, and twenty houses, Shinrone; Surveyor, No. 2, Rural District Council Offices, Roscrea.

Rushden.—Additions at factory, Cromwell-road, for Messrs. W. Green & Son, boot and shoe manufacturers, Queen-street, Rushden.

Additions to factory, Mantons-road, for Mr. W. Knight. Two houses, Wellingborough-road; Mr. William Backwood, builder, 80, Newton-road, Rushden. Alterations and additions to Palace Theatre for Messrs. Cave Brothers. Additions to factory, Rectory-road, for the Central Machinery Company.

Saltburn-by-the-Sea.—Manual institution centre (515.); Mr. J. Hunter, builder, Saltburn.

Sandwich.—Extensions to Guildhall (1,126.); Messrs. Turner & Watts, builders, Cattle Market, Sandwich.

Selby.—One hundred houses, Flibby-road and Armoury-lane; Mr. R. B. McGray, Surveyor, Urban District Council Offices, Selby.

Slough.—Extensions at Gotha Works for Messrs. Peters & Co., railway carriage furniture manufacturers.

Stockton-on-Tees.—Additions at Newtown School (1,500.); Mr. J. Tweedie, Town Hall, Stockton.

Stoke-on-Trent.—School, Rookeny-lane; Architect, Education Offices, Stoke.

Stone (Staffs).—Additions to factory, Oulton-road, for Messrs. Bostock & Co., boot manufacturers.

Stowupland.—Houses (180. each); Mr. G. Harrison, Surveyor, Rural District Council Offices, East Stow.

Sunderland.—Tuberculosis pavilion on site of isolation hospital (1,100.); Mr. William Crozier, Architect, Shire Hall, Durham.

Sutton-in-Ashfield.—Fire-station; Mr. W. Burn, Surveyor, Urban District Council Offices, Sutton.

Swindon.—Business premises for Mr. J. H. Pakeman (900.); Messrs. Drew & Sons, architects, 25, Regent's-circus, Swindon; Mr. A. J. Colbourne, builder, County Building Works, Swindon.

Swinton.—Additions to Cyclone Works for Messrs. Mathews & Yates, Ltd., electrical engineers, etc.

Tavistock.—Ten almshouses (3,000.); Messrs. Peart Brothers, builders, Gilwell-street, Plymouth.

Thirsk.—School (100 places); Mr. J. C. Wrixley, North Riding Education Offices, Northallerton.

Trevelthan.—Twenty-two houses; Mr. W. H. Tresider, Surveyor, Town Hall, Falmouth.

Troon.—Shops and houses, corner of Wallbeck-crescent and West Portland-street (4,000.); Mr. Hugh Watt, Parkview, Troon.

Truro.—Alterations to various buildings, for dispensaries (1,640.); Messrs. S. W. Jenkins & A. E. Brookes, County Hall, Bodmin.

Uppminster.—Church hall (300.); Vicar, St. Lawrence Church.

Uxbridge.—Alterations to factory for Messrs. F. Parker & Sons, Ltd., furniture manufacturers, Cowley Peachey, Uxbridge.

Velindre.—School; Dr. J. James, Secretary, Glamorganshire Education Offices, Cardiff.

Wensum View (Norwich).—School (3,964.); Messrs. T. Gill & Son, builders, 28, Rupert-street, Norwich.

West Hartlepool.—Proposed pavilion (2,000.), Park-drive, for the West Hartlepool Cricket Club.

Westoning.—School (1,700.); Mr. Spooner, County Education Offices, Bedford.

West Sussex.—Additions to school, Aldbourne (550.); school, Lancing (1,478.); alterations to school, Rudgwick (260.); Mr. Thompson, West Sussex Education Office, Horsham.

Winchester.—Proposed baths, North Wall; Mr. W. V. Anderson, Surveyor, Town Hall, Winchester.

Wombwell.—Proposed completion of Park Church (2,000.), for the Vicar.

Worcester.—Proposed school; Messrs. Duckworth & F. F. Spackman, Education Offices, Worcester.

Worsley.—Additions to dye-house for Messrs. Burgess, Ledward, & Co., Ltd., dress goods manufacturers, 22, Dickinson-street, Manchester.

Wroughton (Swindon).—Rebuilding "C. ters' Rest," for Messrs. R. B. Rowley & Co. Ltd., brewers (790.); Messrs. Drew & Sons, architects, 25, Regent's-circus, Swindon.

Yarm.—Grammar school (3,187.); Messrs. Dobson & Son, builders, Stokesley.

Yoker.—Additions to works, Harvey street for Halley's Industrial Motors, Ltd.

FOREIGN AND COLONIAL.

Buildings in New York.

According to the Annual Report of the Bureau of Buildings for the Borough of Manhattan, the total value of the buildings erected in Manhattan during the last ten years about 216,000,000, varying from 17,000,000 in 1904 to 29,000,000 in 1909. The number new buildings varies from 659 in 1908 to 2,572 in 1909, the average cost ranging from 9,700 to 26,000. The total value of buildings erected during 1911 in Greater New York amounts to nearly 40,000,000, showing for the entire city a decrease of 67 per cent. as compared with the preceding year. Manhattan the proportion of fire-resistant buildings has increased from 51 per cent. in 1910 to 39.4 per cent. in 1911, and in a section between Fourteenth and Ninety-sixth streets the value of the fire-resisting buildings is 95 per cent. of all the new buildings.

Building Work, Canada.

The Imperial Trade Correspondent Toronto (Mr. F. W. Field) has forwarded extract from the local Press containing description of the proposed municipal abattoir at Toronto. According to this description, the building is to be absolutely fireproof, sanitary; glazed bricks and tiles will enter very largely into its construction, with vitrified bricks will be used for the floor. The "rendering" building will include departments for the manufacture of oiled oil, a storeroom and also for the manufacture of and address of the United States firm of architects who have prepared the plans, etc. for the building may be obtained by British manufacturers on application to the Commercial Intelligence Branch of the Board of Trade, 73, Basinghall-street, London, E.C.

With reference to the notice on p. 206 of the Board of Trade Journal of July 25 relative to the formation of a company to establish a chain of terminal warehouses from Montreal to the Pacific Coast in connection with the Grand Trunk and Grand Trunk Pacific railway systems, H.M. Trade Commissioner for Canada now reports that the scheme has fallen through.

Belgian Cement.

The British Consul-General in Belgium reports that there was a considerable augmentation in 1911 of the amount of Belgian cement exported to Great Britain. For several years past the quantity of Belgian cement exported has been rapidly declining, but during 1911 there appears to have been a renewal demand, the figures reaching 64,547 tons, compared with 55,354 tons in 1910.

Schools, Hayti.

The British Acting Consul-General at Port-au-Prince (Mr. E. D. Watt) reports that a *Moniteur* of October 9 publishes a law authorising the annual expenditure of 50.0 dollars (about 10,270.) by the Department of Public Works for the construction of national schools in the Republic. Tenders will be invited for carrying out this work in accordance with the plans of the Department of Public Works, and exemption from customs duty granted on all material which it may be necessary to import from abroad.

THE CONCRETE INSTITUTE: PRESIDENTIAL ADDRESS.

THE twenty-seventh ordinary general meeting of the Concrete Institute was held on November 14, in the Lecture Hall at Denison House, Westminster, S.W.

The following were elected members of the Institute:—

W. J. B. Barker, London.
G. J. Bertinshaw, Wellington, New Zealand.
W. E. A. Brown, London.
J. Cathcart, Cleveland, U.S.A.
R. T. Cooke, London.
J. D. Cornack, Professor of Mechanical Engineering, University College, London.
J. P. Day, London.
J. P. Ion, London.
J. W. Gibson, Hull.
A. W. Green, London.
C. M. Gregory, Hove, Brighton.
C. A. Duncan, Behar.
J. M. Jardine, Edinburgh.
A. Bryce Johnstone, Braemar.

W. R. Kerr, Melbourne, Australia.
W. H. Lascelles, London.
W. J. H. Leverton, London.
S. G. Lyttle, Bijapur, India.
G. Metson, London.
A. H. Quick, London.
T. Ritchie, Cape Town, South Africa.
G. M. Stonier, Manchester.
J. Edge Taylor, London.
W. W. Tonkin, Johannesburg, Transvaal.
F. J. Treacher, Malvern.
H. A. Tristram, London.
H. H. Turner, London.
P. J. Waldram, London.
F. V. Wharton, Fort of Spain, Trinidad.

Mr. E. P. Wells, J.P., who presided, said that he brought the total membership of the Institute up to 938. He then delivered his Presidential address, in the course of which he said they were all aware that the scope of the Institute had been enlarged to include structural engineering. The Science Committee had undertaken to compile a standard notation for calculations in structural engineering generally. Further effort in the direction of standardisation was being made by the same Committee in drafting a standard specification for reinforced concrete work, which at the present time was very badly needed, and also a report on the standardisation of attachments for joints in reinforced concrete. The Tests Standing Committee had the following subjects under consideration:—

1. The effect upon steel of the presence of sulphur in aggregates.
2. The grading of aggregates.
3. The expansion and deterioration of concrete due to changes of atmospheric temperature.
4. The effect of the use of sodium silicate on the surface of concrete as affecting reinforcing metal.
5. The erratic results obtained by the Vicat needle in ascertaining the initial set of cement.

The Reinforced Concrete Practice Standing Committee were investigating:—

1. Methods of treating the surface of concrete.
2. Care to be taken to the expansion and contraction of reinforced concrete.

A special Investigation Sub-Committee had been formed to investigate failures and accidents in connexion with reinforced concrete construction, and also the restrictions placed by the Local Government Board upon the granting of loans to local authorities for the purpose of undertaking work in that material.

The Practical Side of Reinforced Concrete Construction.

Proceeding, the President said:—

"With regard to the first and the principal constituent in concrete—namely, Portland cement—it is strange, at this present day, how many engineers and architects still adhere to the old specification of coarse grinding, consequently requiring aeration of the cement. It has been my lot only this week to come across a specification where it was stated the cement was to be spread on a floor for twenty-one days before being used. Those of us who are well acquainted with the present-day cement, and also its fine grinding, know how deleterious this is when great crushing strength is required. I think I have said, on more than one occasion at this Institute, that if cement is to be kept up to its full strength it is absolutely necessary that when it is received on the site of the works it should be stored in air-tight wooden bins; and if this is done cement may be kept for many years and be just as good after the lapse of time as it was when freshly made, whereas if the cement is stored in sacks, and even a very small amount of moist air plays upon them, then the cement is rapidly hydrated and cakes in the sack. If, as is often the case, this cement be rubbed through a sieve, it becomes almost absolutely useless for purposes of concrete-making—by that I mean good concrete.

I have in my mind's eye a case of a contractor who bought cement in the month of October. The whole winter was a bad one,

and he had very little opportunity of using the cement. It was stored in a shed through which the wind could blow freely, and he was rather astonished when the spring came and the cement was used that it would not set. He then wrote to the manufacturers, and when the matter was investigated the true cause of the mischief was found out.

I have myself on many occasions experimented with cement that has been so hydrated, and it is astonishing the enormous reduction in the strength, so much so that it becomes almost useless for making concrete.

Any of you who chooses to make the experiment can do so, and you will find that with the concrete made from an over-hydrated cement the amount of strength obtained will be very little indeed, and that its setting action will be so slow that it will practically take days before it shows much sign of hardening. The only use of such a cement is to mix with an over-clayed cement that is too quick setting; by this means the setting action can be retarded.

Careful Choice in Aggregates.

Passing from cement, one is led on to the careful choice in all aggregates, the proper grading of the same, and also, what is of more importance, the seeing that everything is absolutely clean and the water pure.

I know it has been said that dirt is of some good in increasing the strength of cement concrete, but the only case that I can find where, over any period, a dirty aggregate increased the strength of the concrete was due to the fact that it had been mixed with a very over-clayed cement. It slowed down its setting action, and by that means did good; but if the test had been carried over a lengthy period it would have been proved how fallacious is the advantage to concrete of dirt in any form.

With regard to aggregates consisting of gravels that are dredged either from the river or from the bed of the ocean, it is very seldom that the proper proportion of sand to coarse material is obtained. There is only one gravel that I know where one can see that the proportion is about correct, and that is obtained from the Spurn. In the ballast obtained from the Thames and along the East Coast there is at the present time a great excess of sand, and under any circumstances I would not in any way recommend that this aggregate should be used without separation of the larger particles from the finer and subsequent crushing of the coarse material.

The difference in the strength of concrete made with an excess of sand is very marked where the proportion of cement is not great; that is to say, 6 to 1 and 7 to 1 concrete with an excess of sand show very great falling off in strength, whereas with richer mixtures and an excess of sand, though there is a falling off in the early stages of hardening, after a few years the concrete will almost come up in strength to a concrete made in the correct proportions. Of course, it is well known that for all waterwork a large proportion of sand is required so as to get a perfectly dense mixture, but in no case must this be overdone.

In concrete for waterwork it is not necessary to add anything to make it watertight. If concrete be properly made it will be absolutely impervious to moisture, and if it be found necessary to reduce the labour some of these compounds of hydrated lime are, no doubt, of utility in decreasing porosity, but, at the same time, concrete so made is not improved in strength.

Before leaving the subject of aggregates I wish to call particular attention, as I have done here on more than one occasion, to the use of Fletton bricks for concrete. I have found lately that wherever Fletton bricks have been used disruption has taken place in the concrete, and I think this is due to the presence of lime in the bricks. Fletton bricks that are dangerous to use are those with purple markings, and great care should be exercised by all those who propose to use brick aggregate for concrete work to eliminate absolutely Fletton bricks in any form whatever. In this I am borne out by several who have been unfortunate enough to use the bricks, the result being that the concrete has failed.

I was called in only a few months ago to a special floor that had been put down for testing bowls, when it was found that about a month after the floor had been laid it was becoming uneven in places. On examination it was found that in every case where the floor had risen Fletton bricks in the aggregate were the cause of the mischief.

It is always advisable in the making of concrete that it should be got into the work as quickly as possible, especially in the summer; with low temperatures it is not of such great importance, as the cold slows the setting action and also its hardening. In frosty weather the drier the concrete and the more ramming, so long as there is no chance of displacing any of the reinforcing, the better for the concrete, as it will set very much more rapidly than if there is an excess of moisture.

Reinforced Work and Moisture.

With regard to reinforced work, it is far better that the concrete should have a slight excess of moisture than a deficiency. Certain experiences that I have had lately have shown that where steel has been put into concrete that was too dry the air and moisture had got through the porous concrete to the steel and caused rapid corrosion.

In one case the bottom layer of concrete had been put in and allowed to set, the steel was placed on the dry concrete, and other dry concrete was placed on top. When this work was broken up it was found that the rods in the concrete were quite loose, could be turned round by hand, and the adhesion between the two layers of concrete was anything but good. Now, had the concrete been made wet, there would have been no separation between the steel and the concrete, it would not have been possible to twist the steel rods round in the concrete, neither would moisture have passed through the concrete to the steel and caused oxidation after the alkaline salts had disappeared by age owing to the presence of air and moisture.

Excess of moisture, as we all know, decreases the crushing strength of the concrete; but at the same time in nearly all structures there is generally such an excess of concrete in the compression member, especially where T-headed beams are used, that it is better to have the steel perfectly protected with a slightly weaker concrete than to have imperfect protection with a stronger concrete, because if imperfectly protected corrosion will be almost bound to take place, with consequent disruption of the concrete.

Excessive ramming in concrete is not at all necessary where it is made wet. It is far better to employ very light ramming and see that fine particles of the concrete are brought to the surface of the shuttering boards by means of steel slices or trowels. If this be done there will be very little danger of air finding its way through into the steel reinforcing, but a coarse aggregate first put in with an insufficiency of sand is almost always certain to have some porous parts through which the air and sulphur, especially in a London atmosphere, can attack the steel.

An Important Point in Reinforced Work.

It may be well here to call attention to what I consider to be a most important point in reinforced concrete construction, namely, that as the concrete is being put into the work test-cubes should be made both for ascertaining the strength of the concrete *in situ* and exposed to the ordinary atmospheric conditions, and also to ascertain in the laboratory the strength of a series of cubes made at the same time and kept under laboratory conditions. One set of cubes should be kept on the works exposed to the varying atmospheric conditions, and the other at the laboratory at the normal temperature, say, of 60 deg. Fahr.

Effect of Cold on Concrete.

Some years ago I made an experiment to see whether cold had any effect on concrete, and, if so, to what extent. I found that in the month of December, when the cubes were taken from about 60 deg. Fahr. and placed on a roof where the temperature fell to below freezing-point, a most alarming decrease took place in the crushing resistance of the concrete, and this remained so until such time as the weather became warmer, when the crushing resistance went up and was practically the same as shown by cubes made to the same gauging but kept under normal conditions.

This clearly shows that if a building is constructed in cold weather the crushing resistance of the concrete cubes kept on the works will be low, but if it be found that the other set of test-cubes, kept under laboratory conditions, shows a rapid increase in the strength, then it is only fair to assume that the concrete that has been exposed to the cold air will, with favourable conditions, increase in strength and attain the same strength as the laboratory experiments.

The reason I am calling particular attention to this point is that if a building is constructed in the winter and the test loads are applied up to 50 per cent. in excess while the weather is cold, there may possibly be an excessive amount of deflection, owing to the fact that the strength of the concrete in compression is low, whereas if the experiment were held over until the warmer weather, when the compressive strength of the concrete was largely increased, then the deflection would be practically nothing—of course, assuming that the work in the first instance had been properly designed.

Testing.

If the work is properly designed, and if the supervision has been strict and the work has been carried out according to the drawings, it is fair entirely to dispense with the testing of the structure so long as the experimental cubes show that the concrete has attained the strength required by the engineer or architect.

It is rather foolish to test a structure when one knows by experience that the crushing resistance, owing to the cold, is low. It would be far better to wait until the weather had become warmer and the concrete had parted with a lot of its moisture, when it would have become much harder. On the contrary, if it is found that the laboratory tests are low, say, for the sake of example, one month after being made, then I should strongly recommend testing of the structure to ascertain whether there were anything seriously at fault. Having those conditions of a low laboratory test and a much lower *in situ* test, yet the structure not exhibiting any serious deflection, then the work may be passed; but still, it is advisable in all cases to watch the crushing experiments, as upon these depends almost entirely the strength of the structure. A good crushing resistance means that the concrete is strong in tension, strong in adhesion, and strong in shear, and, such being so, there is very little danger of the structure failing even if there is a deficiency of steel.

The testing of floors and other works is, as a rule, carried out on much too small a scale. Testing should be spread over an area that will at least take in always two sets of secondary beams as well as two spans of main beams completely. By this method of testing the beams always have their full load and the adjoining beams become unloaded, which gives the most severe form of test, unless absolute continuous construction be carried out.

My experience has taught me that where concrete is good, that is to say, mixtures of 5 to 1 and richer, with the ordinary normal loading for which the structure was designed, unless most delicate instruments be used there will be no deflection recorded, whereas when weak concretes are used, namely, 6 to 1 and under, then the deflection at times becomes very great.

In all cases in making deflection tests they should be made, not only at the centre of the span but also at the walls, as very often it is found that a large amount of the so-called deflection is due entirely to the squeezing of the brickwork, owing to the fact that the reaction has not been spread over a sufficient area of brickwork. In no case ought the load on the brickwork to exceed 8 tons per square foot; by this means a good distribution is obtained and the brick walls are strengthened thereby.

Causes of Failure.

In a great many works that I have seen where failures have taken place the failures have been very largely attributable to shattering and strutting. I have in mind cases of beams deflecting 2 in. or 3 in. after the concrete has been filled into the mould, this being due entirely to the strutting sinking into the soft ground underneath. In several cases this has caused what appeared like shear cracks at each abutment, though the work afterwards stood the test load satisfactorily. Still, such cracks made the beam look unsightly, and there could not have been the same adhesion between the concrete and steel, owing to this settlement, as if the boxes had remained perfectly true and level during the whole time the concrete was being put in and until the same were struck.

I know of one case of a failure taking place entirely owing to the strutting sinking into the ground, the sinking taking place over more than a week. The concrete, therefore, never had the least chance of getting a fair adhesion to the steel, but was constantly being drawn away from it by this settlement of the strutting, so much so that when the strutting was removed the whole structure came down with a run.

It is always advisable, if there is any doubt at all about the ground, to have the latter tested beforehand, and it is far better to increase the sole-plates to double the size required, so as to prevent any possible chance of settlement, than to have an insufficient area with consequent settlement and trouble taking place.

Not only does the settlement cause a reverse camber of the beam, but it also gives a fall in the floors the wrong way, and it needs extra expense all round to make good such defective work.

All these are points that are easily obviated by the simple means of closely watching the work as it proceeds, and not allowing any concrete to be put in until the engineer or his representative is satisfied that the strutting is of such a nature that settlement is not likely to take place.

Strutting.

Strutting should always remain up as long as possible after the concrete has been placed in position; in fact, if it were not for the exigencies of trade and also the rapidity with which building works of the present day have to be erected, I should personally like to see all strutting remain up for very much longer periods than is generally allowed, because the harder concrete can get before removal and any weight can get thrown upon it the better it is for the structure as a whole. Unfortunately, in the present day the question of expense has to be very largely considered, and to allow strutting to remain up as long as one would like it would increase in a great many cases the cost of the work, and I am afraid it would become almost prohibitive. Of course, in cold weather strutting must be left up for periods 50 per cent. longer than is allowed in the summer-time, and a great many of the failures in this country, and more especially in America, are mainly traceable to the removal of the shuttering and strutting at too early a period in the life of the concrete. The concrete at the time of striking was weak, but had an extra fortnight or more been allowed for the hardening, then the works that have failed would do doubt have stood up.

Water and Concrete-Making.

Before finishing with concrete-making I would like to refer to water to be used therein. In this country, as a rule, water is almost invariably obtained from what is called a domestic source, namely, water supplied by large public companies who are extremely careful in what is sold to the public. Such being so, it is very rarely in England that one has to use water that does not come from the public supply; but there are cases where it is advisable carefully to examine the same before it is used. There are some places where the water is highly charged with gypsum compounds, and, such being the case, it behoves one to see that there is no likelihood of failure taking place owing to an excess of this compound.

In the South of France, in Algeria, and in a great many districts waters are highly charged with gypsum, and so bad is this in places that concrete is absolutely dissolved and disrupted in less than two or three years. Whenever there is any doubt as to the quality of the water to be employed an analysis should be made beforehand, and so prevent what might lead to a disaster.

Steelwork.

One of the great defects with regard to reinforced concrete is constantly raised by those who have not had much to do with the subject, and often by those who are largely connected with it, namely, the difficulty of getting steel work placed in the position designed by the engineer. It is a difficult matter always to get the work placed in the designed position, owing to the carelessness of the British workman, whose idea seems to be to get the material into position as quickly as possible, no matter whether it be right or wrong, and in a great many cases if he has an opportunity of leaving the steel out he will do so. The only way to get over this difficulty is not to allow any concrete to be filled or poured in until the steelwork had been passed by the engineer or his representative. If this be done there will be very little danger to be apprehended, because if the steel is in the correct position, if the concrete is proved to be as good, as borne out by the *in situ* tests and by the laboratory tests, and if the strutting has not given way, then one may fairly assume that the work has been well carried out and will sustain all the loads for which it is designed, and that there will be no

deflection, or else of such a slight nature that it is not worth troubling about. If, however, the steel be badly placed, the concrete be poor and the strutting has failed, then there is no knowing what is going to be the result.

In a great many years of practical experience I have come to this conclusion, that even if there is a large deficiency of steel in the structure both in tension and in compression, and the concrete is of an excellent quality, there is hardly any chance of failure taking place, but if the steel is up to and even in excess of the requirements asked for, and by any chance the concrete be poor, then if an excessive load be placed upon the structure there is nothing to prevent it failing. As I have stated before, a rich concrete is strong in crushing, tension, adhesion, and shear, whereas with poor concrete exactly the reverse is the case.

A series of experiments that I carried out some years ago of some beams gave for thirty three days' test a factor of safety of $\frac{5}{3}$ to 1, in three years the factor was over 9 to 1. This was due entirely to a very good concrete which was absolutely homogeneous throughout, and when the beams broke they failed only at the centre, the only place where cracks developed. There was no sign of shear and the diameters of the rods where the failure took place were, to all intents and purposes, the same diameters as when they were put in. These experiments, I think, simply show an enormous increase in the lever-arm, due to the rich concrete; in fact, in the case I now mention, the lever-arm was practically the total depth from the axis of the tension members to the outside of the compression member of the beam, but even this will not account wholly for the enormous load that the beams carried, as the tests produced extraordinary stresses both in the steel and also in the concrete itself.

Labourers and the Carrying-out of Work.

A great deal has been done by the London County Council School of Building in educating clerks of the works and others as to the method in which the practical part of reinforced concrete construction should be carried out. They ought to go a step lower and take in hand labourers who are connected with the carrying-out of the work, because until such time as they themselves understand, to even a very slight extent, what is required of them, so long will they be careless in doing the work they have to do.

The foremen employed must be instructed to keep a sharp look-out on all their men, and not to allow luxury in any shape or form. The men know that the foreman is up to all their so-called tricks of the trade, then they will take good care that the work is carried out in an efficient manner, but if by any chance the foreman is careless his workmen will be the same; and it will, I think, very often be found that where anything serious takes place it is not only the men but the foreman and even the clerk of the works on the job who are answerable for this state of affairs.

Electrolysis.

A point that was investigated by the Science Committee some time ago was one which it is advisable, I think, for me to call attention to and that is electrolysis. I have watched on work where this mischief occurred, and only about a couple of months ago I made a further examination and found that the mischief was still increasing. It is a moot point with some as to whether there is any electrolytic action or not, but personally I have very little doubt upon the subject, so that it behoves all designers and contractors to see that there is no possible chance of electric currents finding their way into the steel reinforcing, because should they do so, I do not think there is any doubt whatever that it will mean the eventual disruption of the concrete. It only requires the exercise of care to put a stop to this and to be perfectly certain that all cables throughout the reinforced concrete work are properly insulated, and that there are no stray currents wandering about the work.

Calculations of Reinforced Concrete and Mathematics.

I think a great many of my hearers will agree with me in regard to the calculations of reinforced concrete work that a great deal too much mathematics has been imported into the subject and that common sense has had to take a back seat.

If we were dealing with two materials, both of which were absolutely constant—that is to

ay, the concrete constant within a month after it was made in strength as the steel is immediately after it is rolled—then it would be possible to go in for mathematical formulae of a high order; but where you have a material—e. g., concrete—the strength of which, if all portions are good, is increasing day by day, and in some cases attaining a strength of three, four, or more times that which it was originally calculated for, how is it possible in these ways to formulate any formulae which are even moderately correct? It is far better to use more common sense and simplify or formulate empirical rules which you know are absolutely safe in their application. It is no good trying to extract the square root of two—it is useless.

I have seen cases where the stresses have been worked out to five places of decimals, and it would all have been done by mental arithmetic, and the result would have been so close that it was really not worth while troubling about.

I see cases constantly where rods are put into work varied in diameter to 32nds of an inch. That is not at all necessary. It wastes time on the work, and in a great many cases wrong rods go into the wrong place. It is as bad to adhere in all cases to commercial sizes, never advancing beyond 16ths of an inch, and if possible advancing only by 1/4ths, as by that means the size of the rod is clear to the naked eye and does not require a caliper to be put upon it to find out whether it is 3/4 or 7/8 of an inch. Such reinforcements as these simply how designers lack common sense and bring the work into disrepute. Exactly the same thing takes place with calculations submitted for approval. A mass of figures will be carried out into millions where the whole lot can be simplified by reduction into tens or hundreds, and the elimination of anything beyond two places of decimals. The simpler calculations are made the less liability there is of errors creeping in, and if an error does creep in then it is much easier to discover; and where a whole foolscap page of figures is used to arrive at a result, it means in a great many cases simply courting disaster, as well as being also a waste of time and expense with view to possibly saving a pennyworth of cost.

Figures have always been a great enemy to the complicated calculations, as I do not think they are at all necessary. It only brings to mind the great building that has ever been constructed in London. I am now speaking of as long ago as about five-and-twenty years. In an arch there was a deficiency in the centre of the arch, I think, 1/2 in. in a large sectional area of steel. To make up this deficiency in compression a bar 2 in. by 1/4 in. was riveted on, and this only for a length of 2 ft. or 3 ft., thus making mathematics simply an absurdity, whereas a common-sense engineer would have for the sake of 1/2 in. in 100 sq. in. ever think of giving anything so absurd.

The same applies to reinforced concrete. It far better to work in all cases to commercial sizes of rods, even if there be a slight deficiency in sectional area, than to put in multiples of 1/8 of an inch diameter so as to make up a given sectional area. This entails an enormous amount of work, not only upon the designer, but also upon the foreman who has to take charge of the work, and upon everybody connected therewith, and it is of no practical use whatever. Therefore I should like to see all rules made for reinforced concrete that common sense should enter more largely into the formulae that are given to the world, and not a mass of mathematics provided, which authors know perfectly well are even then empirical, because one material is a constant and the other is an inconstant."

Mr. H. Percy Boulnois, M.Inst.C.E., Chairman of the Council of the Royal Sanitary Institute, in proposing a vote of thanks to the President, said that materials should be standardised, but unfortunately one could not standardise men, and the personal element of the men came into the work enormously. The best design might be ruined by bad workmanship.

Mr. C. S. Meik, M.Inst.C.E., who seconded the vote of thanks, expressed the opinion that less one could get good workmanship one did not get good work in reinforced concrete. All such work the men should be specially trained, and one should make sure that there is not a man amongst them who had been accustomed to make concrete as it used to be done. He emphasised the necessity of making cubes when doing important work. Such

cubes made as the work was going on were of great value afterwards should anything happen to the work. If a failure took place, for instance, during testing it could be found out by reference to the cubes made on that particular day whether the failure was due to the cement or to bad workmanship, and the engineer's mind would be relieved to a great extent when it was found the cement was not at fault.

Mr. E. Flinder Etchells, A.M.I.Mech.E., in supporting the vote of thanks, said he would like to make the Institute "The Institution for Structural Engineers and Architects," because it was the Institution *par excellence* for them. There was no other institution in this country which combined architects and engineers in one corporate body, though there might be in Austria and in Germany.

NEW YORK WATER SUPPLY.

UNTIL 1774 the City of New York was supplied with water from wells, mostly sunk at street corners. The oldest of these, dating from 1658, was opposite the fort at Bowling Green.

The first public waterworks system was constructed in 1774, from the plans of Christopher Colles, an English engineer. The source of supply was the old "Collect Pond" on the site of the present Tombs, and the water was pumped by steam engines to a reservoir between Pearl and Walker streets in Broadway, being distributed thence through mains formed of hollow logs, similar to those formerly used in London for the same purpose.

In 1799 the Manhattan Water Company obtained a charter for supplying the city with water, which they drew from wells near the junction of Reade and Centre streets, and pumped into a reservoir between Broadway and Centre-street, whence it was delivered through hollow log mains.

In 1834 the New York State Legislature authorised the city authorities to obtain supplies from the Croton River, and the works were completed in 1842. The first reservoir on this river was formed by building a dam 50 ft. high, and the water was conveyed to New York in a masonry aqueduct, 8 ft. 5 1/2 in. high by 7 ft. 5 in. wide. For the greater part of its length the conduit followed the Hudson River, hills being pierced by tunnels and valleys filled by stone embankments. The Harlem River was crossed by a bridge of fifteen arches with 50-ft. and 80-ft. spans.

Although designed for the maximum output of 36 million gallons per day, the original Croton Aqueduct was required to deliver as much as 95 million gallons per day in 1880, so as to keep pace with the enormously increased consumption.

In 1884 an additional supply of 23 million gallons daily was secured from the Bronx and Byram Rivers, and in 1890 a second aqueduct from the Croton River was brought into use. This work, known as the New Croton Aqueduct, is 135 ft. 6 in. high by 13 ft. 6 in. wide, and has a capacity of 300 million gallons daily. It crosses the Harlem River by a tunnelled siphon 1,300 ft. long and 300 ft. below water level, and cost 4,000,000.

Storage reservoirs constructed in the Croton Valley, and including the New Croton Reservoir, bring up the storage capacity to more than 104,000 million gallons for the boroughs of Manhattan and the Bronx, the boroughs of Brooklyn, Queens, and Richmond having independent supplies.

As the three aqueducts—two from the Croton River and one from the Bronx and Byram Rivers—can only deliver about 400 million gallons daily, while the average consumption is more than 300 million gallons, works were inaugurated, as a result of the recommendations of the 1902 Commission, for obtaining an additional supply of 500 million gallons daily from the Catskill Mountains.

The works, which were commenced in 1905, include the Ashokan Reservoir, with a storage capacity of 150,000 million gallons; the Catskill Aqueduct, 17 ft. high by 17 ft. 6 in. wide, and 92 miles long; Hill View Reservoir, in New York, with a capacity of 900 million gallons; Kensico Reservoir, on the Bronx River, with a capacity of 40,000 million gallons; and distribution mains, 34 miles long, for supplying the five boroughs of Greater New York.

The works now in progress will cost about 40,000,000, and will yield some 250 million gallons daily. Additional impounding reservoirs will be constructed later for the purpose of providing the further supply of 250 million gallons daily from the Catskill Mountains.

WESTMINSTER CITY COUNCIL.

THE following amongst other matters were dealt with at the fortnightly sitting of this Council on November 21:—

Thames Embankment Extension.—It was decided to pay 50,000, to the London County Council towards the cost of the Thames Embankment extension and improvements at Westminster, as soon as a loan for that amount can be obtained, and to pay a further 50,000, when the properties in Abingdon-street have been pulled down and a part of the land thrown into the public way.

British-American Tobacco Company's Premises.—A letter had been received from Messrs. Gordon & Gunton with reference to the Council's order as to the level of the lowest floor of the new premises at Millbank for the British-American Tobacco Company, stating their contractors say it was almost impossible to make a good job if the basement be tanked with 1-in. asphalt as required by the Council, especially on vertical work, and they strongly recommended 3-in. asphalt. They applied for permission to tank the basement with 3-in. asphalt. It was agreed that the order be varied as requested.

Wood-Paving Contracts.—It was agreed that the Improved Wood Pavement Company, Ltd., be informed that the Council was not prepared to consider an offer for the continued maintenance of the wood-paved carriageways of certain streets, in regard to which notice for the termination of the contract had been given.

TRIBUNAL OF APPEAL UNDER THE LONDON BUILDING ACT.

Galsworthy v. London County Council.

THE Tribunal of Appeal under the London Building Act sat at the Surveyors' Institution on November 21 to hear an appeal by Mr. Frederick Thomas Galsworthy against the certificate of the Superintending Architect of Metropolitan Buildings, dated May 31, defining the general line of buildings on the south side of Euston-road, between Southampton-street and Fitzroy-street. Mr. Ernest Pollock, K.C., and Mr. D. Young appeared for the appellants, and Mr. Daldy for the London County Council. Mr. G. Mould appeared for the executors of Sir Horace Regnalt, the owner of the premises at the corner of Southampton-street, as an interested party, reserving his right to give notice on an appeal within the prescribed time.

Mr. Pollock, K.C., said the appellant was the owner of 49, Warren-street and 347, Euston-road, which were premises immediately behind one another. Fifteen years ago he appeared before the Tribunal in respect of this very portion of the road, and the Tribunal then decided the general line of buildings between Southampton-street and Tottenham Court-road, within which the appellant's premises were situated. The Superintending Architect had now, by his certificate of May 31, laid down a new line, which cut through premises already erected in the block. He contended that in face of the decision of the Tribunal in 1897 the new certificate of the Superintending Architect was bad.

Mr. A. A. Hudson (Chairman) asked how the Tribunal could hear an appeal in respect of a matter which they had already decided. A long legal argument followed, in the course of which Mr. Pollock contended that under sect. 22 his position was that of an aggrieved person in consequence of the Superintending Architect giving a new certificate, and he did not think it was possible for him simply to go on and treat the new certificate as waste paper. The certificate was applied for by the County Council, and he took it that it was their intention to act on it.

Mr. Daldy thought the Tribunal had jurisdiction to hear an appeal. What he said was that the decision of 1897 was not a determination of the building line of this particular place in the Euston-road, but was a determination of something else. The Tribunal could inquire whether the circumstances had altered, and whether, in fact, that the 1897 decision was on the general line of buildings.

The Chairman said the point was that between 1897 there might have been alterations

in the district which might cause the line to be changed.

Mr. Pollock said he was agreeable to evidence being heard of what had taken place since 1897, but he would object to the cases before 1897 being gone into.

Mr. Daldy said he could not agree to that.

Mr. Pollock quoted from the decision of the Tribunal in 1897, which said that the general line of buildings on the southern side of Euston-road, between Southampton-street and Tottenham Court-road, was as defined on the plan annexed. He called attention to the case of *Lilley v. London County Council* in the House of Lords, and submitted that no one could get rid of the previous decision unless there had been changes affecting the general line of buildings in the area.

Mr. A. J. Lambert, surveyor, said he had examined the property between Southampton-street and Fitzroy-street. There had been no changes in the buildings since 1901, except the rebuilding of Dunhill's property.

The parties agreed on the suggestion of the Chairman that there had been no alteration in the buildings between Fitzroy-street and Southampton-street, except Dunhill's premises, which, Mr. Daldy said, were erected by consent, and therefore could not be taken into consideration in any determination of the line.

Mr. Pollock pointed out that the certificate of 1902, giving consent to Dunhill's premises, which were built within the line laid down by the Tribunal, was not necessary.

Mr. Daldy said Mr. Pollock's argument was that the Tribunal could go into the 1897 decision, but they were not entitled to go into it to the extent of finding out what it really was. He submitted that if they were entitled to go into it or proceed on it at all, they were entitled to find out what it really was. If that was done he contended that the decision of the Tribunal of 1897 was not a decision as to the general line of building at all. Of course, the Tribunal was the best judge of what it really had before them in 1897, but he hoped to satisfy them by evidence that what they really decided upon in that case was with regard to all the buildings on the site. In view, however, of the decision of the House of Lords in *Fleming's case*, the Tribunal was not entitled in 1897, although they supposed they were entitled, to overrule a well-established general line of buildings.

The Chairman: You say we were wrong in law in 1897?

Mr. Daldy said how he put it was this—Under the Building Act the Tribunal had to discharge a certain duty, and on appeal they had to determine what was the position of the general line of buildings in a given piece of street. If by a mistake, whether in fact or in law, they had not determined it, then it came to nothing, and it did not matter whether it was a mistake in fact or law. He stood or fell by that. If in 1897 the Tribunal discharged its duty under the Act, then he could not get behind what they had done; but he was entitled to show that by a mistake they did not discharge their duty, although they intended to do so.

The Chairman asked if Mr. Daldy moved the Court to set aside the decision of 1897 on the ground that there was already a line defined and the Tribunal had no jurisdiction. That was really the point; the answer would be: "Why did he not appeal?" Was Mr. Daldy not asking them to reopen the facts of the case to enable him to raise a point of law which ought to have been raised in 1897?

Mr. Daldy admitted that it came somewhat near that.

The Chairman said they were really being asked to decide that their decision in 1897 was no decision at all.

Mr. Daldy said it was a decision, in fact, but he denied that it was a decision under the Act of Parliament. One further point was that in 1897 the Tribunal dealt with a longer length of street than the Superintending Architect at that time dealt with.

Mr. Pollock strongly objected to the Tribunal admitting evidence as suggested by Mr. Daldy. It was only an ingenious method of trying to get the Tribunal to say their 1897 decision was bad.

The Chairman said the Tribunal were agreed that they should not hear the evidence. If they were to go into this they would have to reopen the cases of the properties of thirty-five persons who had interests in the section dealt with.

Mr. Daldy asked to be allowed to give evidence to show that from the time of the passing of the Metropolitan Management Act there was a general accepted general line of buildings, with reference to which consents were asked for and given. His object was to show that in 1897, according to the decision in the case of *Lilley v. London County Council*, the Tribunal was not entitled to alter the

general line of buildings laid down by the Superintending Architect between Southampton-street and Fitzroy-street.

The Tribunal ruled against Mr. Daldy on this point, and allowed the appeal, with 60 guineas costs.

LEGAL COLUMN.

Water Board Charges.

The case of Metropolitan Water Board v. Phillips has been carried to the House of Lords. By sect. 15, subsect. 1, of the Metropolitan Water Board (Charges) Act, 1907, the rateable value of premises upon which the water rate is levied is to be determined "by the valuation list in force at the commencement of the quarter for which the water rate accrues, or, if there is no such list in force, by the last rate made for the relief of the poor or other rate in which such last mentioned rate is included." By sect. 15 the quarter days are April 1, July 1, October 1, and January 1. The question was, what was the valuation list in force? On April 6, 1909, under the provisions of the Valuation (Metropolis) Act, 1869, a supplemental valuation list came into force in which the rateable value of the premises in question was 400*l.* On June 2, 1910, the overseers had sent to the Assessment Committee a supplemental list, placing the value at 399*l.*, but on objection to this list the Assessment Committee reduced the valuation to 234*l.*, and this was returned and signed October 3, 1910—i.e., three days after the first quarter's water rate in question had begun to accrue. The majority of the Court of Appeal held that the latter list went back, and was therefore in force, on October 1. The House of Lords have reversed this judgment, holding no other list to be in force on October 1 but that which came into force April 6, 1909, and which placed the rateable value of the premises at 400*l.* The reasoning of this judgment is easier to follow, but in the case in question it represents some hardship to the water consumer, as had the new list been issued and signed but three days sooner his water rate would have been nearly halved. Hard cases, however, make bad law, and as the Lord Chancellor pointed out, in some cases the assessment might be increased and not diminished, in which case the loss would have fallen on the Water Board, as the lower assessment would have remained in force.

The Trade Disputes Act.

The House of Lords have recently delivered judgments of the utmost importance on sect. 4, subsect. 1, of the Trade Disputes Act, 1906, in the case of *Vacher & Sons, Ltd. v. London Society of Compositors*, which we noted in the Court of Appeal, *The Builder*, April 12 last. The action was one for conspiracy, and libel brought against a trade union, the libel complained of being to the effect that the firm dealt unfairly with their employees. The facts were denied, as the defendant union never delivered a statement of defence, but relied solely on sect. 4 of the Trade Disputes Act, and applied to be struck out of the action. Sect. 4, subsect. 1, of the Trade Disputes Act is as follows:—"An action against a trade union, whether of workmen or masters, or against any members or officials thereof, on behalf of themselves and all other members of the trade union in respect of any tortious act alleged to have been committed by or on behalf of the trade union, shall not be entertained by any Court."

For a long time it has been uncertain whether this section was to be interpreted in its natural meaning or whether the qualification inserted in other sections, and in subsect. 2 of this section, as to certain acts being privileged only when done in contemplation or furtherance of trade disputes, must not be read into it. These doubts, we may say, have really only arisen because it could not be realised that the Legislature intended to place trade unions outside the law as regards wrongful acts committed entirely unconnected with trade disputes. The House of Lords have now held that the meaning of the words used by the Legislature being plain, they must be interpreted in their natural sense, and that the Act does grant this absolute immunity from any restraint in the Law Courts. We have always held this view, as we pointed out in effect of this section when the Bill was before Parliament on the Third Reading and subsequent stages (see *The Builder*, November 17, 1906).

The important point now to be noted is the effect of this section, thus interpreted on the Trade Union Bill now before Parliament. The Legislature can never have seriously intended to enable trade

unions, irrespective of trade disputes, to commit every tortious act, from libel to damage to property, or even personal violence without being liable to a civil suit, as in no civilised state can such a license be allowed to any class, and now that the effect of the section has been demonstrated by the House of Lords we imagine every law-abiding person will call upon the Legislature to remedy what it is quite obvious can only be deemed to be a slip or mistake in the Act.

LAW REPORTS.

OFFICIAL REFEREE'S COURT.

(Before Mr. EDWARD POLLOCK.)

Removing and Reconstructing a Tudor House

Tibbenham v. Gill.

THE hearing was begun on November 1 and continued on subsequent days of a claim for the recovery of 1,695*l.*, balance of an account, advanced by the plaintiff, Mr. Frederick Tibbenham, of Lower Brook-street Ipswich, against the defendant, Mr. John Hamblet (Gill), of Oxford-street, London. The subject-matter of the action has reference to the removal from Hawstead, near Bury St. Edmund's, and its re-erection at Clacton, of a Tudor house. In respect to that the claim was for 850*l.* There was also a claim in respect to furniture supplied by the plaintiff and, amongst other things, to an oak staircase which, according to his case, had been adapted so that it might be in accord with a house of the Tudor period. There were claims under several other heads. Various defences were raised, the defendant pleading, *inter alia*, that the plaintiff agreed to supply materials to complete certain works for 800*l.*, and not 850*l.* subject to certain conditions, including on that no alterations should be paid for unless advised in writing, and then only at agree prices and upon the architect's valuation. It was also pleaded that the defendant's architect had not given the certificate required by the contract as a condition precedent to the defendant's liability to pay. It was further alleged that the plaintiff was claiming payment for many things as extras, which were included in and covered by the contract price and were not extras at all. Several other pleas were raised by defendant as to other items.

Mr. E. Grimwood Mears and Mr. H. Atkin (instructed by Messrs. Rye & Eyre) appeared for the plaintiff; and Mr. Greer, K.C., and Mr. A. S. Garsland (instructed by Messrs. Dod, Longstaffe, Son, & Fenwick) represented the defendant.

Mr. Grimwood Mears, in opening the case, pointed out that the defendant's architect, Mr. Scheuermann, of Ipswich, had endeavoured to get Mr. Tibbenham to sign a contract by which the latter never did so, referring to do his business with Mr. Gill. Counsel intimated that this house at Clacton placed upon it a tablet stating that it was a Tudor house of 1490, removed from near Bury St. Edmund's by Messrs. Gill & Reigate of London. An architect, Mr. H. Atkin, Referee concerning the absence of a contract, Counsel said the parties had made a bargain, and except as a reason for raising money, there was no reason why plaintiff should be bound down by a cast-iron contract at a time when the house was half completed.

The plaintiff, in the witness box, stated that in 1904 he began doing business with Messrs. Gill & Reigate. Witness had made reproductions of panelling, furniture, and houses for Messrs. Gill & Reigate. Witness added that he had introduced Mr. Scheuermann to Messrs. Gill & Reigate, that event taking place in connexion with the putting up of the Tudor House at the White City. It was in February, 1910, that he discovered an old house being used as a barn at Hawstead. He communicated with Messrs. Gill & Reigate and subsequently purchased the house for 250*l.* The firm agreed to buy it, but ultimately it became Mr. Gill's liability. Mr. Gill was managing director of Messrs. Gill & Reigate. In January, 1911, Mr. Scheuermann had got out the specifications, and on January 22 he received the specifications for the plan. He handed them to a Mr. Harry and a Mr. Warner, who did work for him and, after receiving their aid, he arrived at the conclusion what the cost would be. He thought that the cost to carry out the work named in the specification would be about 1,000*l.* or 1,100*l.* Mr. Gill had told him a Oxford-street that that was too much, and that if he could not reduce it they could not sell the Tudor houses.

The Official Referee stated that this was only one house. Mr. Tibbenham: But they have been selling others. Proceeding, he said that Mr. Gill had

anted this house at Clacton to be a great detriment for the firm. Mr. Gill had said that if witness could reduce the price would make it up to him. Defendant had recently said that he would not give more than £500. Mr. Schoemann told witness that could not be done for the money. Witness said that he would have to do it. Witness saw the erection of the old building he had seen down at Hawstead on May 4. He read that his account was made up as follows:—£500 for house, £321 for extras and £14 for garden, making a total of 1,942.18.8d. a prime-cost book showed that the total to him of the defendant's house was £381.14s.2d., which gave him a profit of £10 on the house.

Mr. Meers: Regarding these extras coming £321, is there one single extra put into building that did not receive sanction or not to the approval of the defendant or representative?—No.

Mr. Greer: I do not describe them as extras. I agree that the work was done. Mr. Meers: As regards every item you're charged as an extra, are the prices fair and reasonable?—They are.

Mr. Meers: If my friend wants it, place before your prime-cost book, showing him all items?—Yes. Witness added that he had time to do with the drawing up of the specifications. Witness was then examined length as to the old oak staircase. He marked that it was quite easy for a man with his experience to make an old staircase for approximately of the Tudor period.

Mr. Meers: In Tudor times they had a cully in getting upstairs, and knocked the stairs about. Did you make provision for that?—Yes, we had men running up and down for some time with heavy boots.

Mr. Greer: A cross-examination by Mr. Greer, the witness said that he refused to sign an agreement because he wanted £500, in respect to house and not £800.

Mr. Greer suggested that the contract submitted to plaintiff in a subsequent form put total price for everything at 1,050.

Mr. Greer: I suggest to you that at no time you ever take any objection to the sum of £500. In that document?—Yes, I did; but not tell exactly the date.

Mr. Greer: Did you ever say to Mr. Schoemann that he ought not to have put £500 in the agreement, but that he ought to have put 1,100?—I did, but I can't tell the

where?—In his own office. Mr. Greer: You have done a certain amount of building work before you took this contract?—Yes, I have done any ordinary building work, moving and re-erecting structures, and fitting them up with new parts as much in money with the old as possible?—Yes, I added to them. It has been very rare that I have had specifications before me. The hearing was adjourned.

garden, etc. An interview took place on February 25. Then Mr. Aberne told defendant that he would accept the offer of 1,100, and they went on to discuss the other matters.

On February 26, 1911, plaintiff wrote to Mr. Couchman, saying:

"I am obliged to you for your letter of February 25. I will accept Mr. Glover's offer made through you of 1,100. for the freehold house, completion at midsummer."

His Lordship: I feel very great difficulty about any binding offer having been made.

Mr. Ward Coldridge argued that Mr. Couchman was defendant's agent, and the letter contained all the elements of a good offer. Plaintiff had suggested to Mr. Glover that if the completion of the house was desired to be done at once, then the completion of the purchase should take place earlier than midsummer; but that was the only point left open on February 25. Mr. Glover found, however, that he could not obtain release from the tenancy of his then house until March, 1913, and Counsel submitted, that it was on that account that he cried off the bargain. His first solicitor's letter said:—

"The letters contain no contract, and as your client (plaintiff) is not willing to make the alterations to the house and garden as stipulated by our client, the matter will not proceed."

As a matter of fact, plaintiff had always been ready to complete the house as arranged. Plaintiff, in evidence, stated that the only matter left open on February 25, when he saw Mr. Glover, was whether the purchase should be completed in March, 1911, or the following midsummer.

Other evidence was also called. Mr. Norton, K.C., for the defence, argued that no definite offer was made in the letter of February 25, and that Mr. Couchman had no authority to make such an offer; further, that the letters did not contain all the terms of the alleged contract, and on that ground could not bind the defendant.

Mr. Glover, in evidence, said that at the interview of February 25, the whole question of purchase or no purchase was left open until after he should have seen his landlord.

Other witnesses were also called for the defence.

His Lordship, in giving judgment, said the contract on which plaintiff relied was alleged to be constituted by the letters of February 25 and February 26, 1911. The first of these was the only scrap of writing in the case which could possibly be binding on the defendant, and when this was first read he had felt and expressed doubt as to whether, on the face of it, this was such a simple and definite offer as could by acceptance be converted into a contract. But in case it could or ought to be so construed, it was clear to his Lordship's mind that it was made without the authority of the defendant. In other words, the offer being unauthorised, no acceptance could convert it into a contract binding on the defendant. But on the evidence it seemed clear that this letter was not intended to be a simple unconditional offer, nor was it so treated by the plaintiff. Mr. Couchman was negotiating as to price only, and there were other material matters not referred to in the letter which it was arranged between Mr. Couchman and Mr. Glover should be left to be settled by direct negotiations between the plaintiff and the defendant himself. Mr. Couchman had no authority as to anything but price, or, rather, he declined to have to do with anything but price. If he had authority to make an offer, it was only on certain conditions not expressed or referred to in the letter.

Now, this so-called offer was not accepted at once. Before the acceptance of February 25 was written, plaintiff saw the defendant in order to discuss and negotiate with respect to these matters other than the price, and the meeting of that date terminated before any settlement was arrived at. The letter of February 26 was written by the plaintiff with these other matters remained unsettled. With regard to what took place at the interview, there was, indeed, a direct controversy; but Mr. Glover said that the meeting was taken up with discussion and negotiation as to what was to be done by the plaintiff with the garden and as to the date of completion, and as to certain suggested additions to the cloakroom conveniences, and there were also questions about the papers. Mr. Glover said these matters were unsettled, and his Lordship said he was inclined to believe there was no final or complete bargain concluded on February 26, and as to that passed was merely verbal, and there was no memorandum of any kind in writing on the subject. On any view of the case, therefore, when the letter of February 26 was written by the plaintiff, he was not entitled to treat the letter of February 25 as an unqualified offer to

purchase. And defendant, whom, his Lordship said, he believed stated further that Mr. Aberne agreed to the whole of the negotiations standing over till the following morning, when Mr. Glover was to see his landlord. For some reason the defendant declined to proceed further, and there being no concluded contract, he was entitled to do so. In his Lordship's opinion, therefore, the action failed, and must be dismissed with the usual consequences.

CHANCERY DIVISION.

(Before Mr. Justice SWINFER EADY.)

Barker v. Vecchietti.

MR. EDWARD MALCOLM BARKER, the owner of property in Vauxhall Bridge-road, was the plaintiff in an action against Mr. Quino Vecchietti, of 311, Vauxhall Bridge-road, and he asked for an injunction to restrain the defendant from interfering with any building operations incidental to the raising of a party wall between his property and the defendant's in accordance with plans approved by the London County Council and the joint award of the plaintiff's surveyor and the defendant's surveyor in pursuance of sect. 91, subsect. 3, of the London Building Act, 1894.

Mr. Colefax, K.C. (with him Mr. Goddard), in opening the case, said the matter arose out of the construction of a cinematograph palace in Vauxhall Bridge-road, at the Victoria end. The plaintiff was the leasehold owner of Nos. 313, 315, and 317, Vauxhall Bridge-road, and the defendant was the lessee of No. 311. Between Nos. 311 and 313 there was a party wall, and when the plans had been passed for the alteration of Nos. 313 and 315 into a picture palace, notices were served upon the defendant under the London Building Act, 1894, with respect to the wall, it being proposed as part of the alterations to raise the height of the wall, so that the new roof might rest upon it. After notice had been served and an award made under the Act, and after the building operations had commenced, the defendant proceeded to pull down part of the work on the party wall. The plaintiff thereupon applied to the Court for an *ex parte* injunction, which, upon motion, was extended until the trial or further order. After that the work proceeded, but the defendant again threatened to further interfere with the work. He did not do so, however, as he was warned of the consequences, and now the premises had been completed, and so far as the plaintiff was concerned, the matter was merely ancient history. There was, of course, the question of getting the injunction made perpetual, and that was the object of the present application. There was further a counterclaim by the defendant, which was somewhat difficult to understand. The defendant had been represented by different solicitors, but now appeared in person. The counterclaim set out that the defendant protested against the party wall being built upon, as it would interfere with the access of light and air to his premises, wherein he carried on the business of a lodging-house keeper, and he claimed 3,150*l.* damages for (a) the raising of the wall, (b) for nuisance, and (c) damage to his lease.

His Lordship: There does not seem to be any facts in dispute, but you must better call your evidence and prove the award under the London Building Act.

Mr. Charles O. King, A.R.I.B.A., who acted as surveyor for the plaintiff in respect of the alterations, proved the services of the proper notices. As the first notice was not complied with, witness wrote to defendant, asking him to appoint a surveyor, and, as he did not appoint, witness appointed Mr. William Woodward to act upon defendant's behalf. They then agreed that Sir Alexander Stenning should be appointed third surveyor; but, in fact, it was not necessary to resort to Sir Alexander, as witness and Mr. Woodward agreed as to the award.

Mr. Colefax: Do the buildings interfere in any way with the amenities of No. 311, or in any way damage those premises?—Not at all. Is there any obstruction of light?—No.

Mr. William Woodward, F.R.I.B.A., said he was appointed to act for the defendant in August, 1910, under the London Building Act. He agreed with the award submitted by Mr. King, and he acted throughout in strict accordance with the Act and in the interests of the defendant. Now that the work had been completed, no damage, as far as he could see, had been done to the defendant's premises, nor was there any interference with his light. A wall at the rear of the defendant's premises had been condemned, and the plaintiff had to rebuild it. He did so, and on the suggestion of witness faced it with white glazed bricks opposite the defendant's window. The defendant's light was, therefore, improved.

Mr. Edward Malcolm Barker, the plaintiff, said, on the question of nuisance, that, though the alterations had been completed and the

CHANCERY DIVISION.
(Before Mr. Justice JOYCE.)
Aberne v. Glover.

THIS was a case in which Mr. William de Aberne, an architect, of The Pleasance, 1, 2, Norton, sued Mr. Edward Glover, a merchant living at Warwick, for specific performance of a contract to purchase a house Warwick-road, Solihull, at the price of £1,100. His Lordship dismissed the action with costs.

Mr. Ward Coldridge, K.C., who appeared for the plaintiff, said that his client had built houses in Warwick-road, Solihull. Defendant authorised an estate agent named Chapman to offer 975*l.* for one of these houses sold. This was refused. Mr. Glover then sold on Mr. Couchman, and handed him a letter containing the following:—

"I shall be willing to give 1,100*l.* for the said house with the site, on condition that the vendor shall put the house and gardens in a condition satisfactory to Mrs. Glover." At, Counsel submitted, was authority to Couchman to make an offer, and Mr. Glover said in addition that he would pay a deposit on the purchase price, and completion at midsummer, with immediate possession of the garden for purposes of building.

Mr. Couchman wrote the following letter to Mr. Glover:—

"Mr. Edward Glover writes he will give £1,100 for the freehold land and house, and 10 per cent. deposit. He will be glad to give you immediate possession of garden with, in order that he may plant it. He is complete at midsummer next."

At the same time Mr. Couchman advised Glover to see the vendor himself, in order to arrange about the papering, preparing the

theatre working nearly two years, there had been no complaints of any kind.

The defendant made a long statement to the Court, and protested against the alleged interference with his premises.

In giving judgment, his Lordship, after referring to the facts, said that the plaintiff proceeded to build in accordance with the award. That was his legal right after compliance with the statute. The defendant took the law into his own hands, took no notice of the party wall notice, and while the building was proceeding pulled part of the wall down. He had no right to do anything of the sort, and, as he was claiming to interfere further, the plaintiff obtained an injunction against him. The plaintiff now asked to have that injunction made perpetual. The defendant contended that the wall ought to be restored to its old height. Why? He had no legal right to ask that, because the plaintiff, as adjoining owner in compliance with the statute, was entitled to build upon and raise the height of a party wall. The plaintiff had been manifestly right throughout, and was, therefore, entitled to have the injunction already granted made perpetual and to have the costs of the action.

Then the defendant put in a counterclaim, claiming damages for nuisance caused by the cinema theatre, and in respect of obstruction of ancient lights. With regard to the ancient lights, two surveyors had been called, and both denied that there had been any damage caused with regard to the nuisance by noise, etc., and the plaintiff's evidence had clearly disposed of that, and the counterclaim must be dismissed, without costs, as the plaintiff did not ask for costs on the counterclaim.

His Lordship added that he thought it right to say that the plaintiff seemed to have acted with every courtesy and consideration to the defendant, and the defendant seemed to have attributed that courtesy and consideration to a knowledge and consciousness on the part of the plaintiff that he was doing wrong. "There was," his Lordship added, "no hidden rascality in putting glazed bricks in the wall facing the defendant's premises."

Judgment accordingly.

Surveyor's Claim: Action against

Sir John Bethell, M.P.

MR. JUSTICE PHILLIMORE, in the King's Bench Division, on November 19, concluded the hearing of an action by Mr. William Henry Savage, engineer and surveyor, residing at Cookfosters, Hertfordshire, against Sir John Henry Bethell, Bart., M.P., of Upton Park, Essex, to recover £221.1s. for supervision work claimed to have been done for the defendant in connexion with certain land at East Ham from 1900 to 1901.

The defendant denied liability and said the work was not done to his order.

Mr. Forbes Lankester, K.C., appeared for the plaintiff, and Mr. Colam, K.C., was for the defendant.

Mr. Forbes Lankester explained that Sir John Bethell and Mr. Burges were the owners of land that adjoined, and a proposal was made for the construction of a new road and a small exchange of land between the two owners that would have the effect of considerably increasing the value of the land. Mr. Savage superintended the work so far as it affected the property of Mr. Burges, and was paid his 5 per cent. fees, and counsel said, he would show that he did the same service for Sir John Bethell in regard to that part of the road affecting his land, and he was entitled to the remuneration claimed. Counsel said that the contention between the parties seemed to be whether the plaintiff really supervised the whole work; but he would show that the work was done by the contractor, Mr. Anstead, as one job, and that plaintiff supervised the whole. He believed he would be able to establish clearly that the work that plaintiff supervised was work done in the interests of the defendant, and was work for which the defendant paid the contractors.

Mr. Lankester proceeded to deal with the various items in the claim incidental to the construction of the road, and Mr. Colam, K.C., said he could say at once that the defendant's case was that what plaintiff did he did for Mr. Burges, and was paid by him, and defendant was not liable for any services by the plaintiff.

Mr. Savage gave evidence that for twenty-one years he was Engineer and Surveyor to the East Ham Local Board, and since 1899 he had been in business as a consulting engineer privately. He had, as the local surveyor, been brought into contact with Sir John Bethell in connexion with the development of land in the district. There was land owned by the defendant and Mr. Burges, and he

conceived the idea of arranging an exchange of land and the making of the new road. He approached Sir John, and pointed out that the scheme would improve both properties and enhance the value of the land by bringing his land into better communication with other parts of the district. Both Sir John and Mr. Burges agreed to the construction of the road. Mr. Burges gave the contract to Mr. Anstead, and witness superintended and was paid for his work. Mr. Anstead had the whole contract, and witness also superintended as affecting the land of the defendant.

Counsel: Were you employed by Sir John in connexion with the work?—Certainly.

It was known by Sir John that you were acting as regards one part of the work for Mr. Burges?—Yes.

Did Sir John clearly know that you were asked to supervise the work as affecting the road on his land?—Certainly.

Was the work on the second portion carried on immediately after the first was finished, so that it made one complete job by one contractor?—Yes, it went on continually.

Was the whole plan of the new road your own idea?—Entirely.

And it was submitted to both Mr. Burges and the defendant?—Yes.

In cross-examination by Mr. Colam, K.C., Mr. Savage insisted that he acted for both Mr. Burges and the defendant.

Counsel suggested to the plaintiff that a Mr. J. H. Carte, surveyor, was employed by the defendant, and asked, if this was the case, what need had Sir John to employ plaintiff?

Plaintiff replied that Mr. Carte was an excellent architect and surveyor, but he was not an engineer. Plaintiff said he was taken ill while the work was in progress, but this illness had not caused his memory to be impaired.

Mr. Colam: Is it not a fact that Sir John, when you made your claim, denied that he ever employed you?—No.

For the defence, Sir John Bethell gave evidence, denying that he at any time employed the plaintiff to act on his behalf.

In the result his Lordship held that the plaintiff had not made out his claim, and entered judgment for the defendant, with costs.

CHANCERY DIVISION.

(Before Mr. Justice PARKER.)

Heavy Claim by and against Contractors:

J. Aird & Co. v. the Tanjong Pagar Dock Board.

As already stated, the plaintiffs claim from the defendant £500,000 in damages for alleged breach of contract in connexion with the construction of a wet dock at Singapore. Plaintiffs, who are the well-known contractors, allege that the defendants misrepresented the conditions under which the contract was to be carried out, and, therefore, that they were justified in repudiating the contract. Defendants denied these allegations, and served a notice on the executors of the late Sir John Aird, who in his lifetime was a member of the plaintiff firm and a party to the contract, making a claim against his estate of about £1,000,000, as damages for breach of contract.

Mr. Upjohn, K.C., Mr. Macassay, K.C., and Mr. Schwann appeared for the plaintiffs; and Sir R. Finlay, K.C., Mr. George Cave, K.C., Mr. Romer, K.C., Sir Hugh Fort, Mr. Mathews, and Mr. Hull for the defendants.

The case for the plaintiffs having concluded, Sir Robert Finlay, in opening the case for the defence, said he proposed to call his Lordship's attention to the law applicable to each of three issues. The points he proposed to deal with were the charge of misrepresentation, the allegation that because the work was contracted for was impossible, the plaintiffs were justified in refusing to go on with the work, and that an order for monoliths was given which was beyond the scope of the contract. With regard to the charge of misrepresentation, he would submit that it was clear beyond all doubt that the terms of the contract excluded any claim to rescind the contract on the ground of innocent misrepresentation. In order to get rid of the contract it was absolutely necessary that the plaintiffs should establish fraud, and fraud in the sense of moral delinquency committed by someone for whom the defendant Board were responsible. He would ask his Lordship to say that the charge of fraud ought never to have been made, and that it was absolutely essential, now that it had been brought, for the plaintiffs to prove dishonesty. If that were established, the whole of the terms of the contract would fall to the ground. Therefore, in the first place, he would address himself to the question of law with regard to misrepresentation, and, secondly, to state the nature of the facts with reference to the charge

made against the defendants. Then he would deal with the question of the alleged impossibility of performing the contract, and submitted that it was no answer. If a man contracted to do a particular work it was ground for his throwing it up to say that he found it impossible to do it. The authorities were absolutely conclusive on the point.

With regard to the question of damages the learned Counsel contended that the plaintiffs were liable to pay damages to the defendants for not completing the contract which they had undertaken to complete.

His Lordship said he understood that plaintiffs claimed damages by reason of the fact that the defendants had entered into possession of the works, which, plaintiffs maintained, they were not entitled to do, and plaintiffs alleged that that amounted to repudiation of the contract.

Sir Robert Finlay said that the defendants maintained that they were justified in circumstances in entering into possession of works.

Mr. P. R. Warren, formerly engineer the Dock Board, gave evidence in support of the defendants' case.

[The case was proceeding when we went press.]

Drainage By-Laws.

At Marylebone Police Court, a few days ago, Sir Edward White, former Chairman of the London County Council of an Upper Berkeley-street, W., who have appeared before Mr. Plowden reference to a summons heard by him February 9, taken out at the instance of Marylebone Borough Council, for construct at his residence soil pipes of iron instead drawn lead with proper wiped plumbers' joints as required by the County Council drainage by-laws made under the Metropolitan Management Acts of 1855 and 1889. Mr. Plowden originally dismissed the summons, but agreed to state a case. The magistrate's decision reversed in the King's Bench Division, and a case was permitted for a conviction.

Mr. Plowden now fined the defendant (who was not present) 20s. and 2s. costs.

KING'S BENCH DIVISION.

(Before the LORD CHIEF JUSTICE and a Common Law Judge.)

Claim against a Builder for Arrears of Wages.

HIS LORDSHIP, on Wednesday, November heard an action brought by Mr. William J. Evans, a builder's clerk, of 114, North View Road, Hornsey, against Mr. Abram Kell, builder and contractor, of 274, Kirkbeck Chambers, High Holborn, in which the plaintiff claimed 204s. alleged to be due to him wages. The defence was a denial that sum in question was due.

The jury found for plaintiff for the amount claimed, and his Lordship entered judgment accordingly, with costs.

LONDON COUNCILS.

Barking.—The tender of Messrs. Parsons & Sons has been accepted, at 335s. 11s. 1d. for the execution of private street works Devon-road. Other tenders were from:—W. J. Jackson, at 392s. 15s. 1d.; Messrs. Free & Sons, at 409s. 1s. 5d.; Messrs. Manders & Co., at 416s. 18s. 5d.; Mr. G. P. Trenham, at 436s.; and Mr. D. T. Jack at 455s. 19s. The Surveyor has been instructed to report upon the question of making Bennington-avenue.

Barnet.—It was decided at the last meeting to reduce the expenditure on the proposed new municipal offices to 4,000l.

Battersea.—The London County Council to be asked to substitute wood for the existing granite sets in a portion of the tramway in York-road. Repairs are to be carried to the carriageways of nineteen roads at estimated cost of £1,077. Plans have been passed for Messrs. Chapple & Utting for erection of forty houses in Rosendale-road. Mr. W. J. Middleton has lodged plans for the London County Council for the erection of a building at the rear of No. 125a, Laven Hill.

Berkhamsted.—Plans have been passed Messrs. Gilbert Brothers, for the erection of three houses at Gosson's End.

Bromley.—The following tenders have been received for widening Poverest-lane, Orpington.—Messrs. J. Mowlem & Co., Westminster, S.W., 339s.; Messrs. E. Poill & Son, Broad Common, 377s. 10s.; Mr. R. Large, High-street, Orpington, 355s. 15s.; Messrs. T. Wood & S. Crockenhill, near Swanley, 350s. (accept). Application is to be made to the Local Government Board for sanction to borrow 166l.

aking up Clarence-road. Sanction has been given to the borrowing of 400*l.* for artificial one paving in Palace-road, and 550*l.* for widening Plaistow-lane.

Bushey.—Plans have been passed for Mr. G. Gaggard for the erection of five houses in King George's-avenue; also for the London County and Westminster Bank, Ltd., for the erection of premises in High-street.

Finchley.—The following resolution was moved at the meeting of the Urban District Council last week by Councillor Nicholls:—That, having regard to the need in the district for the erection of additional dwellings for the working-classes, the Plans and Town Planning Committee be directed to take the matter into consideration and bring up a report thereon to the Council at an early date. He said all he wished to do was to secure power for the Town Planning Committee to deal with the question of more workmen's dwellings. Councillor Bloomfield, who seconded, said that these houses could be put up by private enterprise. He had tried to himself, with only four houses, but could not let them to workmen at a low rent that would pay, as the land was too dear. Councillor Royston said he was afraid that were very long, if the present policy of the Town Planning Committee continued, there would be very urgent necessity, not only for dwellings for workmen, but for those in a better position. Councillor Day thought the building of workmen's dwellings was the least objectionable form of municipal trading. Private enterprises would not build workmen's dwellings; people would not put their money to them. Councils had means of borrowing money on advantageous terms, and he was quite sure that the building trade would give local authorities a free hand with workmen's dwellings. After further discussion the motion was agreed to. The following plans have been passed:—Manor Farm Dairy, 100, Manor Farm, Manor Farm, East Finchley; Mr. A. P. Joyce, additions to factory, King-street, East Finchley; Mr. J. Carborough, three houses, Eton-avenue; Co-partnership Tenants, Ltd., twelve houses, Addison-way extension, Oakwood-road; Mr. G. Vaughan, extension of North Finchley Skating Rink into cinema theatre, Great North-road, North Finchley.

Fulham.—Plans submitted by Mr. T. L. Tinton, on behalf of Mr. J. C. Mears, for the construction of sewers on the Broomhouse estate and in Peterborough-road, have been approved.

Hammer-smith.—Mr. H. A. Welch has lodged plans with the Spring-gardens authority for the erection of buildings upon an island site at St. Peter's-square.

St. Pancras.—Electricity mains are to be extended at an estimated cost of 2,000*l.*

Southwark.—Plans have been lodged with the London County Council by the following:—Mr. F. Danby Smith, architect, Parliament-mansions, Victoria-street, S.W., addition to the Newcomen Schools, Newcomen-street; Mr. W. W. Mathe, architect and surveyor, brick-chambers, Holborn, W.C., erection of bridge across Cathedral street; Messrs. Swaney & Sons, Ltd., engineers, Steelworks-lane, S.W., extension of premises of Messrs. H. Edgington & Co., Ltd., 103, Old Kent-road, S.E.

Stepney.—Plans have been lodged with the London County Council by Mr. W. Park for the erection of an addition to "The Mitre," White Horse-lane; as have also plans by Mr. William J. Pitt for the erection of a building at No. 76, Burslem-street.

Waltham-stow.—The Surveyor has been directed to pave, kerb, and channel the footpath in Blackhorse-lane, subject to the owners posting the estimated cost of the work. Anns, etc., are to be prepared by the Engineer for making up the road. The order of Mr. J. W. Pearce, Morecombe, has been accepted, at 18,548*l.*, for doubling the railway track in Forest-road, including motions to Chingford-road and Hoe-street, and doubling the track in certain portions of Chingford-road. A plan and estimate is to be prepared by the Engineer for the erection of a block of temporary buildings at theatorium for the treatment of tuberculosis.

Watford.—The tender of Messrs. J. Ellis & Sons, Leicester, has been accepted, at 3*l.* 18*s.* 4*d.*, for carrying out a portion of the Callow Land storm-water and Balmoral-sewerage scheme. Repairs are to be carried out to the sewer in Marlborough-road.

West Ham.—A portion of Canning-road is to be made up as a new street, the roadway to be paved with granite setts, and the footpaths to be made up with granite. Tenders are to be invited for making up a portion of Dartmouth-road. Plans have been passed as follows:—The Corporation Electricity Department, extensions at 84, Romford-road, Stratford; Mr. M. W. Hudson, alterations to

Salisbury Hall, Romford-road, Stratford; Mr. F. W. Waggott, conversion of Waldstein Hall, Plashet-road, Upton Manor, into cinematograph theatre, etc.; Mr. F. Sherrin, sailors' homes, 61, Lambert-road, Custom House; Mr. H. I. Cundy, proposed extension of cinematograph theatre, Richmond-road, Plaistow; Mr. W. J. Maddison, alterations and additions to "Foresters' Arms" public-house, Whitwell-road, Plaistow; Mr. W. Sweetingham, alterations to cinematograph theatres, Rathbone-street, Canning Town, and Albert-road, Silver-town. The following plans have been lodged:—Messrs. J. & P. J. Groom, amended plan of cinematograph theatre, Forest-lane, corner of Parliament place, Forest Gate; Messrs. A. Mockridge & Co., addition to factory, 17, Second-avenue, Plaistow; Mr. J. Savage, cinematograph theatre, Upton-lane, Forest Gate.

Willesden.—Plans by the Engineer have been approved for widening a portion of Neasden-lane at an estimated cost of 346*l.*; as have also plans for making up the passageway at the rear of Nos. 232-252, High-road, Willesden Green. The following plans have been lodged:—Mr. W. L. Trant Brown, on behalf of Mr. Alex. Phillips, two houses, Chatsworth-road, Willesden Green; Messrs. W. H. Holmes & Son, on behalf of the Holly Lodge Laundry Company, additions to 54, Chaplin-road, Willesden Green; Messrs. W. H. Holmes & Son, on behalf of Mr. J. E. Bernard, addition to garage, 20, Brondesbury Park; Mr. S. R. Miller, on behalf of Mr. C. Miller, addition to Kingsbury Laundry, 37, Dudden Hill-lane; Messrs. Grainger & Price, on behalf of Messrs. T. Illingworth & Co., refrigerator-house, boiler-house, and chimney shaft at New Works, Cumberland-avenue, Park Royal.

Wood Green.—Application is to be made to the Local Government Board for sanction to borrow 320*l.* for carrying out improvements to the footpath across the filter beds. Plans by the Surveyor have been approved for making up Ellesborough-road and Bridge-road as new streets, at estimated costs of 817*l.* and 901*l.* respectively. A plan lodged by Mr. J. Bronson for the erection of eight houses in Vallance road has been approved.

OBITUARY.

Mr. H. Hall.

The late Mr. Henry Hall, who was elected in 1872 an Associate, and 1877 a Fellow, of the Royal Institute of British Architects, was for many years a partner of Mr. Keith D. Young, F.R.I.B.A., at No. 17, Southampton-street, Bloomsbury, W.; the partnership was dissolved as from December 31, 1911, owing to Mr. Hall's retirement from practice on account of ill-health. On last January 1, Mr. Young took into partnership his articled pupil, Mr. Alner Wilson Hall, A.R.I.B.A., the son of Mr. Henry Hall, the firm name of Messrs. Young & Hall remaining unchanged. Mr. Henry Hall made the plans and designs for Cheltenham Grammar School, in competition (May 8, 1886*l.*). Messrs. Young & Hall were the architects of many large and important hospitals, infirmaries, workhouses, sanatoria, and similar buildings in London and the provinces. The category comprises the entire reconstruction, on an enlarged site, of the London Fever Hospital, originally designed by C. Fowler in 1848 (December 22, 1883*l.*); the Hampstead General Hospital and extension buildings (January 31, 1903*l.*); Great Northern Central Hospital, Holloway-road, N. (December 25, 1896*l.*); East Sussex, Hastings and St. Leonard's Hospital (December 6, 1884, and January 29, 1887*l.*); Miller Memorial Hospital, Greenwich, and Royal Kent Dispensary (August 23, 1884*l.*); the Medical School, and extension and Middlesex Hospital, and St. George-in-the-East Baths (October 18, 1890*l.*); S.P.C.K. Training College, Stepney (1897*l.*); Royal South London Ophthalmic Hospital, St. George's Fields (1891-2*l.*); Middlesex Hospital Convalescent Home, Clacton-on-Sea (April 25, 1906*l.*); Chesham School, Royal Portsmouth, Portsea, and Gosport; Huntingdon (isolation), and Royal South Hants, and Southampton Hospitals; Evelina Hospital, Southwark Bridge-road, reconstruction (1907*l.*); Dental Hospital, Leicester-square (1898*l.*); Sanatorium, Shrewsbury School (September 19, 1903*l.*); Royal London Ophthalmic Hospital, City-road, E., at a cost of some 80,000*l.* (1898-9*l.*); Seamen's Hospital, Royal Albert and Victoria Docks, with the London School of Tropical Medicine (1898-1900*l.*); remodelling and extension of Royal Berks Hospital, and site of Whit Infirmary and Comm. Hospital, Ryde, North Staffs, Hartshill, and Chelmsford Infirmaries; Royal Boscombe and West Hants Hospital, in conjunction with Mr. G. A.

Bligh Livesey; Royal Orthopaedic Hospital, Oxford-street, W. (1886*l.*); Bolingbroke, Wandsworth (enlargement), and Maids Vale (June 22, 1901*l.*), for Epilepsy and Paralysis Hospitals; Metropolitan Hospital, Kingsland-road, E., entire remodelling and reconstruction (1906-9*l.*); Fitzroy-square, N.W., Hospital for the Home Hospital Association (1880-93*l.*); the St. Pancras Goldington buildings, Great College-street, for 350 residents (1902*l.*); extensive additions, Chelmsford and Essex Hospital and Dispensary (1909*l.*), with Mr. W. H. Pertwee, Derbyshire Royal Infirmary (July 17, 1887*l.*); New End, Hampstead, Workhouse; Warneford Hospital, Leamington, Jubilee Memorial (1897-8*l.*); house at Dunsley (July 17, 1909*l.*); and their designs for "Hostel of God, Free Home for the Dying," or Friedenheim (July 20, 1895*l.*); and New Royal Infirmary, Manchester, for 500 beds (July 8, 1903*l.*), for which they were one of the twelve nominated to compete.

Mr. J. T. Bressey.

The death is announced also of Mr. John Thomas Bressey, who practised at Nos. 70-71, Bishopsgate-street, Within, E.C., with Mr. C. H. Bressey (who became a member of the Architectural Association in 1883), under the style of Messrs. John T. Bressey & Son, architects and surveyors; the partnership was dissolved in last January. Mr. J. T. Bressey was elected a Fellow of the Royal Institute of British Architects in 1877. He was the architect of Holy Trinity Church, Leytonstone (1878), and the Cobbold Road Schools, for the (old) Wanstead School Board (1888); and of the Schools, with detached infants' schools, cookery and manual training centres, cottages, etc., on the Aldersbrook site, Ingatstone-road, for nearly 1,200 pupils in all (1906-11); the Downside Road, Wanstead, Schools (1895-6), and other work for the Essex Education Committee, Wanstead District.

Mr. T. Arnold.

The late Mr. Thomas Arnold, formerly of No. 10, Basinghall-street, E.C., was elected in 1867 an Associate, and in 1904 a Fellow, of the Royal Institute of British Architects; he was placed upon the list of retired members in 1904. He was the architect of St. James's Presbyterian Church, Wood Green, and the Presbyterian Church, Tooting. He, we understand, took up his abode in Edinburgh a few years ago on giving up practice.

Mr. C. H. Rew.

The late Mr. Charles Henry Rew was elected a Fellow of the Royal Institute of British Architects in 1905, and practised with Mr. N. A. Rew, as Messrs. C. H. & N. A. Rew, at Great Berkhamstead. He was the architect of All Saints' Church, several houses, the new Granmore School buildings (with hall), the Infirmary and Workhouse improvements and extensions, and the Maintained School for Girls in Prince Edward-street, Great Berkhamstead; and of many similar works in the locality.

PATENTS.

List of Competitions, Contracts, etc.

For some Contracts still open, but not included in this List, see previous issues. Those with an asterisk (*) are advertised in this number: Competitions, i., Contracts, iv. vi. viii. x.; Public Appointments, xviii.; Auction Sales, xxiv. Certain conditions beyond those given in the following information are imposed in some cases, such as: the advertisers do not bind themselves to accept the lowest or any tender; that a fair wages clause shall be observed; that no allowance will be made for tenders; and that deposits are returned on receipt of a bona-fide tender unless stated to the contrary.

The date given at the commencement of each paragraph is the latest date when the tender, or the names of those willing to submit tenders, may be sent in.

*** It must be understood that the following paragraphs are printed as news, and not as advertisements; and that while every endeavour is made to ensure accuracy, we cannot be responsible for errors that may occur.

TO CORRESPONDENTS.

NOTE.—All communications with respect to literary and artistic matters should be addressed to "THE EDITOR" (and not to any person by name); those relating to advertisements and other exclusively business matters should be addressed to "THE PUBLISHER," and not to the Editor.
 All communications must be authenticated by the name and address of the sender, whether for publication or not. No notice can be taken of anonymous communications.
 The responsibility of signed articles, letters, and papers read at meetings rests, of course, with the authors.
 We cannot undertake to return rejected communications; and the Editor cannot be responsible for drawings, photographs, manuscripts, or other documents, or for models or samples sent to or left at this office, unless he has specially asked for them.
 All drawings sent to or left at this office for consideration should bear the owner's name and address on either the face or back of the drawing. Delay and inconvenience may result from insertion to this.
 Any communication to a contributor to write an article, or to execute or lend a drawing for publication, is given subject to the approval of the article or drawing, when received, by the Editor, who retains the right to reject it if unsatisfactory. The receipt by the author of a proof of an article in type does not necessarily imply its acceptance.
 N.B.—Illustrations of the First Premiated Design in any important architectural competition will always be accepted for publication by the Editor, whether they have been formally asked for or not.

Remittances (payable to J. MORGAN) should be addressed to the Publisher of "THE BUILDER," 24, Abchurch-lane, London, E.C. 4.

The International Building Trades Exhibition

(With Many Special Sections)
WILL BE HELD AT

LEIPZIG, 1913.

From the beginning of MAY to the end of OCTOBER.

This will be the First World's Fair of the Building Trade and of Homes Perfection.

The Exhibition Grounds cover the vast area of 400,000 square metres. They are situated at the foot of the noble monument of the Battle of Nations. The entire realm of building and of home perfection in its every phase is opened up by this Exhibition—the scientific, industrial, and social aspects being treated in their full significance.

Each section will be well arranged, and the whole scheme of exhibits will be sub-divided into easily surveyed groups.

A quite special attention will be paid to the main features affecting the social life of the people.

The Exhibition is essentially wide in its appeal. Scientists, professional men, and the man in the street alike have been considered. The interest touches every grade and every member of Society down to the humblest individual regardless of calling or status. All will carry away some valuable lesson in the field of building and of home equipment.

The Building Industry and its numerous branches and allied trades will be grouped around scientific centres showing the remarkably high development that this industry has attained as a result of the reciprocity of theory and practice.

The exhibits in the various groups will include parts or sections of actual buildings and constructions, as well as reproductions, demonstrations, and other appropriate features.

FULL INFORMATION

may be obtained from the Directorium of the International Building Trades Exhibition, Leipzig (1913), or from its Official Bureau in England, 3, Regent Street, London, S.W.

TENDERS.

Communications for insertion under this heading should be addressed to "The Editor," and must reach us not later than 5 p.m. on Wednesday. [N.B.—We cannot publish Tenders unless authenticated either by the architect or the building owner; and we cannot publish announcements of Tenders accepted unless the amount of the Tender is stated, nor any list in which the lowest Tender is under 100, unless in some exceptional cases and for special reasons.]

* Denotes accepted. † Denotes provisionally accepted.

LOGIC IN ARCHITECTURE.

A GREAT essential in architecture is that it should be logical and that the designer's purpose should be expressed poetically. Unlike the sister arts of painting and sculpture, it is largely utilitarian in its nature; in fact, as Ferguson cleverly pointed out long ago, it is in many ways more akin to shipbuilding than to either the other arts. A picture, and even a group of statuary, might without exaggeration be said to be a poet's dream; but it would be an obvious misstatement to apply such an expression to any building, although the greatest of the world's buildings possess an artistic appeal founded on rhythm, proportion, mysteries of light, shade, and distance which render them poetical in the highest sense. But the limitations fixed by the fact that physical laws have to be obeyed, and that practical wants have to be dealt with, that, in the case of all great works, architectural monuments take long periods of time to complete and need the most mature deliberation and consideration,

separate it from the other arts by a well-defined and definite line.

Professor Baldwin Brown, in his work on the Fine Arts, objects to the definition that architecture is but the decorative clothing of structural necessity, and points out that the greatest works are the result of two desires—to create a monument, coupled with the necessity of constructing to satisfy some utilitarian necessity, and states that it only rises to the dignity of an art when governed by a sense of proportion.

As, compared with painting and sculpture, there is infinitely less room for the individual note in architecture: it must, in any of its great manifestations, be the product of a master mind expressing itself through the medium of the manual labour of many; technique, which plays so large a part in painting, is necessarily absent; the imitative faculty is not required, and originality of conception or expression must be indulged in with the utmost care.

The work of the greatest periods of architecture was produced by great schools of workers instinctively approaching

the best solution of some problem by continuous and systematic effort, and little concerned about leaving their mark on time by innovation or experiment.

The monuments of Egypt show comparatively little change through periods far longer than that of the entire Christian era, and the whole of the great Greek period shows very little alteration in the originality of conception with which types of buildings were treated, but a gradual and increasing sense of the value of proportion, and care with which the original themes of an earlier period were developed until the great culmination of Athenian art was reached.

Even Ruskin, living in a period when our architects thought it possible to adopt and carry out works in the spirit of first one and then another period of the past, writes that "it does not matter whether we have an old or new architecture, but it matters everything whether we have an architecture which might be taught at our schools from Cornwall to Northumberland as we teach English spelling or English grammar"; and here he (misguided as we feel he was in many

points) has grasped one of the greatest truths, the recognition of which is necessary to the production of really great works.

Until we know and practise what may be called the language of style so automatically and thoroughly that we never have to think of it, we are bound to fail in expressing our meaning logically, clearly and architecturally, we shall be obsessed by detail in the same way that a man trying to express himself in a language with which he is but partially familiar is obsessed by the mechanical difficulty of finding words—a difficulty which renders his clearness of thought useless for any practical purpose.

And we have to remember that the logical expression of one age may represent nothing that is logical to-day. The symbolical carving and sculpture of the great European mediæval period was reasonable and consistent in an age when reading was a rare accomplishment, and when the sculptured message was the direct way of appealing to the understanding of an unlettered people, living in ages of faith and superstition. In this age symbolism (except to a limited extent in certain religious buildings) is an exotic to be indulged in with reserve. On the other hand, the great cathedrals of the Ile de France, with their wonderful development of buttress and vaulting, may represent a logical and reasonable way of dealing with a modern problem. The design for Liverpool Cathedral, now in course of erection, is founded on the logic of mediæval construction, freely adapted to the modern requirements of a great preaching space, unencumbered by supports, coupled with the necessity of providing for the traditional ritual. The domes over the nave of the Roman Catholic cathedral at Westminster lose none of their effect by being cast in concrete instead of laboriously constructed with rings of pumice-stone, as in St. Sophia; and in the great Pennsylvania Railway Station at New York Messrs. McKim, Mead, & White have shown how a modern building, fulfilling all its purposes, may be logically based on the system employed in the *Thermae* of the Romans.

We think that if Messrs. McKim, Mead, & White had in the latter building tried to impress us with their power of inventing original detail they might easily have failed in devising a building expressing modern requirements practically, and, at the same time, America would have lost a masterpiece which will stimulate generations of architects to think out great problems in a reasonable way, expressing them in accordance with the canons of art and the laws of perfect proportion. In the St. Louis Library, again, another American architect has given us a building which is original only in its great excellence and the consistent way in which a practical problem has been solved. It may be said that the best American building shows less individualistic expression than any modern work; it would be easier to discriminate between the work of the American architects by varying degrees of excellence than by individual traits. This may be largely the result of a systematised method of training and a recognised system of

education, of which there is a real want in England.

We feel that in this country a great need is that we should obtain a more thorough knowledge of the work of past ages, but that in obtaining it we should analyse more than we have ever done before the reasons which have been at the root of all architectural development.

Comparatively speaking, too much relative importance has been given to the work of the Greek period. For us it has few lessons beyond the great one of the value of exquisite refinement and proportion. It brings us little nearer to the right solution of the problems which face us to-day; it belongs to a past age and an alien civilisation. Roman architecture, on the other hand, was the work of a people who were resourceful and inventive, whose civilisation had become complex, whose wants approached those of the modern world in their number and variety, and for whom no problem seems to have been too great. In Greek work we have the fullest expression of possibilities open to the designer in a trabeated style, used to express very simple wants, while the arch, vault, and colonnade were freely used by the Romans in such combinations as were best found to fit each case. And the adoption of the Renaissance proved that Roman methods were nearer to the wants and uses of the modern world than those of the mediæval styles, and that a system of decoration and character of ornament, largely dependent on symbolism, had no longer a meaning. Had this not been so, the Renaissance could never have become the architectural language of Europe.

It becomes more and more necessary to define the architectural language by which we can most easily and logically express our wants architecturally.

The best of the works of that phase of the Renaissance which is characterised by Greek detail, St. George's Hall, at Liverpool, and some of Professor Cockrell's buildings must ever seem more or less exotic, with mouldings and ornament borrowed from buildings belonging to a land where atmosphere, climate, and sunlight give altogether different values to architectural forms.

The same, to a lesser degree, may be said of much of the work of the Italian Renaissance. Beautiful as we feel it to be, it is unsuited to harsher conditions, and depends too much on delicate and subtle effects of light and shade to suit a duller atmosphere. Such work is, however, logically right and reasonable in America, where climatic considerations are more favourable than in this country. We believe that in our own Renaissance, in the work of Inigo Jones and Wren and Chambers, we have models on which to base our work, and from which we can reasonably hope to develop a suitable style for the needs of to-day, and that such work is a much safer basis on which to build than that of the Neo-Greek or any so-called "revival."

With the great exception of the executed design for St. Paul's, Wren's work is nearly always the reasonable expression of practical wants, and the faults which mar St. Paul's are the direct consequence of the harassing control under which Wren worked. The City churches are examples of suitable design

for churches in the services of which ritual played practically no part.

We may, however, reasonably revert to some modification of the tradition mediæval church, as ritual has once more become an important element in the Anglican Church, and the necessity of mere preaching space is once more often subordinated to other considerations. Wren was right in his age, and we, departing from the type of church which he built, may be right in our age; either case, a clear and logical recognition of the points to be borne in mind should determine our action. A very strong case can be made out for the retention of the mediæval manner of the treatment of churches whose tradition is based on the continuity of tradition in this country, as our Renaissance churches belong to an age of Protestantism, which was an alien interruption of the tradition of which the English Gothic was the outcome and a reasonable expression.

But, except for churches adapted to the expression and use of ritual, where exceptional treatment may be justified, there seems every reason why we should endeavour to unify our architectural language, and in doing so reject what is unsuitable and alien, unfitted for our climatic conditions, and more or less dependent on greater intensity of light and shade than we have here. The use of marble externally, and the employment in any large measure of mosaic, are hardly suited to our local conditions and the expression of our wants.

A much more careful consideration of the proposed lines on which future building developments may take place will become necessary in an age when newly developed districts and roads are carried out in their entirety in periods of a few years. It is little use to open new thoroughfares except for purposes of traffic, if we exercise, as at present, little or no control over the general heights and effect of buildings in a mass; it is easy to make a new street line Kingsway less satisfactory than Gower Street by the absence of some such control.

Modern English architecture is too often spoilt by a saturnalia of conflicting features; the dome which surmounts the Central Criminal Court is rendered unfitting and trivial when silhouetted against the outline of the dome of St. Paul's, while the spire of St. Martin's, Ludgate-hill, forms a charming and harmonious note leading up to the campaniles and dome of the dominating cathedral beyond. There is little logic and use in putting up a beautiful façade to be spoilt by the near neighbourhood of an engineering bridge which has received no consideration with a view to harmonising it with its surroundings. We can no longer logically isolate any one problem in towns; satisfactory results are alone to be obtained by a much greater effort to secure harmony with our surroundings.

And a greater degree of culture and thought, and an attempt to free ourselves from a desire to create novel detail and logically think out reasonable solutions to new problems, must, we think, be an integral part of any real advance in architecture.

NOTES.

concerning the demolition of the old Westminster Hospital. To the *Saturday Review* of November 23 Mr. Filson Young contributes an interesting article under the above heading, which he prefaces by quotation from the Book of Job—"He violently taken away an house which he builded not." In commenting on the sight of the destruction of the old Office he says, "Mere destruction is not pleasing to witness, and the sight of men being paid to destroy and to do down what but yesterday other men have been paid to make and build up filled with uneasy doubts of the sanity of one of the most admired enterprises of the modern industry." We confess to have recently been troubled by similar doubts: our sense of the value or merit of architecture too often depends on contrary opinion, and too seldom on a well-earned recognition of intrinsic qualities; but from which there is little of the which is not valuable as an historical link of the great chain of time. We all know, however, that such acts of destruction are frequently necessary and unavoidable, but there is much in Mr. Young's observations on the relative differences between the new and old Post Office. Plain and efficient, it has the semblance of a factory; no one, I think, could claim much more for it architecturally. And it is a pity to make way for this factory that the people over the way is demolished." In the greater leisure given by the fewer and the limited opportunities of even the present past we feel that there was something in the time in which men were more apt to think of the poetry and meaning which is instinct in the ideas aroused by the purposes of many buildings, and we think that Mr. Filson Young is right in saying that much of this feeling has been parted from us to the great loss of architecture. We can have buildings which are fine and imposing and suitable for their uses, and which are yet so humanly materialistic in the message they convey to us, and, on the other hand, see structures erected in what we may call debased periods, which we feel could have been produced by those who possessed imagination striving to express its message through building. As Mr. Filson Young puts it, "There is no merit in building down a thing unless you are to put something better in its place"; and, further, in emphasising his argument, he states we "pull down and sell what appeals to the imagination" "to put up in what will only appeal to common sense and material desire." We feel in the present there is much food for thought, and we rarely have we known the dangers which may attend destruction more fully and forcibly emphasised.

In common with King's College and St. George's Hospitals, Westminster Hospital, Westminster Hospital will shortly be rebuilt on a site outside the metropolitan area, and a Bill will enable the Governors to dispose of the site and other property, and to acquire a new site outside the metropolitan area, is to be promoted next year. The present building, designed in an emasculated Tudor manner and clad with white Suffolk bricks with

stone dressings, was designed by Inwood, and built in consequence of an Act obtained in 1836. The hospital is said to be the oldest in London supported by voluntary contributions, and was founded two hundred years ago, occupying in the intervening period no less than four sites. Professor Beresford Pite, in a letter to the *Observer* of October 24, points out that a great opportunity now arises to replan the general building lines in a more architectural manner, and suggests that it would be advantageous if an Imperial zone could be formed at Westminster under an Imperial authority, which could suitably deal with the architectural replanning "of the loose pieces of public places and enclosed grounds that are grouped without much unity round the west-end of the front of the Abbey." Such an authority, Professor Pite thinks, could do more for such a site than the Westminster and County Councils. With regard to the actual site of St. George's, Professor Pite makes what we consider is a very good suggestion, which is that it should be acquired by the Stationery Office, which is separated by a narrow roadway from the back of the hospital, that this roadway should be done away with, and the hospital site, together with the roadway, utilised for new buildings fronting the Abbey. The absorption of the road in the rear would enable the new front to be set back without financial loss, as the land given up would be balanced by the land acquired by the absorption of the road, and the new frontage line would give emphasis to the approach to the west entrance to the Abbey, where State processions have concentrated with so much difficulty on recent occasions like the Coronation. It is also to be hoped that if such a scheme of improvement is, as we earnestly wish, carried out, the new Wesleyan Church House may be completed by the erection of the towers on either side of the entrance, which are at present omitted because of the rights of light possessed by the hospital. The present makeshift not only affects the Wesleyan Church House, but is an unsightly blot in an unusually prominent position, and we trust that an arrangement can be made with the future owners of the site for the removal of the "unsightliness of the incomplete."

Engineering and Art.

In his Presidential address to the Society of Arts Lord Sanderson made some remarks on a topic which is well to the front to-day—the relationship between art and engineering practice. His definition of beauty as something that has been accepted as such in former and present times by the most cultivated judges is not one that will help engineers very much. It is one that, to use the words of Professor Beresford Pite, will not enable engineers to "keep clear of the changing whims of artistic fashion," and may well encourage the meaningless introduction of artistic styles unsuited to the particular material under consideration. The late Sir Benjamin Baker once said that when very young he had thought he could do without architects, and had carried out some very pretty work with columns and arches and scrolls in iron. The result was so pretty that

Mr. Ruskin said of it in a lecture that it made him wish he "had been born a blind fish in a Kentucky cave." In later works, such as the Forth Bridge and the Assouan Dam, Sir Benjamin Baker aimed merely at beauty as denoted by good workmanship, economy of material, and directness of object, thus achieving an artistic style based upon scientific necessities, and giving no occasion for adverse criticism. It is satisfactory to note that Lord Sanderson also regards a certain simplicity as a characteristic of the highest art. Nevertheless, there are many engineering structures in the design of which the collaboration of an architect is essential to the attainment of beauty. But it must never be forgotten that beauty in construction is inherent rather than extraneous.

President's Address, South African Society.

We have before us the November number of the *South African Architect*, from looking through which we gather the impression that even in a new country we cannot escape old troubles. The newly-elected President of the South African Society states that phrases as to architectural advancement are easy, yet "the dull facts proclaim that in the greater part of the South African territory the meaning of the term 'architect' is hardly understood, his employment comparatively rare, and hill and dale are constantly being disfigured by hideous structures which will affect the taste of a future generation as surely as they reflect the bad taste of the present." He goes on to urge that "larger powers should be vested in governments and municipalities to deal with such contingencies," though expressing doubts as to whether their present achievements are such as to merit "absolute confidence." In Johannesburg the "opportunity of a dignified lay-out" worthy of so prominent a position as Brandis-square has been completely ruined, and the gaol, the "pre-war insult," remains in the most prominent position in the town. Town planning is urged as being a first necessity in South Africa as it is here, and the appointment of an Advisory Board of Architectural Control is advocated. The present system of patronage and departmental work meets with adverse criticism, and the advantages of competition are urged in that it "allows greater play and affords greater interest to local patriotism—for, after all, it is local patriotism which makes the town and the village." Truly there is little new in that world which "the eye of heaven visits."

The Metropolitan Water Board's Offices.

In the adjourned Report of the new Water Board's General Purposes Committee a report is made on the subject of office accommodation required by the Board. The Report recommends the acquisition of the site of King's College Hospital, which contains an area of 48,000 ft., with 60,000 ft. super. of clear floor space, all well lighted, subject to the proviso that it should be obtained at a reasonable figure. The suggestion made is that for the present the existing accommodation should be utilised for the

Board's departmental work. The Committee, therefore, recommend that it should be authorised to enter into negotiation for the acquisition of the site and buildings as central offices for the Board, and that it should be an instruction to the Committee to submit a further report to the Board at their next meeting.

THE ROYAL INSTITUTE OF BRITISH ARCHITECTS.

CHRISTCHURCH PRIORY.

In the *Times* of yesterday a letter was published from Mr. T. G. Jackson, R.A., referring to the restorations at Christchurch Priory. The subject-matter of the communication was given in the *Builder* last week.

UNIVERSITY OF LONDON: NEW LABORATORIES.

On the 4th inst. the new Pharmacology Laboratories at University College, designed by Professor F. M. Simpson, F.R.I.B.A., were opened formally by Sir Thomas Barlow, Bart. The building owes its origin to the generosity of Mr. Andrew Carnegie, and the scientific work to be pursued will be organised by the New Institute of Pharmacology, in connexion with the University of London. The new Laboratory contains, besides general and students' laboratories, a demonstration theatre, chemical room, library, professor's room, etc. It consists of three floors and a mezzanine floor as well as a basement.

* Passed the *Special* examination.

COMPETITION ASSESSORS.

THE point raised by Mr. C. F. A. Voysey in his letter to the *Builder* last week (p. 645) has aroused considerable discussion. So far as we have been able to ascertain, the profession generally does not agree with Mr. Voysey in his desire that competitors should be kept in ignorance of the name of the assessor who has been appointed to adjudicate upon their designs. It happens not infrequently that when conditions are issued it is stated that a competent assessor will be appointed, but even when the Royal Institute of British Architects is mentioned as the source of the nomination well-known architects have not considered it desirable to enter. It is an established custom that the assessor should be named beforehand and not kept in the background, and we think Mr. Voysey will have some difficulty in gaining adherents to his banner. We understand that the Council of the Royal Institute of British Architects had the matter before them on Monday last, and that it was referred to the Competitions Committee. It may be well to remind our readers of Clause I. in the Regulations of the Royal Institute relating to competitions. It is as follows:—"The promoters of an intended competition should, as their first step, appoint one or more professional assessors, architects of established reputation, whose appointment should be published in the original advertisements and instructions. The selection of an assessor should be made with the greatest possible care, as the successful result of the competition will depend very largely upon his experience and ability." We have discussed the question with several architects of wide experience in competition matters, and their unanimity in requiring the name of the assessor will be realised from the following views expressed by them.

Mr. William Flockhart, F.R.I.B.A., thinks it is distinctly right that the assessor should be known beforehand. He thinks Mr. Voysey has made an interesting suggestion, good in theory, but questionable in practice. Mr. T. Edwin Cooper, F.R.I.B.A., thinks that competitors should be given as much information as possible, and considers that the publication of the assessor's name in the first instance is essential to the proper conduct of a competition.

Mr. J. W. Simpson, F.R.I.B.A., does not think that Mr. Voysey's suggestion is based on experience or that it can be considered seriously. There could be no surer way, generally, to lose a competition than to appeal to the supposed ideals of the assessor, who, as a man of wide sympathies, approaches his task with elasticity of outlook, and resents any attempt to imitate his own style. Mr. Alfred Waterhouse was remarkable for his catholicity of taste in selecting the winning design in a competition. Mr. Simpson thinks that the name of the assessor should be announced beforehand.

Mr. W. A. Pite, F.R.I.B.A., thinks that the name of the assessor should be published, if only to deter those from entering who do not approve of the adviser chosen by the promoters. He would not stand aside because a professional assessor were not named at the outset if he were convinced that the conditions were good in other respects. Mr. Pite considers the ideal way of assessing a competition is by a jury of three, and he suggests that the Royal Institute of British Architects should undertake the arrangement of every competition on lines which would ensure the best design being chosen. He thinks that many men who are eligible to serve on a jury of assessors would undertake the duties for nominal fees, payable by the promoters through the Royal Institute, and that thereby the reputation of the profession and the advancement of architecture would be secured. Mr. Pite would compete without knowing the names of such a jury.

Mr. F. Winton Newman, A.R.I.B.A., of Messrs. Ashley & Newman, whose Birmingham Council House extension was illustrated

in the *Builder* a few weeks ago, expressed similar views to Mr. Cooper's, and does not agree with Mr. Voysey's ideas on this subject.

Mr. H. Austen Hall, A.R.I.B.A., of Messrs. Warwick & Hall, thinks that unless architect of repute and importance nominated and known in the first place, best competitors will not be attracted. An architect of standing will take the trouble and risk of a speculative design unless he knows that his work will be in good hands. Mr. Hall's letter in our Correspondence Column (p. 678) supplements our interview with the unknown assessor.

Both Mr. H. V. Lancaster, F.R.I.B.A., and Mr. E. A. Rickards, F.R.I.B.A., condemn the unknown assessor. However straightforward the promoters of the competition, there is no guarantee that the adviser who is appointed, but not named in the conditions, will be capable of judging in an enlightened manner. Many thorough experienced architects could be mentioned whose critical powers are inadequate for such special work as assessing a competition. The jury system commends itself strongly to Messrs. Lancaster & Rickards. So many are they in favour of it that, there being safety in numbers, they would be inclined to risk thought and expense in preparing design even if the names of the profession jury were not announced.

Mr. Halsey Ricardo, F.R.I.B.A., thinks that the whole competitive system is vicious and that the discovery of such men as Pines and Alfred Stevens is so exceptional that it does not justify the method. As a rule the successful design in a competition was a compromise, and did not possess the qualities which would be gained if a chosen architect were in personal touch with the requirements. He had all faith in the Royal Institute of British Architects, and so long as he knew that the assessor would be appointed by the Council he would not mind that the nominee should be named in the first instance.

PARIS NOTES.

We are glad, for more than one reason to be able to refer to an article by M. Dubrulle in a recent number of the *Rev. Archéologique*. It is, to begin with, an excellent piece of historical research; deals, further, with one of the most eminent sculptors of the Italian Renaissance; and, thirdly and lastly, it adds, as it were, a feather in the cap of one of the most underrated towns on the north coast of France. Boulogne, whether it is regarded (quite erroneously) as the crowded resort of a noisome kind of British tripper or as the first or last stopping place on your Continental journey rarely awakens any kind of serious interest; the mind of the traveller; yet it is one of the most picturesque and one of the most characteristically French towns in the North of France. In its busy life the tripper, the vivid kind scarcely counts; his sojourn in any case, is usually limited to a few hours and his peregrinations to the stretch between the Quai Gambetta and the Casino. The towns, in fact, possess a more interesting history, harking back to Roman times, and provide more pretty tales of legend or agreeable literary and artistic associations (many of them English). The architectural student might even spend a little time to advantage in the examination not only of the old buildings within the circle of the high ramparts, but also in the observation of many pleasant passages of late XVIIIth century work in other quarters of the town. But we must not be tempted to stray from M. Dubrulle's learned article in the *Rev. Archéologique*, which goes to prove, with wealth of documentary and inferential evidence, that the name and title of Giovanni da Bologna was, in effect, Jean Boulogne or Jean de Boulogne. In an occasional note we do not propose to examine the evidence, which is however, sufficiently convincing, and establishes in the XVth century a link between

BECKENHAM CENTRAL SCHOOLS COMPETITION.

THIS competition has evoked more interest than an elementary school competition usually does, chiefly because at the outset it was announced as being limited to those having special experience.

But in this case, to the disappointment of those who were selected, it was a case of many applying and many being chosen, as the possession of knowledge of and experience in schools is not a rare qualification, and some eighty architects have competed.

The site chosen is a good one, bounded on three and a half of its sides by roads, of which Balgovan-road constitutes the more important frontage, but its great disadvantage is that it barely affords playground area for the number of children to be accommodated.

An unusual feature even in school competitions was that only half the accommodation required was to be built in the first instance, the remainder forming future extensions.

The accommodation asked for was that required for a school for 1,200 in three departments, with certain rooms for handicrafts in connexion with the boys' school, and cookery, laundry-work, and housewifery in connexion with the girls'.

Obviously with a school on so limited a site the planning of the buildings so as to give the utmost possible free space for playgrounds was of the first importance. Usually in a school building the architect's task must be not only to plan the accommodation required in the best possible way, but to so arrange the buildings that convenient rectangular sunny playgrounds are provided free from inconvenient corners and angles, and this was in the nature of things a special point to be met in this case.

An assessor's duties in such a case as this are, first, to make up his mind what type of planning is most suitable, and, having done so, to successively eliminate from the designs belonging to the type the weaker ones till the best remains.

As to the first part of his duties, we consider that Mr. Cross has taken a clear and logical course; as regards the second, we may add that, in our opinion, he has selected what most of us would regard as the best design, but as, to the merits of the second and third designs we confess to having doubts.

The type selected by Mr. Cross was that which has been followed by the greater number of competitors, viz., a T-shaped plan, which has many advantages. The frontage line fixed necessitated those buildings which were brought near the roads being kept back at a distance from them, thus involving loss of space which might usefully be incorporated in playgrounds. The T-shaped plan has the advantage of having only one frontage to a road, the buildings forming the centre of the T, separating in most plans the site into the portions one of which is devoted to boys, the other to the girls' and infants' playgrounds, which most of the competitors have combined.

Another point which has apparently largely influenced the assessor's choice is the convenience obtained by placing the assembly hall at the head of the T, the cloak-rooms for each department and their entrances being in its immediate vicinity, so that the various departments can assemble in and disperse from the hall immediately on entering and leaving the school without having to traverse corridors.

Economy being of the first importance in this, as in many cases, the classrooms in the premiated designs are arranged in parallel rows along each side of a short corridor.

Messrs. Buckland & Haywood Farmer have produced a most excellent and carefully-thought-out plan on these lines. The entrances and cloak-rooms and staff accommodation is most conveniently arranged, and economy is effected by making the cloak-rooms sufficient only in the first case for the numbers to be originally accommodated. Additional cloak-rooms are placed at the end of the classrooms blocks when extended.

The planning of the rooms for special purposes placed in a block at the further end of the middle of the T is extremely well worked out, the boys entering their rooms from outside, which rooms are placed on the ground floor, the girls' accommodation being over, communicating with the girls' school internally, but also having external access. Full use of the playground space is ensured by recognising

the broken line of the Balgovan-road frontage, which is cleverly dealt with.

The elevations are simple and quiet, but we feel they can be considerably improved; but we know from actual experience that in Messrs. Buckland & Haywood Farmer's hands the Beckenham Council are sure of getting a most excellent school.

Of the second design by Messrs. W. T. Hale, of Sheffield, No. 44, and the third design by Messrs. Boram & Fletcher, of Sheffield, we can only say that, though there is little to be found fault with in the plans, we do not consider they are in the running with many designs of the type which Mr. Cross has adopted, and we feel some surprise that he should have given them their places.

In Messrs. Butler, Crouch, & Savage's design, No. 10, we have again a most excellently worked-out scheme, one feature of which is that the head of the T is placed back from Balgovan-road, so that a third playground is formed between the school and the boundary. Possibly a point militating against the plan is the fact that the whole of the corridors and rooms on one side of them are built in the first instance. This, while giving continuous elevations to the main road at the outset, necessarily increases the first cost. The elevations are, we are inclined to consider, the best of all submitted in the competition.

Another excellent design on similar lines is that by Mr. W. G. Wilson, No. 68, every part and detail of which has been carefully and thoroughly considered. A feature in the design is that in the final scheme the infants obtain a hall of their own, while the hall, which is at first used for all three departments, is finally allotted to boys and girls alone.

Mr. E. Cratney, of Walsend, submits in No. 64 a very good working scheme on the approved lines.

Messrs. Appleyard & Quiggin submit a good scheme on open quadrangular lines, facing Belmont-road, the two projecting wings forming the boys' and girls' school, the space between them an architectural court, and the block joining the two wings forming the infants' school. Playground space is thus divided into two—the open court and a large piece in the rear of the buildings forming the remainder, which is divided between two departments.

Of a somewhat similar type is No. 13, by Messrs. Townsend & Bryan.

In No. 25 we have an interesting design very carefully worked out again on open quadrangular lines. The scheme has many excellent points, but the disposition of the infants' school, forming a separate building, and the technical block is bad, as the playground space is much cut up.

The influence of the courtyard, verandah, and open-air type of plan, which has been so largely adopted in Derbyshire and other counties, is evidenced in several designs, notably that of Messrs. Paterson & Jenkinson, of Sheffield, No. 24. This is well and ably thought out, one of the playgrounds being formed by the central court, but, as this centre court is not completed until the second half of the building is built, the scheme would be incomplete and unsatisfactory in the first instance.

Nos. 41 and 48 fall under a similar category, Mr. East submits in No. 27 a thoroughly well worked out scheme having much architectural merit.

We understand that the designs from which the ultimate selection was made included Nos. 3, 43, 52, 69, 29, 10, and 68, which are all grouped together.

Interesting schemes were also submitted by Messrs. Gott, Robson, & Gott, No. 65; Mr. P. A. Robson, No. 71; Messrs. M. B. Adams & M. S. Adams, No. 3; Mr. H. O. Cresswell, No. 15; Messrs. Greenway & Newberry, No. 74; and Messrs. Sutton & Gregory, No. 72.

In this case, as in others we have recorded from time to time, the honours of victory have fallen to provincial architects, which in itself forms a pleasing testimony both to the fairness and open-mindedness of public bodies, since even in London local patriotism is a factor to be considered.

We may say in conclusion that we consider the Beckenham Council may congratulate themselves on the response which their invitation elicited, a result no doubt largely due to the well-deserved reputation for thoroughness and knowledge which the assessor, Mr. A. W. S. Cross, bears in the profession.

There is usually room for individual differences of opinion, but there can be no doubt that the selected design well merits its position.

de Pas de Calais and Tuscany (for theulptor was largely associated with the art of bronze). It was known that he was born at Genoa, but the association of his family with sculpture and his adoption of the name are new and interesting facts. It is not difficult to realise how Boulogne and Bologna became enfolded in Italian pronunciation (how many Italians of that day had ever heard of the French town?), and it may be that the artist, for a time, became content to acquiesce in the misunderstanding of his adopted country which had provided him, in those wonderful days of the Renaissance, not only with the means of acquiring his skill in sculpture, but who had given him opportunity for applying and fame. Associations of this sort may appear trivial, but when we are crossing the channel and have safely negotiated the view of Cape Gris-Nez, and Boulogne heaves in sight, with its ramparts, its domed cathedral, its climbing aggregation of houses, its light-uses and busy quays, we shall be able to add to the viewless memories of the place other *reminiscences* from the past.

A book on an interesting subject has been published recently under the auspices of the Bibliothèque de la Société des Architectes diplômés par le Gouvernement. The author M. Albert Louvet, architecte diplômé par le Gouvernement, and the title of the book "L'Art d'Architecture et la profession d'Architecte." This, the first instalment of work which will be completed in two volumes, deals with "La formation de l'architecte"; the second volume will be devoted to "L'exercice de la profession d'Architecte." M. Louvet has many interesting things to say, and he says them with a good deal of elaboration. If his book contains little that is not generally known by French architects and French students of architecture, it is, nevertheless, an extremely clear *résumé* of the point of view of an architecte diplômé par le Gouvernement of the French position with regard to the education of an architect and the scope of his work. M. Louvet supports the teaching of the Beaux-Arts as the best educational system existing in France, although not without certain reservations. The official *ateliers*—that is, studios attached to the Beaux-Arts—he condemns without qualification, while he supports the existence of the *ateliers libres*. At the qualities which he demands from architects who run an independent atelier—qualities of sympathy largely in regard to the temperament of his students—would probably daunt many architects whose attitudes lie rather in the direction of creating architecture than in teaching it.

He is afraid, for instance, of the too original architect in this position, because he would be more likely to control than to develop the natural talent of his students. M. Louvet particularly emphasises the fact that the conditions under which a modern architect works demand that he should be a person of wide culture as well as possess a clear head for business affairs. He deprecates, on the one line of argument, a student visiting France without he takes with him a knowledge of classic mythology and history. So far as the chief of an atelier is concerned, perhaps his ideal view is summarised in a phrase addressed to his students by a distinguished French architect:—"Je n'ai pas prétention d'être plus malin que vous, seulement il y a plus longtemps que je fais l'architecture et je puis vous donner des conseils." With M. Louvet's arguments we need little to disagree; they seem to us, on the whole, an admirable exposition of a system of training which has provided an example for most other countries, and which has perhaps raised the general standard of architectural achievement in France.

HONOUR TO A FRENCH ARCHITECT.

M. Louis Eugène Marie Feine, of Paris, has been created a Chevalier of the Légion d'Honneur "pour services exceptionnels rendus à la Société d'habitations à bon marché."

Parish Hall, Roehampton.

Mr. Sydney Tugwell, A.R.I.B.A., Architect.

(Royal Academy Exhibition, 1912.)

PARISH HALL, ROEHAMPTON.

This hall is a gift to the parish of Roehampton by the Countess of Leven and Melville, and is intended to commemorate the memory of her husband, the late Earl of Leven and Melville. The seating accommodation is for 400, and the building is faced with Daneshill and Guildford bricks, with Portland stone dressings and Tibbithwaite green slated roof.

The general contractors are Messrs. W. Adkins & Son, of Roehampton, and the building has been carried out without a clerk of works under the able direction of the contractors' general foreman, Mr. G. H. Bones. Messrs. Haden & Sons, of Trowbridge, are the heating engineers employed, and Messrs. Matt. Shaw & Co. have supplied the structural steelwork. The electrical engineers are Messrs. Cecil Cooper & Co., of Gloucester-road, W. The architect is Mr. Sydney Tugwell, A.R.I.B.A.

ARCHITECTS' AND SURVEYORS' APPROVED SOCIETY.

The first general meeting of the Architects' and Surveyors' Approved Society under the National Insurance Act was held on Tuesday at the Rooms of the Architectural Association, 18, Tufton-street, Westminster, when the President (Mr. Reginald Blomfield, A.R.A.) took the chair.

Mr. F. E. Yerbury (Secretary) said that upon the National Insurance Act (of 1911) coming into force, the question of the position of those employed in architects' and surveyors' offices who came within its scope presented itself, and it was felt by certain members of the two professions concerned, after obtaining the best legal and expert advice, that they would be justified in advocating the formation of a special society for the employees of architects and surveyors for many reasons, the chief of these being that such a society would consist of a select membership, drawn from a professional class

whose occupation was healthy, and whose income would in very many cases rise to an amount which would remove them from the scope of the Act. The contributions of those passing out of the Society in this way would remain to the credit of the Society, and, as a consequence, it should be able, in a few years, to offer larger benefits than those actually prescribed by the Act, and in this way the contributions forfeited by those who passed out of this Society would be used for the benefit of fellow-members of their own profession. A provisional Committee of representatives of the Royal Institute of British Architects, the Surveyors' Institution; the Architectural Association, and Society of Architects was formed, and it was decided to proceed with the formation of the proposed Society. The Society was formally approved by the Joint Commissioners for England, Scotland, and Wales on October 16 last, but previous to this provisional approval had been granted by the Commissioners for England. At the present time the membership of the Society was 1,574 ordinary members, one voluntary member, and fifty-five honorary members. There were still a number of applications for membership to be dealt with, and, taking this into consideration, it might be safely reckoned that the total ordinary membership at the beginning of next quarter would be well above 1,600. A few applications for membership had been rejected for medical reasons, so that the present membership, as was anticipated, was composed entirely of select lives. Reverting to the original contention that the majority of members would in time pass beyond the income limit, it was interesting to note that already four members had withdrawn from the Society for this reason, and the following statistics went still farther to support the same contention, that the majority of members would pass beyond the income limit at a comparatively early age:—Number of members between sixteen and twenty-one, 358; number of members between twenty-one

and thirty, 942; number of members over thirty, 274; total, 1,574. With regard to finances of the Society, it was difficult at present juncture to give details, but expenditure up to the present might be divided into three sections, viz.:—(1) Preliminary expenses incurred in the formation of the Society: These amounted 199l. 2s. 1d., and were accounted for as follows: Printing, 129l. 1s. 1d.; clerical wages, 15l. 15s.; legal expenditure, 52l. 10s. advertising, 1l. 16s. These amounts were met by the four professional institutions interested who contributed the following sums:—Royal Institute of British Architects, 80l.; Surveyors' Institution, 80l.; Architectural Association, 20l.; Society of Architects, 20l. total, 200l. Thus the preliminary expenditure might be ruled off as settled, and this way the Society commenced with a clean sheet. (2) Non-recurring expenses: Under this head was reckoned expenditure on office equipment, extra clerical assistance, printing, etc., 50l. The Treasurer would give further financial details, in which he would take into account the present liabilities of the Society. (3) Recurring expenditure: Under this head was reckoned ordinary current administrative expenses, amounting to 31l. 5s. 8d. Up to the present, application had not been made to the Commissioners for payment on account of these expenses, but a friend of the Society had very kindly made an advance free of interest, from which these had been met. It was the business of that meeting to confirm the election of the officers and Committee appointed by the signatories of the application made to the Commissioners for approval of the Society, in accordance with Rules 1 and 25.

The list of now-elected officers was announced as follows:—President, Mr. Reginald Blomfield, A.R.A., P.R.I.B.A. Vice-Presidents: Sir J. F. L. Rolleston M.P.; Mr. C. Bidwell, Mr. Howard Marti Sir A. R. Stenning, Mr. H. T. Stewart

on, E. G. Strutt, Mr. Leslie R. Vigers, Mr. J. Lish, Mr. E. J. Hamilton, Mr. Gerald C. Horsley, Mr. Percy B. Tubbs, Sir Ernest George, A.R.A., Mr. T. E. Collcutt, and Sir Aston Webb, C.B., R.A., Trustees, and Mr. Aston Webb, C.B., R.A., Mr. Daniell, and Mr. W. Edgar Horne, M.P. The President congratulated the members on the formation of the Society, and said it reflected great credit on the younger men, who had borne the brunt of the work. They knew that opinion was divided on the Insurance Act, but it was the law, and as good citizens it was their duty to obey it. Their right to be a Society particularly favourable to the members, because assistants in architects' and surveyors' offices were, as a rule, healthy and vigorous young men, and, further, they were constantly moving upwards in salaries which took them outside the scope of the Act, and in this way the Society would have a large fund from which the less-fortunate members could be benefited. By the formation of the Society they got a solidarity of interest and an *esprit de corps* which was essential to any profession which expected itself and was entitled to the respect of the public.

The Hon. E. G. Strutt moved the confirmation of the election of the officers of the Committee as follows:—Auditor, Mr. Cyril Brown; Treasurer, Mr. Maurice E. Webb; General Committee: Messrs. George Corderoy (Chairman), Walter Cave, George Hubbard, H. D. Searles-Wood, G. Leonard Kingston, Maurice E. Webb, H. Austenall, Ian MacAlister, C. McArthur Butler, Goddard, E. H. Blake, B. Marr Johnson, H. Sabin, Ralph Ellis, Clifford T. Steward, G. Cross, E. C. P. Monson, R. G. Lovell, R. Priest, Gustavus Reeves, H. D. Latham, W. I. Keir, H. J. Higgs, and W. Virgo; Solicitor, Mr. F. R. Yerbury. He referred to the good work done by the Surveyors' Institution and the Architectural Association, and said it was pleasant to think they could work together in harmony. Mr. McArthur Butler (Secretary of the Society of Architects) seconded the motion. Mr. Baker pointed out that he was the first to take steps to form such a Society, but, after spending much time and money, he was told the present Society had been formed. His object in trying to form a Society was to benefit assistants and to obtain the position of Secretary for himself, and he asked some member to propose his election as Secretary. Mr. G. Pearson moved, firstly, that it be referred to the Committee to consider whether they could award Mr. Baker some remuneration for his efforts. But at the request of Mr. Baker he altered this to a motion that election of the Secretary be deferred until this matter had been considered by the Committee.

This was not seconded, and the original motion was carried. Mr. Geo. Corderoy acknowledged the resolution, and spoke highly of the prospects of the Society. He pointed out that a scheme was being outlined to deal with the subscriptions of honorary members for the benefit of the ordinary members, and said it was necessary to obtain 5,000 members within three years to preserve their separate entity. They approached the Institution of Civil Engineers with a view to that body joining them.

Mr. Maurice E. Webb proposed a vote of thanks to the societies who had financed the preliminary expenses, and pointed out that the Committee had spent considerably less than the sum they were entitled under the Act to allocate for expenses. He made a strong appeal to all those eligible to join to do so at once.

Mr. G. Reeves seconded the motion, which was carried.

On the motion of Mr. Gerald Horsley, seconded by Mr. J. H. Sabin, a hearty vote of thanks was passed to the President. It was mentioned by Mr. Horsley that the presidency of the Society would fall in alternate years to the Presidents of the Royal Institute of British Architects and the Surveyors' Institution.

It is necessary that the membership of the Society should reach the requisite 5,000 within the next three years in order that the Society may remain a separate entity for valuation

purposes. As no doubt a very large number of those employed in architects' and surveyors' offices are members of other societies for the purposes of the Act, it should be pointed out that there is very little difficulty in transferring their membership to a Society especially formed for their own profession, and the Secretary of this Society will be pleased to assist them in doing this, if required.

REGISTRATION AND THE ARCHITECT'S ASSISTANT.

We have received from the Council of the Guild of Architects' Assistants the following statement:—

"It is important that the architectural profession should fully appreciate the disabilities that the forthcoming proposals for the registration of architects may impose if they are not framed with accurate and complete regard for all sections of the profession.

The Guild of Architects' Assistants is more especially concerned with that class whose position and interests it has consistently endeavoured to defend. The probable ill-effect of registration upon the assistant has been continually placed before the profession in the technical Press. In order to avoid any derogatory effect of registration upon the assistant certain proposals have been made by the Guild to the promoting societies, particulars of which are enclosed. Possessing no mandate in favour of registration, the Guild desires to see the betterment of the assistant, or at least an unimpaired status for him under the proposed régime. The Guild can offer no guarantee for this result except by the inclusion of the assistant in the Registration Bill. The following statement describes the reasons for his inclusion:—

The architect's assistant is a member of a permanent class which persists notwithstanding the fluctuation of individual fortune. His claim for adequate consideration in the proposed Bill for the Registration of Architects is justly based on his membership in the promoting societies and his position in the profession.

The Bill will unquestionably pose as the inspired democratic ideal of all sections and interests concerned. It is the duty of the profession to see that this description applies. The result of the recent inquiry by the R.I.B.A. into the question of the number of Associates qualified for candidature as Fellows is not known, but should prove a valuable indication of the probable extent of the architect's assistant's interest in the Royal Institute. A glance at the membership lists of the promoting societies will show that about one-fifth are obviously students and assistants. A large percentage of the remainder are employed during the greater part of their career as assistants, and as such many continue. Together with these considerations, which serve to outline the position of the assistant in the promoting societies, there are those which affect the profession as a whole. Every member of the profession passes a varying period as assistant. A large number of assistants are

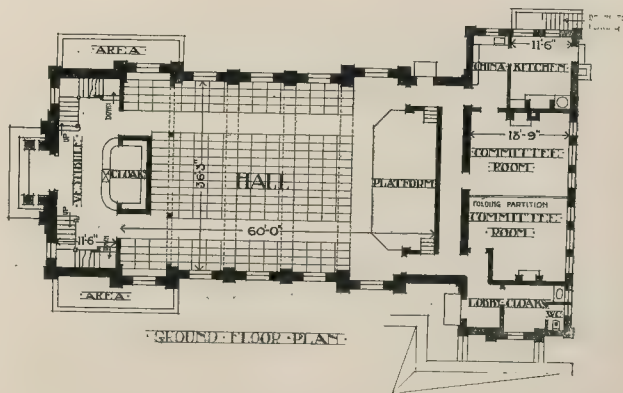

permanently employed as such by Government, municipal, and other corporate bodies. Few are able to hold the position of practitioner continuously and consistently, whilst the experience of many fluctuates between the two positions, which in other cases are held simultaneously. Further, there is the mass of architects' assistants who are unconnected with any professional society, and the fact that about one-third of the students passing through a well-known architectural school find a precarious and lengthy stay in the assistant class.

The Guild of Architects' Assistants believes that the interests it represents are as fundamentally important as any other with which the proposed Bill for the Registration of Architects may deal. Real danger is involved to the younger members of the profession if their interests are not protected. If professional defence is required for maturity, still more is it necessary for immaturity. The profession will stand convicted of neglect for its weaker members if the proposals for registration do not contain, or refer to, a series of protecting clauses to determine the position of the architect's assistant."

ARCHITECTURAL SOCIETIES.

Birmingham Architectural Association: Town Planning.

On the 28th ult. Mr. Raymond Unwin delivered an address to the members of the Birmingham Architectural Association on Town Planning. At the outset he suggested answers to the question why architects should take a special interest in the town-planning question. In the first place, the answer was, he thought, that it affected their buildings; in the second, because it was really architectural work on a large scale; and, in the third, because they, as a profession, stood specially for the addition of beauty to useful building. When it came actually to making a plan for the laying-out of buildings the matter got beyond what either the engineer or the surveyor was trained to do. The function of the surveyor was to bring before the town-planner the whole of the facts of the site as it existed, the whole of its conditions, and the whole of the requirements as to the future; and it was his business when the architect had made plans which architecturally satisfied those requirements to criticise them from the useful point of view. The engineer was the structural and executive man; he must tell them the limitations within which they must work. But when it came to making the actual plan the problem became an architectural one, and it was then that the architect should claim his fair share of the work. Town planning consisted of two things. It was not only a plan, but a scheme. It fixed the width of streets and building lines, and the height of buildings in relation to streets. In some it was laid down that no houses should be of more than two stories, and one partly, or wholly, in the roof. Here the interests of the architect were concerned. Then, again, some schemes gave to the local authorities power to

Parish Hall, Roehampton.

Mr. Sydney Tugwell, A.R.I.B.A., Architect.

approve of the laying-out of groups of streets. Here, too, the interests of the architect were concerned. A limit to a certain number of houses in a row had been suggested in some schemes, without regard to whether there should be a wish to build a group of houses or not at the same time. The area of the site which might be covered by buildings was limited, and if this point were not watched it might easily happen they could never have a street corner built up with any sense of closing in, and there would be great gaps even larger than those allowed under present by-laws. All these were matters which could only be arranged by architects who day by day in their calling were brought into contact with them.

The lecturer pointed out the difficulty of framing regulations for the regulation of building so as not to do a lot of injury. It was for architects to watch town-planning schemes carefully, and in order that they should have their proper voice in the matter he thought it was possible for a few of the architects in a district to form a Committee to study the question and become experts who could advise the rest of their body. In regard to the schemes affecting Birmingham, so far as he could make out there had been no architectural help or advice at all. They had only to look at some of the road junctions to see that no one had ever thought how the buildings were going to look where the roads came together. Birmingham's scheme did not go nearly so far in the matter of regulation of details of building as some others did. Still, there were points which might have been arranged by negotiation, and the Local Government Board were disappointed that the scheme had not received more architectural criticism and help. Town planning was going to bulk big in architectural work in the future, and it was also going to have great bearing on the design of individual buildings.

Glasgow Technical College Architectural Craftsmen's Society.

At the fourth meeting of the Society, Mr. A. H. Purdie presiding, Mr. John Allan, jun., delivered a lecture on "The Manufacture and Use of Concrete Blocks in Building." The lecturer outlined the history of concrete and stated that the dome of the Pantheon in Rome was an early example of this method of construction. The modern system of manufacture and building with hollow blocks, first used in America, and introduced in this country at the Letchworth cottage exhibition, was fully dealt with, and comparative costs given proved it to be a cheap and durable method of construction. The lecturer mentioned a few of the difficulties, and a certain amount of prejudice with which local authorities and landowners viewed this method of building, and invited the co-operation of architects to give this material artistic treatment.

Architectural Association of Ireland.

On November 19 Dr. MacDowell Cosgrave, one of the Hon. Secretaries of the Georgian Society, delivered a lecture on "XVIIIth-Century Work in Dublin," at the ordinary meeting of the Architectural Association of Ireland, 15, South Frederick-street, Dublin. Mr. George L. O'Connor, F.R.I.A.I., President, occupied the chair.

Dr. Cosgrave said it was a discussion which took place there that led to the formation of the Georgian Society for making records of the remains of XVIIIth-century art in Dublin. The four volumes already published gave some idea of the great wealth of decorative work that was lavished on Dublin in the XVIIIth century. The expansion in the century was indeed extraordinary. At first this expansion was not so much one of taste as of necessity. The prosperity that followed the unaccustomed condition of peace allowed of the building of larger and finer houses. The last timbered house had been removed by 1813, at the corner of Castle and Werburgh streets. In the first half of the century the gables generally followed the pitch of the roof, but not much was left of the first quarter, although more than 4,000 houses were added to the city during it. The second half of the century showed a complete change, and each contained quarters in a separate entity. The Fire of London, 1666, made room for a large number of buildings in pure Renaissance style. Palladio was the designer of buildings reckoned amongst the masterpieces of this style, and, as his treatises in architecture were translated into English, his designs were often taken as a guide. The public buildings

of the last three-quarters of the century followed this taste, following the façade of the Parliament House, 1735, in true Italian taste. The present front of Trinity College was built in 1759. By the end of the first half a change had come over plaster decoration in Dublin. The architects of large houses were no longer satisfied with the rough decoration of local workmen, but brought over plaster designers and workers from Italy. It would be observed that the plaster-work of this third quarter of the century was not of severe classical design. The Renaissance had taken a long time to cross Europe, and whilst it was slowly travelling over the style was changing in Italy. So whilst their public buildings were following the published designs of Palladio, and were severely classical, the XVIIIth-century decoration done by workmen brought direct from Italy followed the current style with which they were familiar, and the Irishmen learning from them carried on the same style. The Italian style of the period was Rococo, and the plaster freely used in domestic buildings as a medium for decorative work no longer represented structural lines, but was frankly decorative. In the last quarter of the century the plaster-work was from the designs of the Adam Brothers. The lecturer showed a splendid series of slides illustrating the delightful decorative work of the XVIIIth century. It was the happy lot of the Georgian Society to record the Dublin of the past, but it was the happier lot of the A.A.I. to help and create the Dublin of the future.

On the motion of Mr. Orpen, seconded by Mr. O'Callaghan, and supported by Messrs. Beckett, Nicholson, Geoghegan, and Paton, a hearty vote of thanks was passed to the lecturer. The following new members were elected:—Messrs. Harold Langley Phillips, William Henry O'Donnell, William Mortimer Paton, A.R.I.A., William M'Laren. Rejoined:—Messrs. J. Howard Pentland, R.H.A., S. Ashlin, M.R.I.A.I.

LEEDS AND YORKSHIRE ARCHITECTURAL SOCIETY: PRESIDENT'S ADDRESS.

THE opening general meeting and smoking concert of the Leeds and Yorkshire Architectural Society was held at the Queen's Hotel, Leeds, on Thursday evening, November 21.

The President, Mr. A. E. Kirk, occupied the chair, supported by Mr. J. F. Walsh and Mr. G. F. Bowman (Vice-Presidents), and Messrs. J. W. Connon, H. Perkin, W. Carby Hall, H. S. Chorley, S. D. Kitson, and a number of members, associates, and friends.

The proceedings opened with the President's address, followed by a vote of thanks from Mr. S. D. Kitson, seconded by Mr. H. Perkin, and supported by Mr. G. F. Bowman.

The President referred to the valuable work of Mr. W. Whitehead, Hon. Secretary, on behalf of the Society, and in the course of subsequent remarks, he said:—

"The establishment of a British School at Rome is an accomplished fact, the particulars of which have been published. This should be a great incentive to the students to spur them on to gain the highest reward. It is to be regretted that the Architectural School at the School of Arts, Leeds, has not the privilege of nominating a candidate, but it is hoped that some day it may be won by a Leeds student. The Leeds School of Architecture, under the direction of Mr. Coombs, is doing very good work, and a very thorough training is to be gained there. There are rumours in the air that the city contemplates at an early date making provision for all the different departments of the city being housed in one building. Since the Municipal Buildings were built Leeds has increased, and naturally the different departments have expanded, and new ones have been created at the present time they are scattered all over the city, which means not only extra work for the officials, but also great inconvenience to the general public. Many sites have been suggested in the Council, and also in the Press; of course, most of the criticism has been based on the cost, regardless as to the suitability of the site.

Whatever is done should be worthy of the city. Bradford, our next-door neighbour is going in for an extensive scheme of town planning in the very centre of the city, and unless Leeds wakes up it will be left behind. To my mind, and I think you will agree, the only site for such a building is on the south side of Victoria-square; this would give a glorious opportunity

of architecturally treating Victoria-square and making it worthy of the city. If these buildings are put elsewhere I am certain that Victoria-square will be left for all times a desert of cobbles with a small oasis in the centre—Mr. Brook's statue of the late Queen Victoria.

The enlargement of the General Infirmary will do great things by opening up the north side of the Town Hall. Mr. Kitson's plan shows a small square and gardens which promises to be an interesting lay-out. Just a word with regard to the town planning which comes into this large scheme. The plan shows a fine wide street running from Calverley-street in a crescent, joining Fenton-street at Carnaby-street on the south side of the Artillery Barracks; this seems to finish nowhere for a street of such importance. I would suggest that it be carried forward to where Hilliary-street joins Woodhouse-lane, and a circus formed there, then the traffic would be diverted from the tramlines straight into the centre of the city, and I think that better gradients than Woodhouse-lane and Cookridge-street could be obtained. I know this is going beyond the present infirmary scheme, but I think in a piece of town planning of this magnitude there should be some finality shown to a street of this importance.

Registration.

That hardy annual, registration, again occupied an important position in Mr. Blomfield's Presidential address before the Institute, and I think he strikes the very note of registration when he states, 'A sound and thorough professional training is the basis on which any form of registration must be founded. If we are to obtain public and formal recognition of the fact that architecture is not an art that can be practised by Dick, Tom, and Harry with advantage to the community, and that there is a difference in kind between the work of the trainer, designer, and the architectural efforts of the gentleman who combines the practice of architect, auctioneer, and estate agent, we shall see to it not only that our present standard is maintained by all who enter our ranks, but also that it is slowly and surely raised, so that there can be no question as to who is or who is not qualified to undertake the work that legitimately falls on to an architect.'

The Institute is pledged to the policy stated in the report of the Committee of 1897, but very little headway has been made during the last four years; of course, I know the subject bristles with difficulties, but many converts are being made every year. We in the provinces have, perhaps, felt the necessity more than the London men, but I am glad to think they are coming over by degrees. The new Council have appointed a large and carefully selected Committee to consider the whole question, which contains, I am glad to say, a number of representatives from the provinces, and I sincerely trust that their deliberations will bear early fruit.

The Allied Societies.

A circular letter from the Royal Institute of British Architects has been sent to all the allied societies, stating that the Council are anxious that the control and supervision exercised by the allied societies all over the country should be as complete as possible, and that some of the provinces allotted to them are too large, and that their organisation cannot adequately deal with more than a certain area. They also drew attention to the fact that there are a large number of members and Licentiates of the Royal Institute who do not belong to the allied societies, and ask for suggestions to improve this. With regard to our own Society a fair number of Fellows and Associates who reside in our area are members of the Society, but the percentage of Licentiates is not so good. The figures are as follows:—Twenty-five members, five not; Associates, thirty-five members, ten not; Licentiates, sixteen members, sixty-two not. Leeds, I think, is well situated as a centre for the majority of the towns represented. If it is proposed to create additional allied societies I would suggest that Yorkshire should follow the Ridings, which would then be as follows, viz.:—York and North Riding; Hull and East Riding; Leeds and West Riding. To obtain more supervision and influence over the provinces it would seem necessary that all members of the Institute should become members of the allied societies. In the case of Fellows and Associates, I do not think there would be any opposition, because the Royal Institute of British Architects refund their subscriptions. With regard to the Licentiates

There may be opposition, unless the Royal Institute of British Architects can see their way to refund the necessary subscriptions, which I think they most certainly should do. There is a feeling abroad, I know, that most of the provincial members obtain very little benefit from their membership of the Institute, and I think something might be done to allay this feeling—say, by conferring certain grants to the allied societies.

The XXth Century.

Now let us look at the general condition of things in the XXth century. The age of esoptrics is past. Englishmen are never in the attitude likely to live under any more grinding tyranny than the Caucasus. Workmen are no longer slaves, even though they care quite as little or less about their work. The days when the prelates of powerful churches, or the despots of petty kingdoms, could employ the tedious labour of their serfs in carrying out the architect's dreams have gone for ever.

As Mr. Ruskin has said, "For us there can be no more the throne of marble, for us no more the vault of gold; but for us there is the leftier and leveler privilege of bringing the power and the heart within the reach of the humble and the poor; and as the magnificence of the past ages failed by its narrowness and its pride, ours may prevail and continue by its universality and its lowliness." Some few are called upon to do great things, like the Cathedral at Liverpool, or the County Offices, London. But, as a rule, we must be content to do simple things and to do those simple things as well as in lies. Buildings of unlimited cost are now out of the question. Everyone who wishes to build wishes to build with due economy; be our aim to help him to build art also. The time of the workman man means—to put it in a one word—money. We have to provide buildings simple and good. And the importance of the architect who should succeed, of knowing precisely how and when to place rightly every building of expenditure on his building, whether of mouldings or ornament, sculpture or painting, as increased of late a hundred-fold. Unlike the painter, who places his creations at once upon the canvas, or the sculptor, who petrifies his ideas direct into marble, the architect has to reduce his ideas direct on paper and then to efface his materials by the hands of others. We cannot send houses and churches to the Royal Academy, and the Architectural Room here would be a more direct exhibition of architecture if it consisted of photographs of executed buildings. Drawings of some of the best architectural works are sometimes rejected, because not drawn as coloured pictures. I am glad that the Royal Institute has at last taken photographs into consideration for the election of the Fellowship, because, to my mind, there is the great history of illustrating executed work. The great historical knowledge of architecture arising from the increase in the number of books and photographs has given rise to more and more downright copyism, some clumsy adaptation, and a serious amount of architectural muddle in buildings. Rightly used books and photographs ought to produce a greater consensus of knowledge, and should enable man to think more freshly and design more freely.

Art and Payment.

More "eclectic" building, however clever, only renders more conspicuous the absence of design and creative power. If you wish to produce, and intend to produce, good art you must endeavour to understand first of all that you will never get paid for it. The pleasure you have had in it must be to yourself all the reward you will receive. You will, of course, be paid your percentage calculated on the sum which the builder has received for his part of the work, but you will receive this all the same you work with the mind of the two-square and compasses and not in the spirit of the artist. The art in your work depends wholly on the pleasure you have taken in it, and has no market value.

Creative art can never be produced by rules, however necessary. We cannot always be repeating the wisdom of the ancients. Times change. New wants of time arise. The artistic perceptions in relation thereto grow clearer. There is no rule without an exception, and he who has passed into the inner sanctuary behind architectural rules and canons may sometimes break them with advantage.

The future will tell whether the present has architects able truly to write history on

the wall. The palmy days of Greece contrasted the perfect beauty of the Temple in the noblest architecture with the hovel of the present in its lowest squalor.

In this England of ours to-day power is passing from the noblesse to the masses. Art, if any is to be left at all, must belong to the people, powerfully influencing by its universality their homes and lives.

He who succeeds best without affectation in producing simple artistic work fit for the domestic life of England does most to discredit the modern shams and silly, pretty trumpery which meets us on all sides, and best paves the way for a new era in English architecture.

Prizes to successful students in the annual competitions were then distributed. Mr. W. Butler was awarded a 3*l.* 3*s.* consolation prize for measured drawings of Newland Hall, near Wakefield, the silver medal not being awarded.

The first prize of 2*l.* 2*s.* for design was awarded Mr. W. Voelkel, and the second prize to Mr. Douglas Bowman.

The Society's sketching prize of 2*l.* 2*s.* was awarded Mr. C. B. Chadwick, who also received a 1*l.* 1*s.* prize from the Sketching Club.

A concert arranged by Mr. D. Bowman filled up the rest of the evening.

GENERAL NEWS.

Professional Announcements.

Mr. John Borrowman, A.R.I.B.A., announces that he is moving his offices to No. 9, Adam-street, Adelphi, W.C.

Appointments:

H.M.'s Office of Works.

The First Commissioner of Works has appointed Mr. W. A. Robinson, of the Colonial Office, to be Assistant Secretary *vice* Mr. William James Downer, C.M.G., I.S.O., who has just retired after forty years' service. Mr. Downer entered the Office of Works in 1871; he became Principal Clerk in 1901, and in 1909 was appointed Assistant Secretary and Treasurer of St. Peter's (Crown) Chapel, Vere-street, W.

New Commission: City Lieutenantcy.

At the opening on November 29, at the Mansion House, of the new Commission of H.M.'s Lieutenantcy for the City of London Mr. Charles Herbert Shoppee, F.R.I.B.A., F.S.I., was reappointed Surveyor and Architect to the Commission.

The British Fire Prevention Committee.

The various vacancies on the Council of the British Fire Prevention Committee have been filled as follows:—Lord Montagu of Beaulieu, J.P., V.D., D.L., will take the place of the late Major-General Festing, C.B., F.R.S.; Sir Aston Webb, C.V.O., C.B., R.A., will take the place of Sir John Taylor, K.C.B., deceased; Sir Maurice Fitzmaurice, C.M.G., M.Inst.C.E., will replace Mr. Alexander Ross, M.Inst.C.E., retired; Mr. W. Slingo, Engineer-in-Chief, General Post Office, will replace Mr. E. G. Rivers, I.S.O., late Chief Engineer, H.M. Office of Works, retired; and Mr. Hippolyte J. Blanc, R.S.A., F.R.I.B.A., will replace Mr. Spencer Hart, M.Inst.C.E. The Executive as re-elected includes, among others:—Mr. Edwin O. Sachs, F.R.S.Ed., as Chairman; Mr. Horace S. Folker, F.A.I., as Hon. Treasurer; Mr. Ellis Marsland as Gen. Hon. Secretary; Mr. J. W. Restler, M.Inst.C.E. (of the Metropolitan Water Board), Hon. Chief Officer; Mr. J. Herbert Dyer, Mr. Max Clarke, F.R.I.B.A.; and Mr. Percy Collins, J.P.

The Armouries, Tower of London.

The First Commissioner of H.M.'s Office of Works, in whom the charge of the buildings, etc.—the Regalia excepted—in the Tower now vests, has appointed Mr. Charles foulkes, B.Lit., of St. John's College, Oxford, to succeed Viscount Dillon, M.A.Oxon, F.S.A., who will retire at the close of the year from the Curatorship of the Armouries in the Tower, which he has held for fifteen years past. Mr. foulkes, who was educated at Radley and Shrewsbury Schools, and St. John's College, Oxford, is the author of many works relating to arms, armour, and armourers, amongst them being "Arms and Armour in the University of Oxford" and "The Armourer and his Craft" (1912).

Royal Academy Election.

Mr. Henry Herbert La Thangue, A.R.A., of Petworth, Sussex, who was elected an R.A. on November 27, was educated at Dulwich College, in the R.A. Schools, and at the Ecole des Beaux-Arts, Paris. He is an Examiner in Art to the Board of Education. His pictures for the most part consist of landscapes with figures, and frequently have their scenes laid in the South of France.

City Architect's Department, Nottingham.

The Special Committee appointed by Nottingham City Council to deal with the question of the office of City Architect (rendered vacant by the resignation of Mr. F. B. Lewis), and the future of the Architect's Department, report having had before them a letter from the Nottingham Architectural Society, expressing the opinion that in dealing with the Department the advisability of entrusting the design and execution of important public buildings to architects in private practice should be taken into consideration, the selection to be made by competition, or in such other way as may seem best to the Corporation. With regard to the future of the Department, the Committee state that they are of opinion that it should be continued, and recommend that Mr. Arthur Dale (the present Assistant City Architect) be appointed City Architect, at a salary of 450*l.* per annum, the appointment to be subject to termination by one month's notice on either side. In accordance with the authority delegated to them, the Committee have appointed Mr. Lewis as Consulting City Architect, at a retaining salary of 250*l.* per annum. This appointment is also subject to termination by one month's notice on either side.

Church Building Society.

The Incorporated Church Building Society held its usual monthly meeting on the 21st ult., at the Society's House, 7, Dean's-yard, Westminster Abbey, S.W., Mr. George Cowell, F.R.C.S., in the chair. Grants of money were made in aid of the following objects, viz.:—Building new churches at Walsley, 200*l.*; Harrow-on-the-Hill, St. Peter, Middlesex, 200*l.*; and West Shore, Church of Our Saviour, Llandudno, 70*l.* Rebuilding the churches at Gloucester, St. Catherine, 90*l.*; and Milton, St. James, Portsmouth, 180*l.*; and towards enlarging or otherwise improving the accommodation in the churches at Cavenham, St. Andrew, Suffolk, 10*l.*; Christ Church (Forest of Dean), Glos, 10*l.*; Fir Tree, St. Mary-the-Virgin, Co. Durham, 40*l.*; Fitzroy-square, S. John the Evangelist, Middlesex, 40*l.*; Hambleton, St. Peter, Surrey, 10*l.*; Old Ford, St. Paul, Middlesex, 50*l.*; Othry, St. Michael, Somerset, 40*l.*; Radford, St. Nicholas, Coventry, 75*l.*; Redberth, Pembro, 50*l.*; and Hendon, St. Paul, Sunderland, 30*l.* Grants were also made from the Special Mission Buildings Fund towards building Mission Churches at Bridgmar, Hants, 10*l.*, making all 35*l.*; Cleo Hill, St. Peter, Salop, 20*l.*; East Studlad, Kent, 15*l.*; and West Humberstone, Leicester, 40*l.* The following grants were also paid for works completed:—Newfoundpool, St. Augustine, Leicester, 400*l.*, being balance of a grant of 1,900*l.*; Woolacombe, St. Sabinus, Devon, 80*l.*; Slade Green, St. Augustine, Kent, 20*l.*; Caerwent, St. Tathan, Mon, 40*l.*; Bethnal Green, St. Simon Zelotes, Middlesex, 10*l.*; Dimmington, St. Leonard, Yorks, 20*l.*; Woolwich, St. John, Kent, 50*l.*; Walton-on-the-Hill, St. Mary, Liverpool, 70*l.*; Charlestown, St. Thomas, Halifax, 20*l.*; Highgate, All Saints, Middlesex, 50*l.*; Grimsby, St. Augustine, 150*l.*; Welton, St. Mary, Lincoln, 20*l.*; Eastrop, St. Mary, Hants, 40*l.*; Snettinton, St. Stephen, Notts, 100*l.*; Cardiff, St. Stephen, 200*l.*; Pontyates, St. Mary, Carmar, 75*l.*; Luckington, St. Mary and St. Ethelbert, Wilts, 20*l.*; East Hanney, St. James-the-Less, Berks, 10*l.*; Newtown, near Salisbury, 50*l.*; Two Mile Hill, St. Alban, Bristol, 30*l.*; Silfield, St. Helen, Wymondham, Norfolk, 20*l.*; Pontygwydd, St. John the Baptist, North Wales, 10*l.*; Trebanos, SS. Michael and All Angels, Glam, 40*l.*; and Westcliff-on-Sea, SS. Michael and All Angels, Essex, 50*l.* In addition to this the sum of 790*l.* was paid towards the repairs of thirty-two churches from trust funds held by the Society; and sums of money were accepted as repair funds for the churches at Edenbridge, St. Peter and St. Paul, Kent, and Kensal Town, St. Thomas, Middlesex.

Phillips Memorial, Godalming.

The memorial to the late Mr. Phillips, the chief telegraphist (wireless) on board the *Titanic* has been designed, jointly, by Mr. Thackeray Turner and Miss Gertrude Jekyll. The general motif is that of an opened and closed cloister, 120 ft. square, in a plot of land on the main road to Portsmouth, having a small inner garden, and an unbroken cloister on two sides, with the remoter side arched and open to the meadows and hillsides, generally designed after the style of the local farm buildings and homesteads.

Open Spaces and Recreation Grounds.

Sir Spencer Mayon-Wilson, Bart., Lord of the Manor, has presented 32 acres of Charlton Park, abutting upon Charlton-road and Hanging Wood-lane, to the London County Council for purposes of public resort and recreation. A report presented at the last meeting of the Metropolitan Public Gardens Association, held under the presidency of Lord Meath, sets forth that the limit of option granted to Lord Plymouth for purchase of the Crystal Palace and the grounds has been extended to May of next year in order to afford time for the raising of the £10,000, which is needed for that object; the out-of-pocket expenses will amount to from 20,000l. to 30,000l. in addition.

The Cambridge Public Health Series.

The Syndics of the Cambridge University Press have decided to publish a series of volumes dealing with the various subjects connected with public health. The following provisional list of subjects, amongst others, will be treated by experts:—Sewage Disposal; Water Purification; School Hygiene; Physical Education; Ventilation; Soils, Subsoils, and Climate in Relation to Health; Sanitary Law and Practice; Domestic Sanitation.

BOOKS.

The Cathedrals and Churches of Rome and Southern Italy. By T. FRANCIS BUMFUS. (T. Werner Laurie. Price 16s. net.)

BOTH in matter and manner of compilation this book is praiseworthy. It will be best read perhaps beneath the immediate influence of the buildings which it describes, even as it has been written. The author deals carefully and with knowledge of each master of interest connected with them—their history, architecture, monuments, and the ritual of their services. His time has been for the greater part occupied with the Roman survey. There is variety in Roman churches. Indeed, San Stefano and San Clemente are unique, while some of the earlier interiors, like Sta Maria in Cosmedin are not to be matched in their display of a simple dignity and charm. But Renaissance architecture as it developed itself in Rome seems always a little overweighted by a sense of its dignity—of importance, indeed—and by the claim for the respect it considers its due. This quality is expressed in the contrast between S. Peter's and the Duomo in Florence. Michelangelo learned the Roman manner, but he was ever a Florentine at heart, and lies buried in Santa Croce. All who have made the Eternal City their home for any prolonged period submit to her claim. It is so in the author's case, and, although it renders him a most suitable *elezione*, a greater number of illustrations would enable the reader to follow him more critically, and therefore with a greater interest. Indeed, ample illustration is demanded by all books of this descriptive character, and the architect especially looks for ground plans, without which such a book as this cannot be said to fully satisfy him.

Catalogue of the Etched Work of Frank Brangwyn, A.R.A., etc. (London: The Fine Art Society, Ltd. 1912. Price 3s. 6s.)

THIS is the fourth catalogue of modern etching which has recently appeared. The works of Muirhead Bone were treated by Campbell Dodgson in 1909; those of the late Sir Seymour Haden, by H. Nazby Harrington in 1910; and in the early part of the present year D. Y. Cameron was catalogued by Frank Rinder. Mr. Frank

Brangwyn does not approach etching from the standpoint of the artists we have named. He has a method of his own, and has found in the zinc plate a vehicle for the display of his mastery of drawing and composition. His appreciation of mass as an architectural effect is unquestionable, and certainly unrivalled among the exponents of large architectural plates. "A Mosque, Constantinople" (No. 185), and the "Valentré Bridge, Cahors" (No. 178), are typical of this power, and mark a conception of architecture that is far too little indulged. The long list of works possessed by foreign galleries which is given at the close of the book show the appreciation which he receives abroad. Since the artist makes no pretence of being influenced by the English school of etching, this must be accepted as a wholly individual compliment. Two hundred reproductions are given in the catalogue, necessarily very greatly reduced, but from the collector's point of view sufficient for identification. The size of the plate is, stated in both English and Continental measurements.

The Law Relating to Highways. By H. HAMPTON COPPALL. (London: Charles Knight & Co., Ltd. 1912. 8 vo., lxxx., and 786 pp.)

THIS work was first published in 1905, and the success which attended it showed that a concise treatise on the law of highways was much needed. In this second edition the book has been rearranged, and apparently a great deal of it has been rewritten. The introduction of many more headlines and the breaking up of the chapters into concise paragraphs on particular subjects will certainly be appreciated by those for whom the book is primarily intended. The style of the work seems to suggest that it is intended more for the use of laymen and officials than for trained lawyers, and it is really a comprehensive and exhaustive digest of the somewhat uninteresting branch of the law with which it deals. The author in his preface makes his acknowledgments to better known books on highway law and kindred matters, and one cannot but feel that Mr. Coppall has entirely succeeded in his attempts to boil down the vast stores of learning contained in other volumes to a more compendious and useful size. To have accomplished the task of compressing the whole of the law relating to highways into the compass of one comparatively small volume is indeed a notable achievement, and the author is certainly to be congratulated upon having produced a very readable and useful treatise. The general arrangement of the book and the division of the subject matter is in every way excellent and of such a character that any particular point can easily be located. It is not possible within the scope of this review to give anything like a full account of the many and varied matters dealt with in this comprehensive volume, so it must suffice to say that it is encyclopedic in its completeness. The labour involved in preparing such a volume must indeed have been stupendous, and the author is worthy of all praise for the energy and skill he has brought to bear on the undertaking.

In addition to the main portion of the volume, which deals thoroughly in direct and concise language with every conceivable matter in connection with highways, their administration and use, there is also a very good appendix containing an epitome of enactments relating to highway administration arranged in chronological and sectional order, beginning with Magna Charta 1297 (25 Ed. I. c. 15), which, it is interesting to note, enacted in sect. 15 that no town or freeman were to be distrained to build bridges unless they were already by custom bound to do so. The list is brought right up to date by the inclusion of the Motor Car (International Circulation) Amendment Order dated June 24 of this year. Chapter XXXVIII, which deals with light locomotives on highways, will be found to contain a fairly complete account of the law relating to motor-cars. In addition to the table of contents there is an excellent table of statutes and a table of cases, and the book is also furnished with a more than usually good index. We can with the utmost confidence recommend this book not only to highway officials, but to all who are interested in highway administration, either as county councillors or as district councillors or otherwise. Surveyors and architects, too, should find a place for it on their bookshelves.

Butterworth's Workmen's Compensation Cases. Vol. V. (New Series). Edited by His Honour JUDGE RUGGE, K.C., and DOUGLAS KNOCKER, Barrister-at-Law. (London: Butterworth & Co. 1912. Pp. 697.)

THIS volume of these well-known reports, which comprises every case heard in the House of Lords and the Court of Appeal in England, with selected cases heard in the Irish Court of Appeal and the Scotch Court of Session, from October, 1911, to October, 1912, contains all the characteristics of the previous volumes and requires no recommendation in the hands of the reviewer. In addition to the 697 pages devoted to the actual reports of cases there is a table of cases reported in both series of these reports, and besides an index to the subject matter of this volume there is a digest to the volume arranged according to the sections of the Act.

Both the legal profession and the public are indebted to the editors of these reports for the able assistance they receive in mastering this one very special branch of the law, but the jurist contemplating the number of cases that have arisen under this one Act in this single year may well ask himself is legislation which involves such a mass of litigation well conceived? Litigation means a charge on the public purse, and legislation conferring benefits upon a class at the cost of another class should, if possible, be expressed in clear terms, for if litigation ensues the burden of remedial legislation is increased, whilst no corresponding increase in benefit is conferred. Statutes whose intention and meaning are left to be discovered by the Courts are a product of modern times, and it is necessary to point out that less haste in legislation and more time for deliberation on Bills in Parliament would relieve the public of the necessity for vexatious litigation and facilitate business arrangements and insurance.

Urban Land, Traffic and Housing Problems. By A. W. ALDERSON. (London: P. S. King & Son. 1912. Price 6d. net.)

THIS land in relation to town planning and city improvement schemes is a subject to which as time goes on public attention is becoming more seriously directed, but it presents a problem involving questions social, political, even ethical, with which it is not our special province to deal. From the point of view of the technical town-planner the first essential would seem to be a suitable and unrestricted site for his town, and such control over the whole of the land involved as permits his scheme to be properly developed; but how this control should be obtained it is not for him to say. One fundamental difficulty in dealing with this land is usually ascribed to the fact that it is a monopoly, but the author of this pamphlet suggests that the prevailing ideas are wrong, and that land for town improvement is so costly just because it is not a monopoly, as if it were it could be obtained for nothing. To understand the author's drift, it is necessary to realise that by a land monopoly in any district he means ownership by a single person or group of persons whose interests are identical; not, as at present, by a number of individual persons whose interests are conflicting. If London was owned by a syndicate of which the present landowners were shareholders instead of by a thousand different persons, he contends that the syndicate would be able to give up all land required for improvements without any loss of revenue, as so long as people lived somewhere in London the exact position would not matter. They would still pay rent to the syndicate, and the more land given up for parks or open spaces the more the remainder would increase in value, the total of the rent-roll remaining the same.

When referring in a previous number to the advantages that might be derived from extending to the whole of London the system of single control now obtainable on the estates of the great landowners we expressed the opinion, which we see no reason to alter, that public sentiment would never permit any one man or group of men to own the whole of the land of London. But this land problem has to be faced and solved, and this suggestion is an interesting contribution in that direction.

The Arbitration Clause in Engineering and Building Contracts. By E. J. RIMMER. (London: Constable & Co. 1912. 24 pp. 2s. net.)

THIS is an excellent little monograph dealing with the Arbitration Clause in engineering and building contracts, with the object of putting

forward certain suggestions for the modification of such clause in view of recent legal decisions. The author points out that the powers of an engineer under a contract for engineering or building works have been seriously undermined by recent cases in the Court of Appeal and the House of Lords. The object of the author is chiefly to consider the effect of the decisions in four cases, namely, *Freeman v. Chester Rural District Council*; *Aird v. Bristol Corporation*; *Blackwell v. Derby Corporation*, and *Dickman v. Roberts*, so as to warn engineers of the danger which has arisen therefrom, and then to suggest alterations which may be made in engineering contracts, fair to building owner and contractor alike, for the better security of the settlement of disputes by arbitration. The learned author explains the law as it was laid down in the famous judgment of Lord Justice Bowen in *Jackson v. Barry Railway Company* (1893) 1 Ch. p. 238, and gives a very fair and accurate summary of the effects of the cases above mentioned. The broad lesson to be learnt from them is, he contends, that the Arbitration Clause is by no means unassailable, and he suggests, therefore, that if the building owner desires to ensure that an action cannot be maintained in the courts of law he must now make several modifications in the usual contract as it at present stands. The conclusions arrived at by Mr. Rimmer seem to us to be very proper and useful ones. This little essay, therefore, is decidedly worth perusal by all who are in any way interested in engineering or building contracts.

The Materials Used in Sizing. By W. F. A. ERMEN, M.A. (Constable. 6s. net.)

Though sizing is not an operation of great relative importance in building work, there is no doubt that the properties and ingredients of this material might be better known to many who have to deal with it. That the author has confined himself to the sizing materials used in the textile industry is unfortunate from the standpoint of most of our readers, but, though questions connected with the special nature of cloth do not usually concern an enumeration and description of the ingredients of sizes should be of interest to all responsible for decorative work. The book opens with a chapter on the dyes which are carefully differentiated with the aid of diagrams, and this is followed by a short account of the weighing materials employed, and a more detailed account of the softening ingredients which it is essential to use in the case of fabrics. Chapter IV. deals with the antiseptics necessary to prevent mildew and other putrefactive changes, and Chapter V. with the analysis of sized cloth. A short account of the volumetric solutions required by the analyst follows, and the book concludes with an index preceded by thirty pages of tables, chiefly concerned with the density of various solutions. Though containing some matters of lay interest, the work deals chiefly with the actual operations required by the analyst, to whom it should prove useful.

CORRESPONDENCE.

"A Thoroughly Up-to-Date Society."

SIR,—No one recognises more than I do the value and desirability of criticism, inasmuch as it often brings fresh light to bear upon a subject, but it should, in my opinion, be of value be based on the actual observations made, and not on what the person affected is supposed to have said. In your reference to my remarks regarding the Licentiate, the point I raised was that numbers of those who have been admitted appear to have joined the Institute under

the misapprehension that it would be quite easy—in fact, more or less a matter of form—for them to become Fellows of the Institute, but now they find that they have to sit for, and pass, an examination extending over a period of six days in order to qualify as candidates for the Fellowship. I ask how they feel about it, in the actual words you quote in full.

Had you appreciated my reference you would scarcely have been at a loss to understand how I, as a Fellow of the R.I.B.A., or as the mouthpiece of another society, could make a statement which was perfectly clear and justifiable if quoted in full, but which was rendered misleading through your omission of the context.

As for holding out a bait for Licentiatees to join the Society, it may be of interest to you to know that among candidates who have applied for membership of the Society, but who were not successful owing to lacking the necessary qualification, have been a number of Licentiatees.

Regarding my position as mouthpiece of the Society of Architects, I may, in passing, point out that I made it perfectly clear that the views I put forward in my address were personal, and they are not necessarily those of the Society, except where I make reference to the work upon which the Council are actually engaged, such as the education and Registration of architects.

With regard to the Society's proposal to introduce the Beaux-Arts system of architectural ateliers into England, I would refer you to a leading article in the *Builder* of June 4, 1910, headed the "Beaux-Arts in the United States of America," where you pointed out that all the younger architects and architectural students of America received their training either directly or indirectly on Beaux-Arts principles, with the result that the recent architecture in the United States has gained much by the influence of the Beaux-Arts, and that, while it still displays some of the defects so patent in our own, it has progressed far beyond ours owing to the voluntary subjection to the Beaux-Arts scheme under which the American architect has judiciously elected to place himself. You go on to predict that our students will in the near future feel impelled to follow this example, and you suggest that the sooner this decision is arrived at the more rapid will be our progress; and you close by stating that it would not become us, still laggards in this race, to scrutinise too closely the exact stage that this has been reached, except with a view to modelling our own procedure in the future.

It is true as you now remark, that this system has been of slow and natural growth in France, but, if your former leading article is to be trusted, it is equally true that the system has been introduced into America with the most beneficial results to the architecture of that country. Considering also that in a further note you appeared to recognise that there might be a necessity to obtain instructors from abroad, we might have ventured to have hoped for a more sympathetic attitude towards an attempt to carry out the general ideas which your journal itself suggested.

Another point in my address which you criticise is the suggestion that the R.I.B.A. and the Society should work together generally—one looking after the interests of architecture and the other that of architects. If you will refer again to my address you will see that this is purely my personal suggestion, which I put forward as being worthy of consideration not only of the R.I.B.A., but of the Society of Architects, which as a body has not yet considered the matter.

My idea was, and is, that the two societies should work together by mutual arrangement and in perfect harmony. It would then be to the interests of members of the Institute to become members of the Society (the subscriptions of both societies being adjusted accordingly), and what would naturally happen at the first ensuing Council elections would be that the leaders of the profession would seek election on both Councils, and consequently both bodies would be governed by them, and, in my opinion, the present system of overlapping might be entirely avoided.

I trust you will see your way to publish

this letter in your next issue to correct the misapprehension in which you have inadvertently fallen. PRACY B. TUBBS.

** Our best answer to the above charge of misunderstanding Mr. Tubbs is to quote him in full as his remarks appear in our report:—"The Royal Institute of British Architects have succeeded in getting some 2,000 architects to become Licentiatees, but numbers of these appear to have joined under the misapprehension that it would be quite easy—in fact, more or less a matter of form—for them to become Fellows of the Institute. As a matter of fact, only ten have been able to satisfy the examiners and qualify as candidates for election as Fellows at the first examination which has been held. This examination proved not to be a mere matter of form, but a very real test extending over six days. How Licentiatees feel about this I do not know, but possibly some or even many of them would rather be corporate members of a progressive and thoroughly up-to-date Society, making for reform all the time, than merely non-corporate members of the senior body. I, for one, shall watch future developments in this respect with great interest." The italics are our own. Mr. Tubbs's supplementary remarks that some Licentiatees have not been able to qualify for membership of his Society does not, in our opinion, help to make his position in this matter clearer. If Mr. Tubbs cares to search our columns he will find many appreciative references to the Beaux-Arts system of architectural training. There is nothing contradictory in this respect in our criticism of last week. To approve of the principles of a certain system of training is, however, quite another thing from approving of an attempt to transplant one of its isolated phases. So far as the concluding part of the above letter is concerned, it must have struck other readers besides ourselves that a considerable portion of his opening address as President of the Society of Architects was occupied with the affairs of the Royal Institute, whose President a week previously had, possibly with greater authority, covered the ground.—Ed.]

Fire Protection and the London County Council.

SIR,—In your issue of November 29 you did me the honour of printing my letter regarding what I described as the apathy of the London County Council in enforcing the London Building Act Amendment Act of 1905, and in your admirable article on the subject of the Kensington fire, in which you refer to my letter and also to a reply by the Chairman of the Building Act Committee of the London County Council, you express your hope that "prompt measures will be taken to deal with dangerous cases, particularly where premises are occupied in part for dwelling or sleeping purposes."

I now venture to ask for further space in your esteemed columns, firstly, to meet the reply of the Chairman of the Building Act Committee, and, secondly, to make some suggestions as to the prompt measures that should be taken to remedy the present state of affairs.

My first letter arose out of certain queries of the Coroner presiding at the inquest at the Kensington fire, and in that letter I speak of 50,000 buildings that have remained unattended to for seven years, the small number actually put in order by the Council up to June last (June 12 to be exact) having been only 527.

Having regard to the subject I was discussing—i.e., the fire at Messrs. Barker's—I was obviously referring to existing buildings under sect. 9 of the enactment of 1905, and no figures contradictory to mine have so far been produced on behalf of the Council.

Now, Mr. Taylor, of the London County Council, in his desire to show that the County Council has been active under the Building Act Amendment Act, is at pains to point out that the Council has during the past seven years dealt with 1,189 cases of new buildings, and has granted certificates to such new buildings to the extent of 1,043. I concur with Mr. Taylor as to the exactitude of these two figures, but they have nothing to do with my complaint, as my complaint related to existing buildings—i.e., not to buildings "about to be erected." It is obvious that new buildings for which plans have to be deposited, and in which all existing statutes have to be provided for, must be dealt with as matters of ordinary routine.

Again, Mr. Taylor, in wishing to take credit for his Department for having completed 351

cases under sect. 11 and 4,430 applications for exemption, etc., under sect. 10 and 12 of the Building Act Amendment Act as to projecting shops, etc.—again subjects not complained of in my letter—does not really improve the Council's case against my charges of sluggishness, but the reverse. He has overlooked the fact that the Superintending Architect, in giving evidence on the London County Council General Powers Bill in June last, also stated that, as far as these particular sections were concerned (and apparently also sect. 11), 48,566 have been notified to his department as requiring attention. In other words, some 44,000 additional cases, over and above 50,000 I complained of, have now been waiting seven years for the Council's pleasure.

Thus, by Mr. Taylor's own showing, the position is far more serious than I had desired to indicate.

Mr. Taylor, it is true, prides himself on some 23,500 warnings having been sent out regarding the 48,500 cases notified to the Council, but he is silent on the question as to how many of those notices have been really enforced. May I suggest *nil*, for, as I stated with regard to sect. 9, so with the sects. 10 to 12, the Act has been very much of a "dead letter."

Summarised, about 94,000 buildings in all under the Act are now awaiting action since 1905, including the 50,000 under Schedule 9 previously complained of. Surely this is a terrible total.

It is, however, no use complaining of the County Council's sluggishness without indicating some remedy. The remedy, to my mind, is a very simple one; it comprises the following:—

(a) A public announcement (repeated monthly) by the London County Council that it intends to have the whole of the work under the Building Act Amendment Act remedied by January 1, 1918, the public announcement being followed by two circular notices in the 44,000 cases under sects. 10 to 12.

(b) An immediate instruction to the District Surveyors to notify to the Council within six months (as set out in sect. 17) all cases they consider to come under sect. 9—a matter that has been practically neglected during the past seven years—and immediately upon receipt of these notifications an issue of circular notices to owners concerned that the Council are prepared to receive suggestions accompanied by plans with proposals as to convenient dates for carrying out the necessary structural improvements, and are prepared to assist in every possible way applicants who volunteer assistance and offer prompt remedies.

(c) A cancellation of the existing notification to the District Surveyors that they are not to press the execution of work under sects. 10 to 12 in their respective districts, and in place of that notice an instruction that they shall see that the whole of this work is carried out by 1918 or earlier, the instruction to set out certain guiding principles as to remedies and also grounds for exemption. As to exemptions, any recommendation for exemption signed by the local District Surveyor and two adjoining District Surveyors should be accepted *ipso facto* by the Building Act Committee as a *prime facie* case for exemption without further investigation or expense.

(d) The energetic enforcement in 1913 by legal proceedings of at least one case under sect. 9 and one under sect. 10 in each district as an earnest of the Council's intentions.

(e) The formation of several Sub-Committees of three in the Building Act Committee to sit weekly to accelerate the decisions requiring the Committee's attention under the 1905 Act, with the necessary strengthening of Mr. Riley's personal staff and the staff of the Committee Clerk.

(f) The immediate strengthening of Mr. Stransome's staff in the Building Act Department by five managing assistants, twenty senior assistants, twenty junior assistants, and twenty clerks, etc., all on the temporary establishment, the staff to work by areas, and each senior assistant to follow his own case from beginning to end, all modern mechanical equipment to be used to accelerate the work, including photography and mechanical copying instead of tracing.

(g) The publication quarterly of a list of building owners who have complied with the Building Act Amendment Act of 1905.

If the remedy be organised somewhat on these lines the Council will, in the first place, find that much of the necessary work will be done by owners voluntarily at their own time

and in a manner convenient to themselves—i.e., when doing their usual decorative and structural repairs. They will find a vast number of the owners will submit their own plans and suggestions. The Council will be rid of much of the work under sects. 10 to 12, which the District Surveyors are quite capable of handling, and they will find their intentions to carry through this somewhat unpleasant duty of enforcing the Act of 1905 in a business-like way will be appreciated and met in a proper spirit by the majority of building owners and their professional advisers. As to the cost, owners have already had seven years' time to make the necessary reserves.

Given a procedure on these lines, the necessary alterations to existing buildings can be readily completed in five years, and the structural work will not be found to inconvenience the metropolis, as it is mainly internal and less in quantity than what has been done in London in several active building periods of lesser duration.

EDWIN O. SACHS.

Offices of the British Fire Prevention Committee,

8, Waterloo-place, Pall Mall, S.W.

P.S.—Since writing the above I have been given to understand that Mr. Taylor, in the Council Chamber on December 3, has further confused the issue in certain replies to Mr. Jesson by including the number of buildings that have been attended to by the Building Act Department under the old Factory Acts—an entirely different matter—as work done purely in the interests of the 1905 enactment. There are, of course, a number of buildings to which both the Building Act Amendment Act of 1905 and the Factory Acts apply, but the number of factories erected prior to 1906 which had already then fully complied with the current requirements under the Amendment Act of 1905 are not very numerous, so that any slight overlapping in this direction does not affect my primary complaint, whilst those that partially comply cannot well be included as meeting all the requirements under this law.

Similarly, Mr. Taylor's proud record of the number of buildings inspected under the Factory Acts as a matter of ordinary routine, although a creditable instance of regular work done, in no way assists him in finding an acceptable excuse for not dilating on exercising the powers of the Council in respect to the many thousands of structures (about 94,000) awaiting attention as coming under the different sections of the 1905 enactment.—E. O. S.

Should Names of Assessors be Known to Competitors?

SIR,—Mr. Voysey, in his "open letter," does not take any notice of the chief reason for publishing the names of assessors in competitions, which is that the competitors themselves may know that their work will be judged by men possessing the special knowledge required, as well as an impartial spirit.

When the ablest man that can possibly be obtained is appointed assessor there is no question of designing "up or down to the assessor's taste," or of refraining to compete because you "do not sympathise" with his taste. The late Mr. Alfred Waterhouse, R.A., was an admirable assessor, but neither the Cardiff Town Hall and Law Courts nor the Colchester Town Hall bear the least resemblance to his own buildings.

Some experience leads me to think that it is among the unsuccessful designs that one has to look for feeble imitations of the assessor's own "manner" in building. I do not know of a single instance in which the successful design has been markedly based on the judge's particular taste, as seen in his own works. Unless the name of the assessor is known, and is in itself a guarantee of both his fairness and ability to judge, there would be but small response among architects to any competition that might be promoted, however important.

I fear Mr. Voysey will have some difficulty in getting supporters for his complaint, because I believe the grievance is an imaginary one.

H. AUSTEN HALL, A.R.I.B.A.

Ruskin and Pugin "the Younger."

SIR,—In your interesting leader of November 22 on the late Mr. Norman Shaw I notice a chronological slip which may perchance cause perplexity to the future historian.

Speaking of the middle of the last century, you say "Ruskin and his ardent lieutenant, the younger Pugin, were beginning to arouse the imagination of architects." The reference here must, of course, be intended to apply to that great champion of the Gothic Revival, Augustus Welby Pugin. His brilliant crusade, however, began as far back as 1836 with the publication of the "Contrasts," and his unique career closed prematurely in 1852, just sixty years since. Thus his date precluded the possibility of any lieutenantancy with respect to Ruskin, while his qualities must always have made of him a leader and nothing less. And, in point of fact, the two men, though owning a common objective, were far from seeing eye to eye during the brief coincidence of their activities.

The error is no doubt primarily one of family chronology. The "Elder Pugin" known to professional biography was the French refugee of the early century, and Augustus, his son, is correctly termed "the younger." Overlooking the first generation, however, recent writers have constantly applied this differentiation as to the grandson, the late Edward Welby Pugin, whose date, of course, approximates to that indicated in your article, but whose personality and record must by no means be confounded with those of his distinguished father.

W. RANDOLPH.

[** The reference was to the son of the French refugee—to Augustus Welby Pugin. Perhaps it was a little unhappy to refer to Pugin, who was seven years the older, as "lieutenant" in the Gothic movement, but the idea was to suggest that his contribution was secondary to that of Ruskin.—THE WRITER OF THE ARTICLE.]

INTERCOMMUNICATION COLUMN.

A Dictionary of Architecture.

SIR,—Would you kindly, per the *Builder*, give the name and publisher of a good Dictionary of Architecture? P. GUY.

[** Our correspondent gives no indication of the kind of Dictionary he is in need of, and as the range of subjects dealt with in books of this class is very wide—some being stronger on the historical than on the practical side of architecture—we think it well to give a list of the principal reference books in the English language:

(1) The Architectural Publication Society's Dictionary of Architecture. Prepared by the Committee of Architects. 6 Vols. London, 1848-1892. (Price about 5*l.* 10*s.* to 6*l.* 10*s.*) For historical and biographical information this work is still of great value. Its bibliographical lists, which are given at the end of most articles, form a veritable *Index Liborum*, and afford the inquirer the fullest particulars as to the most important sources to be consulted for further information.

(2) "A Dictionary of Architecture and Building: Biographical, Historical, and Descriptive." By Russell Sturgis. 3 Vols., 4to. London and New York: Macmillan, 1901-2. (3*l.* 15*s.* net.)

(3) Atkinson: "Glossary of Terms Used in English Architecture." Small 8vo. Methuen, 1906. (3*s.* 6*d.* net.)

(4) Weale: "Dictionary of Terms Used in Architecture, Building, Engineering, etc." 8vo. London, 1876. (5*s.*)

(5) Passmore: "Handbook of Technical Terms Used in Architecture and Building." 8vo. Scott, Greenwood, 1904. (7*s.* 6*d.* net.)

(6) Parker: "Concise Glossary of Terms Used (chiefly) in Gothic Architecture." Small 8vo. Parker, 1876. (5*s.*)

(7) "Parker's Glossary of Terms." 3 Vols., large 8vo. Fifth and best edition. 1850. (Price about 2*l.* 5*s.*)

All these books may be obtained from Mr. B. T. Batsford, 94, High Holborn, W.C.—Ed.]

WESTMINSTER HALL ROOF.

Mr. Hay Morgan on November 27 asked the representative of the First Commissioner of Works whether the roofing of Westminster Hall was in need of repairs, and Mr. Wedgwood Bann replied that a thorough inspection of the roof was urgently needed, and the First Commissioner proposed at once to erect scaffolding in order to see what repairs were necessary.

ILLUSTRATIONS.

Hostel of the Resurrection, Leeds.

THE plan of the complete scheme is designed in the shape of a semi-quadrangle with front to Springfield Mount, about 170 ft. long, and east and west wings about 77 ft. long. The semi-quadrangle is open to the south except for the dwarf wall shown in the foreground.

The first portion comprises the central tower and half the front to Springfield Mount: the east wing was built about two years ago.

The part already built includes a large hall, common-room, smoking-room, common study, grand staircase under the tower, kitchen offices, servants' quarters, and thirty-two bedrooms. The portion yet to be built includes the chapel and vestries, warden's rooms, and further study and bedroom accommodation.

The contractor is Mr. J. T. Wright, of Skinner Lane, Leeds.

Proposed Church, Finchley, Middlesex.

THE site for this proposed new church at Finchley was a somewhat narrow and sloping one, occupied by a temporary iron church, over and about which it was intended to build the new church, so that the temporary building need not be removed till the new church was completed. The plan consists of a nave, 103 ft. 6 in. long by 38 ft. 6 in. wide, with narrow passage aisles, and having porches and baptistry at the west end, the baptistry being continued up to form a small bell turret or tower. The organ was intended to be placed in a raised position at each side at the east end of the nave. The chancel is 40 ft. 3 in. long by 22 ft. wide, with chapel on the north side and narrow aisle and choir and clergy vestries on the south. The roofs were intended to be constructed with steel principals, so as to avoid thrust, and the interior of the church was to be ceiled with a boarded ceiling as a ground for colour decoration, the walls and piers being white, with a coloured panelled dado against the aisle walls. The seating of the building was for an inclusive total of 760.

The design was prepared by Messrs. Geoffrey Lucas & Arthur Lodge, of Hart-street, Bloomsbury-square, W.C., in conjunction with Mr. John Page, B.A., the perspectives, illustrated herewith, being pencil drawings by Mr. Lucas.

Parliament Buildings, Winnipeg.

IN our issue of November 22 we published the winning design for the Parliament Buildings, Winnipeg, by Mr. F. W. Simon, F.R.I.B.A. In the present issue is illustrated the design of Messrs. Edward & W. S. Maxwell, of Montreal, who were among the five premiated competitors in the final competition, assessed by Mr. Leonard Stokes, F.R.I.B.A. As will be seen, Messrs. Maxwell's design is on similar lines to that of Mr. Simon, which was produced in England, and, although not successful, Messrs. Maxwell are to be congratulated on their fine effort to provide a dignified House. The style of the buildings was left to the discretion of the competitors. They were reminded, however, that "the province is politically within the British Empire, and that this fact should be expressed in its public buildings." We regret that the photographs received from Canada did not show the scale of Messrs. Maxwell's drawings.

MEETINGS.

FRIDAY, DECEMBER 6.

Glasgow Technical College Architectural Craftsmen's Society.—Professor G. Gourlay, B.Sc., on "A Review of Byzantine and Italian Architecture."

SATURDAY, DECEMBER 7.

Aberdeen Architectural Association.—Mr. Thomas Beattie on "Decorative Plasterwork, and the Adaptation of Old Methods to Modern Requirements." Illustrated. 7.30 p.m.

MONDAY, DECEMBER 9.

The Architectural Association.—Joint meeting with the Art Workers' Guild. "The Practice of the Crafts in Modern Building." 8 p.m.

Royal Society of Arts (Gower Lecture).—Mr. C. R. Darling on "Methods of Economising Heat."—II.

Bristol Society of Architects.—Mr. Francis Bond, M.A., F.G.S., on "The Growth of the English Parish Church." 8 p.m.

The Incorporated Clerks of Works' Association (Carpenters' H.R.L. London-veal).—Paper by Mr. John Barnes on "Marble Mosaics and Tiles." 8 p.m.

University of London (Victoria and Albert Museum).—Mr. Banister Fletcher on "Gothic Cathedrals of France." 5 p.m.

TUESDAY, DECEMBER 10.

The University of London (British Museum). Mr. Kaines Smith on "Greek Daily Life." 8 p.m.
The Institution of Civil Engineers.—Mr. H. A. Humphrey, M.Inst.C.E., on "The Generation and Distribution of Producer-Gas in South Staffordshire." 8 p.m.

WEDNESDAY, DECEMBER 11.

Royal Society of Arts.—Dr. F. Mollwo Perkins, F.I.C., on "Natural and Synthetic Rubber." 8 p.m.
Northern Architectural Association.—Mr. Lawrence Weaver, F.S.A., on "Small Country Houses of T-Day." 7.30 p.m.
Edinburgh Architectural Association.—Mr. J. Hayes on "Scale of Ornament in Architecture." 8 p.m.

THURSDAY, DECEMBER 12.

Royal Society of Arts (Indian Section).—Sir Bradford Leslie, K.C.I.E., on "Delhi, the Metropolis of India." 4.30 p.m.

Society of Antiquaries.—8.30 p.m.
Leeds and Yorkshire Architectural Society.—Brief description of a tour in Italy and exhibition of drawings by Mr. G. H. Foggit and Mr. Piet De Jong. 6.30 p.m.

Institution of Electrical Engineers.—8 p.m.
Shagfield Society of Architects.—Mr. R. F. Traylen on "Barnack Church, with Parallels from Neighbouring Churches."

The Concrete Institute.—Mr. Robert Cathcart and Mr. Laurence Gidd on "The Effects on Concrete of Acids, Oils, and Fats." 7.30 p.m.

University of London (British Museum).—Mr. Banister Fletcher on "Greek Corinthian Buildings." 4.30 p.m.

The Society of Architects.—Mr. E. W. Harvey Piper (hon. member) on "Salisbury Cathedral." Lantern slides. 8 p.m.

COMPETITION NEWS.

A list of current Competitions is printed on page 694.

Harrogate School Competition.

The Competitions Committee of the Royal Institute of British Architects have been in correspondence with the promoters of this competition. As a result of the correspondence the conditions have been amended, and are now regarded as satisfactory.

The following addendum to the conditions of the competition has been issued:—"In the event of the buildings being proceeded with the author of the design placed first by the assessor

shall be employed to carry out the work unless the assessor shall be satisfied that there is some valid objection to such employment, or that the lowest tender received for the work is more than 10 per cent. above the author's estimate." The premiums offered are 100l., 50l., and 25l., and designs must be sent in by February 3, 1913.

School at Govan, N.B.

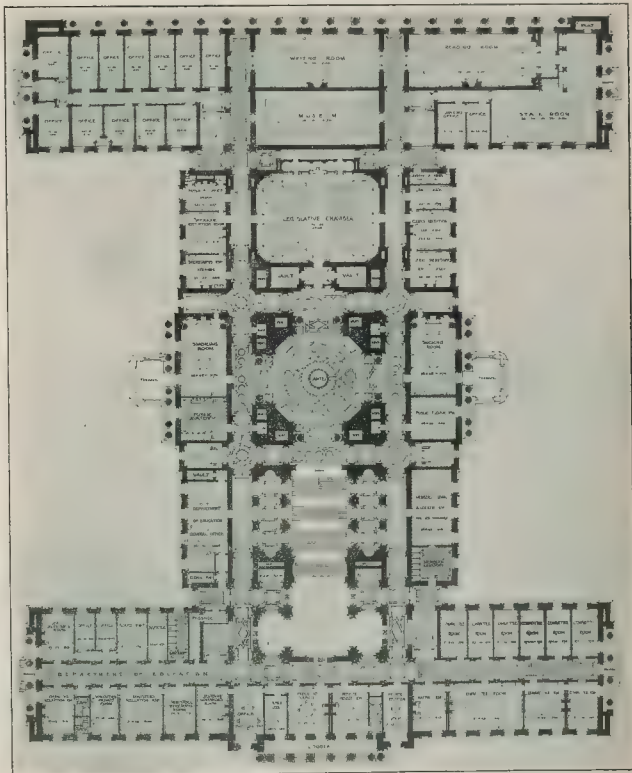

Six architects or firms of architects were invited to send in competitive designs for a new school at Govan, N.B. Mr. Andrew Balfour, F.R.I.B.A., of Glasgow, has been placed first on the list, and his design will be carried out forthwith. Accommodation for 1,200 scholars will be provided, and it is estimated that the buildings will cost about 18,000l.

Competition Assessors.

Reference is made on p. 670 to the question of naming assessors in the early stages of competitions, a point raised by Mr. C. F. A. Voysey in our last week's issue.

VICTORIA AND ALBERT MUSEUM:
RECENT ACQUISITIONS.

SOME important acquisitions have recently been made in the Department of Woodwork in the Victoria and Albert Museum. The earliest is a French casket of the XIVth century, which is stated to have come from the Church of the Holy Trinity at Eu, in Normandy. This casket was presented to the Museum by Mr. Murray Marks; it is of oak, gilt, and elaborately carved with Gothic tracery, the mounts being of gilt copper, and the interior painted with the coronation of the Virgin and the symbols of the four Evangelists (exhibited in Room 51). A pair of oak cupboard doors from Northamptonshire, painted with scenes representing the orders of Angels,

Design for Parliament Buildings, Winnipeg, Manitoba.

By Messrs. Edward & W. S. Maxwell, Montreal.

dating from about 1500, are exhibited in Room 7. Of about the same date is a standing livery cupboard carved with open Gothic tracery; the ostrich feathers which form part of the decoration probably represent the badge of Arthur, Prince of Wales, oldest son of Henry VII. This was found recently in a farmhouse at Burwarton, Shropshire, and was presented by Mr. Robert Mond, F.S.A., through the National Art Collections Fund (Room 6).

A fine piece of panelling, bearing the date 1546, has been purchased from a house known as Beckingham Hall, at Tolleshunt Major, Essex (Room 52). It is carved with decorations in the style of the Renaissance, among which are the Royal arms as borne by Henry VIII. and those of Stephen Beckingham.

The Museum collection of painted wooden roundels (also in Room 52), which were in use in Elizabethan and Jacobean times, has been enriched by an uncommon set consisting of twelve pieces enclosed in a turned case. In Room 55 is shown a cabinet of the period of Charles II., mounted with brass and decorated with raised lacquer in gold and colours on a black ground. In the same room is a Queen Anne writing cabinet, believed to have belonged to Dean Swift.

A gap in the historical sequence of English panelled interiors (Room 56) has been filled by the presentation from the National Art Collections Fund, assisted by a body of subscribers, of a panelled room of about 1730 removed from No. 26, Hatton-garden. The panelling is of pine, with elaborately carved mantelpiece, doorways, and recesses.

THE LONDON COUNTY COUNCIL.

The usual weekly meeting of the London County Council was held on Tuesday in the County Hall, Spring-gardens, S.W., Lord Chelysmore, Chairman, presiding.

Loans.—The Finance Committee recommended that loans be made to Borough Councils as follows:—Stepney, 70,000*l.* for electricity undertaking; St. Marylebone, 1,750*l.* for electricity undertaking; Stoke Newington, 2,050*l.* for a street improvement.

Regent's Quadrant.—In a report of the General Purposes Committee it was stated that in connexion with the appointment of a Committee to consider the design to be adopted for completing the rebuilding of the Quadrant, Regent-street, they considered that it devolved upon the Council to do all in its power to assist in securing that the new buildings should add to the amenities of the thoroughfare, and in this connexion the elevation of the buildings is obviously of importance. Except as regards certain matters of detail dealt with in the London Building Acts, the Council has no statutory control over such elevation, and it appeared to them that it would be desirable that

the Council should be represented upon this Committee, and therefore recommended "that H.M. Treasury be requested to approve of the nomination by the Council of a member of the Committee appointed to consider the design to be adopted for completing the rebuilding of the Quadrant, Regent-street."

The Kensington Fire.—The Building Acts Committee in presenting a report of the fire at the premises of Messrs. John Barker & Co., stated that the means of escape from this building had been under the consideration of the Council, and in April, 1912, suggestions for their improvement were sent to the owners, Messrs. Barker, with reference to the whole of the block of premises bounded by High-street, King-street, Ball-street, and Young-street. The suggestions affecting the portion of the building in which the fire occurred were:—To provide a smoke-resisting screen at the head of the open staircase adjoining the staff bedrooms with a self-closing door therein, and to mark clearly the alternative escape by the casement window at the opposite end of the passage. Negotiations followed, and on July 13, 1912, Messrs. Barker were pressed to carry out the Council's suggestions or to submit counter-proposals with a view to their being carried out during the summer recess. Two further interviews took place after that date, at which the owners were again urged to take action. The Committee further stated that if the suggestions put forward by the Council had been carried out they were of the opinion that the screen at the head of the staircase would have kept the smoke from entering the bedroom passage for a sufficient time to enable the staff to escape, and this view was also expressed by independent experts who gave evidence at the inquest. The Committee also reported that they had been informed that a scheme for rebuilding the whole of the premises was being prepared, and that plans for the front portion would be submitted to the Council shortly.

FIFTY YEARS AGO.

From the *Builder* of December 6, 1862.

Save Leicester-square.

It is to be hoped that the inhabitants of the neighbourhood of Leicester-square and the friends of open spaces will organise a proper opposition to the company who threaten to fill the area with a general market. Now that the "globe" is removed, the largeness of the space, which had been forgotten, comes to light again. Thrown open, as we have said before, with trees bordering a few walks, it would be a boon and a blessing. Every inch of open space in the metropolis ought to be fought for—given up only at the sword's point. Leicester-square, first

Leicester-fields, has many stories. In the house of the Earl of Leicester, at one corner died Elizabeth Queen of Bohemia. To this house retired two Princes of Wales in dudgeon. In Savile House Peter the Great was entertained by the Marquis of Carmarthen. *Posee Plastiques* and a *Café Chantant* are the present entertainments there. Sir Joshua Reynolds lived, painted, and died at No. 47 in the square; Hogarth, whose house was on the opposite side, took his regular walk in the enclosure; and after him came the great John Hunter, who formed there that collection which has grown into the noble museum of the College of Surgeons in Lincoln's Inn-fields. However, it is not of the Leicester-square of past times that we would speak, but the Leicester-square of to-day, which we would see improved, beautified, and preserved for to-morrow. The Board of Works, if they have power, should give their aid to prevent the area from being again blocked up.

. The fortunes of this square remained at a low ebb until 1874, when they were placed upon a secure footing through the generosity of Baron Grant. The enclosure was laid out by James Knowles, the architect, and a statue of Shakespeare took the place of George I. on horseback. The figure of this monarch had shared the vicissitudes of his surroundings. It came from "Canons," the seat of the Duke of Chandos, in 1748. It was taken down and buried, upon the site being required to accommodate the Great Globe, which was one of the sights of the town from 1851-62. When this was removed the statue was dug up and replaced in position, minus a leg, and thenceforth served as a cock-shy for the urchins of the neighbourhood. As a final insult the horse was one night painted piebald, and this breach of public decorum aroused the attention of the authorities, and led to negotiations between the Metropolitan Board of Works and the various landowners interested. Ultimately Baron Grant came to the rescue, as stated, while George I. was sold for the sum of 18*l.* The café chantant referred to, standing upon the site of Savile House, has since become the Empire Music Hall, while the Panopticon, a rival to the Polytechnic in its claims upon popular science, has been transformed into the Alhambra. In addition to the names of celebrities above given, once residents in the Square, we may add those of "Athenian" Stuart and John Gwyn, the architect of Magdalen Bridge, Oxford. —Ed.

ARCHITECTURE AT DETROIT.

S regards architecture in North America it may well be said that much water has run under the bridges during the past twenty years.

illustrating the changes which have taken place within that time we reproduce some of the works of a leading "firm" or "association" of architects which may be named among the pioneer architects of the "middle west" of the United States. As far as twelve or fifteen years ago the work of a few men in that part of the country was conspicuously above the level of all others and heralded the approach of a new era of art—Messrs. Burnham & Root, of Chicago; Messrs. Eames & Young, of St. Paul; Mr. Cass Gilbert, of St. Paul; and Messrs. Mason & Rice, of Detroit, were the first to adopt architecture properly speaking; they were the first to insist upon beauty of design as part of their duty to their clients and to their own reputations.

It is impossible for us in England to realize the difficulties which these men had to overcome in attempting to educate the masses of art the usually *nouveau riche* of the country in the Mississippi valley; but the varying popular taste of the time, as in Detroit, it existed is interestingly reflected in the architecture of the times, and the general improvement is indicated.

The echo of the work H. H. Richardson was doing in the Eastern States is noticeable in the First Presbyterian Church, built in 1884, and in the Masonic Temple, erected in 1894. The log cabin at Palmer Park (1882) and the police station at Belle Isle mark back for inspiration to the days of the frontiersman and the early French of Detroit. The residence of Mrs. W. H. Wood, built in 1895, is touched by the grace of the Italian Renaissance style, and the Joseph Morrell Wells, of McKim, White, and White, had so successfully introduced to New York, in his designs for the Century Club and the Villard (afterwards

Mr. Whitelaw Reid's) residence. The works above mentioned are by Messrs. Mason & Rice.

In 1898 Mr. Mason associated with himself Francis Swales, one of the earliest of the pupils of the Society of Beaux-Arts architects of New York, and the work of the following few years is in the modern Renaissance style developed by the French system of training and study of Classic and Renaissance styles.

Berry Brothers' office building (on this page) was probably the first design of the kind produced in the "middle west."

The Temple Theatre (p. 682) and the Elks Building (p. 683), by J. M. Wood and F. S. Swales, and the Jewish Temple Beth El, by Messrs. Mason & Kahn, assisted by Mr. Swales, were built in between 1898 and 1901. The Woodward-avenue Apartment House, built in 1902, was produced while the

Jacobean style was for a time "fashionable." Since that time most of the public and commercial buildings have been based upon Classic and Renaissance precedents, and the residences upon French Renaissance and the so-called "Colonial," and upon the conditions of climate and use of new kinds of materials, such as concrete and hollow terra-cotta blocks.

The examples selected are intended to convey some idea of the "local colour" of the architecture of Detroit.

For an American town Detroit is an "old" place, having been founded more than two hundred years ago. It was formerly the "capital" or seat of the Governor of the Louisiana territory.

The plan of the town was designed by Major Pierre Charles L'Enfant (also planner of the city of Washington), and is among the most excellent town plans in America. Detroit is a city of nearly half a million inhabitants, and is notable for its cleanliness, broad, well-paved, and well-lighted streets and avenues lined with large trees. The houses are not fenced in, but stand back some distance from the street pavements, and the effect of the principal avenues thus created is as of a park with houses in it rather than of a roadway bordered with buildings. A number of old French customs and old French families still survive in

Proscenium Arch, Temple Theatre, Detroit.

Detroit, and have perhaps something to do with the fact uppermost in the mind of every Detroiters that it is "the city where life is worth living."

HOUSING OF THE WORKING CLASSES ACTS, 1890 TO 1900

UNDER date of November 5, 1912, the Law Government Board for Scotland issues Memorandum with respect to the provision and arrangement of houses for the working classes.

We extract from this Memorandum the paragraphs dealing with the arrangement and construction of the houses, which should be of more immediate interest to those concerned with the technical side of the question:—

(2) Standard of Construction.

In designing houses for the working classes the first consideration is that they shall meet the reasonable needs of the class of persons whom it is proposed to accommodate; and while it is desirable that simplicity of design and economy in construction and general arrangements should be aimed at, it would well to bear in mind that houses erected by a local authority ought generally to be as well as will be a model or standard for houses of the working classes which may be erected by private persons.

(5) Types of Houses Most Suitable

The types of houses that may perhaps be regarded as the most suitable in ordinary circumstances for buildings on new sites are cottages, whether semi-detached or in rows, or

(2) two-story houses, whether semi-detached or in rows, with separate dwellings on each floor.

(6) Number and Arrangement of Buildings on the Site.

(a) Generally.—The arrangement of houses on the site and to some extent the design of the houses will depend upon the size, situation and character of the land, but the site should be so utilised as to secure ample open spaces in connexion with the houses and the best possible aspect for the living-rooms. Overcrowding of houses on a site should be avoided, and must, of course, be taken to comply with any town-planning requirements, by-laws, other local provisions in force in regard to new streets or open spaces in connexion with buildings.

On the question of the number of houses to be erected on a site, the local authority should doubtless consider it necessary to have regard to the cost of the site and the extent to which street works will be necessary; but it would be well to bear in mind that the annual saving in respect of a loan for the land, spread over

Elks Building, Detroit.

Messrs. J. M. Wood and F. S. Swales, Architects.

maximum period of eighty years, would in cases constitute a comparatively small portion of the total annual cost of providing houses. On the basis of ten houses to acre and land at 100*l.* per acre, the loan charges per house for land-purchase would be less than 2*d.* a week. If the land cost 500*l.* per acre the loan charges per house would be less than 9*d.* a week.

Building in Rows: Back Streets.—Where houses are built in rows, it is desirable that should be set back from the street line, to allow small gardens or forecourts to intervene between the houses and the street.

is undesirable that long rows of houses
ut a break should be constructed; and,
rule, the number of houses in a continuous

row should not exceed eight to ten. Long rows are open to objection, not only because overcrowding of houses on the site may be the result, but also because they give a monotonous and depressing appearance and prevent easy intercommunication between streets.

It is advisable where cottages are erected in rows to have the gardens placed back to back without any back street intervening, except in cases where there are no water-closets or daily removal of household refuse.

In the case of houses of more than one story, the system of entering from balconies has many advantages, provided that these are so arranged as not to interfere with the lighting of the rooms.

(c) *Semi-detached Cottages.* -In areas where

land is less costly the dwellings will with advantage be built in pairs or singly, so as to secure better light and ventilation and larger gardens. Larger ground area and frontage will, as a rule, be more often possible in rural areas than in urban areas, and where large gardens are provided and a slightly increased rent is charged the tenants should be able to secure some return in the form of garden

(d) *Other Arrangements of Houses on Site.*—Where the statutes and by-laws admit, it may be desirable to consider other arrangements of streets and buildings which may reduce the expenditure on land and on street construction—e.g. (1) the formation of groups of houses on back land, access to the houses being either

from comparatively narrow streets if the houses are set well back from the street line and if the streets are not intended or likely to become important thoroughfares, or from streets of full width of which portions might be turfed or planted with trees; and (2) the grouping of a number of houses round an open space which would serve as a recreation ground for the occupants of the houses (see sect. 11 of the Housing of the Working Classes Act, 1903).

Note.—Under sect. 44 of the Housing, Town Planning, etc., Act, 1909, the Board have power to revoke any by-laws as to new streets or buildings that they consider may unreasonably impede the erection of dwellings for the working classes.

(e) *Frontage of Houses.*—In the laying-out and development of sites for building the execution of the necessary street works is frequently a source of heavy expense, and there is a tendency, especially where the streets are wide and of costly construction, to make the greatest use of the frontage. As a result, houses are sometimes built with an unduly narrow frontage, the necessary internal space being obtained by making the houses deep from front to back or with projections at the back. These methods of construction interfere with the due access of light and air to the rooms, and in order to avoid these objections the frontages should not be unduly restricted.

(7) Accommodation to be Provided and Arrangement of Interior and Outbuildings.

(a) *Generally.*—The house, as previously stated, should be designed to meet the reasonable needs of the prospective occupants, and the internal arrangements will no doubt be influenced to some extent by custom of the locality and by the habits of the population. Although the actual arrangement of the rooms may not lend itself to any great variety of planning, the dimensions of the rooms and the arrangement of doors, windows, fireplaces, etc., need careful attention, and some suggestions in regard to these matters are made under the appropriate headings below. Where cottages containing more than three rooms are to be provided it will usually be found more economical to place the extra room or rooms on an attic floor.

(b) *Simple Type of House.*—Houses for the poorer working classes should contain at least a kitchen, a bedroom, a scullery, a large press for food, a water-closet, and a coal cellar. In such a house the ordinary necessities would be met by the following arrangements—

Kitchen.—This is the living-room used by all the family in common and ought to be as large and commodious as possible. It should contain a large press for food ventilated from the outside, and a range with a boiler for hot-water supply.

Scullery.—The scullery should have a washing boiler and a sink.

Bedrooms.—A bedroom should be as large and airy as practicable, and should be provided with

a fireplace. The door, window, and fireplace should be arranged so as to secure convenient space for bed and furniture and to ensure the freest circulation of air. If the bedroom is at the front of the house, a passage should be formed alongside for direct access from the front entrance to the kitchen. In this way the bedroom will not be used as a passage room.

Height of Rooms.—Sect. 172 of the Burgh Police (Scotland) Act, 1892, provides that in new houses the height of rooms on the ground floor shall be at least 9 ft. 6 in. and on the other floors, except attics, at least 9 ft. For working-class houses these heights may be considered too liberal, and burghal local authorities may with advantage consider the discretionary powers afforded by sect. 39 of the Burgh Police (Scotland) Act, 1903, to secure a relaxation of these requirements. The advantage of such a relaxation will be either a reduction in the cost of the building, or, as is frequently more desirable, an increase in floor space.

Water-Closet Accommodation.—Water-closet accommodation should be provided for each house, and the entrance to it should be preferable from the inside of the house.

Bath.—Where practicable the water-closet apartment should be made large enough to accommodate a bath.

Coal Cellar.—A coal cellar should be provided either inside or outside the house.

Windows.—Sect. 173 of the Burgh Police (Scotland) Act, 1892, provides that the window area of each room shall be not less than one-tenth of the floor area of the room—unless in any case the Town Council otherwise determine. The windows should be made to open at top and bottom, and should be placed not more than 12 in. from the ceiling in order that the upper as well as the lower portion of the room may be ventilated. At the same time, windows should be sufficiently low to enable children to see out of them.

(8) Materials, Walls, Floors, Doors.

The materials of which the houses should be constructed will vary according to the locality. Brickwork covered externally with harling or cement is an economical form of construction. A cheap wall can be formed of two 4½-in. bricks with a 2½-in. space between, and tied together with iron cramps at intervals. The outside face of the wall should be harled, and the inside face of the wall plastered directly on the brick.

The floors of kitchens and bedrooms should be constructed of wood flooring—those of sculleries and outbuildings being of concrete finished in cement.

Strongly framed and lined doors are preferable to panelled doors of inferior quality.

(9) Standardisation.

In order that the cost of construction may be reduced as much as possible, special attention should be paid to arrangement of planning,

detail of construction, and type of fitting in order that these may be standardised the whole scheme.

THE WORKING OF THE IRISH LABOURERS' ACT.

THE National Housing and Town-Planning Council, having decided to urge upon the Government the desirability of giving financial assistance to local authorities to enable them to build houses for rural labourers and the poor in our towns who are not able to pay an economic rent, decided to investigate the working of similar legislation in Ireland. They appointed a deputation to visit Ireland for this purpose, consisting of the Chairman, Mr. William Thompson of Richmond; the Treasurer, Mr. W. Wilkins, of Derby; the Secretary, Mr. Henry Aldridge; and three other members. The deputation appears to have been well received and put in the way of obtaining reliable information from every point of view. After visiting three typical districts in Leinster, Munster, and Ulster—provinces presenting conditions parallel to those obtaining in the poorest English districts—the deputation presents its conclusions in a Report of great interest and value, which tells us that the inquiries made in Ireland have deepened the conviction of the deputation as to the wisdom and justice of adopting similar policy in Great Britain.

As there was no incentive for private enterprise to make provision for the poorest class, the Irish Labourers' Act was passed in 1883 to do with the situation. Little was done, however, till 1891, since which time the Acts have been extended and amended. Under their provisions 211 out of 213 Rural District Councils have built cottages, 20,534 being erected under the Acts passed between 1883 and 1906. Since then 18,607 have been built, and, in addition, there were on March 31, 1912, 3,439 in process of construction, making a total of 42,680. The amount already sanctioned by the Local Government Board for this purpose was, on March last, 7,906,273*l.* This provided 39,200 cottages built and 3,439 in course of erection.

The cost, not including land and roads, has been from 128*l.* to 200*l.* per cottage. The average total cost, including land and roads, has been in Ulster, 196*l.*; in Leinster, 186*l.*; in Munster, 176*l.*; and in Connaught, 211*l.* per cottage. Land has been obtained at about 25 per cent. above its agricultural value, and at prices ranging from 25*l.* to 60*l.* per acre, though in some cases near towns this has risen to 100*l.*

The rents, which did not appear to have any relation to the cost of the cottages, but rather to the amount it was possible for the tenant to pay, vary considerably. In Ulster the rent varies from 9*l.* 4*s.* to 2*s.* 4*d.* per week, in Munster from 4*d.* to 1*s.* 2*d.*, in Leinster from 6*d.* to 2*s.* 9*d.*, and in Connaught from 4*d.* to 1*s.*

Condemned Cottage : Kilrush Rural District (Co. Clare).

New Cottage : Ennistymon Rural District (Co. Clare).

Condemned Cottage: Lismore Rural District.

New Cottage: Lismore Rural District.

few cottages, however, are let at 4d. or the average throughout Ireland being 1d. per week. These rents include from 1/2 to 1 acre of land to each cottage. The rents vary from 10s. to 22s. per annum, and are paid by the tenants themselves, an arrangement which the deputation refers to be "in every way admirable." Few exceptions anyone working for wages rural district is eligible as a tenant, provided the wage does not exceed 2s. 6d. per day. No lodgers nor overcrowding are permitted, though it was found that these regulations are always strictly observed. The tenants appear to be well satisfied with the cottages and to appreciate the improvement of their situation.

The deputation considers that, as a general rule, the cottages are well built and are good value for the money spent, though it notes some exceptions. These may perhaps be accounted for by the fact that it appears difficult to get work done in some parts of the country. It can well be understood, when it is realised that many of the cottages are built far away from villages in isolated places to which access is difficult. In consequence of this better-class cottages do not care to tender for work done in remote places, and it has to be done by unskilled and unqualified persons. Also the difficulty of properly superintending such work is at once realised.

Most of the cottages are detached and of one story only, as the Irish labourers seem to prefer a house without a staircase. Others, however, are of the two-story semi-detached type, but some of the tenants have not become accustomed to them, and complain that the rooms are hot in summer and cold in winter; this has generally been where the bedrooms are open to the rafters and without ceilings. The deputation reports that it does not consider the single-story type suitable to English requirements, and appears to consider there is some element of superiority in a two-storied building, as the Irish will appreciate, as they get accustomed to it. No doubt the two-storied building should be more economical than the bungalows, and for this reason alone preferable for similar work in England.

The usual cottage provided in Ireland consists of one large living-room, part of which is screened off by a partition to form a bedroom, and two other bedrooms entered out of the living-room, thus giving the accommodation prescribed by the regulations of the Local Government Board. These regulations require eight of the rooms on the ground floor to be not less than one-half the area of the ceiling to be 8 ft. 6 in. in the roof. They also fix the cubic contents of living-rooms at not less than 1,200 ft. 3 in., and of one bedroom at 600. No bedroom is less than 600. They give power to adapting houses to the standard of new ones, and in practice this has been found to cost more than building new ones.

The land seems to have been selected by Committees appointed by the Rural District Councils concerned. These Committees would have to consider the following points emphasised by the regulations of the Local Government Board: Good land, easy access and drainage, good aspect to north or east for cottages, convenient water supply, economy in fencing by using existing fences, and minimum damage to owner and occupier of land.

We gather from the Report that these points have, as a rule, been well considered, the position of the cottages being generally satisfactory, though in some cases the position of the house or the quality of the soil left room for improvement.

An important point that should not be overlooked is that the active administration of the Acts, whereby so large a number of cottages has been built, is primarily due to the power of representation possessed by the labourers themselves. That is to say, any three agricultural labourers may, by signing a form issued by the Local Government Board, set the necessary machinery in motion.

With regard to the general effect of these Acts the deputation found that "there is a general agreement that a marked improvement in all respects has been effected in the habits and standards of life of the people," even though those standards are still lower than those in rural England. During the period over which the erection of cottages has extended wages have everywhere increased, but in view of the many economic prices operating the deputation is only prepared to say that the building of these cottages has had no adverse influence upon wages. In this connexion it is pointed out that the tenants of the new cottages are in a more independent position in negotiating terms of employment; many of them having come from the "tied" houses of the employer, the reason for this is obvious.

Again, there seems to have been a general consensus of opinion that the building of these cottages has been a distinct success from the point of view of health. All available figures point in this direction, general vitality is increased, and zymotic disease diminished. This will be understood when it is realised that many of the tenants come from mud cabins without either chimney or window. This old type has, thanks to the Act, largely disappeared, and a few more years' energetic administration should result in its total abolition. Indirectly the Act has had the effect of causing owners to improve their property in order to escape condemnation, and it is satisfactory to learn that, as a rule, neither landlords nor farmers are hostile to the administration of the Acts.

In their final general observations the deputation point out that where so much State aid is given it would be well if better inspection of the cottages and reports upon the way in which the Rural Councils are administering the Acts could be secured. They suggest that a

little extra expense at first in such matters as better bricks for chimneys, better footings, cement skirtings, and more extensive use of cement for rough-cast would prove economical in the long run. Although the deputation considers that "the architecture of the later cottages is, on the whole, not unpleasing," the examples we give, if typical, show that it still leaves something to be desired. The use of good materials, in every way an economy, would seem to be the legitimate method by which this object could be promoted.

After expressing their warm appreciation of the admirable work done by the Local Government Board for Ireland, the deputation, in conclusion, express their conviction that the passing of these special Irish Acts has been abundantly justified in the results achieved. "The supreme merit of the work thus accomplished in Ireland rests in the fact that thereby local authorities have been enabled to clear away the hovels which existed in all parts, and to build up new houses and a new people in a way which no other method has accomplished elsewhere."

They also point out that "no other practical remedy has yet been suggested by which British local authorities may be adequately assisted to perform the difficult task of clearing away unfit houses, and providing homes in which the poorest families can be reared in decency and comfort," though they expressly disclaim the intention of bringing forward any definite and detailed proposals as to the manner in which the example of Ireland might be followed in Great Britain.

The illustrations of cottages which accompany this article appear in the Report of the National Housing and Town Planning Council, to whom we are indebted for the loan of the blocks.

PROPOSED NEW ROAD, SURREY.

At a recent meeting of the Surrey County Council the Highways Committee reported that the County Surveyor had prepared plans and sections for a new road to form a loop on the Portsmouth-road, between Beverley Brook Bridge and the village of Esher, showing the route, which, after numerous trials, surveys and consultations with the Traffic Branch of the Board of Trade and with the local authorities, appeared to be the most desirable from the point of view of the main purpose, which has been to find an alternative route for an entirely new road between the above-mentioned points, so as to afford better ingress and egress to London from the south-west. The Committee have given instructions for the scheme to be forwarded to the Road Board for their consideration. Mr. C. T. Giles, K.C., speaking on the Report, stated that he dissented from the statement that the plan "appeared to be the most desirable from the point of view of the main

purpose." Efforts had recently been made by a considerable body of people to acquire a large amount of land in order to preserve the view from Wimbledon Common; but the plan of this proposed new road showed that a wide detour was to be made, so that the owners might have a double building frontage, and the probability was that buildings would be erected on both sides of the road where it skirted the land to which he referred, spoiling the very view which they were so anxious to preserve. Alderman Pain, Chairman of the Board, said that Mr. Giles's proposition was that the building frontage on the Wimbledon side should be done away with. He pointed out that the Chairman of the Road Board was a member, if not the Chairman, of the Committee for the extension of Wimbledon Common, and he had spoken to the County Surveyor on the subject, and was as anxious as Mr. Giles himself that the fairest route should be carried out. This could not be adopted, because the road at the present moment followed the course of a town-planning scheme adopted by the local authority. In the result, a motion by Mr. Giles—"That the Council approve the opinion expressed by the Chairman of the Highways and Bridges Committee, that it would be a great public advantage if the new arterial road were to be bounded by open spaces adjoining Wimbledon Common"—was passed.

CIVIC DESIGN NOTES.

Whose Work is Town Planning?

WITH reference to the article under this heading in our last Review of Civic Design, a correspondent sends us the following:—

"More important than acquaintance either with a levelling-staff or with 'styles' and 'Orders' is the possession of the imaginative sense. The town-planner's imagination must be able to see in the lines and symbols of a map the valleys and hills, the brooks and boundaries, the sky-lines and distant views which exist on the ground. And he must be able to grasp, from a few rough lines called an elevation, the effect of placing a building in the middle of this natural framework. With a pencil and a few pieces of flat paper he must visualise the scene as it will be, and reject or accept with true artistic insight what exists as yet only in his imagination. And along with all this there must be a sound knowledge of constructional work in buildings, of maximum gradients and of suitable widths of roads.

Modern requirements are thus resulting in a new type, the town-planning specialist, who, whatever his previous training has been, as architect, engineer, or surveyor, must, above all, in this practical age still be a visionary. If he is an old man he must dream dreams, and if he is a young man he must see visions. To-day there is an opening for the dreamer."

Sussex Road Scheme.

THE Roads and Bridges Committee of the East Sussex County Council suggest an improvement of the Lewes to Newhaven road, the cost of which is estimated at 27,744. This will provide a highway 30 ft. wide from bank to bank, with macadam 18 ft. wide. The Road Board will contribute 11,700, the Newhaven Rural Council 8,000, and the East Sussex County Council the remaining 8,044.

Town Planning in Rural Districts.

THE Royal Sanitary Institute at Doncaster held a sessional meeting at which the subject of town planning in relation to the development of the South Yorkshire coalfield. It was stated that thirteen new collieries were being or were about to be sunk near Doncaster, and that there would be a population of 120,000 people in the near future directly dependent upon mining. It was pointed out that if it was a sound investment for the Government to spend 500,000 upon the development of Uganda it could spend 200,000 upon developing South Yorkshire. It was a national question, and if they failed to do what was necessary to-day they would be compelled to do it twenty-five or thirty years hence at a far greater cost.

The conference carried a resolution in favour of such measures as might facilitate the putting into operation immediately of the Town Planning Act in the Doncaster rural district.

Although town planning in the country may seem a contradiction in terms, this resolution calls attention to the necessity of considering the ordered arrangement of the whole of the country. We have already referred to this

question in a leading article on country planning, more in connexion, however, with the growth of motor traffic and the small holding and "back to the land" movement. There seems every reasonable probability that in so thickly populated a country this question must ultimately arise and the Town Planning Act become the Town and Country Planning Act. In the meanwhile any application of its present powers in districts which may technically be considered rural is to be welcomed. There certainly appears a *prima facie* case for town planning in the Doncaster rural district.

The Australian made by the Commonwealth Federal City.

A power plant, a railway, and brickwork are the first visible signs of the city that is to be. The district contains several kinds of stone, some soft, some hard, besides shale and clay. This softer stone will probably be used in the manufacture of Portland cement, whilst the harder variety is likely to prove useful as ashlar. It is estimated that some ninety millions of bricks will be required for official purposes alone, and Government kilns are to be erected capable of producing fifteen million bricks a year. The clay that has been found in the territory—the River Molonglo flows through the area—is said to be suitable for brickmaking, and it is claimed that the bricks can be made and delivered at 11. 6s. per 1,000. The Government are undertaking the manufacture of their own bricks, as bricks have been high in price of late, and supplies have been low. Both the New South Wales Government and the Victorian Government have established State brickworks. A central power-house is to be built at a cost of about 20,000, capable of supplying electricity for the whole district where power will be required during building operations. A reservoir and dam are to be erected costing about 90,000, the water supply being by gravitation to the whole of the city area as completely planned.

New Houses and Streets.

THE Commissioner of Police in his annual Report, just presented to Parliament, gives the following particulars as to the number of houses built, streets formed, etc., in the Metropolitan Police District during the last ten years:—

Year.	New Houses Built.	No. of New Streets.	Length of New Streets and Squares.
1902	25,480	301	61 764
1903	26,420	320	68 944
1904	23,239	374	74 139
1905	21,570	300	69 406
1906	21,415	285	64 917
1907	19,211	264	62 172
1908	13,377	257	51 1,658
1909	13,243	217	48 378
1910	11,757	172	28 1,456
1911	10,027	90	15 733

The number of new houses being built on December 31, 1911, was 2,009.

Central Area foot for the remodelling of the Improvements.

IMPORTANT schemes are on the foot for the remodelling of the central area of several of the large provincial towns. At Bradford the building of the Midland through line has led to a suggestion that advantage be taken of the opportunity to replace an area of narrow streets and poor property. At Dundee an improvement scheme dealing with the Overgate and the area behind the Town House, after meeting with some opposition, till further information was made public, was finally agreed to at a recent meeting of the Town Council, and a Provisional Order was promoted to obtain power to schedule the areas affected. At Manchester a private syndicate proposes to acquire land on both sides of the Irwell for an additional Exchange and other buildings, which will greatly enhance the commercial facilities of the city. At Birmingham the widening of Broad-street at the cost of 40,000, instead of the relief road suggested in 1907, should get rid of the bottle-neck which has been so dangerous to traffic at this spot, and proposals have been brought forward for the reconstruction of the Witton-road Bridge, near Witton Railway Station, and for the construction of some 200 yds. of the Salford Bridge-road between Wheelwright-road and Bronford-lane, being the last section of the road as originally planned.

Town-Planning the Birkenhead Town Council Schemes.

SIR W. LEVER has offered the Brocklebank Estate, 1,500 acres in the Wir district, which he recently purchased from late Sir Thomas Brocklebank's executors. The property, equal to nearly one-half the of Birkenhead, comprises many townships. Stoneton Hall was formerly a seat of Stanleys. With the exception of small areas to be used by Lever Brothers, the whole of the land is offered at the same price which William Lever paid for it. The area will be used for town planning, of which a central road 120 ft. wide, for quick and slow traffic, and boulevards for pedestrians will form a feature. The Croydon Town Council have just resolved to formulate a scheme in respect of the road of country, some 600 acres between Wadd and Russell Hill, and near to the proposed by-pass road to the west and south of Croydon from Thornton Heath to Purley.

The Local Government Board have lately received two schemes from the Birmingham Corporation, and one from Rochdale, and, it is understood, have authorised a further scheme prepared by Stoke-on-Trent Corporation of 85 acres in the borough.

Open Spaces and Recreation Grounds.

THE Valentines Park Extension Council ask for contributions, before the end of the year, to an aggregate amount of 800, to enable them to acquire 23 acres, with the mansion-house, fruit-garden, and rosery of Valentines to the existing park at Ilford, Essex. The Local Government Board have signified their sanction to the Malden and Coombe Urban District Council borrowing 3,600, to purchase lands as an open space in Kingston Vale, as part of the Wimbledon and Putney Commons Extension scheme.

Engineers' Town Planning Competition.

A SPECIAL interest attaches to the Town Planning Competition recently announced by the Institution of Municipal and County Engineers. Being confined to members and students of the Institution, architects are presumably excluded. But, curiously enough, whether intentionally or not, the subject chosen is one into which the aesthetic element enters to a rather unusual degree. A seaside pleasure resort should express something of the festive or decorative side of life. Its general layout should give the keynote and should perhaps more entirely dominated by aesthetic considerations than would be permissible in a factory town; while, with the exception of a sea wall protecting the front, there seems to be nothing which marks this subject as one that involves any engineering problem out of the common. Municipal and county engineers will have an opportunity to produce a characteristic lay-out in harmony with the prevailing sentiment of such a town, and the result cannot fail to be instructive.

Plymouth Hoe affecting the amenities Improvement.

AN important improvement affecting the amenities of Plymouth Hoe is foreshadowed by the recommendation that the Corporation should acquire those portions of the West Hoe Estate not yet developed. The land in question overlooks the Hoe, from which it is separated by a high cliff, and has a frontage of 362 ft. to the Grand Parade-road on the sea front. It lies between West Hoe terrace and the land under the control of the Plymouth Promenade Pier. The site is suitable for winter gardens and baths, and the cliff lends itself to a lay-out in terrace walks and gardens. The Corporation already owns the foreshore to the west, and the present purchase is in a line with their settled policy of acquiring the whole of the foreshore to the Hoe, and so preserving its amenities.

Municipal Ownership at Parliament for the purpose of Eastbourne.

THE Town Council of Eastbourne is to promote a Bill in Parliament for the purpose of acquiring the Devonshire Park and Baths for the sum of 100,000. The Duke of Devonshire, who is a large shareholder in the company, will mark the occasion by a gift to the town of 10,000, with further financial advantages should the Town Council agree to maintain a good orchestra. This extension of municipal control, we think, be advantageous to Eastbourne, and enable the Town Council to still further increase its attractions.

THE BUILDING TRADE.

WATER SUPPLIED TO BUILDERS.

THE case of Metropolitan Water Board v. Johnson & Co., in which judgment was deferred, has resulted, as is too the case where this Private Act regulating water supply by the Metropolitan Water Board is under consideration, in a difference of opinion, and, as the Divisional was constituted of two judges, the result is that the judgment of the County judge as against the builders stands untroubled. The defendants in the case are a firm of builders who, under contract with the War Office, were engaged in carrying on time to time necessary work at the Barracks. The War Office had a contract with the Metropolitan Water Board for supply of water for domestic and non-domestic uses, and the War Office, as part of their contract with the builders, agreed to supply with the water necessary for the building operations. Notwithstanding this, the Water Board, under sect. 17 of the Water Board (1907), made a claim upon the builders in respect of the water used by them in building operations, and the County judge decided in favour of the Water Board.

Sect. 17 provides that any builder being engaged to erect any building or part of a building shall require a supply of water for that purpose shall be deemed to be the occupier of the premises within the meaning and for the purposes of sect. 16, provided that, if the County judge determines, they may instead of affording the required supply by measure, afford the same at a rate not exceeding 7s. per 1000, of probable total cost after making such allowance as the Board may think reasonable for the use of water. By a general resolution passed in 1907 the Board had resolved that no builder should be entitled to pay by meter, but to pay on the 7s. scale.

Before the Water Board Charges Act, 1908, was passed it had been held in the case of Metropolitan Water Board v. Paine (the Builders' case), 17, 1906, under the East London Waterworks Act, 1853, that a person carrying out building operations on a site bare of buildings was not the owner or occupier of "premises" under sect. 79 of that Act, so as to be entitled to demand a supply of water by meter.

In Johnson's case Mr. Justice Channell, who was sitting on the judgment of the County judge, considered that the builders were not persons who "require a water supply" within sect. 17, as desiring to become customers of the Board. He pointed out that if they had sunk a well and obtained a supply of water the Board could not have called them to become customers, and so the defendants were concerned, their position was much the same in obtaining the supply from the War Office, although questions might arise between the War Office and the Board as to the use the water was put to. The judgment of Mr. Justice Channell was that sect. 17 was directed to enable builders to demand a supply in circumstances in which the decision of the County judge's case applied to deprive them of such a supply.

Justice Avory, who upheld the decision of the County judge, interpreted the word "require" in sect. 17 as "having need of," and held that if a builder needed water for building operations he must make a request under sect. 16 and pay the charge under sect. 17, and what is the effect of these judgments? It appears to be that if a builder requires water for building operation, and the only source available is the water of the Board, then the Board has a statutory right to charge the builder at the rate specified in sect. 17. If a builder has any other supply independent of the Board's, then the section may not apply; but if the builder does not require a supply of water, this point is left in some doubt. If the Board's supply is required, no contractual agreement between the builder and another person drawing from that supply will relieve the builder from liability.

In the case in question there was also a difference of judicial opinion whether the War Office, having agreed for water for domestic or non-domestic purposes, could supply or use water for building purposes; but the point is not important because in future the Board no doubt will schedule the supply as "not for building purposes."

Builders must note that where Board's water is used at all they will have to pay for it, and they must provide in their contracts for any recoupment of this statutory charge laid upon them. We have frequently commented upon the necessity of an amendment and simplification of this Private Act of the Water Board, which has not only caused endless litigation, but has also been found by the Courts extremely difficult of interpretation.

CHANGES IN RATES OF WAGES.

THE Labour Department of the Board of Trade has recently issued the nineteenth Report on Changes in Rates of Wages and Hours of Labour for the year 1911.

The year was one, the second in succession, of improving wages, 507,207 workpeople, exclusive of agricultural labourers, seamen, and railway servants, receiving increases, the net result of all changes showing an increase of 34,578s. a week.

There is an interesting table in the Report, from which it can be seen that there is a direct relationship between the labour market and exports and imports. In years of increasing imports and exports the rates of wages were higher and the percentage of unemployment lower, and *vice-versa* where imports and exports declined. It would appear from this how dependent is the labour market on the general trade of the country, and therefore how disastrous strikes which affect that trade must be to the working classes. If it be argued that 1910 and 1911, both strike years, have shown increases in wages, it may be pointed out that in 1907, the year in which the imports and exports were the highest, with the exception of the last two years, the increase in wages was not, as in 1911, 34,578s., but 200,912s. In 1907 the loss of working days due to strikes was 1,678,670, but in 1910 the loss of working days was 9,846,831, and in 1911 7,552,100. With the prosperous conditions prevailing in 1910-11 it is obvious that in all probability the increase in rates of wages would have been considerably larger had not conditions of trade been so disturbed by trade disputes. A reference to the Report will also show that changes in rates of wages are, in the large majority of cases, effected without a stoppage of work. Thus, in 1910, 538,663 workpeople had their rates varied without stoppage, and 10,275 after stoppage, whilst in 1911 the figures are 767,259 without stoppage, and 149,107 after stoppage. Surely from these figures the deduction should be drawn that strikes injure the prosperity of the nation, and consequently lessen the wage bill in all trades, and that they should only be resorted to as a last resource.

In the building trade the net effect of the changes in rates of wages was an increase of 1,609s. per week, as compared with an increase of 377s. per week in 1910, and a decrease of 713s. in 1909. But 47 per cent. of this increase was in the rates of wages of carpenters and joiners. In this trade it may, however, be noted that the changes in the rates of wages of 15,316 workpeople were arranged without strike, and of only 1,575 workpeople after strike.

STAFF DINNER.

ON Saturday last week, the first annual staff dinner of Messrs. Bovis, Ltd., was held at the Victoria Mansions Restaurant, when a large company assembled. In response to the toast of "The Directors," the Chairman referred to the progress made by the company, and said that, whereas they had commenced trading only three years ago with a total staff of about six hands, they were now responsible for the wages and welfare of nearly a thousand men of all trades, this development being largely due to the efforts of the staff as a whole.

The dinner was described, in an amusing manner, as a "specification of the dinner," and followed the same lines as an ordinary specification. A concert followed.

WOOD PAVEMENT v. ASPHALT.

THE Third Commission of the Municipal Council, having come to the conclusion that it was time to consider a plan for harmonising the Parisian thoroughfares, Mr. Adrien Oudin was instructed to prepare, in his own name, a report upon the matter. The Council, after having passed in review the different coverings employed up to the present, indicates the advantages and disadvantages of each, and pronounces himself, says *Le Editeur*, in favour of asphalt. Conformably with the conclusions arrived at in Mr. A. Oudin's Report, the administration, in concert with the representatives of the eighty districts of Paris, drew up a long list of the thoroughfares which ought to be asphalted. These works of transportation, which interest more particularly the centre districts, are proposed to be completed within seven years, at the rate of about 100,000 metres per annum, the Municipal Councilors reserving the right to indicate to the administration the most urgent operations and to come to an understanding with them as to the proper regulation of the works.

BUILDING TRADES AMALGAMATION.

MR. W. THORNE, M.P., presided at a Conference of representatives of a number of Unions in the building trade on the 3rd inst. at the offices of the Parliamentary Committee of the Trade Union Congress, London. The Conference was called to consider a scheme for a central fighting fund to be controlled by an Executive Committee representative of the subscribing societies, and leaving complete autonomy to each Union as far as its friendly benefits are concerned. A vote was recently taken on the question of amalgamation by Unions containing a total membership of 117,370, and in the ballot 31,541 supported the scheme, while 12,156 voted against it. The support given to the amalgamation scheme was not sufficient to allow the promoters to carry it into effect. The discussion of the question was not concluded at the sitting, and the Conference adjourned.

GENERAL BUILDING NEWS.

CULLUMPTON'S NEW CHAPEL.

THE new Unitarian chapel at Cullumpton is being erected at a cost of about 1,000l. from the designs of Mr. R. M. Challice, architect, of Exeter. The building will provide accommodation for 120 people.

JESUIT SCHOOLS, LIVERPOOL.

THESE new schools for St. Francis Xavier's have been erected at a cost of 13,000l. from the designs of Mr. A. Homan, A.R.I.B.A. The materials used in the building are thin red Ruabon bricks set in white mortar with Portland stone dressings, and with Kentmere silver-grey slates for the roof. The building is heated by radiators and lighted by electricity, and accommodation is provided for 650 boys. The contractors for the work were Messrs. L. Marr & Sons.

AGRICULTURAL COLLEGE, NEAR NEWTON ABBOT.

THE Seale-Hayne Agricultural College is being erected from the designs of Messrs. Mitchell, Son, & Gutteridge, architects, of Southampton, and the cost of erection is estimated at 22,000l. The buildings will be erected on a site 350 ft. above the sea level and will form three sides of a quadrangle. The northern block will contain the technical buildings, agricultural, botany, chemistry, and science rooms, with laboratories. The western block will include residential quarters for the staff and students, and the eastern block will be comprised of the dining hall, common-rooms, kitchens, etc. The electric lighting will be from power generated on the site, and the heating will be by hot-water pipes.

NEW BUILDINGS IN EDINBURGH.

THE new tuberculosis dispensary buildings have been erected at a cost of about 8,500l., and the buildings include administrative and educational departments. On the east side are the drug dispensary, two research laboratories, and an X-ray room. Other rooms include a board-room, museum, lecture hall, etc. The architects for the work are Messrs. Sydney Mitchell & Wilson.

PUBLIC HALL, NEWTONMORE.

MR. Alexander Cattannach, of Kingussie, is the architect for this new public hall, which

Glasgow.—Seven houses, Rowenshall-road, Shawlands; Messrs. W. Wallace & Sons, builders, 3, Rowenshall-road, Shawlands, Glasgow. Adaptation of church buildings into dwellings.

* See also our list of Competitions, Contracts etc., on another page.

and erection of new church at Crownpoint, Mile End, for the Trustees, Christ Church, Glasgow. Six houses, Auchinairn-park; Messrs John Marshall & Sons, builders, Bishopbriggs, Glasgow. Additions to works, 17, London-road, Parkhead, for Messrs. John Walker & Sons (Glasgow), Ltd., cabinet-makers. Addition to works, Broadstreet, Mile End, for Messrs. Mayor & Coulson, electrical engineers. Picture theatre, Hillstreet, Shettleston; Mr. George Urie Scott, 69, Gallowgate, Glasgow.

Glenburn (near Prestwick).—One hundred and eighty-four houses (20,000L.), for Messrs. William Baird & Co., Ltd., ironmasters, 168, West George-street, Glasgow.

Goble.—Alterations and additions to workhouse (4,115L.); Messrs. Jackson & Oates, builders, Goble.

Halifax.—Buildings (2,000L.); Secretary, West End Golf Club, Halifax.

Higher Bebbington (Birkenhead).—School (9,345L.); Messrs. J. Lee & Sons, 28 and 30, Village-road, Bebbington.

Ipwich, Offices, Prince's-street: Mr. E. Thomas Johns, architect, Lower Brook-street, Ipswich.

Kendal.—Extensions to vagrant ward (400L.); Mr. M. G. Shaw, architect, 45, Highgate, Kendal.

Kidderminster.—Additions to premises, Hurst street, for Messrs. Tomkinson & Adam, carpet manufacturers; additions to Caldwell foundry, for Messrs. Bradley & Thurton, Ltd., ironfounders.

Kettering.—Disinfecting-station; Mr. T. R. Smith, Surveyor, Town Hall, Kettering.

Lancaster.—Proposed sanatorium; Mr. J. C. Mount, Town Hall, Lancaster.

Lancs.—Schools, Fleetwood, Horwich, Waterloo, and Whitworth; Mr. H. Littler, architect, 16, Ribblesdale place, Preston.

Leeds.—Proposed church schools (9,000L.); (car, St. George's Church, Leeds).

Leith.—Warehouses, corner of Shore and road Wynd, for Messrs. R. & D. Slimon, ironmongers, Shore, Leith.

Lisburn (Co. Antrim).—Theatre; Mr. T. Houston, architect, 17, Wellington place, Belfast.

Little Mill (Mon).—Reformatory; Mr. J. Ains, Architect, Shire Hall, Newport.

Liverpool.—Proposed baths at Pierhead (for W. R. Court, Baths Engineer, Town Hall, Liverpool).

Llanelli.—Proposed fifty houses; Mr. George Jones, Surveyor, Urban District Council Offices, Llanelli.

Malby.—Churches at South Elmsall and Malby (5,000L.), for the Yorks Congregational Union.

Malvern Link (Worc).—Enlargement of school (700L.); Messrs. Pritchard & Pritchard, architects, Bank chambers, Kidderminster.

Manchester.—Parochial hall and classrooms; ex. C. P. R. Muir, The Priory, Victoria Park, Manchester.

Margate.—Ten houses (about 700L.), for the Margate Philanthropic Home; Mr. W. J. Evers, architect, 12, Marine-terrace, Margate.

Meltham.—Extensions to hospital (1,500L.); Mr. F. Dearnley, Surveyor, Urban District Council Offices, Meltham.

Middlebrough.—Tower to church (4,000L.); Messrs. J. Sainsbury & Sons, architects, 1, Morrison.—Open-air swimming-bath at Morrison Park; Mr. G. Ball, Engineer, Town Hall, Swansea.

Mytholmroyd.—Sixty-two houses, New House estate, for Messrs. Helliwell & Shaw, Sowerby ridge.

Neath.—Locomotive shed for the Great Western Railway Company; Messrs. C. H. Hunt & Sons, builders, Station Works, High Wycombe.

Newburn.—Proposed remodelling of works for Messrs. J. Spencer & Co., Ltd.

New Mills.—School (250 places); Mr. A. E. Iwards, Clerk to the Governors of New Mills and District Secondary Schools, Spring Bank.

Newry.—Additions to Town Hall; Mr. Charles Blayney, Surveyor, Town Hall, Newry.

Northampton.—Workmen's dwellings, Beeve Estate (8,946L.); Mr. J. W. Goswage, Elder, care of the Clerk, Town Hall, Northampton. Additions to Far Cotton School (71L.); Mr. G. J. Fisher, builder, 6, Castilian-terrace, Northampton. The following plans have been passed:—Motor garage, Weston chaff, Weston street, for the Northampton Brewery Company, Ltd.; additions to factory, Giles's-terrace, for Mr. S. S. James; additions to Nos. 56 and 57, Kingsthorpe-road, for J. R. Newcomen; additions to factory, Waver-road, for Messrs. G. M. Tebbutt & Co., Ltd.

Norton (L.W.).—Additions to St. Andrew's church, for the Vicar.

Oldham.—Proposed enlargement of Water-Addings Wesleyan Church Schools (1,000L.), for the Trustees.

Paisley.—Additions to No. 54, High-street and No. 104, George-street, for the Paisley Provident Co-operative Society, Ltd.

Portsmouth.—Stores at Camber (8,837L.); Messrs. McLaughlin & Harvey, Ltd., builders, 15, Brecknock-road, N.W. Boatswain's office, etc. (Flahou (540L.); Messrs. Jones & Sons, builders, Portsmouth.

Prossell.—Additions to garage for the Knot Motor Company.

Preston.—St. Cuthbert's Church; Mr. T. Moore, architect, Well-walk, Hampstead, N.W. Ramsbottom.—Proposed institute; Vicar, St. Paul's Church, Ramsbottom.

Ravenshall.—Alterations at Constable Works for the Cotton Celulose Company, Ltd.

Richmond-on-Thames.—Cookery centre, corner of Halford and Paradise streets; Mr. H. Sagar, Education Offices, Richmond.

Ridder.—Proposed workmen's dwellings; Mr. A. B. McDonald, Engineer, City Hall, Glasgow.

Rossendale.—Rebuilding Sunday-school (2,000L.); Trustees, Waterbarn Baptist Church, Rotherham. Alterations to Badesley Moor-lane Sanatorium; Mr. W. C. Harrison, Clerk, Guardians' Offices, Rotherham.

St. Albans.—Sunday school and institute; Vicar, St. Paul's Church.

St. Austell.—Proposed additions at work-house; Mr. John Stephens, Clerk, Guardians' Offices, St. Austell.

Salford.—Plans have been passed for alterations and additions to four warehouses in Clegg's-court, and alterations and additions to "Victoria Inn," Ordsall lane.

Sedgefield.—Hospital (700L.); Mr. J. W. Lodge, Clerk, Guardians' Offices, Sedgefield.

Sheffield.—Mission hall, Bath-street (1,250L.), for the Trustees, St. Andrew's Presbyterian Church; Rev. W. Marcus, Pastor, 19, Victoria-road, Sheffield.

Skelton.—Dispensary; Mr. A. Burton, Surveyor, Town Hall, Skelton.

Southampton.—Erection of Regent's Park School (15,164L.); Messrs. Jenkins & Sons, Ltd., builders, 149, Above Bar, Southampton.

Stafford.—Headquarters, Bailey-street, for the 6th Staffs Battery R.F.A. and Staffs Yeomanry.

Stirchley.—Central premises for the Ten Acres and Stirchley Co-operative Society.

Sutton.—Proposed girls' school; Mr. Ramsay Nares, County Education Offices, Kingston.

Swadincote.—Proposed Roman Catholic Church for Trustees, St. Edward's Church, Newhall.

Trowbridge.—Extensions to offices (12,000L.); Mr. J. G. Powell, Surveyor, County Hall, Trowbridge.

Truro.—Hostel; Mr. F. L. Pearson, Ashley place, Westminster, S.W.

Waddington.—Proposed restoration of Parish Church (1,000L.), for the Vicar.

Warrington.—Proposed extension to car sheds; Mr. J. Telfer, Tramways Manager, Town Hall, Warrington. Plans have been passed for extensions of works in Vernon-street for the Vernon-street Tanning Company, Ltd., and for additions to St. Elphin's Church for the Trustees.

Weardale.—Church (5,000L.); Messrs. Clark & Moscrop, architects, Feetham, Darlington.

Weymouth.—New bakeries, etc., for the Weymouth Co-operative Society.

Whitley Bay.—Hall, Grosvenor Estate, for the Vicar, Parish Church, Whitley Bay.

Wigan.—Church; Vicar, St. Paul's Church, Goose Green, Wigan.

Wolverhampton.—Proposed completion of the reconstruction of Wolverhampton and Staffs General Hospital (54,100L.), for the Governors.

Woburn Green.—School; Mr. W. Riley, Architect, County Hall, Aylesbury.

Worcestershire.—Proposed school (300 places), Bromsgrove, and school (400 places), Catshill; Mr. A. W. Priestley, County Education Offices, 37, Foregate, Worcester.

Yarmouth.—A plan has been passed for ten houses, Hamilton-road, for Mr. J. S. Read.

York (Glasgow).—Additions to works for Messrs. Bull's Metal and Melloid Company.

FOREIGN AND COLONIAL.

Rebuilding of Hankow.

In his Trade Report for the year 1911 the Commissioner of Maritime Customs at Hankow states that, as a result of the revolution in China, the once rich and prosperous native city of Hankow is a heap of charred ruins—an area of 2 square miles, formerly occupied by a network of streets full of fine shops and teeming go-downs, having been utterly destroyed. To attempt to assess the damage would be futile—100 million taels or 500 million taels might equally be near the mark. The blotting-out of the city has been the cause of untold misery to thousands of its

former inhabitants; but the cloud is not without some silver lining. The city consisted of a congested mass of buildings of all sizes, with the usual narrow lanes and insanitary conditions, and only its destruction would ever have made possible the city on modern lines which is absolutely required for the proper development of the port. Much raising of the land behind will be necessary before the new city can be built, but plans are being drawn up to utilise the old site with a view to future extension. With local desolation and general disturbance, it is hard to prophesy when Hankow will recover. An old experienced Chinese merchant holds that not less than thirty years will be required; the writer, with eight years' experience of its growth under great difficulties, expects that the third year of a settled government will see its trade greater than ever. Immense sums will have to be spent on the new city, but it is only reasonable to suppose that China as a whole will come to the aid of the place which has been destroyed in establishing the Republic. The local leaders have shown wisdom throughout, and may be expected to rebuild the city properly. The old site is too small; the new city should be planned with a view to using the triangle between the railway and the rivers entirely for business purposes, and driving both the residential and poor quarters to the other side of the railway. An excellent thing for Wuhan would be an electric tube under the river, the power plant also lighting Wuchang and driving trackless cars; it appears to offer few difficulties, and a double line would cost under 1,000,000L., perhaps only 700,000L. It would provide the needed medium of communication both for the present and when the Canton Railway reaches Wuhan, and would relieve the congestion at Hankow by the waste hills and lands on the Wuchang bank of the river being taken into residential occupation, the enhanced price for which the Government could sell such land going far to pay the cost of laying the line. Such a tube would be far more effective than the constantly mooted bridge, which a competent foreign engineer has estimated to cost 6,000,000L., apart from cost of land approaches, and which would cost a large sum for upkeep.

Building, etc., Straits Settlements.

The Registrar of Imports and Exports at Singapore (Mr. A. Stuart) reports that the Budget of the Straits Settlements for 1913, subject to possible modifications before final approval, makes provision for the expenditure of the sums named on the following public works, viz.:

Singapore.—New District Court, 48,000 dollars; offices at Government House, 60,000 dollars; extensions to printing office, 64,000 dollars; additions and alterations to the general hospital, including electric lighting, about 335,000 dollars; installation of water carriage sewerage system at hospitals, gaols, and asylums, 90,000 dollars; new lunatic asylum (total estimated cost of 750,000 dollars), 100,000 dollars; new school, 60,000 dollars; kitchen including boilers, rice steamers, light rails, and trucks at Quarantine Station, 21,350 dollars; lining part of banks of Rocher Canal with concrete (total cost of 225,500 dollars), 37,500 dollars; river improvement works, 40,000 dollars.

Penang.—Improvements to Fort Cornwallis light (total estimated cost of 170,000 dollars), 60,000 dollars; new school, 49,000 dollars; hill railway, 100,000 dollars; installation of reservoir filtering apparatus at Bukit Panchor, 95,000 dollars.

Malacca.—New hospital at Jasin, 70,000 dollars; reclamation wall to reclamation, 25,000 dollars; a bridge over the Kesang River, 20,000 dollars; purchase of three 6-ton road rollers, 13,000 dollars. (Dollar equals 2s. 4d.)

Builders' Supplies, Canada.

H. M. Trade Commissioner for Canada reports that a firm at Montreal, who state that they have business connexions with architects and builders in that city, are desirous of obtaining agencies to cover Montreal and Quebec of British manufacturers of builders' supplies, such as architectural terra-cotta, fire-bricks, tiles, steel window-sashes, etc. The name and address of the firm may be obtained by British manufacturers on application to the Commercial Intelligence Branch, 73, Basinghall-street, London, E.C.

Medical Laboratory Equipment, South Africa.

H. M. Trade Commissioner for South Africa reports that the Union Government have given a site on Hospital-hill, Johannesburg, for a new institute for medical research. The Witwatersrand Native-Labour Association is stated to be contributing 40,000L. towards the building and equipment. The institute will be maintained conjointly by the Government, the Witwatersrand Association, and the Provincial Council.

THE CONCRETE INSTITUTE: BILLS OF QUANTITIES FOR REINFORCED CONCRETE.

MR. E. P. WELLS (President) took the chair at an ordinary general meeting of the Concrete Institute held at Denison House, Vauxhall Bridge-road, on November 28, when Mr. John M. Theobald read a paper on "Bills of Quantities for Reinforced Concrete Work."

Mr. Theobald said he made no reflection upon the quantities supplied by the specialists under the present system either upon the score of inaccuracy or otherwise; his criticism was solely directed against the system and not against its exponents. Reinforced concrete, from the point of view of the quantity surveyor, had but recently emerged from a healthy infancy, but now that its employment was being adopted on all sides there was a feeling, not confined to members of his own profession, that the specialist contractor should receive the same treatment as the builder, and it was with the grounds of that opinion that he proposed to deal. In advocating the claims of the quantity surveyor in connexion with reinforced concrete he knew he would be told that time did not admit of his employment and that until the details were complete he would be unable to commence his work, and the delay entailed thereby might be considerable. He admitted the objection, and his reply was that the client must wait. There might, of course, be cases in which rapidity of construction was everything, and under those circumstances he said at once that the preparation of bills of quantities by a quantity surveyor was impracticable. He might still, however, be advantageously employed in the preparation of a schedule of prices and subsequent measurement. Under the present system the quantities issued by the concrete specialists by their own showing were prepared before the working details were complete. He believed that under the present régime their correctness was not guaranteed, which, assuming for the sake of argument that the drawings from which the building was subsequently erected differed from those from which the quantities were prepared, would seem to press unduly upon the contractor. He urged even more emphatically the employment of a fully qualified quantity surveyor for the preparation of quantities for reinforced concrete when they arrived at the question of variations. Dealing with the point of method of measurement, he said he had in his office a bill of quantities prepared by a firm of specialists in reinforced concrete for a building the cost of which ran into five figures. It consisted of three items—concrete, centering, and reinforcement. With the greatest respect, he said that no contractor, however experienced, could price that bill with any degree of accuracy, and he did not see how he could be expected to do so. Contractors, they all knew, would price anything, and this particular job had no doubt been priced on the "what I lose on the swings I gain on the roundabout" principle, at a covering price to include all the cuttings, circular work, etc., that had not been measured. The time, however, had now arrived when bills of quantities for reinforced concrete should justify their existence, and be, in fact, such as would enable the contractor to form an accurate idea of the work involved, which, in his opinion, he could not do under the present system. Mr. Theobald proceeded to make a number of suggestions as to the method of measurement, not with the idea of laying down any hard or fast rules, but with the object of obtaining the views of others. In the first place, he thought all concrete and centering should be kept separate on the various floors. The concrete in walls, floors, beams, stanchions, stairs, etc., should also be separated, but he did not consider it necessary to further subdivide the concrete. The prices of concrete and reinforcement were easily arrived at, and varied but little. From his point of view the centering was by far the most difficult item for a contractor to price, and it was therefore absolutely necessary that the description should be as full as possible and every variation and labour either measured or described. Commencing with wall centering, if circular it should be so described, and the radius given. Then, with regard to the vexed question of deduction for openings, he believed, unless very large, it had hitherto been the custom to assume the centering went across the openings, and, consequently, to ignore them. These openings should be deducted, and a numbered item taken of centering to openings

of various widths and heights—averaged where similar in size, but not otherwise. This item he had seen measured per foot run, but, as the chief cost was that of maintaining the supports of the wall centering in which the openings occur, it was essential that the contractor should have the actual sizes—an average of the same would be incorrect because misleading. Floor centering needed no discussion. He would only mention that all raking or circular cutting and waste should be measured. The centering to beams should be measured per foot super—circular being, of course, kept separate—including all cutting at angles, etc. If the beams were played on bottom edge, he would measure either "Extra labour forming splay blank width on edge of beam casing"; "Angle fillet blank width and fixing on edge of beam casing to form splay"; or, take the item "Including all splayed edges"; the latter, however, he considered unsatisfactory. If the beams were irregular or unusual in shape, he would keep the centering separate and give a sketch.

The centering to small beams, say, 18 in. girth and under, he would measure per foot run. The centering to columns and stanchions should be measured per foot super, every variation in the shape being kept separate and fully described. He preferred to include all cutting in the description, but it could, of course, be measured separately, though he saw no object in doing so. All extra labour, such as from octagonal to square, he should number as "Extra over centering for —," giving a full description. Centering to stairs should be measured per foot super, as "Centering to sloping soffit of stairs." If "fleving," it should be measured separately. All edges of concrete floors, well-holes, sides of steps, etc., should be measured per foot run, giving the thickness, but if 12 in. thick or over, per foot super. All centering should include for all necessary strutting up from floor below or otherwise supporting.

The steel reinforcement being only of light bar it was not necessary to separate the various weights on each floor. Bends, hooked ends, etc., when forged, should be numbered. Stirrups and ties should be numbered, giving the diameter and length of the wire.

Sir Henry Tanner wrote that he quite agreed with the principles of the author. The practice of inviting design and tenders in open competition was, in his opinion, unsatisfactory. It led to cutting down of the most vigorous mind, although the design might be within the limit laid down. The quantities prepared by specialists were generally based on the French system, which was very comprehensive in the details. It was not usual to find a staircase put down as one item, whether of stone or wood. This was not what they were accustomed to in England, and the results were difficulty in adjusting variations, and, he presumed, in the majority of cases the building owner suffered. Another matter having very serious results on the progress of the work was the multiplication of sections differing by $\frac{1}{2}$ in. in diameter. The mills could not be got to put in rolls for the small quantities involved, whereas there would be no difficulty if pains were taken to add a little to some and take off a trifle from others and adjusting distances apart. Under the present system the delays that took place at the commencement were appalling. The drawings showing the plans and sections and generally the positions of the beams and stanchions were prepared by the architect and, together with a specification and conditions of contract, were supplied to persons desiring to tender. This labour would be appreciated by architects, and added considerably to their expenses. With the tenders were supplied some calculations and a few typical details, and, the contract having been secured after examination of these details, they were at the tender mercy of the specialist, and he suited himself or the contingencies of his business as to the supply of the rest. It was the builder who was answerable to the building owner, and the specialist could generally shuffle out of any responsibility. The consequence was that the ordering of steel was delayed and the time allowed to the mills was altogether insufficient in normal times. In his opinion the specialist, like the architect, should always be ready with the whole of his drawings, and the quantities should be properly prepared by a surveyor in the English system. If reinforced concrete building was to become popular it must be made as simple as possible, which meant economy, and generally was entirely advantageous.

Mr. W. E. H. Burton (West Riding of Yorkshire) wrote that if the paper resulted in a quantity surveyor becoming duly recognised as a necessary agent in the carrying out of work on reinforced concrete it would inaugurate a new era that would be hailed with delight by architects and contractors alike. Under the present system it was wellnigh impossible to secure satisfactory competitive tenders.

Mr. Alban H. Scott said, if it were not serious the attitude which architects took towards so-called specialists would be humorous. The architect lost all caste by dealing with them the way many of them did. The architect threw the whole responsibility on to them, but, of course, could not get rid of his legal responsibility. Foreign specialists came over and secured the builders by getting them to pay large sums for licences, and that was why builders were willing to put up with the inconveniences and losses they did.

Mr. T. A. Watson thought at the present time there was too much haste in the preparation of reinforced concrete schemes. If the author's scheme were carried out the architect or building owner would have to decide on a firm of reinforced concrete specialists to carry out the work and on the engineer who should design the work. Under the present state of affairs a contractor was asked to tender at four or five different schemes.

Mr. A. G. Cross generally agreed with the author, but did not think the benefit which would follow to the building owner by the employment of a quantity surveyor had been sufficiently emphasised.

Mr. S. Bylander considered that the thing should be made as simple as possible, as pointed out how he would measure.

Mr. T. E. Bare pointed out that one of the difficulties of the quantity surveyor would be the question of steel, and he suggested, with regard to that, they should have provisions quantities calculated from constants, then the would not be in a difficulty with regard to the detailed drawings not being prepared in time. A fair estimate of the amount of steel which would be required could be arrived at in that way.

Mr. W. G. Perkins (Holborn) remarked that what it really came to was that the architect should learn a little more about reinforced concrete, and should be able to design his floors, beams, and stanchions in such a way that he was able to show on his drawings approximately the number of bars, their arrangement and diameter, and so on. The quantity surveyor would thus be able to measure them and put it into his bill. That would give the builder something to price and give a basis on which to measure extras and omissions.

Mr. R. M. Kearns did not agree with the author as to the method of measurement. He considered that labour items should be included as far as possible, as they were liable to be overpriced, particularly as regarded centering.

Mr. W. E. Davis thought that the author's suggestions as to measuring would meet with general approval. One point he had always had a doubt about was the re-use of centering. They might get a warehouse with five or six floors, and it made a great difference as to the number of times it could be used on the same building. Any suggestion as to how that could be dealt with in the bill of quantities would be useful.

Mr. G. Cordery believed with the numerous systems of reinforced concrete it was impossible to lay down any one system of measurement. The trained mind of the surveyor must be applied to the circumstances before him, and he must produce a bill of quantities which would present in an ordered form the varieties of work which had to be done, having due regard to the methods of construction which would be employed in connexion with the particular system which it was anticipated would be used. He thought the time was coming when engineers would design in reinforced concrete as in other materials, but he did not think the materials would be largely used in domestic or civil architecture.

Mr. W. R. Wood suggested that it was time that the 'Surveyors' Institution should call a meeting with the Quantity Surveyors' Association, and, with the assistance of the ferro concrete specialists, formulate a system of measurement which would be generally adopted.

The President, having demonstrated on the blackboard how he himself took out quantities for reinforced concrete, further discussion was adjourned till December 12.

THE INSURANCE ACT.

It is becoming day by day more apparent that the decision by Departments as to the cases of persons who do or do not fall within the terms of an Act of Parliament is not a satisfactory method of procedure nor a good substitute for the practice hitherto in force of referring such questions to be decided in the Courts. Under the Insurance Act the Insurance Commissioners in the first instance decide whether a person is an insured person under Part I. of the Act, whilst under Part II. of the Act relating to unemployment the decisions of the Unemployment Commission are final. The Unemployment Commission number over 1,000. Yet it is open to doubt whether, in the light of all these decisions, the public is in the least better informed as to what classes fall within the Insurance Act. The reason for this is that the principle can be deduced from the provisions of the Act that the Insurance Commissioners are to decide upon the facts of each case, and, as they multiply, confusion is worse confounded, as a multitudinous number of decisions laying down no general principles are absolutely useless in securing a uniform interpretation of any Act of Parliament. We can illustrate these observations by a reference to one or two of the cases recently decided by the Commissioners. On October 21 inquiry was held as to the status of certain persons working for local authorities. One case was that of a stone-breaker who verbally contracted to break stones, having occasional engagements on account, but not being entitled to the payment of the whole sum until his contract was completed. It was stated that the man had not been dismissed until the work contracted was done, and that the only supervision he was subjected to was that of a surveyor who saw that the work was properly done. There were other cases as to men engaged in road repairs, digging, etc., under similar conditions of service. In the *Times* of November 19 the decision on these cases was announced as follows:—"The Commissioners hold that the persons contracting for labour under the Local Government and Rural District Councils under conditions detailed at the hearing on October 21 not liable to be insured in respect of such occupations. This decision is given on the grounds of the particular cases submitted at the hearing, and it will not necessarily apply to all persons who contract to do work for local authorities." Now, had these cases come before the Courts for decision some principle would have been laid down which would have been a guide in all cases of a like nature. The principle is not hard to find because, by reference to the decisions under other Acts of Parliament, it will be seen that the above persons were not employed "under a contract of service" within the definition contained in Schedule I. of the Insurance Act, but were independent contractors. A contract of service creates the relationship of master and servant, and in determining whether such a relationship has been created the two most important points to consider are whether the work contracted for is to be done under the direction and control of the person for whom it is being carried out, and his power of dismissal. In the above cases these elements were absent, and thus the persons were independent contractors and not servants.

In the case of such persons must not be confused with those who are employed by one person, but are engaged in the business of some employer. Under the Insurance Act in certain circumstances the employer in whose business they are engaged is then deemed to be the employer of such persons, although no contract of service exists between them, but they are working under contracts of service with an immediate employer, although the Act does not place the burden in the first instance to the employer. The independent contractor is working under no contract of service with anyone.

LEGAL COLUMN.

Metropolitan Water Board : Recovery of Rates. Without going into the legal technicalities involved in the case *Metropolitan Water Board v. Dunn* we may draw the attention of readers to the conclusion arrived at by a Divisional Court. The Water Board were owing for eight quarters' water rate, and more than six months had elapsed since the last quarter's rate had accrued due. The first six quarters were supplied under the statutes

relating to the old Lambeth Water Company, but this did not affect the decision, which was to the effect that under the Metropolitan Water Board Charges Act, 1907, read in connexion with other statutes, the limitation of six months within which proceedings must be taken only applies where summary proceedings are taken before justices, and has no application to proceedings in the County Court.

Damage to Plate-Glass Windows.

The decision of a Judge of the High Court in the case *London and Manchester, etc. Insurance Company, Ltd., v. Heath*, that the damage done by Suffragettes to plate-glass windows was not caused "directly by or arising from civil commotion" within the meaning of a policy of reinsurance, is one of considerable importance to the public. The advocates of female suffrage, to forward their political views, have committed a series of outrages against certain members of the public who have no direct interest in their political propaganda.

In certain policies of insurance damage from riots and civil commotion is expressly excepted, and had an action been brought upon such a policy the defence would, no doubt, have been raised that wanton damage done for an alleged political purpose came within that exception. It now appears that such a defence would not hold good, but it behoves all owners of property to examine their policies to see if they are protected from the modern attentions of the gentler sex! No doubt in many policies the words referring to "civil commotion" have been deemed sufficient to cover the class of damage now sustained; but although the above decision shows that this is not the case, it does not follow that the policies contain general words covering this class of damage, and, therefore, the result may be that many persons are practically uninsured. Owners of premises liable to such damage will be well advised to take legal advice on the terms to be used in such policies.

Under the Trade Disputes Act, as we showed last week, no civil action will lie against a trade union for any tort, and yet political powers are being conferred upon them. If at times of excitement at elections damage is done to property by or on behalf of trade unions this might equally not be "civil commotion," and, even if it were, access to the Courts for any civil remedy is closed.

It is clear that insurance policies should contain a special clause relating to damage done "in contemplation or furtherance of political opinions."

LAW REPORTS.

KING'S BENCH DIVISIONAL COURT.

(Before Mr. Justice AVORY.)

Metropolitan Water Board v. Johnson & Co.

In the absence of Mr. Justice Channell the judgment of the Court in this case was delivered by Mr. Justice Avory. The case came up from the Westminster County Court on an appeal by Messrs. Johnson & Co. (builders) against a decision in favour of the Water Board. Some time ago the builders carried out certain work at Hounslow Barracks. Under their contract with the War Office they said they were to have the necessary water free. The War Office had a supply by meter for domestic and non-domestic purposes, and it was now urged by Messrs. Johnson & Co. that the Water Board were not entitled to charge them, in addition, at the rate of 7s. per cent, on the probable cost of the work. The County Court Judge allowed the claim of the Water Board, and his Honour's decision was now upheld by the Divisional Court.

Mr. Justice Channell, in the course of his judgment (which was read by Mr. Justice Avory), said, in his opinion, the appeal of the builders ought to be allowed, but as Mr. Justice Avory agreed with the decision of the County Court Judge the appeal would be dismissed. He thought this was a proper course to follow in circumstances where two judges heard an appeal and held different views on the matter. The account sued for was only 15s., but the question involved in the case was of great importance. Therefore there would be leave to take the case to the Court of Appeal. In his opinion, the wording of sect. 17 of the Act meant "persons who desired to become customers of the Board for their water." The supply of water was a matter of statutory contract, and if the War Office were breaking their contract by using the water passing through their meter for building purposes they might, no doubt, be proceeded against. He did not, however, think this case differed from that of a person supplied with water by meter who under-let part of his premises and arranged that his under-

tenant should use the water. His Lordship saw no ground for saying the statute was intended to give the Board power to charge builders a higher rate than other persons, and if the Board wanted to prevent this sort of thing he thought they should embody in the schedule of their agreements the words "non-domestic, otherwise than for building operations," or something to that effect.

Mr. Justice Avory, delivering his own judgment, said he thought the appeal should be dismissed. It appeared to him that sect. 17 of the Act must be read as ancillary or supplementary to sect. 15, and that the effect and meaning of sect. 17 was that a builder who had need of a supply of the builder's water for the purposes of his building operations must make a request for such supply and pay the special charge. He did not think a builder could be heard to say he did not require the water because he had succeeded in obtaining it without making a request to the Board under sect. 16.

The appeal was dismissed with costs, and leave to appeal further was granted on an application by the builders.

Mrs. W. O. Danckwerts, K.C., and Mr. Mickelthwait were for the builders; and Mr. Clavell Salter, K.C., and Mr. Goodland represented the Water Board.

OFFICIAL REFEREE'S COURT.

(Before Mr. EDWARD POLLOCK.)

Contractors' Heavy Claim :

Pethick Brothers v. Metropolitan Water Board.

THE hearing was begun on December 2 of an action by Messrs. Pethick Brothers, contractors, of Plymouth and London, against the Metropolitan Water Board, from whom plaintiffs claimed 16,121l. 7s. 4d., balance of an account in respect to the construction of filter-beds, a reservoir, etc., at Long Ditton, Surrey.

The plaintiffs' case was that by a contract dated December 28, 1906, they undertook to carry out the works in question for the defendant Board at a total cost to the latter of 54,783l. The plaintiffs alleged that they had been permitted to go on with the work until October, 1907, when defendants had wrongfully declined to allow them to finish the work, dismissed them from the site, and unjustifiably used their tools, materials, and plant.

The defendants admitted the contract, but pleaded that it was a term thereof that the work should be finished within a certain specified date. They said that there were two clauses, the first of which stated that the contractor should finish and deliver up to the Metropolitan Water Board the whole of the works and should complete the removal of all temporary works within a period of eighteen months; that three of the filter-beds and so much of the pipe-lines, and other outfall works, as might be necessary for their proper and efficient working, should be completed within a period of six months from the date of the Engineer's certificate to commence the work, the whole of the works to be delivered up and complete in every respect and in a good and proper condition. The other clause stated that should the contractors during the continuance of the work in the opinion of the Engineer fail to proceed with the work with such diligence as to ensure its completion within the specified time the Board might determine the contract, take possession of the works, plaintiffs' tools and materials, and use or sell them as the absolute property of the Board. On January 7, 1907, the plaintiffs were ordered by the Engineer to begin work, and the defendant Board alleged that in October of that year the whole of the work was greatly in arrear, with the result that the Engineer gave his certificate to the Works and Stores Committee of the defendant Board, certifying that in his opinion the contractors had not and were not proceeding with the work with that diligence that would bring about its completion within the stipulated period. The Board determined the contract, as they claimed they had a right to, and took possession of plaintiffs' tools, materials, and plant then upon the site. The Board admitted that plaintiffs had not yet been paid the balance of the value of the work carried out by them before the determination of the contract, but they denied that there was a sum of 16,121l. 7s. 4d. due to the plaintiffs. The defendants counter-claimed for 1,394l. 6s. 6d., which they alleged was due to them as the result of plaintiffs' non-compliance with the contract. Owing to the delays and the necessity to determine the contract the Board had had to employ other contractors to complete the work, involving charges to the Board of 13,617l. They admitted, on the other hand, that plaintiffs should have credit for a sum

of 12,223l., which defendants claimed to retain against the 13,617l. That left 1,394l. as the amount counter-claimed for by defendants.

The plaintiffs raised numerous defences to the counter-claim. They alleged, amongst other things, that on October 2, 1907, the Engineer withheld necessary instructions and directions as to the method of carrying out the works, and that he was not competent to give the certificate. The plaintiffs further alleged that in purporting to give this certificate the Engineer did not exercise his judgment. Plaintiffs denied that they were responsible for any delay, or that they were guilty of any lack of diligence. In regard to the counter-claim, they claimed that the Engineer had no power to authorise the defendants to deduct any sums which would otherwise become due to the plaintiffs. Nor was a certificate of April 23, 1911, a further certificate as required by Clause 35 of the contract.

Mr. A. Hudson, K.C., and Mr. Arnold Inman (instructed by Law & Worsam, agents for Bond & Pearce, of Plymouth) appeared for the plaintiffs, and Mr. Holman Gregory, K.C., and Mr. J. Goodland (instructed by Walter Moon) represented the defendants.

Evidence was called on behalf of the plaintiffs' case, the first witnesses being Mr. Arthur Henry Pechick, partner of the plaintiff firm. The hearing was continued on the 3rd, and on December 4 when Mr. Pollock took his seat Mr. Hudson said that under the circumstances he must withdraw certain parts of his clients' reply and defence to the defence and counter-claim. He could not proceed with the suggestions that the Board's Engineer had failed to give directions; that he was not competent to give the certificate; and that in giving the certificate he did not exercise his judgment.

Mr. Frank Pollock, who was in charge of the work at Long Ditton, gave evidence, and eventually Mr. Ernest Selby, of Messrs. Selby & Sanders, quantity surveyors, of Caxton House, Westminster, was called. Mr. Selby stated that they were employed by plaintiffs to measure up this work. They completed the measuring-up of the work and submitted draft accounts to December, 1907, and early in 1908 they effected a total up to a certain point. That was to say that they agreed upon a total for the value of the work done, but not for the plant, and they did not agree for any amount that the Board might claim against their clients. When they were measuring with another firm they were aware that a counter-claim was being made. The witness added that the agreed figure was 13,948l. 7s. 6d. for the value of the work done, after making deductions in respect to materials supplied by the Board and allowances in respect to the value of materials on the site.

Mr. Holman Gregory contended that his points had been proved by the evidence called for the plaintiffs.

[Mr. Hudson was advancing legal points when we went to press.]

OFFICIAL REFEREE'S COURT.

(Before Mr. EDWARD POLLOCK.)

The Erection and Removal of a Tudor House : Tibbenham v. Gill.

THE further hearing of this claim by the plaintiff, Mr. Frederick Tibbenham, of Lower Brook-street, Ipswich, for the recovery of 1,687l. balance of an account from the defendant, Mr. John Hamblet Gill, of Oxford-street, London, in respect to work done and materials supplied in the removal of a Tudor house at Hawstead, near Bury St. Edmund's, and its re-erection at Clacton-on-Sea, for which furniture was supplied, was to have taken place on Mr. Pollock's return from the country, where he had been engaged, since the adjournment, in trying another action.

On Friday, November 23, the case of Tibbenham v. Gill came before Mr. Pollock in town by way of summons.

We understand that the case has been settled on terms agreed between the parties.

The defendant had raised various defences in the pleadings, and a summarised report of the plaintiff's examination and cross-examination was published in the *Builder*.

CHANCERY DIVISION.

(Before Mr. JUSTICE PARKER.)

Action By and Against Contractors : J. Aird and Co. v. the Tanjong Pagar Dock Board.

THE hearing was continued this week of the cross-claims in the action, the plaintiffs claim being against the defendants for 500,000l. as damages for alleged breach of contract in connexion with the construction of a wet dock at Singapore. Plaintiffs, the well-

known contractors, allege that the defendants misrepresented the conditions under which the contract was to be carried out, and therefore that they were justified in repudiating the contract. Defendants denied these allegations, and served a notice on the executors of the late Sir John Aird, who in his lifetime was a member of the plaintiff firm and a party to the contract, making a claim against his estate of about 1,000,000l. as damages for alleged breach of contract by the plaintiff firm. Mr. Upjohn, K.C., Mr. Macnaghten, K.C., and Mr. Schwann appeared for the plaintiffs; and Sir R. Finlay, K.C., Mr. George Cave, K.C., Mr. Romer, K.C., Sir Hugh Fort, Mr. Mathews, and Mr. Hull for the defendants. [The case was proceeding as we went to press.]

LONDON COUNCILS.

Barnes.—The Local Government Board is to be petitioned to issue an order authorising the Council to purchase compulsorily lands and premises necessary for carrying out improvements at Barnes High-street.

Bernersley.—Plans have been passed for Messrs. Enthoven & Son, Ltd., Upper Ordnance Wharf, Rotherhithe, S.E., for additions to lead smelting works in Rotherhithe-street; as have also plans by Messrs. Stephens & Son, 55, Hill-street, Woolwich, S.E., for the erection of additions to No. 251, Southwark Park-road, for Mr. Thomas Bernard, 1, Rotherhithe New-road.

Bethnal Green.—The General Purposes Committee of the Borough Council have decided to adopt the Public Libraries Acts, and they have authorised the Town Clerk to communicate with Mr. Andrew Carnegie with a view to obtain his assistance in the matter of the cost to be incurred by the Council in erecting a library.

Camberwell. Plans and estimates by the Borough Engineer have been approved for paving Pickwick-road as a new street. The estimated cost is put at 875l. Plans have been passed for Messrs. Hichison & Co., Messrs. Ashhead & Ramsey, and Messrs. Watson & Kilwood, for the erection of a picture palace at the corner of Well-street and Blackbridge-street; a building in Peckham-road; and a garage at the Grove Hotel, Dulwich Common-road, respectively.

Croydon.—Application is to be made to the Local Government Board for sanction to borrow 6,000l. for the erection of a firestation at Thornton Heath. The tender of Mr. G. Lewin, Croydon, at 274l., has been accepted for erecting a shop and stores at Waterworks-yard, Surrey-street. The Roads Committee report that the Improvements Committee of the London County Council propose to recommend that a widening of the tramway terminus at Norbury be proceeded with. The scheme provides for the widening of Hermitage Bridge at a cost of 380l. The Housing Committee have been authorised to prepare a scheme under the Housing and Town Planning, etc., Act, 1909, dealing with land between Waddon and Russell-hill. Tenders are to be invited for the erection of a branch library at Thornton Heath. The following plans have been passed:—Mr. E. J. Saunders, 48, Wellesley-road, mission hall, Boston-road; Mr. R. B. Manser, Beddington, three houses, Teevan-road; Mr. J. E. Trimble, Kilmarin-avenue, six houses, Strathroy-avenue; Messrs. W. Smith & Sons, London-road, vicarage, Elmwood-road; Messrs. Luscombe & Son, Paddington, tower to St. Michael and All Angels Church, Poplar-walk; Mr. W. T. Taylor, Stamford-road, additions to Whitgift-street Hall; Mr. C. H. Gibson, 42, Park-lane, three houses, Clyde-road; Mr. P. Richardson, 30, Addiscombe-avenue, three houses, Woodside Green; Messrs. W. Aston & Co., Thornton Heath, twelve houses, Ederline-avenue; Messrs. Berner & Son, 104, Forge-street, extensions to Gas Company's offices, Katherine-street; Mr. C. Taylor, 9, Bingham-road, seven houses and shops, Lower Addiscombe-road; Mr. O. Gray, 39-41, New Bond-street, six houses, Pollards-hill West.

Deptford.—A portion of Whitepost-lane is to be made up and paved as a new street. The following plans have been passed:—Messrs. C. Miskin & Sons, Ltd., additions to St. Mary's Church, Erlam-road; Mr. J. H. Forbes, buildings, New King-street, for Messrs. Vornberger & Co., Ltd.; Messrs. Wright & Co., three blocks of flats, Brookmill-road; Mr. F. Danby Smith has lodged plans with the London County Council for the erection of additions to the Electric Palace in High-street.

East Ham.—The Borough Engineer has been directed to prepare plans and estimates for making up Beauford-road. Messrs. Reddon & Co. have had plans passed for the erection of eight houses in Chesley-gardens.

Edmonton.—At the last meeting of the Guardians it was decided to provide a receiving home for one hundred children.

Hamwell.—At the next meeting of the Urban District Council a motion is to be put forward to the effect that the Baths and Washhouses Act be adopted for the district.

Hendon.—At the last meeting of the Education Committee the Works Sub-Committee submitted a recommendation to the effect that instructions be given the Architect, Mr. Wilson, to draw up plans for the new school on the Hamilton-road site. Mr. Page moved that the matter be referred back for consideration, as he was of opinion that the matter should remain in abeyance for about a month, and a fresh competition instituted. The Chairman, in reply to a question, said that if the amendment was not carried it would not entitle Mr. Wilson to any further architectural work for an indefinite period. Mr. Cartwright said he would prefer to see an open competition for a school of the proposed magnitude. Mr. Poulton said that open competition had been held in the cases of the Hyde School and the Garden Suburb School, and Mr. Wilson had been successful in both instances. The Chairman said that in connexion with the competition for the Garden Suburb School an agreement had been entered into with Mr. Wilson whereby they should appoint him to carry out any new work within the period of the erection of the new school and up to one month of the occupation of such school. So far as he could see, there was no reason why the Committee should back out of an agreement entered into after full consideration. Councillor Ford said that, in view of this agreement, they were in a position that, until the handing over of the new school, Mr. Wilson was entitled to any work without any restriction as to cost. They were compelled, if they started before January, to have Mr. Wilson's plans, and Mr. Wilson's price. The Chairman replied in the negative, stating that the Committee was the sole judge of the plans, and might refer them back often as they pleased. Councillor Ford said that, if the Committee referred the plans back they would be in the same position as regards time as if they waited a month and had an open competition. This was not the time of the year when building operations could be carried out apace, and a delay of a month or six weeks would not appreciably retard the opening of the school. If Mr. Wilson got the work in open competition it would spur him on to give the best value for money. After further discussion the Sub-Committee's recommendation was approved.

Holborn.—The application of the Prudential Assurance Company, Ltd., for permission to construct a subway under Brooke-street, has been granted, subject to protective conditions. **Hornsey.**—Sanction has been received from the Local Government Board to the borrowing of 2,400l. for the erection and furnishing of a temporary school at Muswell-hill. Messrs. Herbert & Co., Rookfield-avenue, Muswell-hill, have had plans passed for the erection of two houses in St. James's-lane.

Huddersfield.—Plans have been passed as follows:—Mr. E. T. Dunn, on behalf of Lord Rowallan, sixteen houses, Goodmayes-lane, and eight in Allot-gardens, Abbotsford-road; Messrs. W. P. Griggs & Co., five houses, The Drive; Messrs. Rawlins, Culver, & Co., seven houses, Charlbury-gardens; Mr. J. E. Achy, on behalf of the London General Omnibus Company, motor bus garage, High-road, Seven Kings; Mr. E. G. Faunoh, on behalf of Mr. J. W. Cornforth, motor garage, Holcombe-road; Mr. J. G. F. Meaden, extensions to school, Village Homes.

Lambeth.—Plans lodged by Mr. G. Hitchings, on behalf of Mr. Leopold S. Rogers, have been approved for carrying out drainage works to six houses proposed to be erected on the east side of Tulsemead-road; as have also plans lodged by Mr. James Parsons, on behalf of the Duchy of Cornwall, to drain three blocks of eighteen flats proposed to be erected on the north side of Chester-street, Kennington-road. Plans have been lodged with the London County Council by Mr. A. Dixon, on behalf of Messrs. W. Whitbread & Co., Ltd., for the re-erection of the "Engineers' Arms" public-house, Waverley-road; as have also plans by Messrs. W. Jones & Sons for the erection of a motor garage on the site of Nos. 2, 2a, 4, and 6, Kennington Park-road.

Leyton.—The Surveyor has prepared an estimate amounting to 150l. for increasing the dressing accommodation at the second-class swimming-bath. Tenders are invited for supplying the Cann Hall Estate sewers, for which the Local Government Board have sanctioned the raising of a loan of 1,600l. The following plans have been passed:—Mr. A. Radcliffe, twelve houses, Grove Green-road; the New Model Laundries, Ltd., additions to laundry,

place: Mr. W. Hendon Winder, fifteen years, St. Helier-road; Messrs. J. Jarvis & Co., Ltd., cinema, corner of Kirkdale-road; Church-lane; Mr. P. Cornish, twelve years, High-road, Leytonstone.

Children and Coombe.—For making up, etc., at 525 ft. of Dickerage-lane (exclusive of way paving) the tender of Messrs. J. J. J. & Co., Ltd., Grosvenor-road, Westminster, S.W., has been accepted at 608*l*. The tender of Messrs. J. Wainwright & Co., Ltd., Upton Mallet, has also been accepted, at for paving the footways in Dickerage-

Widdles.—The County Engineer and Surveyor has been authorised to construct a tarred footpath on the west side of Cowley, Widdles, at an estimated cost of 220*l*. Tenders are to be invited for substituting "grass" paving for macadam on the margins of a portion of the Uxbridge-road, Southall, for providing an efficient surface-water drainage. The approximate cost is put at 1*l*. It has been decided to purchase certain land in Beaconsfield-road, Southall, for the erection of a new school. The North-West School, Southall, is to be enlarged by 400 places. Repairs are to be carried out to Walton Bridge, which is in a dangerous condition. Steel is to be substituted for the existing timber decking, and tenders are invited for carrying out the work, which is estimated to cost 3,000*l*.

Handsworth.—Plans have been passed for E. J. Ward for alterations and additions to Messrs. Laundry, Merton-road, Southfields; for Mr. J. Copp, for thirty-six houses in Upton-avenue, Streatham; and for Messrs. J. Evans & Sons for four houses, Nightingale-lane, Balham.

West Ham.—The Education Committee have decided to invite fresh tenders for the erection of a new handicraft centre at Upton-lane pool.

OBITUARY.

Mr. F. E. Robertson, M.Inst.C.E.
Mr. Frederick Ewart Robertson, who died at his residence, No. 32, Courtfield-gardens, London, a few days ago, aged sixty-five years, was a partner of Sir A. M. Rendel, Robert Rendel, of Dartmouth-street, S.W., consulting engineers. After practising for years in England as a civil engineer he joined (1868) the Indian Public Works Department; as Chief Civil Engineer to the Western State Railway he constructed cantilever bridge at Sukkur, across the Indus, for which and other services he was elected C.I.E., 1892. In 1890-7 he was Chief Engineer, East Indian Railway, and President, Indian Railway Board, in 1897-8. He then joined Sir Alexander Rendel in partnership, became a member of Council, Inst.C.E., and published "A Practical Treatise upon Building" and an "Arabic Vocabulary of Egypt," and was the author of numerous technical articles and papers.

Mr. S. C. Smith, R.H.A.
The death last week is announced of Mr. Catterson Smith, of No. 42, St. Stephen's-gate, Dublin, aged sixty-three years. He was the son of the late S. Catterson Smith, President of the Royal Hibernian Academy, and for twenty years was Secretary, R.H.A. He painted a large number of pictures and portraits, including those of the late Duke of Devonshire in the Dublin Castle Gallery and Queen Victoria in the Royal College of Surgeons, Dublin.

PATENTS.

APPLICATIONS PUBLISHED.*

1,765 of 1911.—Samuel Elliott: Process of appliances for drying or seasoning timber.
1,032 of 1911.—Maurice Joseph Poulain: Pipes and the like.

1,432 of 1911.—Henry Frank Berry: Apparatus for heating and drying stone and for materials for use on roads and like surfaces.

1,585 of 1911.—William Croydon Edwards: Reinforced concrete structures.
1,927 of 1911.—William Joseph Dibdin: Filtration tanks for treatment of sewage and other foul waters.

1,077 of 1911.—George Wilkinson, Adam Wilson and Joseph Finney: Building bricks and blocks.

1,159 of 1912.—John MacNoull Wilson: Apparatus for removing paint and varnish.

All these applications are in the stage in which opposition to the grant of Patents upon them can be made.

5,306 of 1912.—Allgemeine Tiefbohr und Schachtbau Aktiengesellschaft: Process for sinking shafts or driving tunnels and the like.

5,913 of 1912.—James Dammel Prior: Boilers of domestic firebricks.

5,925 of 1912.—Johann Walzel and Johann Petho: Domestic smokeless stoves.

9,156 of 1912.—Emil Henry Rieter-Bedmor: Fibrous cement plates.

9,801 of 1912.—Henry Frank Berry: Heating and drying of stone and other materials for use on roads and like surfaces.

12,637 of 1912.—Ralf Lees and William Lees: Wood tensioning machines.

13,967 of 1912.—George Robertson Hislop: Kitchen ranges and other solid-fuel burning stoves.

SELECTED PATENTS.

14,576 of 1911.—Otto Hermann: Roof-lights.

This relates to roof-lights, the frames of which consist of a number of superposed louvered frames carried by systems of lazy-tongs levers. The frames 4, 5, 6 are carried by four sets of lazy-tongs pivoted at 1, 2, 3 to the frames and operated in pairs by three-

14,576 of 1911.

armed levers 8 pivoted at 24 to the frame 6, and having their longer arms connected by a crossbar 25, to which is attached a chain 9. The two shorter arms of the levers 8 are connected, one directly to the cranked end of the lever 7, the other by means of a link 11 and bell-crank 13 to the cranked end of the lever 14.

14,915 of 1911.—Harry August Stockmann: Reinforced concrete construction.

This relates to reinforced concrete wherein the tension members 5, 6, upper or compression members 1, 2, and transverse members 3, 4, connect the upper series and alternate with similar members 7, 8, 9, which connect

14,915 of 1911.

the lower series, and the inclined zigzag or truss members 10, 11, 12, 13. The longitudinal members consist each of two wires twisted together, the twists being reversed at the loops which embrace the transverse members. Extra rods 14, 15, may be added.

14,948 of 1911.—Raimund Janesch and Anton Schnell: Walls, partitions.

This relates to a hollow wall or partition which is formed of blocks or is cast *in situ* so that the inner face is permeable to air and the outer face is impermeable. The blocks are hollow, the inner portion being

14,948 of 1911.

formed of asbestos, concrete, or charcoal concrete, and the webs and outer portion *b* of ordinary concrete; the hollows *d* form ventilating passage and communicate with the outer

air through passages *f* or otherwise; they may also communicate with each other through passages *e*. A similar wall is cast *in situ*, and other forms are built up of L, U, or T shaped blocks.

15,013 of 1911.—Emil Abraham Kling: Portable derricks and shear legs.

This relates to a portable derrick which comprises a pair of posts swivelled together and adapted to be folded to different angles as required. The posts 9, 10, mounted on wheels 13, are connected together by swivel members 19, 21, and also by levers 39, 40 pivoted one to each post and connected by a hook and eye at 41, 42. A sheave 23 is hung from the member 21, and a rope passes over

15,013 of 1911.

the sheaves to a hand winch 25. A bar 28 hinged to the post 10 is provided with notches 30, 31, which engage a pin on the post 9, so that the posts may be worked at either a large or small angle; or, if greater flexibility is desired, a chain 36 suffices to prevent the legs being forced apart. The derrick may be turned, if required, so as to work round corners of waggons and the like.

TERMS OF SUBSCRIPTION.

"THE BUILDER" (Published Weekly) is supplied DIRECT from the Office to residents in any part of the United Kingdom at the prepaid rate of 1*l* 5*s* per annum, with delivery by Friday Morning's Post in London and to subscribers elsewhere by special delivery, 2*l* 5*s* per annum; and to all parts of Europe, America, Australia, New Zealand, India, China, Ceylon, etc., 3*l* 5*s* per annum. Subscriptions payable to J. MORRAN should be addressed to "The Builder," 1, Catherine-street, W.C.

Rowley Bros. 10,456
Fairhead & Son 10
Brand, Pettitt, & Co. 10,452
Matlock Bros. 10

* In our issue for November 22, in the list of tenders for a new school at Bradwell, page 632, we gave the name of Mr. W. Heap, of Northampton, as the lowest tenderer, but indicated that the next lowest tender had been accepted. It should have been stated, however, that the reason Mr. Heap's tender was not accepted was because his tender was ruled out of order as he did not stipulate a time for carrying out the work.

THE ARCHITECT AND THE LAY-COMMITTEE.

WE believe that it is a generally acknowledged fact amongst architects that, although the practice of their art is set with all manner of difficulties, it is not so much the actual carrying out of work entrusted to them that taxes their resources as the ways and means to which they have to resort, on occasion, in order to make sure of the commission. In other words, the architect's great difficulty is to secure work, and, having achieved this with no in upon his reputation, to safeguard his interests from the day the contract is signed to that of the final settlement of accounts, his own amongst the number. We are well aware that the mere enumeration of these two axioms will awaken memories in the mind of many an architect of injury inflicted upon him, may be years ago, for this is nothing new, or it may be yesterday; for it is going on every day. That such a state of affairs is to be entirely avoided is beyond the wildest expectations, but we fear

that it will be aggravated unless serious and concentrated effort is brought to bear upon it from outside the ranks of the profession as much as from within. There is probably not an architect in this country who has been in practice on his own account for a period of ten years who could not tell of experiences which would be illuminating; of prospective and presumably assured clients lured away at the psychological moment; of intrigue of some kind or another which was too much for him because he would not stoop to combat it; of clients who have protested against the final certificate, whereas the "extras" were entirely of their own ordering or necessitated by their vacillating minds; while stories of injustice suffered in the thousand-and-one directions that may result from a competition conducted on satisfactory lines are too rife for us to attempt to touch upon them here, even if we felt inclined to do so, in view of the fact that real progress has been made in recent years towards the elimination of the "undesirable competition." But, although architects

may have differences with their clients at one stage or another of their business relations, they often have themselves to blame, for the simple reason that they do not know how to manage them; it is often indeed a delicate proceeding, and, as practically no instruction or guidance is given in the architectural schools or meted out by the practitioner to his pupil, the young architect often finds himself checked in the game of life till he has learned by bitter experience; again, the architect may have grievances associated with this or that competition, but if that is so now-a-days, he more often than not has himself to blame for entering upon one the conditions of which have not been approved by the Committee of the Royal Institute of British Architects whose special duty it is to watch and report on such matters.

But the architect who finds himself face to face with a Lay-Committee is in an altogether different position, and we wish in particular to draw attention here to some of the indignities to which he may find himself subjected under trying

conditions. It is a theme to which attention appears to have been little directed, certainly not for lack of data.

Let us take the case of a Committee composed of a number of men and, in these enlightened days, in all probability comprising an equal or possibly a preponderating number of women, all cultured as far as general knowledge constitutes culture, but ignorant of architecture and the methods of the men who keep the lamp of beauty bright. Imagine such a Committee taking upon itself the onerous duty of formulating a scheme for a large modern building intended to be put to a variety of uses: of selecting a site for it, and of appointing an architect to design and carry it out. At a very early stage of its labours it finds that it cannot proceed far without some expert aid, for beyond a vague idea of the nature of the accommodation required to be provided little is known. Questions quickly arise as to how many floors should this accommodation be disposed upon, and how much land will be required. If half an acre, will every square yard allowed to be built upon by the by-laws in force in that particular district be covered? If double that area, will the building be lost on a site too large for it? Till some plans, however rough, have been prepared to scale no site can be acquired. Accordingly the services of an architect are retained, and as one site is favoured after another he surveys, and by means of report and plan provides the Committee with valuable information, valuable possibly in a negative sense as proving more often than not that certain steps should not be taken. For these services he receives nominal fees out of all proportion to the labour and skill expended, and he may then find that the Lay-Committee has reserved the right to appoint any architect and on a given day to invite applications for a specific commission. We believe that it is no uncommon thing for such a course as we have outlined to be followed, and we cannot take exception to the proceedings so far, either in theory or practice, for "who pays the piper calls the tune." But we do regret the custom which seems to be prevalent amongst architects of pouring in drawings and photographs of executed work to impress the lay-mind with the magnitude of their achievements, the amount of their resources, and presumably their hunger for more work, after they have ascertained that the decision rests with a Committee who has shirked the appointment of a professional adviser to act in a purely professional manner in a purely professional matter. The Lay-Committee in its ignorance of architecture, and the machinery by which it is only too often produced, is naturally caught open-mouthed. It seeks safety by following the line of least resistance, and thinks that, because Mr. A. has built a Town Hall which has not tumbled down, he must surely be safer to trust with another Town Hall than Mr. B., who has only built a library, although the library be better of its kind than Mr. A.'s Town Hall. The principle is absurd, and we touched upon it some weeks ago in dealing with certain aspects of "official architecture," for it is this sort of thing which tends to make

architects stereotyped specialists in a dead art instead of versatile exponents of a living one.

The invitation to architects to send in specimens of their work having been responded to, we can expect no other result than that the palm of victory should be given to the runner with the longest list of "events" to his record; we should not blame a Committee for perpetrating such a blind act; the members could hardly be expected to know any better. The error would not be there, but in their taking upon themselves the privilege of adjudicating upon what is practically a limited competition, and it lies primarily with the architects for submitting their work to be judged by untrained minds. A violation of the rules of etiquette is no mark of genius or learning, but, apart from such questions, it is obviously unfair to any younger men who might be amongst the "invited"; it goes without saying that "to him that hath shall be given and from him that hath not shall be taken away, even that he hath." If Mr. B. is never to be given a school to build because he has never built a school, it is clear that his experience will be confined within narrow limits, and many a reader of this article will cast his thoughts back to the client who gave him his very first commission; viewed in this light, he will at least acknowledge this client to have been brave, almost heroic, whatever his other merits or demerits may have been, for he it was who entrusted him with a commission knowing that he had not previously designed and executed any building at all in his own name.

Now, this attitude of the lay-mind towards architecture is becoming serious, and it is quite time that in more ways than one architects should take a stand and make clear their position. Our hopes for the future of our art centre largely round the public; there never were such means of acquiring an intelligent interest in architecture open to them as there are to-day; books without number are being published as much for the "general reader" as for the professional student; lectures free to anyone who cares to apply for admission are being delivered practically every day at this season of the year at the leading educational establishments in the country; the daily Press is awakening to the vital importance of beautiful homes and dignified cities, and is preaching spasmodically what the professional Press has been urging for years. All this is tending to educate the public and to open up the one road by which the fine arts may be restored once more to their rightful place in this country, and there is no more hopeful sign and no tendency which it behoves us to encourage and help forward more earnestly. But it has its dangers; it does not follow that because they benefit by the available means of acquiring an interest in matters architectural the public are to take upon themselves duties which these very books, lectures, and articles are meant to teach them, namely, that the art of architecture is too big a subject to be trifled with by amateurs. They should realise that all matters of technical import should be referred to those qualified by training and experience to deal with them, seeing that they alone

are fit to plunge into the deep as troubled waters, the shallows at the brim of which provide such excellent paddling for those who have neither the courage nor the skill to invade more than knee-deep. "The tyranny of the assessor as a correspondent points out in a letter we publish elsewhere, "is nothing to the ignorance of the Lay-Committee."

The acquisition of a little knowledge is always dangerous, but it is particularly so in the case of such a pursuit as that of architecture, whose appeal is peculiarly smattering; easily acquired, and an apparent show of knowledge can readily conceal an absolute ignorance of the principles underlying it. Architecture is a great constructive art; the outward forms, colours, and decorations are mere language by which the skilled architect expresses himself, yet people who have not the least comprehension of the constructive problem, which was the very thing with which architects of all ages no less than those of our own day have grappled, and to which they have given this or that expression by accident or design, are setting themselves up as critics and taking upon themselves to say what is good architecture and what bad, and who is the best architect of a given number. As a matter of fact, the opinion of the person with no technical knowledge and no special training in a particular craft has little value; more than that, it may be mischievous, and when it is given collectively by a Committee or Board constituted of such persons and by the iron of fate with powers for the time being to tie the hands or reject the project of some architect who finds himself unexpectedly at their mercy, it may be positively harmful to the progress of our art, and architects should stand shoulder to shoulder to resist it and annul it whenever occasion arises.

It may with a certain amount of assurance be urged that any architect who has been building for ten years, and building well, is fit to be entrusted with the design and execution of any ordinary architectural work, for the principles underlying all kinds of building are the same; the planning and the question of outward expression will be the only aspects of a problem upon which one unacquainted with any particular kind of structure will need to focus a trained intellect. And this concentration of a fresh and vigorous mind upon an entirely new problem has been productive of some of the happiest results which the chronicler of modern architecture will be called upon to record. We want to see building schemes in the hands of the most thoughtful and scholarly architects, and we are training them every day; we want architectural literature from the pens of writers who know *first hand* what they are writing about. We must be broad in our sympathies and firm in our convictions, if we are going to hold our own in a restless age—an age of inquiry and undigested thought. Above all, the profession must do what they can to make sure that their interests are being watched and guarded in all places and at all times by those who really have at heart the furtherance of architecture and the constructive and decorative arts allied with it.

NOTES.

BOTH the *Observer* in its issue of the 8th inst. and the *Standard* in its issue of the 7th inst. call attention to the danger attended by the erection of further buildings in the private enclosures of St. Paul's Park. The Marylebone Borough Council, within whose area is contained a large portion of the Park, and the Metropolitan Council have both made public statements against the proposals which have been made. The latter body states that "The operations are being conducted on Park land which was formerly on an annual tenancy by people who lived in villa houses next to it. Everyone understood that when the leases of the houses fell in the land would be added to the Park, and as these leases fall due in the future it is with considerable apprehension that we view these building operations"; further, if "buildings are allowed to be erected in the present instance, what advantages have we that others will not be reaped on the other enclosures?" It pointed out that the new buildings of St. Paul's College, occupying no less than 10 acres, have already begun the process of enlarging the Park into a town, and that two other dangers are threatened—first, the proposal to continue Portland Road, linking it up with Portland town; second, the possibility of part of the Royal Botanic Gardens being selected as site for London University. Attention was called to these dangers in the House of Commons, and the likelihood of the proposals being entertained was pointed out by Mr. Wedgwood Benn, replying to questions put on behalf of the First Commissioner of Works, also that the Office of Works had not received any suggestion with reference to the land in question, and there was "little probability of its being agreed to if put forward." In view of the importance of preserving London's open spaces we hope the protests made will arouse sufficient opposition to secure the defeat of any such proposals. We are glad to hear that the appointment of a House of Commons Committee to deal with these similar proposals is mooted.

In a letter to the *Times* of the 10th inst. the danger threatening the stability of St. Paul's Cathedral by the construction of the proposed tram subway is again drawn attention to by Mr. Evelyn Macartney. This is no idle remark, but a well-founded note of warning issued by one who is in a position to speak with authority. It appears that in the east walls of the Cathedral to the side of the tunnel would be only 1 ft. and that the bottom of it would be 6 ft. above the footings at their deepest point. Considering the nature of the soil and the presence of water, any subsiding which is likely to drain off the water is almost certain to lead to subsidence unless extraordinary precautions in the way of underpinning are first undertaken. That the stability of the Cathedral would be endangered by such meddling operations as are proposed, without these precautions being first taken, goes without saying, and we think

that the authorities have good cause for drawing attention to a serious menace to the National Cathedral. This may be a utilitarian age, calling for all manner of increased facilities for transit, but it behoves us first to safeguard our ancient monuments, and none more jealously than St. Paul's Cathedral. By adopting Blackfriars Bridge as the link between the tramway systems risk to St. Paul's would be averted.

We are glad to notice "Thoughts on Architecture," "Beauty in Architecture," delivered recently by Mr. W. S. Purchon, A.R.I.B.A., at Sheffield, which we print in this issue. The lecturer very truly states that "One of the most important qualities in architecture is unity"; . . . "the various forms which compose a building must be so arranged and welded together as to form a single whole; no part of a design must look like an afterthought." In saying that "Proportion is a relative matter, the harmonising of the shapes of the different forms with each other and with the whole," we feel Mr. Purchon's definition a little incomplete, as it has surely more to do with space than actual form except in so far as form is expressed by space? In other words, the lecturer seems to have harmony even more in his mind than proportion, though harmony can only be obtained by the observance of the canons of proportion which dominate everything else. We cannot agree with the statement that Blenheim Palace is "not really so bad as it is supposed to be." But the

lecture, as a whole, is one of those thoughtful attempts to recognise first principles, which are in architecture the one thing essential, as clear and logical thought must be a necessary forerunner of successful accomplishment.

We much regret that the Piccadilly Manchester Corporation Site, Manchester, should have put architects to the enormous labour which a competition for a public building of the first importance involves, and then proceeded to consider whether it was a project they wished to carry out! Such an inversion of the positions of the cart and horse is productive of the greatest injustice to architects. Every public body should be competent to decide its own wants, and not until those wants have been thrashed out should it ask a body of professional men to submit designs on the obvious implied understanding that someone of them will be entrusted with a building. The fact that the profession does not work for money premiums, however considerable, but for the opportunity of designing and carrying out buildings which will bear the tests of criticism and time needs constant and vigorous enforcements. The Commission now sitting at the Manchester Town Hall to consider to what use the Piccadilly site should be devoted is a bad instance of the way in which we are treated by the public whom we try to serve. We hope that among a multitude of counsellors the Corporation of Manchester may find wisdom, but we wish they had done so before and not after they had put the profession to the trouble of a competition.

In another column, under the heading "The Railway Strikes and Lock-outs," we draw the attention of employers and employed to the very serious effect the constant resort to strikes has on the wages of the working classes and the trade of the country. Since those observations were written a strike has been commenced on the North-Eastern Railway upon wholly inadequate grounds. A main line driver was charged with having been drunk when off duty and of assault. The charge for assault was not made out, but the man was convicted of drunkenness and, according to the reports in the Press, he was reduced in rank to a pilot engine-driver. It is apparently contended that he was wrongly convicted, and many men have gone out on strike. Their action in so doing will be noted by the public, in whose interest the action of the railway authorities was taken. Men occupying positions of such responsibility as engine-drivers should be as sober when off duty as when engaged in their duties, and a railway company employing a man in such a capacity after he had been convicted by a properly constituted tribunal of any insobriety would be guilty of a serious breach of duty. A strike instituted on the grounds that a company shall not perform a duty to the public is an attempt at intimidation which can only be universally condemned. There are constitutional methods of testing the justice of a conviction, and the company have certainly not shown any desire to be severe with the man, but if judicial

Joiners' Hall, Salisbury.

From a sketch by Mr. Leslie Barofort.

Of the several incorporated companies which formerly existed by Charter in this city, the Joiners alone retain any premises of architectural merit. Their building stands in St. Anne's-street on a steep slope. The carved brackets supporting the upper windows are attributed to the hand of Humphrey Beekham, a native of Salisbury, during the reign of James I.

decisions are to be made the subject of strikes discipline is at an end, and the public are threatened with serious danger. Whatever may be the merits of the particular case, it is obvious that it should not be the occasion of a strike, and the action of the men shows the reckless use they make on the least excuse of a remedy which should only be resorted to as a last resource in trade disputes of a serious nature.

"BYZANTINE CHURCHES IN CONSTANTINOPLE."

By PROFESSOR W. R. LETHBRIDGE.

IN the fine new volume published under this title* Dr. A. van Millingen gives us a worthy companion to his authoritative work on the city walls of Constantinople, and one with a more definite appeal to architects. These two works, together with the comprehensive volume written by Mr. Dalton on Byzantine Arts other than Architecture and Miss Bell's accounts of her explorations, are providing us for the first time with adequate material for the study of Byzantine archaeology. If Mr. Antoniadis, who for long lived in England and writes perfect English, would issue a condensed version of his great work on St. Sophia for our use we should be archaeologically happy.

Some acquaintance with the main principles followed by the Byzantine builders of the best time—that is, the VIth century—may be recommended to all modern architects. The more modern they are the more they may profit from a contact with this very free and very reasonable form of ancient art. Nothing is so likely to break down the dreary "Classic" or "Gothic" view of architecture. I do not recommend it, vital and beautiful as it was, as "Byzantine," but rather as a third link in the long chain to which we should be adding our own contribution.

* "Byzantine Churches in Constantinople." By A. van Millingen. (London: Macmillan & Co. Price 31s. 6d. net.)

In the preparation of his volume Dr. Van Millingen has had the assistance of Messrs. Ramsay Traquair, W. S. George, and A. E. Henderson, all architects with a competent, first-hand knowledge of Byzantine buildings. It contains 92 plates, 116 plans and other figures, and 330 pages of text which gives a complete historical and architectural account of the now existing churches of Constantinople.

This admirable book has given me very much pleasure, bringing back, as it has done, the memory of a fortnight of delight spent in visiting several of these churches nearly twenty years ago with my gifted friend Mr. Harold Swanson. We were taken to them by Canon Curtis, who did good work in Constantinople, and we saw many things which have probably now passed away. By the side of the then recently-made railway which skirts the shore outside SS. Sergius and Bacchus there were heaps of Byzantine capitals and other fragments. A little further on a large section of the sea-wall had the upper part of its brickwork set in patterns, and the walls were largely intact. An archway with Victories on either side formed an opening in the wall to the quay on the Golden Horn, and many interesting marble fragments appeared here and there in the masonry, most of which have probably been now gathered into German museums. Outside of the wonderful land-walls were only cypresses and turbaned tombs—nothing ugly. A small house near Gul Djami, which Canon Curtis thought occupied the site of the Church of the Holy Apostles, had two marble capitals of the wind-blown acanthus type forming a step to the entrance. The shoemakers working at the doors of their little shops all sharpened their knives on pieces of royal porphyry.

The English method of reviewing books as practised in the literary journals of omniscience should be an offence to people who like to call themselves practical. The staple of such "criticism" is to keep on saying that any given work might be different from what it is—if blue, say it should be red. I cannot pretend to show how the learned author with whose volume we are now concerned should have done his work better, so

I will only venture to thank him, and in making use of a few points in his great work of material, I will endeavour to discuss them.

The Church of St. John of the Studion was a noble basilica built in the VIth century. I say "was," for, except the western portico and the outer walls, it is now a squalid ruin. It seems to have been nearly perfect in the XVIIIth century; it degraded quickly during the last century; in 1900 it was injured by fire, and later a heavy load of snow broke down the roof. The portico opening on a pleasant court, once an Atrium, is of great beauty, and happily gives us some indication of what the interior which appears to have ranged exactly with it was like. Over the aisles were galleries supported by a marble entablature resting on verd-antique columns. Above the marble beam stood another range of columns supporting the roof. This is a very beautiful scheme for a great congregational building. The double tier of columns separated by marble beam is found again at SS. Sergius and Bacchus. In the flank walls of the basilica are two ranges of windows, the upper ones being large. There is a splendid mosaic floor: finds of tesserae and other evidence show that the upper parts of the walls were covered with mosaic, while the lower were plated with marble.

The most valuable old description of St. John of the Studion is that of Pococke, which I may quote, as it has not been used by Dr. Van Millingen:—"The finest most after St. Sophia is called by the Greeks Constantine's Church, but is the church of a monastery called Studion. There is a very handsome portico, with four pillars of white marble, which support a very fine entablature, there being another of the same kind within. The nave is divided from the aisles by seven verd-antique pillars, 6 ft. 2 in. in circumference. I took particular notice that they are of the composite order. These are as many more pillars of the same order, and, probably, of the same material but they are whitened over; there appears to have been a gallery on each side, which is not remaining. There is a cistern under a Court to the south, in which there are four rows of Corinthian pillars."

ELEVATION OF THE NARTHEX by Ramsay Traquair.

Fig. 1. From "Byzantine Churches in Constantinople."

(By permission of Messrs. Macmillan & Co.)

Up to the gallery level the walls were lined with marble; that they were similarly treated above is possible but not certain. The cubes of mosaic found, probably came from the soffits of the upper arcade and the Bema semi-dome.

On this account I have put three especially notable observations in italics. (1) The general entablature was similar to that of the portico. (2) The lower range of marble columns, about 2 ft. in diameter, were composite, and different from others in

2. Church of SS. Sergius and Bacchus, Constantinople: Ground Plan.

from a measured drawing by Mr. A. E. Henderson.

Cistern, which are described just below Corinthian. Now, the capitals of the octo are "composite"—that is, they have anthus leafage below and big volutes at angles. The internal columns, therefore well as the entablature, were like those the portico. Gillus, indeed, as quoted Dr. Van Millingen, says that the internal was like that of the vestibule. The upper columns were Ionic. These are all properly assumed by Mr. George in his restoration (see illustration produced on page 702, Fig. 1), but it is satisfactory to find the ordonnance of the interior clearly described. May I say here that agree with keeping the roof low and leaving clear-story windows? The upper windows the galleries were doubtless made so large they are to light the nave. Altogether get a very complete restoration of this the early basilica.

When I visited the church there were one two finely-carved upper blocks of capitals in the Atrium Court. One of these believe I recognised last year in the Berlin Museum. I also have a note that Mr. Freshfield—to whom we owe so much as long the only student of Byzantine art in England—bought and brought away some carved capitals because the Turks were using pistols at them. One of these has anucopia on the face and "thistles" at angles. This, however, would have been later than the basilica.

The plan and whole structural scheme of the Church of SS. Sergius and Bacchus (Fig. 2) wonderfully perfect—a single and complete work. It is pointed out on page 71 how "the octagon stands askew within its rectangular frame," so that they "have not the same orientation." It is questioned whether this is due to inaccurate work or "the result of the effort to adapt the church to the lines of the earlier Church of SS. Peter and Paul, which which it was united. If we may take the plans as accurate, it is architecturally certain that the adjustment was intentional. The effective interior and its axial vista is liberately twisted 5 deg. or 6 deg. from the central line of the square building. It is done very skilfully; the narthex and its transe-door are pushed to the south of the east front, while the apse is pushed to the west. Moreover, the whole bema and apse, with its east window, are planned on the diagonal axis, so that all the important points

in the vista are in the same line. It would be worth while comparing the direction of sunrise on the day of SS. Sergius and Bacchus with that of SS. Peter and Paul to see if they would offer any explanation of the change of orientation. It is certain, I believe, that St. Sophia points to the sunrise of Christmas Day. In any case, there can be little doubt that SS. Peter and Paul was first built, giving the general direction. This church was almost certainly on the north of SS. Sergius and Bacchus, as indicated by the thinner wall here as compared to that on the south side.

When Swainson and I visited the church he set himself to make out the monograms on the capitals, which, I believe, he was the first to do. He afterwards published them in the *Byzantinische Zeitschrift* (Fig. 3), and pointed out that, although the name of Theodora appears as well as that of Justinian, her title Augusta is not given as at St. Sophia. I gave my attention principally to the form of the dome, describing it thus:—"It is not properly described by Salzenberg or Choisy. It is not spherical, nor set on regular pendentives, but each angle of the octagon being rounded into a niche, the dome springs in sixteen sides, the alternate ones over the angle niches being concave to the interior. On the inside modelled plastered ribs follow the sixteen divisions and surround the eight arches. This is much disguised with Turkish painting, but it is certainly Byzantine." I should add that it is not so much that the "sides" are alternately hollow and straight, which would make a perfect geometrical device for setting a cupola over an octagon, but the alternate hollowed sides rise at first rather vertically and then are slurred into a flatter concave. The form has thus no strict geometrical definition, but it is very delightful, especially on the exterior where the leaden skin fits over the "bumped-out" parts. As Dr. Van Millingen points out, the marble columns of the interior are "in pairs, alternately verd-antique and red Synnada marble"—those of the straight sides are green and those to the alternate curved bays are red; this is a precedent followed at Sta Sophia.

It is noticed that the arch at the foot of the staircase to the gallery is built of fragments "from the old ciborium or eikonostasis." Not from the latter, I think, for they are small in scale, and it is likely that the eikonostasis was formed by a continuation of the lower order with its entablature. Note how this ends now at the side of the

opening into the bema (A in Fig. 4). In this case the great inscription of the interior would have begun here, and it seems to call for a beginning of some length.

On St. Irene it is perhaps better not to speak in any detail before Mr. George's

Fig. 4.

monograph is published; but there can be little doubt that, in the main, the suggestions offered in this volume are sound, including that as to the original form of the nave. Perhaps, however, Justinian's share in the present church is a little understated. In the chronological table at the end of the book the early part of the much-rebuilt Chora Church is assigned to the VIth century, but St. Irene only comes under the VIIIth century as "St. Irene 740." Rivroira has lately assigned the whole structure to the VIIIth century, but I feel that I may still say that "the originality of the scheme . . . and the large freedom of the handling marks it as of the VIth century."

The VIth-century Church of St. Andrew, in Kriest, is a small structure of very great beauty, which was hitherto little known. I am able in Fig. 5 to reproduce the isometrical section given in the book.

Of the later buildings I cannot speak at any length. St. Mary, Pammakaristos, still has a fine mosaic in a dome and an important east front. The exterior of the apse of the side church, with its niches and the series of triangles under the cornice, should be compared with similar features at Murano and St. Mark's, Venice. This part is doubtless a work of the XIth century. The comparison shows how strictly Byzantine the Italian churches just mentioned are.

In St. Theodosia I drew the cross incised on a slab figured on page 174. It was then a little more perfect, for there was a disc at the end of the arm, and the foliage finished below it instead of passing up to the upper quarter space.

Pococke gives the best old account of the church, or group of churches, of the Pantokrator:—"Another church converted into a mosque is on the brow of the fourth hill. It was dedicated to the Almighty, has two porticoes, and is divided into three parts, the domes being supported with pillars of red granite. The whole is adorned with the figures of the Apostles and the history of Our Saviour in mosaic work, and the subject of each compartment is described in Greek; the Turks have disfigured the faces. On the outside of this church there is a very fine coffin of a single piece of verd-antique of a very extraordinary size; there are crosses cut on it." There were imperial tombs in the church, and this was evidently

Fig. 3. Monograms on the Capitals of S. Sergius at Constantinople.

Fig. 5. From "Byzantine Churches in Constantinople."

(By permission of Messrs. Macmillan & Co.)

one of them. I believe we saw such a sarcophagus in the street not far from the church.

Dr. Van Millingen, in describing the middle church of the group, says:—"The floor in the archway leading into the south church is paved with marbles forming a beautiful design. If the whole floor was thus decorated, the effect must have been extraordinarily rich." It is a work of *opus sectile* of great interest, as being the prototype of similar pavements in Italy. In a plan of the church by Texier at the Institute of Architects this elaborate floor is shown as covering the central square area between the four columns of the south church. "Fragments of fine carving have been built into the pulpit of the mosque, and over it a Byzantine canopy." I remember that we climbed up the steep steps of this beautiful pulpit. The sides of the canopy are marble slabs with "arches" cut out of them. In the spandrels were crosses in shallow relief (now defaced), and on one side three monograms. The first of these seems to be *Kyrie Boethi*. I trace them from sketches by Mr. Swainson. (Fig. 6.) The mosaics described by Pococke have disappeared, but some marble wall lining still exists, with a cipollino dado, and then above a band of verd-antique a tall central panel of red surrounded by two wide bands, verd-antique and red.

Dr. Van Millingen brings his work to a close with a full account of the Chora Church, the least-injured ancient church in Constantinople. The resemblance of its east end

historical text seems to agree with this view. A claim for the VIth-century date of the older part was made many years ago by Professor Hayter Lewis in the *Procopius* issued by the Palestine Pilgrims' Text Society.

I fear that the wall paintings of the paracloision have faded much since "my time." Then the coloured interior was of great beauty, and the paintings were interesting even compared with the splendid mosaics. Notice in Fig. 99 a band of mosaic of Italian "Cosmati" type. Similar mosaic patterns have been found at Daphne, and it seems certain that such Cosmati mosaics were of Byzantine origin.

I had not thought of writing so much. The interest of the volume has drawn me on.

W. R. L.

OFFICIAL ARCHITECTURE IN INDIA.

We have before us Mr. Begg's Annual Report,* illustrated by a selection of the photographs supplied to him of buildings carried out under Government supervision, which is specially interesting, coming, as it does, at a time when the building of New Delhi is under consideration.

It contains clear evidence of the number and importance of the works executed by the Government of India—that remarkable experiment in the world's history, the almost despotic government of an Eastern people by a Western in the interests of the governed rather than that of the conqueror.

Such work as devolves on the Consulting Architect must in the nature of things be exceedingly difficult, as it is work carried out without the adequate assistance which would be forthcoming here, and in a trying climate, and confronted with the problem that Kipling puts into the words "East is East and West is West, and never the twain shall meet"; and if we criticise we do so with full knowledge of, and sympathy for, the difficulties of those who are placed in so onerous a position.

The Consulting Architect gives a list of twenty-four of the most important works coming under his care during one year, and when we mention that this includes two churches, five post-offices, and three Court houses it may be readily seen that the

capacity of the ablest designer and organiser may well be overtaxed.

We believe in clear thinking and plain speaking, and we hardly understand Mr. Begg's first impressions of the Taj, or can quite see the bearing they have on such Report as this; we, however, quote the passage as being interesting: "I declare the Taj is not architecture—not, at least, in the accepted sense. Something far finer, perhaps, better, higher; art of transcendent order, maybe; poetry in craftsmanship; music in marble; an inspired dream of hitherto unattained future caught and rendered solid. Solid, yes; but hardly real. And the architect who would be so vain as to go to it seeking notions for his work—anyone worthy to be called architect, who had an inkling of what to expect, could go to it for that base purpose—would come away disappointed."

In contradistinction to this rhapsody Mr. Begg utters sound sense when he says "Now, if it be true that native India architecture has died under our rule, I think it very doubtful whether we could be blamed for it. Only art with very little vitality can be killed by Government letting alone, which is all we are accused of doing. It must be unworthy to live if it cannot survive the want of direct Government patronage."

The buildings illustrated fall under two heads, those which are frankly English in design, like the Calcutta Medical College designed by Mr. Begg, and the new Secretarial Council House, carried out under Mr. Ransome and Mr. Begg; and, on the other hand, such instances of an Eastern rendering as Muir College, Allahabad, by F. O. Oertel, and the Daly College, Indore, by Colonel Sir S. Jacob, K.C.I.E.; and we are sorry to say that neither type strike us as being on logical lines.

Those first mentioned are but ordinary Georgian design, having little to differentiate them from the buildings of this country, and the latter are a lifeless and uninspired effort at imitation.

Nothing ever designed had stronger vernacular feeling than our own Georgian work; it suits our climate, and it suited the conditions which brought it about, but it is one of the last styles to accord with India, or to be in place in the tropics.

Neither do we feel that we can adapt the architecture of the Moghuls and breathe into it the spirit of living architecture. We believe that a *via media* is to be found in some style built up on the basis of the Southern European Renaissance, the type of Spain and Italy and the Colonial Empires of Spain and Portugal.

In the Portuguese colonies of Macao and Goa, and in the lands which once formed the Colonial Empire of Spain, in especial Mexico, we are nearer what we require. In these places the Renaissance was carried out by native workmen under a European ruling race; and in Mexico especially the art of the conquered race modifies the type and gives it local colouring.

In Mexico, too, buildings had often to be carried out in materials which were far from being of the character we consider sufficiently good in Europe. The Americans have shown us how well the Renaissance is adapted to the conditions of a hot climate, but it is architecture characterised by a larger and freer handling than that which is indigenous and suitable here, and the American architect has shown his adaptability by many delightful buildings in Southern California, which are outcomes of the picturesque local traditions left by the Spanish Missions.

We must hope that the building, of the new capital of India will be an achievement which will demonstrate our ability to rise, if not to the full height of our opportunity, at least to a large measure of success, and that it will react, and revivify the official architecture of our Indian Empire.

Fig. 6.

to that of Sta Sophia Salonica is pointed out, and in the architectural description it seems to be suggested that the older parts go back to the VIth century. This cannot, I think, be the case in regard to the main apse, for it has a wide triple window of a late type and two external niches like those mentioned above as characteristic of the XIth century. The "restored bay" on page 315 also looks late, and it seems to me that the old part, irrespective of foundations, is not earlier than the XIth century. The more cautious

EXHIBITION OF THE ARTS
AND CRAFTS SOCIETY.

MANY changes have marked the progress of the art in the last fifty years. At first it was strife, and, winning, the progress became triumphal, until to-day we may join in with fresh unstained banners and enthusiasms; but, instead of dissipating our strength and energy in the battle, we may use it legitimately in our work. The Society of the Arts and Crafts was, in some way, a pioneer of this. Prophets, it is true, had gone out before and prepared the way, but it was still rough, full of pitfalls and of griefs. That we fell by the roadside was inevitable, but we won through. Now, with a certain sense of triumph, they hold their tenth exhibition, at the new Grosvenor Gallery. Criticism has a persistent way of regretting "the good old time"—the habit is as old as Solomon—always to the disadvantage of to-day. The present exhibition has been compared very generally—"it is inferior to the last." It is difficult to compare things separated by three years, and, besides, it is quite unnecessary.

Has the Society achieved its aims? Is it still a healthy body? Surely both questions may be answered in the affirmative. It hardly matters if the exhibitions are in merit. That is inevitable; for, after all, once the ground has been opened up, the seed sown, there are influences around our knowledge which touch the harvest of golden plenty or blight it to thin purity. It may be unfortunate, but genius, which knows the course of life, the direction of art, is unknown and new ways, from its infancy, is almost worn out before its first clearing is reached.

Many great voices are stilled, that we of the younger generation—from our nearness to the things—somewhat disparage. Ruskin, Morris, and the Pre-Raphaelites may seem to us to have builded on strange soil, but we must not forget that we use their foundations to raise the fair fabric of art which our generation hopes to raise.

Day by day we move further away from our first designs; we alter window, frieze, and cornice, and the conception widens out, closing ever new beauties, but we build on what we did not lay. Somewhat ancient hands laid the first stones!

Much as we hope for the future, we cannot find it in ourselves to call this a great age of art. We refer not to lack of great artists, but to the attitude of a whole people towards art. It is a thing apart from life. If we allow ourselves, it follows that, beyond the accident of the individual, we must be content with less.

Judging this exhibition, let us adopt a table criterion, not looking for peers of the best left by the ages, but for lesser things, which may be found. The best, but, at any rate, we shall not be disappointed. Of the work of architects there is little. Sir Herbert Lorimer, however, finds time to let his fancy flow out to the making of little things. And his exhibit is so various that it is led to believe that the true architect is the head and front of designers. What a warning thing is the carved and coloured crest of the late Duke of Fife (101)! It is a decorative heraldry—not the commercial work of the Herald's College—without any pretence to reality or that superficial flash that destroys the medium. It is only a piece of pine carved and painted the similitude of a mounted knight in a loup. Some of the credit must be given to Herbert Young, who carved it, who stayed hand before it had gone too far. Two dressing-glasses (94 and 98), from the designs the same architect, show his appreciation of dainty form and material. The general lines, which are similar and traditional, are delightfully simple, whilst the form of the tops of the glasses is intricate enough to show the beauty of the cross-banded lead. Little ivory finials and drawer-pieces make playful dots of colour. Equal knowledge of art make his tables (89 and 90),

bookstands, etc., pleasant things to look at. He understands that it is good to omit, good to allow material to be its own sufficient excuse.

In the vestibule there is an extremely interesting design for a barge by Francis W. Troup, for Hertford College Boat Club (497), which should make a delightful addition to river architecture. Needless to say, it is quite unlike the usual houseboat, which has to be covered with flowers before it looks anything but derelict or worse. W. Curtis Green shows photographs of a small church (518), very simple in idea and in execution. Indeed in many ways it shows how good architecture and expense are not synonyms. Another good photographic exhibit is a pleasant cottage at Haslemere, by A. J. Penty (530). C. R. Ashbee does not shine so much in architecture as in other of his multitudinous activities. His isometric drawing of the London Fraternity House (359 A-B) puzzles at first by its strangeness, but when analysed it is a mass of incongruities. Ernest W. Gimson is represented by none of his beautiful furniture, and we have to be content with his design for the Federal Capital of Australia (356), drawn on three large strainers, which shows how fair a city might be, begun and carried out on a preconceived plan. Furniture makes a fairly important part of the exhibition. There is a sideboard, by Hamilton T. Smith (110), in walnut, of simple design, which is very effective. The wood is unpolished, and the three small door panels of the front are chosen for their fine figure. It is a little lacking in suavity, however, because it is almost independent of the past. Without tradition nothing is possible beyond the expression of the plain facts of construction, a little more or a little less disguised. Something remains to be added and makes it art. Yet it must be admitted at once there is nothing amateurish about this work, nor in that other piece of cabinet-work close by a walnut writing-table inlaid with shell and ebony by A. Romney Green (122). If the latter is lacking in fine form, something is given in compensation in the way of inlay. This inlay is splendid, and of itself gives character to the piece. An armchair (121) by the same craftsman is more supple in design and solves the difficulty of making a comfortable chair good to look on. Several smaller exhibits from the same hand are equally interesting. There is a set of painted chairs with rush bottoms, after an old pattern by Alfred Powell, which are very pleasant (23). A few other painted pieces may be mentioned. A cupboard designed by W. R. Lethaby (328), and painted presumably by the painter of the chairs, is crude in colour. There is no life either about the patterns of the flowers with which the panels are decorated; but indeed the design of the whole is not even worthy of the work upon it. Opposite this cupboard is a small tall-boy by M. Hindshaw, prettily decorated in gay colours which one would love to see in a child's bedroom. It would be a happy child. A more important exhibit, from its size, is the fireplace for Dunsany Castle by George Jack (71). We wish it were better designed so that one might enjoy the carving, which is first-rate technically, but, as it is, it only serves to emphasise the ugliness of the lines of the upper part of the overmantel. It shows at once the gulf that is sometimes fixed between the designer and the craftsman, which can seldom be bridged over in the person of one man. Another case in point is the fireplace by H. Longden (455), which, although exquisitely worked and engraved, fails of any æsthetic purpose because of its lack of idea. Now, the bookshelf by C. Spooner (435) is admirable because of its design, and it is no less so because it was executed by J. H. W. Brandt. These collaborators also exhibit a walnut writing-table (468), very well designed and executed with great taste in the choice of wood. Ambrose Heal's furniture varies considerably in merit; his book and print-case (31) and

china cabinet (56), both in black-bean wood, are the best. His very rich sideboard (375) is fulsome, whilst the dining-table in chestnut (151) is archaic. This is too great versatility.

Walter Crane's cabinet in ebonised wood with needlework panels (126) is fascinating, and here again we find the value of tradition, and it would be well if still more inspiration were taken from old models. It must, however, be noted that on the whole there is a great advance in design due to the study and appreciation of old work. In nothing is this more noticeable than in the jewellery. It is hard not to run into superlatives when speaking of this work, and if we were in the happy circumstance of the rich nothing would give more pleasure than to take our lady and deck her out in some of these lovely and exquisite trinkets.

Arthur and G. C. Gaskin are among the most prolific, and we find our catalogue marked again and again opposite their work. Take, for example, the peacock (391 w). It would surely be difficult to find anything more charming in colour and design. There is nothing gaudy about it, but all its small parts combine to make a perfect gem. A brooch by Ethel P. Agnew and a cross and chain by Edith Stewart (390 n and l) may be mentioned. In all this section, so numerous that it is impossible to particularise, there are very few poor designs, and how infinitely superior are even these to the best works of commerce! Yet they are all very reasonable in price. Some of the silverwork is scarcely less interesting. There is a fine sports cup by C. R. Ashbee (153 m), with the beauty of outline and interest in the body that would scarcely be surpassed by the best old work. The wedding-howl by R. O. Pearson (153 a) is charming. In the same case are two other very fine howls by Bertram J. Young (1) and Bernard Cuzner (j). All the work in this case is very good.

There is a good deal of calligraphy and illumination and book-design, much of which is surprisingly beautiful. The inscriptions in gold, "DOMINI EST TERRA" (293), by Phoebe Rensell and that other one by Charles Braithwaite (310) are good examples of finely-spaced lettering. There are some good illuminated books by Allan Vigers. That page (c) with the splendid words, "God Almighty first Planted a Garden," is decorated round the margin with the flowers of which the essay treats, rich in colour like a summer flower-bed.

The cases of printed books (337-345) are so good that one need not differentiate between them. The Book of Job (344), by Florence Kingsford Cockerell, and Douglas Cockerell's Etonian Book show what fine work is being done in writing and book-binding. It is always less interesting to criticise designs than the finished work, but there is no actual stained-glass. Some of Robert Anning Bell's cartoons (139-41) are in themselves masterpieces, and would probably work out into beautiful windows. Again, the heraldic drawings by W. E. Hodges (86) would probably make very good windows if carried out carefully. The cartoons by C. W. Whall and M. Hutchinson are of a very conventional kind, and are drawn without any leading. We must say that the work in this section is not very convincing.

The case is otherwise with the exhibit of James Powell & Sons (537). Out of such glasses Keats would have loved to drink—"to watch the beaded bubble winking at the brim." Contemplating these glasses, we longed for an unquenchable thirst in order to try to slacken it out of such exquisite ware. But the prices held us back.

The case of pottery by W. Howson Taylor (507) is another exhibit, interesting because of its variety and intrinsic goodness. Art and science, and sometimes accident, mutually act and re-act upon one another to produce pottery, as various in colour as the rainbow, and with forms as graceful as any old ones. W. H. Cowlshaw's pottery is also very good.

The exhibition as a whole is one of which the Arts and Crafts Society may be justly proud, and all the work attains a fairly high standard in design and workmanship. Some of it indeed is superlatively good. In this respect it is better than almost any picture show we have ever seen. Our difficulty, after two careful visits, is to pick out representative things with some distinguishing character about the rest. And this is no slight one, if one considers the infinite scope and variety of the exhibition.

PICTURE EXHIBITIONS.

The exhibitions of the New English Art Club had of recent years begun to lose their individual note; they did not vary particularly from the exhibitions of any other more or less advanced society. One was beginning to feel that the Club had delivered its message (and we all know how valuable that was in the nineties). This autumn, however, it seems to have recovered its energy. In the nineties it had to fight against outworn sentimental and anecdotal views which dominated the general view of painting, and it eventually won the day. To-day what has it to struggle for? We scarcely know. Certainly not for the expression of originality, of which we have enough and to spare. Perhaps a little for sanity. The struggle of "the young man knocking at the door" is no longer in question; nowadays he is admitted before he has reached the threshold. And Mr. Augustus John and the other painters of the New English Art Club who have not succeeded to Academic rank can no longer be quite included among the younger generation of painters. Mr. Augustus John's large decorative painting, "The Mumpers," gives the keynote, certainly more than any other picture, to the exhibition. The keynote is, broadly speaking, the substitution of character for the older ideals of what was considered beautiful in painting. As a piece of decoration "The Mumpers" possesses considerable qualities, although we are far from being attracted by the composition as a whole. As the realisation of a subject we can discover little in it that makes for the kind of enlightenment which is communicated by works which endure in art, although it has some charming passages, charming perhaps because they are reminiscent of Botticelli or Leonardo, even perhaps of Mr. John himself. It is all a little noisy and overdone. But we welcome the intellectual energy, the frank expression of a point of view in the picture, not only because these things are interesting in themselves, but because they help to give fresh life to a society that may serve again a useful purpose in the artistic economy.

It is perhaps a far cry from the ultra-modern art of Mr. Augustus John to that of Mr. Anning Bell. The latter painter suggests no difficulties in the way of appreciation. In his water-colours at present on view at the Leicester Galleries, illustrating the Biblical story of "Mary, the Mother of Jesus," he reconciles us to established conventions. Few modern artists have a more distinguished sense of the decorative purpose of painting in which everything inessential is omitted, or can handle plain washes of colour more harmoniously or effectively. In the type of subject of which his present series of water-colours is composed Mr. Anning Bell naturally brings to mind earlier and other treatments—a difficult ordeal for any painter. The spiritual qualities in certain religious aspects of this earlier art can never perhaps be recovered; Mr. Bell, however, goes far to do so largely through his sensitive and unaffected feeling for decorative composition. In the more dramatic phases of his subject he is not so successful as in his groups of little children, or angels, at a prayer on a hillside, in which the spiritual conception is very beautifully suggested.

The range of the art of Mr. Joseph Pennell is concerned with quite other issues than

those of the two painters of whom we have been writing. "The Wonder of Work," which is given as the title of the catalogue of his exhibition of etchings and lithographs which are on view at the Galleries of the Fine Art Society, indicates to a certain extent their character. Mr. Pennell has recently visited the works of the Panama Canal, and his etchings and lithographs go to illustrate not only the monumental nature but also the artistic quality which may be discovered in this undertaking. These spacious, vigorous studies are worthy of the artist at his best. The lithographs are exceptionally good, and will certainly add to his reputation.

On Monday a joint meeting of the Architectural Association with the Art Workers' Guild was held at Tufston-street, the subject for discussion being "The Practice of the Crafts in Modern Building." Mr. Gerald Horsley, President of the Association, in the Chair.

The President.

In welcoming the visitors, said the Art Workers' Guild comprised within its ranks something like thirty different crafts. It was founded about twenty-eight years ago, and he had the honour of being one of its founders, and the object was to afford opportunity for men following different crafts to meet together; at that time such opportunities were very few, and they were in no way organised. It had been a most successful society, and was still in a flourishing condition, and the members had reaped the benefit of becoming acquainted with crafts other than their own. He was the Hon. Secretary for about eighteen years, and looked back on that time with feelings of the deepest pleasure. He thought the subject chosen for discussion gave opportunity for many views being presented.

Mr. F. C. Eden

said that a few years ago they used to be told that the practice of the crafts was the whole duty of architects. Since then their mentors had moved with the times, and now engineering was said to be the "noblest architectural result of the Renaissance," and the one thing needful. The earlier theory was that the workman—craftsman they liked to call him—was to be fancy-free in manipulating his material, and by a flourish of his tools, as by a sort of peaceful picketing, to warn off the architect from ignorant interference with his self-expression. Architects had usually been willing to learn—at any rate up to a certain age—and, though they could not agree to leave carpenter and mason to work their own sweet will entirely untrammelled, they came to see that the touch of Nature and Nature's materials was worth a deal of office drudgery, so that nowadays it might be hard to find one to show the fine impartiality attributed to Sir Gilbert Scott and mark his design for a reredos as being for "oak or alabaster." And, now that they had gone so far with the critics, they pounced on them, dragging with them a new boy dressed up as an engineer, and affirmed that he was the only real artist in whose mathematical formulae the secret of architecture lay hid. The old arts and crafts theory was that they should

give the carpenter a saw and a log and the need only wait to get a fine hammer-beam roof just as the co-operation of mallet, marble, and Michelangelo once produced a David. The new theory was to provide an engineer with a book of tables and formulae, and a thousand tons of steel cut to stock sizes, and the splendor of the result was the only form of architectural beauty possible in the XX century. He owned to a scruple about subscribing to either of these theories, since they seemed to him to have originated in the uncomfortable shades where cranks and faddists do peep and mutter, and to take but small account the one of things as they were and the other of things as they should be. In any case the result was to queer the pitch for the poor architect. He might still perhaps have his use if he kept abreast of the latest invention whereby civilised man hoped to become dumber, more and more comfortable animal, and if he were clever and unscrupulous enough to build a box for 1500, to keep the uncivilised in. What ever theories were afloat, it seemed to him absurd to suppose that fine architecture could exist without right practice of the crafts, even the humblest of them. For example, the reason why the earlier works of that great master who had been lately taken from them could not give them the pleasure which they felt they should was surely that at the time they were built the right sort of brick and tile was not to be got. The trade of the brick and tile maker was perhaps the one in which the most real improvement had taken place, chiefly by the substitution of hand-work for machinery, while carpentry continued to deteriorate owing to the increasing use of machinery in the trade. But he wished to confine the few remarks he had to make to one trade, the conditions of which could hardly be said to be satisfactory—that of the house painter. The most they dared expect from him was to lay a sufficient number of coats of good lead paint and match a sample tint with fair accuracy; that he worked with neatness and left no smears on the window panes. But even in matching a tint his methods were wrong. He would mix a mass of paint certainly, but why was the result so unpleasant when it was upon the wall? It was simply because the only way to get a beautiful effect of colour was by a glaze which allowed the under colour to strike through. The French way technically was better than ours, the difference consisting in the way the first coat was laid over the priming. For this the painter made into a thickish paste with oil and driers, without turpentine, and this was spread, not with a brush, but with a broad spatula and well pressed home. It took about a fortnight to dry, and was followed by three more coats laid on in the usual way, the only difference being that the brushes used here were much longer and softer hair than ours. For decorative objects such as frames, revetments, images, and screens for churches, and so forth the best method he knew was to lay a good ground over the whole surface, whether wood or stone, and upon this two coats of colour ground in spirit and mixed with spirit varnish. Then a coat of spirit varnish only, and, finally (and this was most important), the glazing or toning coat of colour, wax and turpentine. Tempera colour could be used over the red, if preferred, instead of the spirit medium, and could be burnished like gilding where a glass surface was required. What he had described must not be confused with the method of dirtying carved mouldings that had come into vogue lately. In a recent text-book he had read—

Mr. F. W. Troup

said the title given as the subject for discussion was suggested by the President, and he took it that by the "the crafts" he meant to suggest what was often called the artistic crafts as distinguished from what were generally known as the trades connected with building. Every trade, however, was a craft no matter how crudely commercial it appeared at times to be. Indeed, one of the best examples of a

derm craft was to be found in the practice of ferro-concrete. Although this seemed to require the most abstruse scientific calculation of its strains and stresses, and was usually regarded as an extreme example of the useful tools of the engineer in the province of the hitect, it was none the less absolutely dependent upon the most careful craftsmanship for its execution. Ferro-concrete appeared to him to be the modern analogue of a classical medieval craft. So much was it a true fact that many engineers fought shy of it and declared that they knew where they were with steel and simple, but that this mixture of steel and concrete was a hybrid of uncertain strength, and who could tell how long it would last? Its votes had to admit that it was a young craft, and there might still be about it some mysteries not fully gauged; but they must remember that even the arch in its early stages must have been masons a good deal of trouble before they had the hang of all its possibilities when properly harnessed, and its tricks if used without full knowledge and proper control. Fore leaving this group of ancient crafts, which were now usually designated trades, he would like to enter a protest against the assumption that there was no longer in the trades any real craftsmanship. He thought, on the contrary, there was an immense deal of traditional craftsmanship in all the ordinary building trades—bricklaying, masonry, carpentry, plastering, smithing, and so forth. The real trouble, it appeared to those who were most keenly versed in the apparent freedom, the easy, untrammelled symmetry in medieval work, was that at the modern workman attempted to hide the best of his real craftsmanship beneath thin geometric precision, quite unnecessary and usually undesirable. Many architects, recognising this, had attempted to overcome it by using rough bricks, wide joints in masonry, and by other means in other materials had tried to get some semblance of the fling and go that seemed to come unsought in the work of a medieval craftsman. He feared, however, they must acknowledge that this was only a makeshift. Emanating from the architect, whatever its merits might be, it was more of an artificiality than it ought to be, or would be if it came direct from the craftsman himself. It did not go so far as to condemn these voices of the earnest and conscientious architect. He could not help admiring the results when ably directed and well executed. But he did venture to point out that they were not only imitated, but easily exaggerated by those who did not always think for themselves, and are inclined to overdo "the very latest thing." Moreover, it was not a solution of the craft problem, although it might possibly in time and perhaps help in arriving at some more radical and permanent. Whilst there was a little difficult to define in general terms the artistic crafts, it would be pretty generally accepted that carving, modelled stucco, decorative painting, and stained glass came under that head. Most of these crafts were indeed usually practised by men of a special training, but the materials were the same for the crafts as for the trades—the carver decorated the joinery or carpenter's work, the modeller the plasterer's work, stained glass was only glorified glazing, and so forth, and that they must recognise at once that the work done in what was known as the artistic crafts was no more than the ornamental part of the building trades. It required no very condotte reasoning to arrive at this somewhat obvious conclusion, but it appeared as if it were forgotten by the craftsmen themselves. They, too, often dissociated themselves from what he had been calling "the trade" of their craft. They learned to carve and not to learn joinery; they learned to model stucco and knew little or nothing of plain plaster work. If the craftsmen worked more with the artisans of the corresponding trade, regarding himself as a superior plasterer, bricklayer, or smith, and not merely the man to whom was apportioned the duty or privilege of doing the ornamental scraps and finishings, would go some way in overcoming the difficulties and dangers into which architects fell when they tried to direct in detail the manner in which materials should be finished in the things they had to superintend. He would like to see the conscience of the mason further encouraged to come on the scene after the building was finished to carve and finish bosses and ecks, marked on the architect's drawing as "left rough for carver." The modeller could have something to say and knowledge

from which to say it, with regard to the work of the plasterer generally. He would not, as now, merely deliver so many dozen beautiful casts whose exquisite modelling only made the plain walls look silly by comparison. And where the case required it, the trained tradesman, or if he liked "artistic craftsman," would merely direct the general finish of the work without introducing any decoration or ornament whatever. The unattainable ideal was, of course, that he should be the foreman of that trade. His guidance of the workmen under him might and should be a real training of the workmen. Coming from a man versed in all the traditions of the craft, his orders and directions would be different from and more effective than those of even the most able architect, whose directions were often regarded and perhaps rejected as whims and fads.

Mr. Christopher Whall

sent a written communication, in the course of which he said the subject was in two parts—with a trenchant division. "The Practice of the Crafts" was one and "Modern Building" was another. He would like to start with the challenging paradox that there was no practice of the crafts in modern building. To tell them why he said that he must define what he meant by the practice of a craft. To practise a craft they must first learn it, and to learn it to any purpose they must learn it as a child when the mind was a *tabula rasa* and the spirit docile and obedient. To learn a craft the learner should begin as a small boy—an apprentice, and his school should be his workshop. In the old days the apprentice worked the brushes, ground the colour, sorted and waxed up the glass on the easel, and so on, and in intervals was taught the elements of his craft, and so by degrees learned all of it with the prospect of being a journeyman and some day a master. Was there any such training now? In a sense there was, but in essence there was not, except in the workshops of those idealists who had set themselves to revive the crafts, and they had already revived the almost forgotten name. In the ordinary shop in which wares were produced there were boys who did all kinds of small services, but when it came to learning their craft they only learned one particular operation of it. Everything was arranged so that they should not become masters. To learn the elements of any craft was the key to the right way of tackling all crafts and the intelligent way of dealing with them and directing them. A man already a craftsman in one material had the key to craftsmanship in general, and saw the whole situation from a right point of view. He would say to architects, and especially to learners of architecture, "Get a workshop knowledge of something."

Mr. W. Curtis Green

said that those who inspired the formation of the Art Workers' Guild had done architecture a good turn; they linked together architecture and the crafts, and had built up a body of craftsmen unsurpassed in their way. As a result of this reunion English churches and houses were the standard of excellence throughout the world. They knew that the practice of the crafts had not touched their cities or reached the sources of production; it had not done so yet, and when they looked back at the last fifty years or examined the present was it not too much to expect that it should in so short a time have reached so far? They had explored the arts and crafts of the East and of the West, of antiquity and of the Middle Ages. Not content with the fulness this knowledge of history brought, they became enslaved first by one period of artistic activity and then by another, looking, some of them, for salvation in the resurrection of the dead rather than in the quickening of their own spirit. At one time it was the convention of Greece, the clearly-defined articulate art; at another it was the orderly and majestic attributes of imperial Rome; again, it was the romance and daring of the Byzantine School; then their hope lay in the Middle Ages, first the Gothic and then the Italian, and later the French development. Each fresh enthusiasm had had its distinguished exponents and had achieved wonderfully fine work in building and the crafts. These individual achievements satisfied all the definitions of great art but one. Collectively they were evidence that the modern was no whit behind his forbears in architectural genius and in individual craftsmanship. In

other words, the modern mind was as capable of conceiving noble buildings and of doing beautiful work as that of antiquity or of any age. To name only a few buildings of different phases—St. George's Hall, Liverpool; Old Newgate, Westminster Cathedral, St. Agnes, Kennington, were noble conceptions as creditable to their authors as were the monuments of simpler times. Each in a sense was an example of a still living manner of expression; for every great period had contributed something that could not die, yet of none could it be said that "this is vital," for none were in a language common to all. They asked themselves whether it was just now possible to find a language common to all. Anything added over and above the necessity of the case appealed either to the heart or the intellect; to both if it was a work of art. In the case of the mechanical art of the suburban villa and place of worship the appeal was to the untrained eye. When the intellect came in, whether in Classic, Gothic, or modern work, art becomes conscious; it was only when it became so and recognised the necessity for discipline and control that it could ascend to the heights. On the surface this confusion was not unlike that at the building of the Tower of Babel, but below there was necessity and a basis of unity which would result in another era of vital art. In their wanderings, whether to Versailles, or among American sky-scrapers, or to Surrey farm-houses, they were, let them believe, doing useful service. Their admiration of the civic sense of the Parisian was drawing them to inquire into their methods and aims; their intellect called for the exercise and discipline of orderly and stately schemes shown in beautiful drawings. Their interest in the great American school led them into the secret that the applied method of design was not satisfying the Western world. Their tours among old buildings had taught them the right use of material, and they had mastered the meaning and value of texture; and their little experiments in the planning of pleasant urban dwelling-places had shown them that, while all things might be lawful, all things were not expedient. So that, besides producing individual instances of fine work, they had collected evidence which another generation would sift if they could not. Education consisted in a series of enthusiasms in a series of awakenings. Beginning with the architect and craftsman, it filtered down through the trades and through the public. If education was only skin deep, so were shams. If the false ideals that have so nearly smothered the crafts had taken 100 years to grow up, why should they not pass away in a like period of time? Prophecy was a cheap business if the prophet placed the event sufficiently far away, but faith had firm foundations in the faithful. The craftsman knew that the attributes of his art were not transitory; they might be dimmed in times of prosperity or change, but if they were buried 3,000 years, like the corn in an Egyptian sarcophagus they would spring to life again in a suitable environment. For a time the environment was unkindly, and the practice of architecture and the crafts called for considerable qualities.

Mr. E. P. Warren

said the question of the controlling of the crafts of traditional building was a difficult and complicated one. To begin with, no architect was worthy of having control of subsidiary crafts unless he had, at any rate, extreme interest in them, and it therefore became everyone who aspired to design and control building to interest himself and study as far as possible the various crafts with which he would have to deal. The conditions under which architects had to work were increasing, complicated, and difficult. New materials, methods, and needs were constantly arising. They had new types of buildings and new systems of construction, but they had always some of the old traditional crafts left to them which must be conducted very much in the way they had always been, and one was that of the mason. In masonry they had still to deal with the cutting and shaping of the mass of stone for their appointed positions on a building, and if they could eliminate as far as possible the steam saw and rely on the mason with his chisel they could still get their work done, especially by country masons, very much as it had been done within the last 200 years. As to carpentry, the output of the steam machine was inevitable, and they could not put back the clock and select their trees and have them cut down and wait three years before using them.

It was hopeless for architects to think that by using ancient and primitive methods they could really do anything which would give an ancient and primitive result. However they wished, they could not get away from modern trends and fashions. They must accept the methods of the particular age in which they lived, but they could all see that as far as possible the inevitable machine-made piece of material was applied to the place it was fitted for. And what was most important, the architect could in dealing with the ornamental parts of a building select men to do the work and minimise the opportunities, instead of spreading them, so that those who did the work were properly paid. Having selected as good a man as they could get, then give him as much rope as they possibly could. Needless to say, they must get a man who had been trained in a manner which fitted him for employment upon a building. He must have had something of an architectural and building training. A carver might be able to carve something which was delightful in itself, but if in conjunction with a building it did not accept the proportions and sense of the building or the treatment of the material with which it was composed it was no good. Although there was much lacking in the training of architects in the knowledge of the crafts, there was a great deal also lacking in the training for the crafts in a knowledge and sense of architecture.

Mr. C. F. A. Voysey

remarked that the predominant idea in his mind was that they should be possessed of some ethical feeling before they could express themselves in any material or in any way. It was no use teaching the crafts until they had taught the use of the crafts, i.e., what was it they wanted to express in their crafts? Mere craft which expressed no emotion they were better without.

Mr. Tapper

observed that in Roman times and medieval times right down to Georgian times the craftsman and workpeople were doing things in a more or less self-contained way. Now, when they thought of the enormous City offices being put up, it was impossible to conceive of any question of art entering into it at all. Competition could lead to dreadful results. Crafts as they understood them could only be and were only applied in a very small way, such as when a lover of art said he wanted the very best.

Mr. W. J. Allcorn

said that when people stopped teaching art it would give some of the younger ones a chance. He believed that when they had a traditional builder working in the country the work was as good now as ever it was. The work done in the old castles by builders who had been connected with building all their lives was much better than it was when a London architect was called in.

Mr. G. Leonard Elkington

considered that architects were very much to blame for the divorce of that intimate relationship between the design and the craftsman which used to exist. In the old days, when the workman took a great interest in his work, he was called on to design and cap on a feature appointed to its place in the building, but nowadays that was hopeless, largely because the architects had attempted to create a corner in design and the workman had lost all interest in his work. If they could do anything to prevent the grinding out of the small builder who took a real interest in his work they would get better buildings.

Mr. H. M. Fletcher

believed that workmen did still take an interest in their work, and if they as architects talked to them they would find they were ready to give two or three alternative ways of doing a thing. He had heard American architects express astonishment at the amount of knowledge and skill shown by English bricklayers.

Mr. Theodore Fyfe

thought the discussion had gone off the lines, and was hoping to hear an impassioned speech from a painter as to the employment of his art on a building.

Mr. Napper

humorously referred to the great fuss made about old buildings, and asked them to try and imagine what the building looked like when

it was first erected. When a thing was broken they called it art. It might be that a good deal done to-day might get artistic in that way.

Mr. Halsey Ricardo

remarked that it was humanity which really came into art. It was not age or imperfections which made these old things artistic, but the human touch associated with them. They had to consider, however, that they lived in their own epoch and machinery had altered the whole world for them; and crafts had come to be relegated almost to luxuries. All over London there were schools of art, many of them largely maintained by the ratepayers. The students were taught up to a point, and then just as they were prepared to do something they were told to go because they would interfere with trade. He suggested that the walls of the new London County Hall ought to be decorated by those who had attended these art schools.

Mr. W. S. Frith

believed they had as good craftsmen to-day as ever, but the competition of the present day too often meant the getting of a certain amount of work done for a certain sum, and in carrying his experience was that the man who had the least knowledge and least conscience was the man who could do it the cheapest.

The President

said what it all came back to was that they wanted more understanding between themselves and their co-workers. The want of sympathy and knowledge between the architect and craftsman was no doubt due to the unfortunate loss of tradition which had undoubtedly taken place in their art, and they must endeavour in the different ways open to them to bring back the feeling and spirit which moved that old tradition.

THOUGHTS ON ARCHITECTURE.*

To define architecture in two words is rather a dangerous proceeding, but for the purpose of this lecture I will call it "Beautiful Building." Before a building can be called "beautiful," and so, to accept my definition, be worthy of the name "architecture," it must possess certain qualities, and it is with these qualities that I shall deal this evening.

First, however, I want to say a word or two on what are, I think, erroneous methods of architectural criticism. Often in the presence of some ivy-clad ruin we are led away by the respect we consider due to old age, by our interest in historical associations, and by the general air of picturesque dilapidation possessed by the ruin, into the belief that we are looking upon a fine architectural work.

On such occasions we should try to remember that the ruin was once a brand-new building, and also, just as it has been said that even the youngest of us may make a mistake, so even the oldest and most dilapidated of buildings may not be beautiful. Again, when some great new building is erected we are inclined to condemn it, simply because it is new, forgetting that that quality was possessed once in its history by every work of art.

If, on the other hand, we incline to praise the new building, our praise is often based largely upon its size, its great cost, the fact that it is built of some expensive material, or that it is richly covered with ornaments. Or, having studied architecture rather more closely, we may like the building because it does not differ much from buildings of some favourite period, or dislike it intensely because it does differ from such buildings.

These methods of criticism, though I know they are very frequently adopted, are not, I think, the best, and I will now proceed to deal with some of those qualities, which may with advantage be considered when one is studying or criticising buildings old or new.

Unity.

One of the most important qualities in architecture is unity, as I understand it is in other forms of art. The various forms which compose a building must be so arranged and

*Some extracts from a public lecture on "Beauty in Architecture," delivered in the Fifth Hall at the University of Aberdeen, by Mr. W. S. Purchon, A.R.I.B.A., on November 16.

welded together as to form a single whole; no part of the design must look like an afterthought.

A simple example on a small scale occurs in the triforium at Lincoln Cathedral. Here three openings in a wall are made into one composition by means of the uniting arch. While such details or small parts of buildings as this are of great importance, the study of architecture should not be limited to them, as it often is, and I shall next consider the main masses of which buildings are composed.

(The lecturer then dealt with the effect of such a feature as a spire, gable, or pediment in pulling a design together by providing a point of concentration, and with the effect of unity which results from using similar forms for parts which are doing the same kind of work.)

The untrained designer, anxious perhaps to show his versatility, introduces into his buildings a remarkable variety of forms, with the result that the quality of unity is entirely absent.

(In dealing with the various arrangements of the main masses of which buildings are composed a view was shown of the buildings at Philæ.)

As shown in this slide, this example at Philæ is already partly under water, and it will probably be entirely submerged before long. The prospect of this raised considerable discussion in various papers, and in order to simplify the problem as to whether these buildings should be sacrificed in the interests of the irrigation scheme or *vice versa*, one writer asked us to decide which we should save from a burning building, a valuable old master or a baby.

Punch, thinking this problem still too difficult, as babies differ in quality, substituted Mr. George Bernard Shaw for the baby.

So when I say that I regret the proposed submersion of these buildings, I hope I shall not be accused of preferring the picture to either the baby or Mr. Shaw.

(The lecturer then dealt with the division of buildings into horizontal layers by means of projecting upper stories as in mediæval buildings, by setting back upper stories, by strings and cornices, by the use of different materials, and by treating the same material in different ways, giving the Riccardi Palace, Florence, as an example of the latter.)

When the Riccardi Palace was designed—about 1430—architects in Italy were turning their attention to the masterpieces of classic art, and that is why the horizontal line is so insistent in this example. In Gothic architecture the vertical line is the dominant one, so that in such a front as that of Wells, while there are horizontal divisions, the vertical ones are much more easily seen. It will also be noticed that these vertical divisions are formed by means of buttresses necessary to the stability of the structure, and they are frequently emphasised by being carried above the roof lines in the form of pinnacles, which are also useful from the structural point of view.

(Attention was also drawn to the advantage of three unequal stories over three equal ones in mediæval cathedral interiors, and incidentally to the fine effect of the shadow in the triforium.)

Symmetry.

Symmetry is a quality which may be observed in many of our most important examples. It has attracted the designers of all ages, from those of the mysterious Egyptian temples to those of the present day. It will be found that most of the temples of the great period of Greek architecture are symmetrical, and symmetry played a great part in the design of the great buildings of the Romans. In later styles, too, we find much importance attached to this quality, convenience being unfortunately in some cases sacrificed in its interests. Symmetry in a building or a group of buildings helps considerably in giving unity to the composition. If we consider for a moment the Horse Guards building in Whitehall, with its dominating central part, subordinate wings, and the shelters for the sentries in the foreground, the advantages of the orderliness and balance given by a symmetrical treatment must be at once apparent.

On the other hand, we must not ignore the fact that in many charming buildings the quality of symmetry is absent, and a certain picturesque effect takes its place, though the picturesque effect is usually due to

dual growth rather than to conscious sign.

And while the front of the Parthenon is unmetrical, the spaces between the columns and the columns in the back row are exactly behind those in front. Such an arrangement gives a subtle rhythm, which is greatly to the beauty of the building, and makes an equally spaced portico look good in comparison.

In much the same way the beautiful front of Inigo Jones' Banqueting Hall in Whitehall gains much by having its front divided into three parts, of which the central one is larger than either of the other two.

Proportion and Scale.

Proportion and scale are terms frequently used in architectural criticism, and frequently understood. Proportion is a relative matter, the harmonising of the shapes of different forms with each other and with the whole. For instance, in this charming building (Morden College) the flat form of the pediment is in proportion to the rest of the building, fitting in well with its simple horizontal treatment. At the same time, the steep gable of this beautiful church (Strington) is in proportion to the rest of the building. Again, a tall, narrow window is a good proportion for one position, in this church, and a long flat one in another, as in this delightful example of domestic work at Colley Weston.

A building is said to be designed on a false scale when its parts are few and large compared with the whole building. The Old London building at Oxford is an example of this. The "grand manner" is a term applied to such a design. On the other hand, a large building may be frittered away by designing it on a small scale, covering its face with a large number of small parts. In small buildings, such as small houses, the scale should be small, or an appearance of pretentiousness results. This question of scale must be considered even in such unimportant trifles as the sizes of stones in the walls, and of the panes of glass in the windows. A false scale may be, and often is, set up by substituting sheets of plate glass for the original small panes, as has been done in the principal windows of this charming house at Stamford. The attic windows are as they should be.

Strength.

Another extremely important quality in architecture is strength, which must be as apparent as well as actual. The use of representations of human figures as supports is successful. In this example, however, in the Erechtheum at Athens everything is done that could be done to give the appearance of doing their work too difficultly.

But the Albert Memorial is really strong in its proportions, and less demonstrated by the fact that it has stood so long, yet one cannot but admire the courage of those who go to it (some were shown on the slide), and it looks as if it ought to collapse. It is held together by concealed ironwork, otherwise the arches would push out the piers.

Restraint.

In other arts, the quality of restraint is of great importance. Ornament and picture should not be distributed evenly over a building, but concentrated on important points, such as the main entrance, the central gable or pediment, or the top of a tower. In doing this the ornament only gains by contrast with a plain face, but it strengthens the design by emphasising important features, which are made to attract attention. The plain face is so valuable; it is only the poor designer who is afraid of it—the master always its value.

The Proper Use of Materials.

So far I have dealt with shapes and forms and the appearance of things, and it might be inferred from what I have said that beauty in architecture is but skin-deep. It is, however, far from being the case; it goes right down into the very bones of the structure. I have, for instance, said little or nothing about the nature of the materials of which things are made. It is true there are those who hold that the form is the

thing, and that it matters little of what it is constructed.

But in other arts it is a truism that a medium must not be stained, and as an etching is not at its best when it most nearly resembles an oil painting, and as a condensed novel rarely, if ever, makes a good short story, so each of the materials used in architecture has its own characteristics, making it most suitable for certain purposes. I give as an example a beautiful piece of Greek detail worked in a fine marble. In a coarser material a different type of ornament would be more suitable. Even some marbles are not suitable for the same purpose as others, for in the Temple of Neptune at Sunium the veins of the marble conflict with the effect of verticality given by the flutes.

Truth in Architecture.

And this brings me to the question of truth in architecture, for to be beautiful a building must be true; it must be genuine. In these beautiful old houses the genuine timber-work really supports the work above; much that is done nowadays consists of thin boards nailed to a wall.

And in similar fashion the various parts of a building should not be ashamed of themselves; they should look like what they are. The best is always got out of a feature by making it express its purpose. A column should be made to look—as indeed the Greeks made it look—as if it were supporting something; every line in the columns of this temple built by the Greeks about 2,400 years ago suggests the function of the column as a support.

A thirteenth-century capital suggests support, and support managed easily, but the wreath of ornament carved round later capitals—while possessing, it is true, distinct decorative value—does not express the function of the capital.

Similarly chimneys should be treated fearlessly as chimneys. They have often given the architect difficulty, probably because he was trying to use a style in which chimneys were not used originally. In such cases chimneys have been made to look like columns, as at Bingley House. It is a golden rule in architecture to make a virtue of necessity. If a difficulty arises, it should be turned into an opportunity.

The west front of Beverley Minster is in many ways a fine piece of work. Unfortunately the gable in the middle is much flatter than the steep roof behind—it is not a legitimate piece of design.

In all great architecture the construction is not concealed. The Greek gloried in his column and lintel, the Roman in his arch and vault, and the mediæval builder in his vault and buttresses. The cathedral builder, for instance, was not only not ashamed of his methods of construction, but he drew attention to them, bringing shafts down the piers to draw the eye up to the vaulting, as in the chapter house at Wells Cathedral, and making features of his flying buttresses, as in the exterior of the cathedral at Amiens. In this way is architecture made real and vital. All great architecture, in fact, must be a beautiful expression of construction, and as new methods of construction are adopted it does not do to conceal them under ancient forms.

Expression of Purpose.

And under this head of truth may also be mentioned the undoubted fact that a building to be beautiful must express its purpose. For Amiens Cathedral as a cathedral is beautiful, but as a hospital it would be foolish. That is, of course, an extreme case, but the same principle applies, if in a lesser degree, to less extreme cases.

Old Newgate Prison—one of the finest buildings we had in England, now unfortunately pulled down—was a fine example of a building expressing its purpose. The other day a little boy passing one of the important buildings in a great manufacturing city was heard to ask his father, "Is it a picture palace?" I do not think he would have asked that question had he been passing grim Old Newgate.

A house should look like a house; it should suggest the home, not the municipal building. This building at Stamford, for example, is a charming specimen of home-like architecture, small in scale, quiet, and restful. And this reminds me that architecture is not

only a matter of cathedrals and town halls, for the house or cottage may be beautiful, too.

The Claims of Utility.

On no account should convenience be sacrificed to external appearance; the latter must be a natural development from the uses to which the various parts of a building are put.

In many houses of the XVIIIth century in England, in order to obtain a finely-balanced exterior, the kitchens were placed in a subordinate wing balanced on the other side by, say, a block of stables.

On the other hand, the convenience of a house has often been sacrificed to obtain an irregular or picturesque outline. Symmetry or picturesqueness obtained in such a manner is, however, entirely false.

The claims of utility and convenience can, however, be pushed to an unreasonable extent. Some shop-keepers, for instance, desire a shop front in which there are no visible supports, so that we get as a result the terrible spectacle of a great building apparently resting on a sheet of plate glass. The provision of adequate visible support cannot, I think, conflict with the reasonable claims of utility, and some shop-keepers are beginning to see the value of beauty in their buildings. In Debenham's shop in London, for instance, an attempt has been made to treat a shop in a dignified manner. Of course, there are shop-keepers who would say that even these supports are just so much wasted window space. Selfridge's store is another example. Possibly one may not like it, but one is bound to admit that it is a serious attempt to deal with a difficult but interesting problem—a problem which is raising a good deal of discussion in connexion with the rebuilding of Regent-street Quadrant.

Suitability to Environment.

A building to be beautiful must be suitable to its environment. One frequently sees a house or other building, which, while perhaps very suitable for another position, is quite unsuitable, and consequently lacking in beauty where it is.

Built in a somewhat bleak position amongst the hills one sometimes finds a modern house which might well have been erected in the Thames Valley, while probably close at hand is a charming old farmhouse exactly suited to its surroundings. Such, for example, are several of the old farmhouses and halls within a few miles of Sheffield, simple, unaffected, entirely suitable for their position, and altogether delightful.

Older buildings, far exceeding in number all the others, are suitable to no environment with which I am familiar. I refer to the dreary streets composed of houses of uniform ugliness, which form such a large part of many of our towns, and which have made such inroads into the pleasant lands surrounding them. Too many of these houses are also inconvenient, and more or less insanitary and dangerous.

Influence of Climate.

In this connection the direct influence of climate on architectural design may well be noted. Under the bright suns of Greece we find strikingly refined detail, depending for its execution, as we have seen, on a beautiful marble. Open porticoes and colonnades are also to be found here as in other sunny climates, together with flat, broadly overhanging roofs and comparatively small windows. In more northern countries steeper roofs and larger windows are more suitable, as shown, for example, in the east end of Beverley Minster, and details to be satisfactory must be bolder. The vigorous detail in the corbel of the Percy Tomb, Beverley Minster, is much coarser than good Greek detail, and has much stronger effects of light and shade, and is therefore more suitable for the climate in which it was made. Just as Greek detail is more beautiful in Greece than in England, so is this detail more beautiful here than it would be in Greece.

During the early part of the last century many buildings were erected in England, copying as closely as possible the buildings of ancient Greece, regardless of the fact that they were quite unsuitable for our climate.

There was also a Gothic revival, leading to the erection of buildings copying as closely as possible those of the Middle Ages, regardless of the fact that the habits of the people had

quite changed. Even worse is the attempt sometimes made to reproduce not only the form of the old work, but even its dilapidated appearance.

And now the question of the style to be adopted in the new buildings for Delhi has arisen, and many letters about it have been written to the Press. Should the buildings be on the lines of existing Hindoo buildings, or should we build in our English style in India, as Rome gave her architecture to the countries she conquered (with the exception of Egypt)? One writer has suggested that the modern English style should be used, but modified to suit the climate—a suggestion which reminds one that an increasing number of English buildings are on lines more suitable to a hot climate than our own.

But in all buildings, whether in England, India, or elsewhere, the first consideration should be the fulfilling of the reasonable needs of those who are to use the building, and full attention must be paid to such sanitary requirements as the provision of adequate air space, window space, and means of ventilation. The architectural treatment must be developed out of these requirements. It must be made suitable to the environment, and due attention should be paid to such qualities as those with which I have briefly dealt.

Buckingham Palace.

I should now like to draw attention to the proposed remodelling of the front of Buckingham Palace. The present front was unfortunately carried out in a material unsuitable to the climate, and as a result has had to be painted—a process which always leaves stonework dull and uninteresting. Apart from this, the old front is not really so bad as it is generally supposed to be. The new design is quite good. The architect, Sir Aston Webb, was not given a free hand; he had to work to the existing position of all the openings, and under the circumstances he has done well.

It may be thought, and I know it is thought, that his design is rather ordinary; this because it is broad, quiet, restrained, and dignified. The three main masses are strongly treated; there is no doubt about the greater importance of the central one. The strongly-marked horizontal joints in the lower story suggest strength, the columns and pilasters impart the necessary air of dignity, and the small amount of ornament which is used is applied "in just the right places." Given a free hand, it would have been better.

I think, to have abandoned the central feature, and so have given the monument in the front a still quieter background. While I have not given a formula for beauty in architecture, we have seen, I think, that it depends on several things, some of them matters of external appearance, such as the proper arrangements of the main masses, and the tying together of the various parts so as to give unity to the composition, and the concentration of ornament, but others going right down into the very core of the building, and dealing with the materials of which it is made, the uses to which it is to be put, its construction, and the welfare of the people who are using it. We have also seen that what is beautiful in one place is not necessarily so in another.

Our Relationship to Architecture.

And what, we may ask, should be our relationship to this architecture—this beautiful building? Is it something about which we are to read or talk? Or is it something to see which we are to travel long distances? Is it not rather that which we, as dwellers in a city, should see all about us, in our public buildings, in our shops, in our factories—even in our homes?

It may perhaps be difficult to light the lamp of beauty in the special climatic conditions which prevail in a manufacturing city.

I have spoken of making a building suitable to the climate. For the present climate of Sheffield glazed wares is perhaps the best material, as it can be washed down at frequent intervals. And glazed ware, though it is usually ugly, need not be so. One usually associates it with crude colouring and ugly ornament, but it can be treated beautifully, and used with charming effect.

But I have heard it suggested that the Sheffield atmosphere can be improved, and I should not be surprised to find that that is not beyond our skill in these days of

engineering efficiency, and I think meet of us would welcome such an improvement.

Would it not be worth much to us if our city were really a beautiful one? Let us think for a moment what a beautiful city means, a city free from shams and ugliness—a city in which all the streets and buildings would be pleasing to the eye and mind.

The present visitor to Sheffield, when asked how he likes it, invariably answers: "The country around it is beautiful."

Will the visitor of the future ever be able to answer: "It is a beautiful city with beautiful surroundings?"

Is this an impossible ideal?

It is not impossible; it needs chiefly on the part of the people a great love of and a great desire for the beautiful.

Professor Lethaby tells us that when the cathedrals were built the people were as concerned about them as we are about cricket. When we, as a people, are as interested in the beauty of our buildings as we are in sport we shall not tolerate ugly cities. Street improvements will no longer be considered only as problems of traffic, sewers, and water mains, and the builder of a private house will remember that it is not only for the comfort of himself and his family, but that it is something which will give either offence or pleasure to countless passers by.

And this state of things is slowly but surely coming. Already large numbers of people are becoming interested in such questions as town planning and the provision of garden suburbs, and incidentally in beautiful buildings.

I think the time is not so very remote when people, reading of our times, will wonder, not so much at our remarkable developments in engineering and other science, but rather that we could have been persuaded to put up with so much totally unnecessary ugliness.

ROYAL ACADEMY SCHOOLS.

THE evening of December 10 was occupied as usual by the distribution of prizes to students at the Royal Academy. Sir Edward J. Poynter, Bart., P.R.A., was in the Chair, and announced the following awards:—

Landscape painting—"In an Orchard," Creswick prize (25*l.*) and silver medal to Evelyn Muriel Young; extra prize (5*l.*) to Una Hook.

Design for the decoration of a portion of a public building—"Romans Disembarking Slaves," first prize (30*l.*) and silver medal to James Williams; second prize (10*l.*) and bronze medal to Gerald Leslie Brookhurst.

Design in monochrome for a figure picture—"Joseph's Brethren Bringing the Coat of Many Colours to Jacob, Genesis, Chap. xxxvii, 31-32," Armitage prizes, first (30*l.*) and silver medal to Horace Edward Quick; second prize (10*l.*) and bronze medal to Hilda Marion Hechle.

Composition in colour, prize (10*l.*) and silver medal to Florence Margaret Walden.

Cartoon of a draped figure—"An Orator: To be Treated Classically," prize (25*l.*) and silver medal, not awarded.

Two paintings of a figure from the life, first prize (10*l.*) and silver medal, not awarded; second prize, bronze medal, to Robert John Swan.

Two paintings of a head from the life, first prize (5*l.*) and silver medal, not awarded; second prize, bronze medal, to Florence Margaret Walden.

Perspective drawing in outline (open to painters and sculptors only)—"The Bromley Palace Room in the Victoria and Albert Museum," prize (5*l.*) and silver medal, no competition.

Set of four drawings of a figure from the life, first prize (15*l.*) and silver medal, to Horace Edward Quick; second prize (10*l.*) and bronze medal to Hilary F. Cleveland Skinner.

Set of three studies of drapery, silver medal to Hilda Marion Hechle.

Drawing from the antique, prize (5*l.*) and silver medal to Nancy Wordsworth Arnold.

Painting from still life, prize (5*l.*) and silver medal to Sylvia Ellen Gauntlett.

Model of a design—"Sisera and Jael, Judges, Chap. iv, 17-21," first prize (30*l.*) and silver medal to Alfred Henry Wilkinson; second prize (10*l.*) and bronze medal to Joseph Herman Cavthra.

Two models of a bust from the life, first prize, silver medal, not awarded; second prize bronze medal, to Alfred Henry Wilkinson.

Model from the antique, prize (5*l.*) and silver medal to Allen Howes.

Design containing figure and ornament—"Gathering Grapes: The Vine to be Treated

Ornamentally," prize (5*l.*) and silver medal not awarded.

Set of three models of a figure from the life, first prize (15*l.*) and silver medal to Allan Howes; second prize (10*l.*) and bronze medal to Peter Induan.

Design in architecture—"An Entirely Detached Town Residence for a Nobleman in the Capital City Overlooking a Public Park on its West Side," Travelling Studentship (England), 60*l.*, tenable for one year, to Oliver Frederick Savage.

Set of architectural drawings, first prize silver medal, Augustus Gaffett Bryett.

An architectural design—"The West Front of St. Martin's-in-the-Fields, including the Tower and One Return Bay," prize (20*l.*) and silver medal to Charles Frederick Butt.

An architectural design (First Term students only), first prize (15*l.*) and silver medal to Geoffrey P. Agnew Fildes; second prize (10*l.*) and bronze medal to William Henry Hamlyn.

Perspective drawing in outline (open to architects only)—"The East End of St. Martin's-in-the-Fields," silver medal to Walter Lilwellin Clark.

Original composition in ornament (open to architects only), prize (5*l.*) and silver medal, to Harold Thomas B. Barnard.

Architectural design with coloured decoration—"One Bay of a Hall for a City Company or Guild," 5*l.* and silver medal to Augustus Gaffett Bryett.

Landseer scholarships in painting and sculpture, of 40*l.* a year each, tenable for two years, have been awarded:—In painting to Horace E. Quick and Douglas S. Gray; in sculpture to Alexander Stiles and Allen Howes.

THE COST OF SCHOOLS.

THE *Times*, in an article on Local Administration, gives some interesting particulars of the cost of recent school buildings in various parts of the country.

At Maltby, near Doncaster, a school building for 1,000 children has been erected round a quadrangle which is to be utilised for open air instruction. Flat roofs are a feature of the school, the cost of which works out at 10*l.* 2*s.* a head, or 11*l.* 3*s.* inclusive of the site.

The Brighton Education Committee have recently erected a school for 620 children in classrooms of fifty, each classroom with external walls, two verandahs connecting the classrooms. A special feature has been made of ventilation and lighting, and the accommodation includes a large hall, 45 ft. by 26 ft., and hot and cold shower-baths. The cost of the whole works out at 14*l.* 1*s.* 8*d.* exclusive of the site. It is stated to be the first school of the kind in the South of England.

The cost of schools of this new type is said to compare favourably with that of those of the older type schools recently erected in Bedfordshire, ranging from 8*l.* 8*s.* to 14*l.* per head, the most recent of those in West Ham from 23*l.* 4*s.* 7*d.* including or 21*l.* 10*s.* excluding site; while in Middlesex the cost ranges from 11*l.* 4*s.* 7*d.* a head for a school for 160 children to 16*l.* 10*s.* a head for one whose accommodation is 1,143, both exclusive of sites. The average cost of schools in Durham during the years 1910 and 1911 has been 12*l.* 13*s.* 10*d.* inclusive of site.

On the strength of the above figures it would appear that the cost of the more modern type of school need not exceed that of the former type, while they possess very great hygienic advantages.

The National Education Association at their meeting in November were unanimous in expressing their opinion that localities could not do all that was needed without additional central grants.

MODERN STAINED GLASS.

Mr. Christopher Whall has had on exhibition a very fine new window for the Parish Church of Melrose. His windows at Gloucester and Canterbury Cathedrals are well known. The practice of obtaining effects by etching out the ruby from "flashed" glass has been used with a brilliant effect, while those who are familiar with Mr. E. S. Prior's quarries, which have here been plentifully employed, will realise their decorative value. Twenty years ago the possibility of glass manufacture as quarries instead of sheets or tables came as a surprise, and the qualities thus attained, in the first instance, we believe, by a glass-maker named Rust, are incomparable in the treatment of glass windows considered as mosaic.

GENERAL NEWS.

The Christmas Holidays.

The week after next the *Builder* will be published on Tuesday, the 24th inst., and to draw attention all communications for the Editor must reach our office by the first post Monday, the 23rd.

Professional Announcement.

Mr. Hugh Spencer Stowell, architect and surveyor, has removed to 151, Grosvenor-st., S.W.

Appointments.

A surveyor to St. Bartholomew's Hospital will be appointed early in January. Particulars of the appointment may be obtained from the Clerk to the Governors. Candidates must be members of the Royal Institute of British Architects, or of the Society of Architects, or of the Surveyors' Institution.

Mr. Alexander Burnett Brown has been appointed by the Governors of Charterhouse as surveyor of the Charterhouse London Estates in succession to the late Mr. E. B. I'Anson.

The Portico, St. Martin's-le-Grand.

It is stated that the Committee of St. Chad's Hall, a hall appertaining to Durham University, have made application to H.M.'s Office of Works for the stones of the portico of the (old) General Post Office, with the object of incorporating the order in their new buildings.

Planning of Delhi.

In the House of Commons last week Mr. King asked the representative of the Secretary of State for India whether the Committee sent out to report on the building of the new Delhi was informed that a particular architect had been selected to submit plans for the new government buildings; and, if so, the name of the architect would be stated. Mr. Baker said the answer was in the negative. Mr. King asked whether any architect had been selected to design the Government house in the new Delhi, and if so whether any particular style of architecture had been imposed upon or selected by him for the proposed building.

Mr. Baker: No selection has yet been made. Mr. King then asked if the India Office had consulted another architect besides Mr. Stevens on the planning of the public buildings in the new Delhi.

Mr. Baker: The India Office has not consulted any architect about the planning and signing of the public building of new Delhi, but no decision has been come to how and by whom they will be carried out.

Mr. King further asked whether a London Journal published last July what purported to be a summary of the preliminary report of the Joint Committee which went out to Delhi to report on the planning of the new part of that city, whether its publication was authorised by the India Office; and whether in future official reports, the full text of which was withheld, would be imparted to the public in this manner.

Mr. H. Baker: The newspaper article to which the hon. member presumably refers is not authorised by nor were the materials supplied by the India Office. The information which it contained with regard to the alternative plans for the new Delhi and to the views of the Town Planning Committee seems to have been generally known in India.

Mr. King addressed some further questions to the Secretary for India on Tuesday regarding the architecture of new Delhi, and

Mr. H. Baker replied that Mr. H. V. Manchester was engaged to pay a visit to India as consulting expert to advise as to the site for the new city, his expenses being paid by the India Office. The further question of the construction of the buildings had yet to be decided, and the Secretary of State at present was not prepared to make a statement on that point.

Mr. King asked if the Government of India and the India Office were aware that there was an additional school of architects and building craftsmen in India, and whether their existence would be considered in commissioning architects and builders of the structures to be erected in new Delhi.

Mr. H. Baker replied that the circumstances mentioned and all other relevant matters would be fully considered.

Westminster Hospital Site.

Replying to Sir H. Craik, Mr. Wedgwood has stated that Westminster Hospital site could not be used for any other purpose than

that of a hospital without the consent of the Crown, and there were various restrictions as to buildings. The Government had the subject under consideration as to, in the event of the removal of the hospital, their power being exercised in order to secure that the site should be used in a manner suitable to the dignity of the situation.

Royal Free Hospital, W.C.

A fund is opened for an extension of the buildings and the erection of a new out-patients' department, at an estimated outlay of some 50,000*l.* The governors have bought 1½ acres of adjoining land at the rear of Messrs. William Cubitt & Co.'s premises. The hospital was founded by Dr. Marsden in 1828 in Greville-street, Hatton-garden, and in 1843 was removed to the barracks in Gray's Inn-road, of the City Light Horse Volunteers, of which the old (stables) front remained until twenty years ago. The north, or Duke of Sussex, wing was rebuilt in 1855, the south and east blocks in 1877-9. The later administration blocks, with isolation ward and staff quarters, standing on the site of the original front, were erected in 1894, after designs by, we gather, Mr. William Harvey.

The Artists' Guild.

A preliminary meeting was held in June last at 79, West Cromwell-road, W., to consider the advisability of forming a Guild of Artists on a religious basis, to include both men and women "whose main work is any branch of art." At St. Paul's Chapter House on November 8 a number of musicians, painters, and craftsmen assembled and formed the Guild. The Bishop of Winchester was elected and has agreed to become President of the first year.

The chair was taken by Mr. Walter Ford, who gave an address which set forth the object of the Guild. He said there were many religious people who have no belief in art; there were more artists who have no belief in religion. Those who met to inaugurate this Guild were able to believe in both. This Guild of Artists, as was demonstrated at the meeting held in June, felt that it was truer wisdom to start as a smaller body with strong principles than as a larger body with weak ones. The Guild, then, sought to unite in a common society those artists who believe in the Christian faith and who find in it an inspiration for their life and for their art, which is their life's work. The Hon. Secretary is Miss M. C. M. Bergman, 107, Goldhurst-terrace, South Hampstead, N.W.

Leeds Training College.

This great building, which has been erected at a cost of 242,000*l.*, in spite of the protests of "indignant ratepayers," has now been opened. It is built from a design selected in a local competition by Sir Aston Webb, R.A. The Government grant is unusually large, amounting to 75 per cent. of the cost of building, and equipment and maintenance grants of 53*l.* per annum for each man and 38*l.* per annum for each woman student. With this financial aid and the annual fees of 20*l.* the college will be self-supporting as long as it is full, which, judging by statistics, is a certainty. The college is designed after a careful study of Continental and other models, and will serve a wide area without costing the ratepayers of Leeds anything—a prospect with which the Committee may well feel satisfied.

The Royal Sanitary Institute.

At an examination in sanitary science as applied to buildings and public works, held at London on December 6 and 7, twenty-two candidates presented themselves. The following nine candidates were granted certificates:—E. G. Shaw Cranfield, East Sheen; P. F. Gosling, East Dulwich; W. H. Hall, Finsbury Park; Jagtap, Balkrishna, Piraj, Westminster; W. E. Masters, Dulwich; G. J. Rees, Ystalyfera; E. Weeks, Oxford; A. White, Bulford Camp; R. K. Wortley, Brighton.

BOOKS.

Old Houses and Village Buildings in East Anglia, Norfolk, Suffolk, and Essex. By BASIL OLIVER. Illustrated by collotype plates from photographs specially taken by Horace Dan, Sydney A. Driver, and others, with numerous illustrations in the text. (B. T. Batsford. 21s. net.)

It would seem that England even now is an almost inexhaustible treasure-house. As one

corner of our land after another is scoured by the observant seeker for the handwork of bygone days it is truly remarkable what stores are waiting to be disclosed, and when the chronicling of them is entrusted to the hands of men skilled in the use of pen, pencil, and camera the result cannot fail to be most fascinating. At some time or another each part of England has had its tide of prosperity; the ebb may have flowed, but not without leaving its landmarks in the churches and in the houses both great and small which were set up in almost countless numbers by a prosperous and thankful people. In Tudor times the commerce and industry of East Anglia were at their zenith; the constant intercourse with Flanders and the influx of Flemish weavers and workers in all manner of crafts from France, Germany, and Italy, and particularly from the Low Countries, gave a wonderful impetus to the building arts in the three counties under consideration just at a time when the native traditions were sufficiently vigorous to reject any opposing innovations, but not so persistent that fresh ideas and new methods of workmanship should not be accepted. Indeed, they were incorporated so nicely that it is often difficult to say where native tradition ends and where foreign influence begins. But as one turns over the plates in this delightful book one is reminded again and again of the crowd-stepped gable so general in the Low Countries and so rare elsewhere on this side of the Channel south of the Tweed.

We notice many a little touch in the shaping of metal and wood and plaster, and in the treatment of brickwork which betrays the hand of the foreigner. Nevertheless, the work as a whole always bears the stamp of the English builder; it was made from materials native to the soil, and met the needs of the English people and the climate of our land in a workmanlike and sensible manner, showing the power of the Englishman to do what was required of him under all conditions.

The book is the fifth of a well-known series on "Old Cottages and Farmhouses," and does not attempt to deal with the larger manor-houses and country seats, most of which have been illustrated elsewhere, but is limited to the smaller and little-known domestic buildings which, from their modest dimensions and secluded positions, are in danger of being forgotten and of disappearing, from one cause and another, before any permanent record has been made of them. An immense amount of good and beautiful work has already been lost owing to the neglect and apathy of those in whose keeping it has been, while anyone who has travelled about the country knows what incalculable harm has been done by unsympathetic "restorations." Interiors of houses have suffered even more than the exteriors, and the two views of "Upper Chambers" at Alston Court, Nayland (Plate XVII.), and "Giffords Hall, near Winchambray" (Plate XIX.), are especially welcome. If these books did no more than record they would have served their purpose, but they do a great deal more—they stimulate interest in those who are responsible for the upkeep of old buildings, and they are a source of inspiration to those engaged in designing and carrying out new work. Although the collotype plates are the main feature of such a book as this, the letterpress is indispensable, and the many plans and sketches of constructive and decorative detail, drawn direct from the buildings which form the subjects of the plates, are valuable to the architect and craftsman.

Timber-framed buildings naturally figure prominently, but in Essex especially these were often treated externally with plaster, and the examples of purging and the various patterns are eminently suggestive for modern work. Brickwork, stone and flint, and weather-boarded and tile-hung buildings are all illustrated, while the windmills, which were once so plentiful in the Eastern Counties, are represented by five examples, and one of these has been blown down since the photograph was taken. Having regard to the scope of the book, it will be found to comprise typical work in all the materials in use from the latter part of the XVth to the beginning of the XVIIIth century; it is admirably produced and is a fine contribution to the series to which it belongs.

Brasserie. By J. S. M. WARD, B.A., F.R.Hist.S. (Cambridge University Press. 1912. 1s. net.)

The appearance of this little book comes opportunely at a time of increasing general

interest in the subject of which it treats. This country contains even now a far larger number of monumental brasses than any other in the world, and but for vandalism in the past would possess ten times as many. England may therefore in a sense be regarded as the home of this form of art, although the custom of engraving brasses as monuments to deceased persons was originally introduced, probably very early in the XIIIth century, from the Continent; and for this reason, as well as for the historic interest attaching to these memorials of long past worthies, and the contemporary evidence they afford on the armour, dress, and social conditions of medieval times, sepulchral brasses are deserving of careful study. The developments through which English architecture passed during the five centuries of continuance of this art—which phases are faithfully reflected in the architectural adjuncts represented on monumental brasses—add still further to the interest of the latter.

Unfortunately no cheap popular handbook has hitherto been available for the use of intelligent visitors to our parish churches and college chapels, where the greater number of monumental brasses is to be found. We therefore welcome the advent of this little volume as a means of popularising a fascinating branch of historical art. The author comes well equipped for his task, and careful perusal of his work convinces us that he is no mere compiler, but has intimate first-hand knowledge of his subject.

Mr. Ward departs from the usual method of previous writers by treating his subject strictly in chronological sequence instead of grouping brasses into military, clerical, civilian, ladies', etc. Thus, commencing with the earliest extant brass in this country, that at Stoke d'Abernon in Surrey (1277), he devotes Chapter I. to a general consideration of those brasses which were laid down during the reigns of the first two Edwards (1272-1327), whether representing knights and their ladies, priests, or civilians, and whether exhibiting architectural accessories or not; and succeeding chapters carry on the story to successively later times. There is much to recommend this method of treatment from the historical point of view, although it is attended with certain practical inconveniences, which the author evidently realises, for in Chapters V. and VI. he departs to some extent from his own arrangement by intercalating a detailed account of clerical vestments and monastic garb as

depicted on mediæval brasses, resuming his historical sequence in Chapter VII. There is, however, some justification for this, as the dress of clerics varied very little, if at all, during the whole of pre-Reformation times.

Later chapters discuss special types of brasses, and in Chapter XIV. the author gives a detailed description of the architectural features, as canopies and brackets, associated with the engraved effigies. In the concluding chapter some useful practical hints are given to those who contemplate taking up brass-rubbing as a hobby.

A valuable feature is an appendix, giving a list of brasses of each period and class described; and a bibliography is added which includes most of the important works on the subject published since the commencement of the last century.

The work is well illustrated by reproductions of rubbings and engravings of well-known brasses, one of which we reproduce by favour of the publishers.

We can recommend this manual to all desirous of gaining an insight into a very interesting branch of our native art.

MAGAZINES AND REVIEWS.

THE *Burlington Magazine* devotes its pages this month for the most part to literary art. Duccio, of Sienna, is a notable figure in the Italian school of painting, and an illustrated article is devoted to a consideration of his work. An illustrious Frenchman said of David that if he were not an important painter, he was at least very important to France, and the same may be said of Duccio with regard to Siennese Art. Another article describes a porphyry figure lately discovered at Ravenna. It belongs to the school of Alexandria—quite the most unattractive of the Greek colonial types. The drapery is arranged with dreary formality. That the sculptures of Charles and Wells successfully escaped this type of traditional influence puts an increased estimate on their value. Mr. Ayns Vallance continues his well-illustrated review of Early Furniture, while some reproductions of fine Italian medals cause us to wonder anew at the exhibition presented by our modern comage. The Victorian penny, bearing the superscription of Wyon, is nowadays something to be treasured.

The *Connoisseur* again considers mezzotint portraits, with further examples from the illustrious engravers of the XVIIIth century, including one by T. Watson after "Wright of Derby." The work of this painter, who is represented in the National Gallery by the "Experiment with the Air Pump," lends itself to the rich contrasts of light and shadow obtainable by mezzotint. "The Orrey," engraved by Wm. Pether, represents perhaps the most important of Wright's striking effects of chiaroscuro.

The *American Architect* gives plans and elevations of one of those well-arranged libraries for which America is distinguished. It is the Avery Library, Columbia University. New York, designed by Messrs. McKim, Mead, & White.

Moderne Bauformen (Stuttgart) illustrates some modern architecture in Germany and Austria. We notice those tendencies toward *l'art nouveau* which we are accustomed to look for in much of the Continental design, but there is much also that is pleasing, particularly in the example of a mansion at Stuttgart.

Architektonische Rundschau has devoted itself to styles that are more traditional. Some

illustrations of garden-city cottages at Bromley are both interesting and attractive. The basement floor is still largely adhered to in Germany, which, while it greatly simplifies the ground plan, multiplies the staircases, which are further added to by a second floor in the examples given.

THE LONDON COUNTY COUNCIL.

THE usual weekly meeting of the London County Council was held on Tuesday, in the County Hall, Spring-gardens, S.W., Lord Chylesmore, Chairman, presiding.

Loans.—The Finance Committee recommended that loans be made to local bodies, as follows:—Hackney Borough Council, 1,000l., for footway paving; Wandsworth Borough Council, 3,100l., for street widenings; and the Guardians of Mile End Old Town, 11,702l., for poor law purposes.

Marble Arch Tramway Scheme.—The Finance Committee, in presenting a report dealing with the various stages of this scheme, stated that they were of opinion that it was unwise for the Council to incur the heavy expenditure involved by the present scheme, more especially as it was for a line which would be practically isolated, and would thus form an unconnected part of the Council's general tramways system. The Committee's report was adopted, and the scheme abandoned.

St. Paul's Bridge.—Various reports were presented dealing with the Tramways, Trolleys, Vehicles and Improvements Bill, and it was agreed to introduce the Bill in the next session of Parliament. The Bill provides for a double line of tramways from Southwark-street over the proposed St. Paul's Bridge and through a new subway passing under Cannon-street and St. Paul's Churchyard to the north-western end of Cheapside.

Theatres, etc.—The Theatres and Music Halls Committee have approved of the following drawings:—Bow-road (late Bow and Bromley Institute), arrangement of the cinematograph enclosure; 3 and 4, Coventry-street (Globe Cinematograph Theatre and Restaurant), heating and ventilating arrangements; Downing-place, Hammersmith (The Colisée), arrangement of the seating, etc.; 382-386, Edgware-road, separation of the basement from the hall above; 213, King-street, Hammersmith, arrangement of the gallery; London Palladium, provision of a removable platform in the orchestra space; 36, Tottenham-court-road, arrangement of the seating and the panelling; Piccadilly Hotel, temporary ballroom; Theatres de Luxe, 75, Balham High-road, rearrangement of balcony, seating, etc., and ventilating arrangements.

CORRESPONDENCE.

Should Names of Assessors be Known?

SIR,—The question of competition assessors which has been raised by Mr. Voysey with such characteristic pleasantries will be to good purpose if it serves to further the interests of the competing architects.

I consider that the announcement of the assessor's name as early as possible is of the utmost importance, and is likely to inspire confidence and lead to many joining in the competition who otherwise would not have done so. A good assessor, good conditions thoroughly considered in relation to questions of site and requirements, resulting in a clear course and a straight fight, can do nothing but good in securing a first-rate scheme and much educative instruction to novices, besides a good sporting chance into the bargain. What can be more stimulating, and who would question such an award or doubt the ruling, however much it might be contrary to personal predilections?

It is almost suggested that the announcement of the name of the assessor leads to playing up to his methods and characteristics. I believe such to be a negligible quantity, the exponent of that vice being more likely than not to be "hoist by his own petard"; and it is easy to see how this method of procedure is more likely to militate against success than to further it. Such devices do not produce good quality of planning or distinction of architectural treatment. Absolute confidence in the assessor should be paramount; while, on the other hand,

Brass. William Grevel and Wife, 1401.

ere should be as absolutely no ground for questioning the award; but who would? Alas, this is not always so! "Humamum est errare," and the best of intentions fail, sometimes unwittingly on the part of the promoters, or on the other as unwittingly in the appointment of an assessor. There should be no ground for such a condition of distrust in the interests of the competitors and the good of architecture particular.

I see much to commend in the adoption of the jury system, although it must be admitted there are difficulties to be considered and overcome; but these surely would yield to conference. I have often wondered whether it would be possible for the Royal Institute of British Architects officially to undertake the assessing of all competitions. I say all because I would include the small competitions where the luxury and expense of the employment of an assessor is out of the question. Let the President of the R.I.B.A. be the official assessor; on a considered list of names a jury of three could be appointed, all assessors' fees being paid to the R.I.B.A., thus forming a fund for the new department. The jury would proceed upon, possibly on scale. Provided that difficulties could be overcome, such as the relation to the promoters, together with the necessary technical knowledge necessary for the building in question, some scheme satisfactory to the profession could be evolved. What could result? Let us hope harmony and the mutual advancement of architecture.

Finally, from the educational point of view, the interests of the promoters and for the advancement of our art, the promulgated designs could be exhibited in the spacious galleries of Conduit-street.

WILLIAM A. PITE, F.R.I.B.A.

Sir,—Mr. Voysey's ideals are always high and command one's respect, and I am a little surprised that he should countenance competitions in any form. It is perfectly true that a competitor cannot help being influenced by the work of the approved assessor, who naturally must be biased in favour of his own tendencies. I think, however, that Mr. Voysey exaggerates the danger of any design being very materially influenced in this way. The knowledge that the assessor will be a competent man, likely to cognise and give due consideration to any attempts at really fine work, far outweigh any drawbacks.

I understand that Mr. Voysey holds the opinion that English architecture ceased in the Tudor period, and it might need a minus of the very first order to resuscitate a style that would commend itself to him. It is hardly conceivable that any attempt will be made to design a building on any scale arising from traditions, which ceased at such period, but I believe that the attempt would be honestly considered if it could be reconciled with modern needs. The competition system will never give full opportunity to any man's powers, but at least it discovers competency of kind, and it is always open to the successful candidate in consultation with his Committee to show his untrammelled conception of the most suitable design.

The British public does not yet care sufficiently about architecture even to be "imposed on"; it accepts a building as a whole, as so much material turned to convenient uses when it has learned to accuse an architect of unfaithfulness "in style it will be a long way towards the recovery of a natural style so urged by Mr. Voysey.

The tyranny of the assessor which he explores is nothing to the ignorance of the lay committee, from which the profession has suffered so much. I would recommend Mr. Voysey to join forces with the Institute and get them to deal drastically with the disloyalty of those members who enter promiscuous competitions with no assessor at all—this, in my opinion, is a much greater grievance.

P. MORLEY HORDER.

Teachers as Adjudicators.

Sir,—May I be allowed the opportunity to assure those concerned that I was glad to read the letter in your issue of the 29th ult.

from Mr. Prestwich, which, of course, disposes of the fears I had expressed? The similarity between the designs was so striking that I was far from being alone in my suspicions, and it is a pleasure, therefore, to know that these drawings were actually the unaided work of the candidates.

Is it not, however, unfortunate that they should have been published as being works by students of the Liverpool School when it would appear from Mr. Prestwich's letter that he has not been a student for over two years?

The explanation this gentleman gives of the similarity of the designs I think strengthens considerably the opinion I advanced at the close of my last letter.

ALREADY AN ASSOCIATE.

Fire-Escape and the London County Council.

Sir, Doubtless to some of your readers Mr. Edwin O. Sachs' recent letters on the above subject will appear to constitute a very strong indictment of the London County Council. While I hold no brief for this body, yet as a former member of its architectural staff, and as one who has given some little attention to the question of means of escape in case of fire, I desire in a few words to examine the justice of your correspondent's attack. Mr. Sachs addresses his letter from the offices of the British Fire Prevention Committee, and in this and other ways he conveys the impression that fire prevention and the provision of means of escape in case of fire are very similar things, and that the danger from both these standpoints increases with the populousness of a district. This is not, however, the case. The danger to property in consequence of an outbreak of fire is obviously greater in London than in a small town. But the risk to the occupants of a building in the event of fire is much less. In London the fire brigade, with their escape, are on the scene within a few minutes of the alarm. In an ordinary country town the arrival of the brigade can hardly take place in less than half an hour. In London a provincial town, where large buildings are frequently detached, such escape is generally not available.

The London County Council have now most drastic powers in regard to the requirement of means of escape from existing buildings, and, though there may be cause for criticism as regard the details of their policy, it will generally be conceded that, by putting these powers into force in a gradual manner, they are acting reasonably. And this especially so, having regard to the fact that no similar powers in reference to ordinary trade buildings which are not factories or workshops apply in provincial districts.

Mr. Sachs' sympathies with persons exposed to great risk in the event of fire are, presumably, not confined within the bounds of the metropolitan area, and it would seem that the energy displayed by him in criticising the London County Council, who are shouldering these responsibilities, might be more advantageously employed in rousing the more lethargic authorities outside the metropolis to the need of an extension of their statutory powers. In London it is not now possible to put up an important building without providing reasonable means of escape in case of fire. In provincial districts, where the danger to life in the event of fire is greater, a person may still propose to erect a new building which is a veritable death-trap, and if the building is not a public building, a factory, or a workshop, the local authority has no power to interfere.

HORACE CURTIS, A.R.I.B.A.

Wall Decorations.

Sir,—In your issue of November 29 Mr. Jennings remarks the paucity of good design in the productions of many of the present-day wallpaper manufacturers. His ideas are interesting, and his condemnatory criticism errs in its mildness. . . . The strongest arguments would be in favour of the contention that wall and other surfaces should be treated by the craftsman-decorator without the intervention of the paper-printer. This is the goal to which all craftsmen's efforts should be directed.

Wallpapers are almost unknown in some European countries, and English people return from abroad impressed with the beautiful

interiors they have seen and wondering at our own supineness in this respect. The reason for this superiority of the foreigner is that the handicraftsman has every encouragement given him to put on record the fruits of his skill and experience. . . . In place of paperhangings, with all their insanitary accompaniments, walls might be treated with paint or distemper, and some personal ideas or suggestions of the client could be embodied in a stencil, with a finished effect in design, broken colour, etc., quite as good or superior to any block-printed paper, not more costly and infinitely more permanent. A coalition of decorators should be formed, and so provide work for those legitimately entitled to it. Architects do not exercise the great powers they possess in anything like the degree possible to them; if they would only take up the question a great improvement in the decorative requirements of the country would soon manifest itself.

GEO. RIDEMAN.

["* Architects achieve more on the lines advocated by our correspondent than he appears to realise. We should welcome the views of readers on the points he raises.—Ed.]

The Trade Disputes Act.

Sir,—The judgment in the case of Vacher & Son v. the London Society of Compositors, deciding that no action for libel against a trade union can be entertained by any Court, has served a very useful purpose by removing any doubt as to the extent of the immunities conferred upon trade unions by the Trade Disputes Act, 1906.

By the Trade Union (No. 2) Bill, which is now before Parliament, the Government is deliberately extending the powers of the unions so that they may enter into trade and compete against others by wrongful means and yet carry the absolute immunities of the Trade Disputes Act; or they may run newspapers and libel and slander all who cross their path and yet leave their victims without redress. How powerful this weapon will be in contested elections or trade disputes is easy to imagine.

The judgment will be welcomed by all who had previously recognised the need for an alteration in the law. The first step towards a cure is to diagnose the disease rightly, and now that this has been so ably done by the Law Lords the politicians cannot long be allowed to shirk their duty.

The danger is that in finding a remedy there may be some inclination to go too far and so create an injustice on the other side.

I would therefore call the attention of your readers to a Bill which has been prepared by the Committee of the British Constitution Association (copies of which can be obtained from their office, 11, Tottil-street, S.W.), and which has been introduced into Parliament by Lord Robert Cecil. This Bill relieves the unions from liability for unauthorised acts of their members and others only when such acts are effectively repudiated by the managing committee. Again, while allowing the unions all reasonable latitude for carrying out their objects in accordance with their rules it prevents them from using their great power for the purpose of injuring others. So well does it attain to the happy medium that it has almost, if not entirely, disarmed criticism. The Parliamentary Committee of the Trade Union Congress attempted an attack upon it, but were quickly silenced.

W. V. OSBORNE.

BLOTTING PADS FOR 1913.

We have received specimens of the well-known Registered Date Indicating Blotting Pads which Messrs. Hudson & Kearns, Ltd., Stamford-street, S.E., produce, and which we are glad to welcome. We may draw special attention to the pads Nos. 7 and 8A, which appeal to us as being not only most serviceable, but as most sensible blotting pads and diaries.

BAYLISS PRIZE INSTITUTION OF CIVIL ENGINEERS.

Mr. H. Knowler, of the Borough Engineer and Surveyor's Department, Wimbledon, in the examination for Associate Members of the Institution of Civil Engineers, held last October, has been awarded by the Council of the Institution the Bayliss Prize, a distinction given to the student of the Institution who obtains the highest marks at the examination. There were over 150 candidates.

ILLUSTRATIONS.

Church of the Annunciation, W.

R. WALTER TAPPER, F.R.I.B.A., is the architect of the Church of the Annunciation, Old Quebec-street, W., and his design, represented by the drawings by Mr. Charles Gascoyne, reproduced herewith, was shown at the Royal Academy Exhibition this year. The church is now in course of construction, the contractor being Mr. F. T. Chinchin, of Kensal Green.

St. Andrew's Hospital, Dollis-hill, N.W.

REFERENCE is made elsewhere (p. 717) to the new Catholic Hospital now in course of erection on Dollis-hill from the designs of Mr. Robert L. Curtis, and the illustrations on our plate are in connexion with the article.

MEETINGS.

SATURDAY, DECEMBER 14.

The Institution of Water Engineers.—Winter general meeting, at Burlington House, W. Mr. J. C. Thresh on "Some Recent Examples of Pollution of Public Water Supplies." Mr. E. J. Silcock on "The Valuation of Water Undertakings on Transfer to Local Authorities"; and Mr. Adolph Kemna on "Recent Advances in the Science of Water-Purification." 10.30 a.m.

MONDAY, DECEMBER 16.

The Royal Institute of British Architects.—Mr. Horace Porter, M.A., on "The Walls of Visby, Gotland." 8 p.m.

The Surveyors' Institution.—Mr. M. C. Duchesne on "The Value and Marketing of English Timber." 5 p.m.

Liverpool Architectural Society.—Mr. Lawrence Weaver, F.S.A., on "Small Country Houses of To-Day." 6 p.m.

The Institute of Sanitary Engineers. Mr. J. O. Neumann on "The Collection of House and Trade Refuse." 8 p.m.

Royal Society of Arts (Cantor Lecture—III.).—Mr. C. R. Darling on "Methods of Economising Heat." 8 p.m.

The University of London (Victoria and Albert Museum).—Mr. Banister Fletcher on "French Medieval Castles." 5 p.m.

TUESDAY, DECEMBER 17.

The University of London (British Museum).—Mr. Kaines Smith on "The Achievements of Art: The Life Principle." 4.30 p.m.

The Institution of Civil Engineers.—Mr. H. A. Humphrey, M.Inst.C.E., on "The Generation and Distribution of Producer-Gas in South Staffordshire." 8 p.m.

WEDNESDAY, DECEMBER 18.

Royal Society of Arts.—Mr. Joseph Pennell on "The Pictorial Possibilities of Work." Illustrated. 8 p.m.

The Auctioneers' and Estate Agents' Institute.—Mr. Horace Cubitt, A.R.I.B.A., on "The London Building Law and the Development of Property." 7.45 p.m.

Edinburgh Architectural Association.—Mr. Lawrence Weaver, F.S.A., on "Small Country Houses of To-Day." 8 p.m.

Nottingham Architectural Society.—Mr. T. Wright on "Examples of Pictorial Architecture and Miscellaneous Subjects." 8 p.m.

THURSDAY, DECEMBER 19.

The University of London (Imperial Institute-reading).—Mr. Kaines Smith on "Review of Foreign Lectures on Medieval Decorative Art." 3.30 p.m.

The University of London (British Museum).—Mr. Banister Fletcher on "Greek Town Plans and Theatres." 4.30 p.m.

The Institution of Electrical Engineers.—Dr. S. P. Thompson on "The Work of the International Electro-technical Commission." 8 p.m.

FRIDAY, DECEMBER 20.

The Institution of Mechanical Engineers.—8 p.m.

COMPETITION NEWS.

A list of current Competitions is printed on page 730.

Barnet Workhouse Children's New Home.

At a recent meeting of the Guardians ten sets of plans for the Home proposed to be erected in Welhouse-lane for the accommodation of the Workhouse children were considered, and a recommendation by a committee of the whole Board that premiums of twenty-five, fifteen, and ten guineas respectively should be awarded the authors of the three sets of plans marked "Economy," "Compactum," and "Flat Lux" was adopted by eleven votes to eight.

Extension of Dunkerque.

The prize of one thousand francs offered for the best design for the enlargement of the City of Dunkerque (Nord) has been awarded to M. A. Agache.

Municipal Meeting House, Clichy.

A jury of no fewer than eleven members considered the designs submitted in the competition for "Une Maison Municipale de Réunions" at Clichy. There were several Town Councillors on the panel, but the professional side was strongly represented by architects nominated by the *Préfet de la Seine*, the *Société des Architectes diplômés par le Gouvernement*, the *Société Centrale des Architectes*, and by the competitors themselves. According to the report in a French newspaper, there were only fourteen designs, and after the process of elimination the first prize was given to the project of M. Guidetti.

ARCHITECTURAL SOCIETIES.

Glasgow Technical College Architectural Craftsmen's Society.

At a meeting of the Royal Technical College Architectural Craftsmen's Society, held in the Society's room within the College on Friday last week, Mr. A. F. Purdie presiding, Professor Charles Gourlay, B.Sc., A.R.I.B.A., F.S.A. Scotland, delivered a lecture, entitled "A Review of Byzantine and Italian Architecture," in which he outlined the history of Christian architecture in the near East and in Italy from the beginning of the IVth century until the end of the Renaissance period in Italy. After dealing with the Byzantine work in Constantinople and Salonika he treated of the Early Christian architecture of Rome, the work in Northern Italy, in which the influence of the Byzantine style is manifest, then the Romanesque, Gothic, and the Early Middle and late Renaissance architecture of Italy, both ecclesiastical and secular. The lecture was illustrated by a series of lantern slides, which enabled a good general understanding of the principles of design, composition, and details of the work under review to be obtained.

The Guild of Architects' Assistants.

We have before us the epitome of a paper read by Mr. W. H. Baker before a meeting of the Guild of Architects' Assistants, on

December 4, entitled "My Experience of the Formation of an Approved Society (National Insurance Act)."

Mr. Baker generally explained the Act, laying special stress on the advantages of Clause 91 which makes provision for members leaving one society and joining another. He considered that the latitude and freedom of the wording of the Act is not realised, that it was possible to have stamps representing four, twelve, thirteen or any number of weeks, and that it was not impossible to provide for payment by cheque. It was also possible to form an approved society doing away with sickness and disablement benefits and substituting any other of the fourteen scheduled benefits, one of which was superannuation or pension. His object was to make known the fact that compulsory insurance need not cause a disruption of the relations which had existed hitherto between principals and their assistants.

Manchester Society of Architects.

At a meeting of the students of the Manchester Society of Architects on December 4 a paper on "Architectural Sculpture" was read by Mr. W. O. Jones, Mr. J. H. Woodhouse being in the Chair. The lecturer devoted the chief part of his paper to the development of the architectural sculpture of Greece, culminating in the work of Phidias on the Parthenon. He laid great stress on the development in composition of the pediment, pointing out that the great essential is the gradual increase of interest and emotion of the subordinate figures leading up to the central dominating feature in the apex. In the discussion that followed Mr. Jones indicated the lines to be followed in the application of sculpture to modern work.

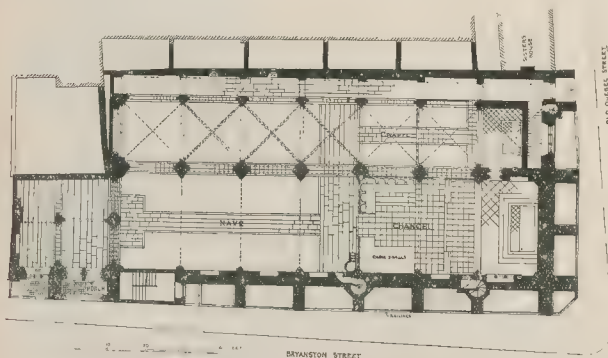

FIFTY YEARS AGO.

From the *Builder* of December 13, 1862.

Our Public Statues and Memorials.

Nothing so much struck the artistic section of our crowds of foreign visitors during the present season as the extreme poverty of our public memorials and honorary statues. They appeared to our continental critics utterly unworthy of the intellectual and artistic eminence of our nation; and so, in fact, they are. And the foreign critics, however drastically unpleasant they may have been in their mode of stating it, were perfectly correct in their general verdict.

* * * There is nothing we have so little faith in as the pessimistic note. No good has been achieved by mere negation. Yet we find little to say that can combat the "general verdict" above given. Whether our regard is turned upwards towards Nelson or downwards upon Oliver Cromwell, it must be confessed that we meet with but few monuments to kindle the imagination. The arch on Constitution Hill, with its crowning quadriga, may fairly be claimed as a recent triumph. So may Sir Goscombe John's little statue to Arthur Sullivan in the Embankment Gardens, while the Peter Pan group at Kensington must be counted as a graceful concession to a popular sentiment. But our memorials to great men seem to us best to find their parallel in the eulogiums of the after-dinner speech. In this country we have never acquired the lyrical expression of which sculpture is capable, perhaps because we take so little heed of the memory of our artists, musicians, and poets—a theme that would naturally evoke this expression. In Paris, the Parc Monceau and the Luxembourg Gardens are open-air galleries dedicated to French creative genius. The memorials to Watteau, Mappassant, Chopin, Gounod are exquisite, while Frémiet's Jeanne d'Arc is an example of the romantic charm in which an historical figure may be clothed. The standard of Classic in England is the Classic of the Renaissance, and has little in common with the Greek spirit, which embodied all the essentials of romanticism.—Ed.

Warwickshire House, Gower-street, Bloomsbury: Entrance Hall.

Messrs. John Slater, F.R.I.B.A., and J. M. Keith, A.R.I.B.A., Architects

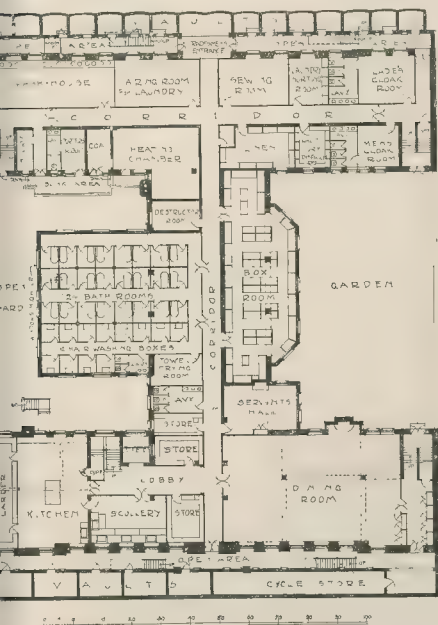

WARWICKSHIRE HOUSE, GOWER-STREET.

URING the last few years there has been a considerable amount of discussion in the public Press as to merits or demerits of the system of "living-in" adopted for their employees by the large London drapers, and the results which admittedly have obtained, especially when the upper part of shop premises has been devoted to the living-rooms

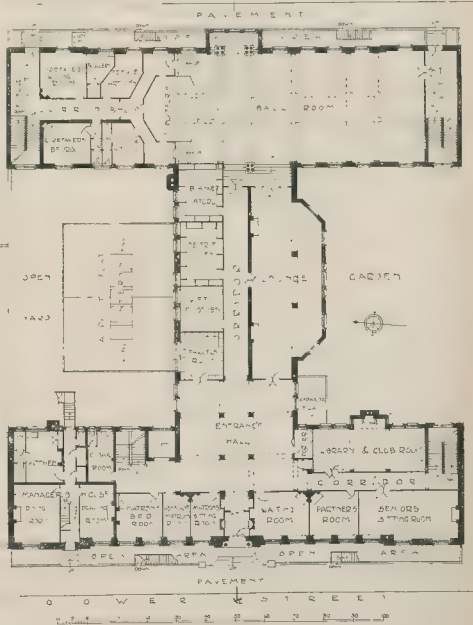

of the assistants, fully justified the severest criticism. Messrs. Bourne & Hollingsworth, of Oxford street, have, however, always contended that under proper conditions not only are the comfort, well-being, and health of the employees much better secured by the "living-in" system than when they have to find their own lodgings, but that it is vastly preferred by them.

A few years ago this firm erected in South-

crescent, Store-street, a large hall of residence for 418 of their female employees, from the designs of Messrs. John Slater & Keith, of Berners-street, and the success of this undertaking encouraged them to put in hand a much larger building for the same purpose under the same architects. An admirable site was secured on the Bedford Estate fronting on Gower-street and Malet-street, and this building is now in

Basement Floor.

Ground Floor Plan.

Warwickshire House, Gower-street, Bloomsbury.

Warwickshire House, Bloomsbury: Front to Gower-street.

Messrs. John Slater, F.R.I.B.A., and J. M. Keith, A.R.I.B.A., Architects.

occupation. Accommodation is provided for 614 residents, including servants, and it is not too much to say that the employees enjoy all the comforts of a first-class hotel.

From the plans and views reproduced here-with it will be seen that the architects have designed a building admirably suited to the uses for which it is intended. It has frontages of 152 ft. 8 in. to Gower-street and to Malet-street, with a depth of 168 ft. 5 in., and is H-shaped on plan, thus securing ample light and ventilation for all rooms.

In the basement next Gower-street are the dining-room, kitchens, etc., and next Malet-street are various store-rooms and service-rooms and a laundry and ironing-room, which are used by the employees for small articles of dress. In the central block are placed the servants' hall, a large box-room, and the baths and hair-washing rooms, twenty-four of the former and twelve of the latter, all separated by Sicilian marble divisions 6 ft. 6 in. high, carried on iron supports, so that the partitions are kept 3 in. off the floor. There is also a heating chamber with separate boilers for the hot-water supply and for the warming, the whole of the heating plant being in duplicate to provide against a break-down.

The ground floor contains a large entrance hall opening from Gower-street, part of which is used as a lounge, and opens on to another large lounge in the central block facing south. There are also a library, seniors' sitting-room, partners' room, matron's private rooms, and some specially heated drying-rooms for damp garments. Nearly the whole of the Malet-street frontage is occupied by a large ballroom, 84 ft. by 37 ft., which can also be used for private theatricals, with stage dressing-rooms for artists and separate lavatory accommodation. There are two separate entrances from Malet-street for this part of the building. A small maisonnette is cut off from the main building on the ground and first floors with separate entrance from Gower-street, and this is occupied by the head of one of the departments. With this exception the whole of the upper floors is occupied by bedrooms of varying sizes accommodating one, two, three, and in a few cases four persons. In order to avoid

crowding up the bedrooms with wardrobes, etc., the walls of the corridors are lined with steel lockers for clothes, one for each person, and thus the bedrooms are always kept tidy. In the central block on each floor are the

water-closets and housemaids' closets. On the top floor is a small isolation hospital, with six beds, separate kitchen, bath-room, and nurses' rooms, and here any suspected case of infectious illness is at once isolated. An electric passenger lift is provided for residents, and a goods lift for the kitchen services. The whole of the building is warmed by radiators.

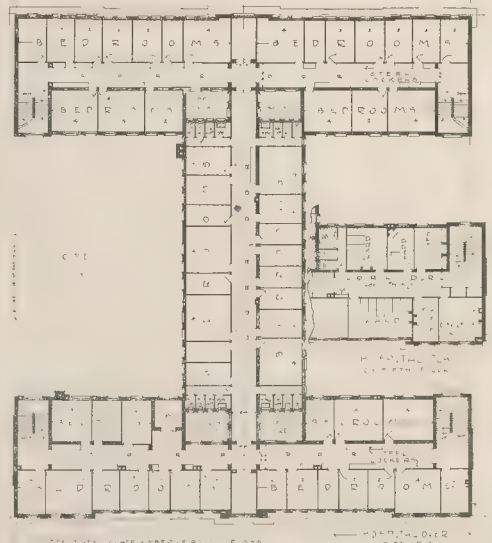

The building, which is faced with Lawrence's red bricks with Portland stone dressings, is of fire-resisting construction throughout, the floors being formed of hollow reinforced concrete beams by the Siegwart Fireproofing Company, Strand, W.C., and the whole of the steel stanchions and girders are encased in concrete. The roof is flat, covered with asphalt, and all the four staircases are carried up to the roof so that ample means of escape are provided. All the woodwork of ground floor is of oak, and the hall, lounge, and corridors are laid with marble, the ground being white and blue Sicilian with green Norwegian slabs. The ballroom floor is laid with 12-in. pitch-pine boards in narrow widths resting on 5-in. by 2-in. fir joists 16 in. apart, and these are spiked to another set of joists 3 ft. apart, thus securing a good springy dancing floor and a very economical outlay.

The bedroom floors are finished in Granolithic on which is laid directly a very heavy linoleum, but no floor boards are used.

The constructional steelwork is by Messrs. Moreland & Son; the wrought-iron work by the Coalbrookdale Company, Berners-street, W.; the asphalt and damp-proof courses by Messrs. Vaux Travers; the heating, ventilation, and hot-water supply by Messrs. G. N. Haden & Son; the ornamental ironwork by the Coalbrookdale Company; the baths, lavatories, etc., by Messrs. J. Bolding Sons; the electric installation by Messrs. Banks Bros., New Oxford-street, W.C.; the steel lockers by the Crittall Company; and the lead-glazing by the Luxfer Syndicate, Hill-street, E.C.

Messrs. R. Waygood & Co., Ltd., Falmouth-road, London, S.E., have supplied one of the electric passenger lifts to raise 25 cwt. 200 ft. per minute from basement to fifth floor, a travel of 67 ft. The lift is fitted with up-to-date safety appliances, and the control is in the hands of an attendant operating a car-switch and a centring detachable handle in the cage, with a special slowing-down device on approach to stopping-places.

Messrs. Gilbert Seale & Son, Lombard-grove, Camberwell, have carried out the stone carving to the exterior, the wood carving to ballroom

Bedroom Floor Plan.

Warwickshire House, Gower-street, Bloomsbury.

go, entrance hall, and entrance, and all the mental plaster-work in ballroom, lounge, dance hall, and corridor.
The general contractors were Messrs. G. E. H. & Sons, of Maidstone, and Mr. Thomas Ken was clerk of works.

PAINTING STRUCTURAL STEEL.

Scientific research and practical tests have made clear the fact that certain pigments possess the property of encouraging corrosion when applied to steel, although excluding moisture, while others tend to retard corrosion. These pigments may be classified as moisture-retarding and rust-retarding, the former being suitable for finishing coats, and the latter for priming and foundation coats.
No whole question of painting steelwork has yet been considered fully in a report presented to the American Railway Bridge and Building Association, from which the following are taken.

A rust-retarding coat can be suitably made of red-lead and pure linseed oil, freshly mixed, with a small proportion of turpentine to prevent penetration.
Natural oxides are slightly less costly, and will be applied by less expert labour than lead.
A leaded oil without pigment is considered suitable as a first coat, because it tends to cause the peeling and blistering of paint towards applied.
On painting steel on the site, paints containing the same kind of pigment as in shops can be used if covered by an elastic iron coat, otherwise only paints suitable for painting should be applied.

A priming coat on the site red-lead or leaded oil should be darkened by adding a little carbon black to the extent of from 10 to 20 per cent. The objects are to enable men to judge if the surface is being properly primed, and to make the second coat more effective.

Carbon, lamp-black, and graphite give satisfactory results as finishing pigments; but the oil must be of suitable quality, and the addition of some appropriate gum improves the paint in respect of elasticity and durability.

Before repainting structures the surface should be cleared from all scale, rust, and dirt, and be made smooth. If the entire structure is to be repainted with a rust-retarding finishing-coat the parts cleaned and all exposed surfaces should be given a coat of red-lead or red-lead paint before the finishing coat is applied. The use of turpentine in paint applied over the surface is advisable because this will promote adhesion between the two layers.

WIND PRESSURE ON BUILDINGS.

Supplementary to the investigations made in this country on the subject of wind pressure on buildings, some interesting experiments by Professor Smith, of Purdue University, are worthy of notice.

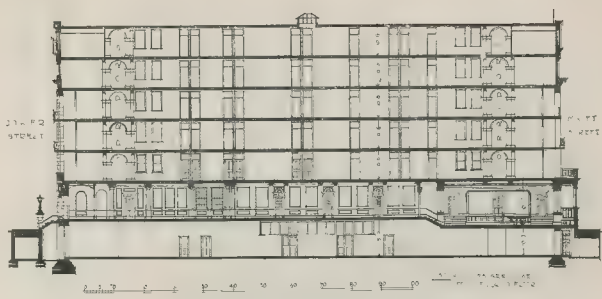

For the purpose of his tests Professor Smith erected a model building erected on an open site, constructed so that the wall length and height and the roof slopes could be varied to twenty-seven different combinations.

From a study of the pressure diagrams and curves plotted from the values obtained after correction for measurable errors in the apparatus, Professor Smith deduces the following conclusions:—

(1) The increase of wall height tends to increase relatively the average pressure on the windward surface, while the decrease of height with unaltered roof height tends to decrease the average pressure on the windward surface, and to cause pressure on the leeward roof slope.

(2) The increase of wall height tends to decrease relatively the average suction on the windward wall. If the roof is long in comparison with the height, or if the height is small in comparison with the roof span, the leeward wall suction is relatively small.

(3) The increase of height tends to increase relatively the flow of air around the ends of a building. If the building is short in comparison with its height, the flow of air around the ends has more influence than the flow of air around the roof upon the relative pressure and suction on the windward and leeward surfaces, respectively. As the end flow increases the

Section on Line AA. (See Ground Floor Plan.)

Warwickshire House, Gower-street, Bloomsbury.

windward pressure tends to become of maximum value, while the leeward suction at the middle tends to become of minimum value.

In view of these conclusions Professor Smith considers that present methods of estimating wind loads on industrial buildings should be modified. For instance, in the case of roof trusses on masonry walls or on steel framing with long diagonals, he recommends that a suction effect of about four-tenths the unit wind pressure should be taken for the leeward roof slope of all closed buildings, and a pressure or suction effect derived from his curves, taken for the windward slope. The resulting stresses will not only differ in amount from those calculated on the customary basis, but in some members will differ in sign. He considers that wind loads on purlins may generally be neglected, or taken at lower values than usual, but points out that the need for secure anchorage to guard against the lateral movement and vertical displacement of roofs is clearly indicated by the results obtained.

A NEW CATHOLIC HOSPITAL.

In January, 1913, St. Andrew's Hospital, Dollis-hill, N.W., will be ready to receive patients. The Institution, which owes its origin to the generosity of an anonymous lady, stands on the crest of Dollis-hill, on a site of 7 acres, and advantage has been taken of a long level plateau to give an ideal situation for the main buildings. They are thus placed far above all obstructions, present or future, of light, air, and view; and the outlooks comprise, in the various directions, the vale of Cricklewood to the south, the Weald of Harrow westwards, the valley and waters of the Brent to the north, and the heights of Hampstead Heath and Golder's Green to the east.

The elevations of the hospital buildings are of red brick with Portland stone bands and dressings. The centre block is emphasised with a facade of stone, and is surmounted by an octagonal dome and cupola. At the four corners are flanking towers forming the sanitary annexes, and these towers are also finished with domical shaped roofs. The coverings of the ordinary roofs are of grey-green Delabole slates, and the domes and cupola are covered with copper. Open-air terraces are formed along the front at the ground-floor level and balconies at the first-floor level.

The architectural character of the centre is of a simple Classic style. The projections formed by the entrance lobby support an open-air balcony with stone balustrading, above which at the second-floor level is a niche with a life-sized statue of St. Andrew, the patron of the hospital.

The building consists of four floors, and comprises administration centre, two wings accommodating the wards and an axial corridor at the back connecting with the commissariat and nuns' and lay nurse quarters.

The basement floor is devoted to general stores, heating chambers, cold storage, etc., and is approached externally by a sloping way, by means of which ambulance litters can be easily wheeled in and out. The centre corridor runs from end to end, giving direct access to all the various stores, stairs, and offices. The central axial corridor gives direct communication with the kitchens.

On the ground floor the main entrance gives

access to the entrance hall, at the sides of which are the rooms of the administrative offices and waiting-rooms. This hall leads immediately to the main staircase and to the side corridors connecting with the ward on the right and the ward on the left, when built; while the axial corridor beyond leads to the kitchen and refectories of the sisters and nurses. Adjoining the entrance hall and main staircase are the medical officers' rooms, reception-room for patients and dispensary. The wards are in direct communication with the main corridor, and are long, lofty, and well lighted, each for eighteen beds, and each ward has its own ward kitchen, day-room, and sanitary annexe.

The main staircase is built around a commodious enclosure in which is a lift designed to accommodate a bed or litter and giving access to all floors from the basement upwards. This lift is operated by electricity and is automatically controlled so that no attendant is required to work it.

On the first floor (and grouped round the centre corridor) are the private wards with their separate kitchen, bathroom, and sanitary annexe, also the rooms of the nursing superintendent. Here also (approached by a short corridor) are the X-ray room, with its dark-room and test-room adjoining; and there is also a mending-room and clothes-room adjacent to the linen-room. The main corridor gives direct communication to another ward. This is of equal accommodation to the ground-floor ward, and, like it, has its day-room, ward kitchen, bathroom, and sanitary annexe, and secondary staircase leading down to the grounds.

The second floor is also served by the main staircase and the main bed and passenger lift, and gives convenient access for both patients and sisters to the chapel, which is on this floor under the dome.

Adjoining the chapel is the priests' sacristy, and later on a tribune will open into the chapel from the adjoining sisters' sick-room.

Immediately joining the corridor and main stairs is the operating-room, with its anaesthetic and sterilising rooms and a robing chamber for the operating surgeon.

The remainder of this floor so far as the main building is concerned is apportioned to the use of the sisters as dormitories.

The axial corridor is an open air approach to the rear building, and leads to a small suite of isolation rooms. There is an outside stair to the flat roof, which can be utilised as a roof garden, and which affords a splendid view of the surrounding country.

The rear building has on the basement floor the kitchen, scullery, meat and vegetable stores, and tradesmen's entrance. This kitchen suite communicates by means of a direct corridor to the centre of the main building, where two service lifts run to the upper floors, and by means of which the food is sent up to the various wards. The service will be conveyed on trolleys, with special heating arrangements for keeping food warm in transit. The lifts have automatic electric control, so that the service will be convenient and expeditious.

The ground floor of this rear building has refectories of the sisters and dining-room of the lay nurses, with service lift from the kitchen immediately below. Two stairs communicate with the first floor, on which are the separate recreation-rooms of the sisters and the nurses, whilst the nurses' stairs continue to the second floor, where their private rooms are situated.

SECTION A-B

St. Andrew's Hospital, Dollis-hill, N.W.

Mr. Robert L. Curtis, Architect.

Throughout the buildings every precaution has been taken to eliminate corners and angles which might induce the lodgment of dust. Rounded corners, angles, and curves have been worked on walls, floors, and ceilings, and joinery wherever practicable, and the surfaces throughout are of impervious materials. The floors, roofs, and stairs are of reinforced concrete construction and are practically fireproof.

The floors throughout are finished with Terrazzo mosaic (with the exception of the chapel and hall, which are in the Roman mosaic). Terrazzo mosaic dados have been put to the stairs and corridors, and the walls and ceilings of wards and corridors are of Keene's cement, and will be finished in enamel and in flat distemper to the ceilings.

The heating of the main wards is by open fire central ventilating stoves, with sterilisers, and the private wards and other apartments are warmed by open well fireplaces. The corridors, hall, staircases, and administration rooms are heated by low-pressure hot-water radiators, and similar hot-water secondary heating is also supplied to the wards; the installation throughout being from the hot-water mains in the basement supplied by the duplicated boilers in the furnace-room. Here also is a battery of hot-water boilers, which supply a hot-water domestic service to the

whole of the lavatories and suites throughout the building. The sanitary fittings, lavatories' water supply, together with the outside drainage have been carried out under the supervision of Messrs. Bost & Sons, consulting engineers.

The grounds are being laid out with approach roads and paths, with trees and shrubs and green sloping lawns at the front and kitchen-gardens at the rear. The boundaries are enclosed with oak fencing, and the frontage along Dollis Hill-lane is protected with wrought-iron fencing and entrance gates.

The architect for the work is Mr. Robert L. Curtis, Finsbury-square, E.C.

Messrs. Patman & Fotheringham, Ltd., are the general contractors for the building; Mr. Peters is foreman in charge; and Mr. James Keating (Ilford) the clerk of the works. The following were the principal sub-contractors:

Fireproof ferro-concrete floors and stairs by the Cubitt Concrete Construction Company; heating and hydrant installation by Messrs. Jeffreys & Co., Ltd.; electric lighting and telephones by Messrs. Bakewell & Son; electric lifts by Messrs. Waygood & Co., Ltd.; wrought-ironwork and railings by Messrs. Bayliss, Jones, & Bayliss, Ltd.; stoves by the Teale Fireplace Company; sanitary fittings by Messrs. Shanks & Co., Ltd.; locks, bronzework, and ironmongery generally by Messrs. Colledge & Bridgen, of Wolverhampton; pavement lights

by Messrs. Hayward Brothers & Eckstall Ltd.; blinds by the General Seating Company; cooking and kitchen fittings by the Shaw Engineering Company, Ltd.; oak fencing by Messrs. E. C. White & Son.

BILLS FOR CONSTRUCTIONAL WORKS :

SESSION 1913.

THE London County Council's Bill providing for tramways, with street widenings at intervals *passim* from Cricklewood to Marble Arch (but this project was abandoned at the Council's Meeting on last Tuesday); (Hildon Hill, Hendon, to Chalk Farm-road, by way of Finchley and Adelaide roads, Southwark-street to Cheapside, *via* St. Paul Bridge; Crouch End to Seven Sisters-road and Holborn to Farringdon-road, *via* Charterhouse-street, and Farringdon-road to Ludgate Circus. The Metropolitan Railway seek powers to acquire the Great Northern and City Railway undertaking and to extend it to Lothbury, and to connect it with their system at Liverpool-street and with the station of the Waterloo and City line; the London Underground Railway Company propose to acquire the Central London and City and South London Railways with enlargement

SECOND FLOOR PLAN.

St. Andrew's Hospital, Dollis-hill, N.W.

Mr. Robert L. Curtis, Architect.

the City and South London Company's lines from St. Pancras to Clapham Common and the Lancashire and Yorkshire Railway will make new lines at Bolton, South-Knottingley, Goole, and Royton, and the Victoria Station, Manchester. Powers bought by the Metropolitan Water Board construct three service reservoirs, with ten tanks in Hanworth, Greenford, Eltham, Wivich, Tatsfield, Cudham, and Westerham, conduits at Hanworth, Sunbury, and Wokingham; by the Mid-Kent Water Company, the Urban District Council, South Stafford Water Company, and Bradford, Coventry, Worsley, and Northampton Corporations, reservoirs, aqueducts, and ancillary works. New bridges there are projects by the London County Council—rebuilding of Lambeth Bridge; the Great Northern Railway bridge over the Regent's Canal; Leicester Corporation new bridges; Lancashire and Yorkshire Railway—new bridges. Extension of harbour and maritime improvements are projected by the Leith Dock Company and the Limerick Harbour Commissioners; by the Dover Harbour Board, new wet dock, two sea walls, and a quay, division of the present tidal harbour into a dock, and a communication between that and the Commercial Harbour; by the Liverpool Dock and the Nilton Haven Commissioners; at Greenock and Port Seton, new piers, quays, etc.; and for two piers, a break wall and wharf, a wet dock, etc., at Dover. Escalators will be constructed at Aldershot, Paddington (Waterloo and Baker Street), and Charing Cross (Hampstead Heath). Stations. To form connexions with the London and North Western Railway.

POURED CONCRETE HOUSE IN PARIS.

Supplementary to our article on the poured concrete house constructed at Santpoort, we give particulars of a similar building erected in May last at St. Denis, now a working-class suburb of Paris. The dwelling-house was constructed in accordance with the Harms et Small system of the Société Française de Maisons et Constructions Moulées. The general mould was built up of 2,602 iron sections assembled by means of bolts and nuts so as to provide two surfaces between which the concrete could flow, and kept at required distance by lateral stays. Fig. 1 shows part of the interior of the mould with the reinforcement for the walls, position, and Fig. 2 the exterior of the mould up to first-floor level. It will be seen from Fig. 1 that the concrete is only slightly reinforced, the sectional area of steel only about 1 per cent. of the sectional area of the concrete. The rods are arranged to form a network with proportionately sized openings. In addition to the reinforcement, there are pipes in the mould pipes for chimney flues,

Fig. 2. Poured Concrete House, Paris: Mould erected to First Floor Level.

the outer sides of the door and window frames, the ends of the stair treads, and the ends of the floor beams.

The latter were moulded separately of 1:2:2 concrete and suitably reinforced. By moulding the beams in advance it is possible to remove the general mould at an earlier stage than would be permissible if the floors were poured similarly to the walls of the building.

The concrete for pouring is mixed in the proportions of one part Portland cement, three parts sand, and two parts gravel, with 120 to 175 per cent. of water, so that the mixture shall be able to flow very freely.

For preparation of the concrete a rotary mixer of sufficient size was placed near the site of the building with a platform conveniently arranged for feeding purposes. The raw materials were conveyed to the platform in small trucks proportioned to deliver the correct amounts of cement, sand, and gravel for each batch of concrete.

Concrete was conveyed from the mixer in skips sliding down an inclined plane, hoisted to the top of the mould, and poured into the space between the two sides.

All the concrete was poured at one point, without tamping of any kind. The perfect fluidity of the concrete is due not merely to the large proportion of water, but also to the admixture of a substance provided for in the Harms et Small patent.

In order to overcome the natural tendency of the materials to separate by gravity after the concrete has been poured the viscosity of the latter is sufficiently increased by the addition of colloidal substances in small quantities during the operation of mixing.

After removal of the moulds the surface of the concrete was found to be perfect in every respect; the joints of the castings forming the mould leave fine lines on the surface, resembling the joints between cut stones in masonry.

The exterior wall surfaces can be left just as they are, and the interior surfaces can be painted or decorated in any desired style.

Houses constructed in this manner possess the advantage of being perfectly dry from the start, and they are particularly hygienic, as all the interior surfaces can be washed, and there are no inaccessible spaces such as abound in houses constructed in accordance with ordinary methods of building.

Another advantage that should appeal to architects and builders is that the perfectly monolithic nature of the entire building enables it to act as a single unit, and therefore reduces foundation work to a minimum, at the same time obviating the risk of cracks such as appear in ordinary buildings as the result of local settlement of the soil.

The merits of the system are clearly expressed in the following extracts from a report on the house at St. Denis by M. G. Tronchet, Architecte en Chef du Gouvernement:—

"The appreciable advantage of the system is that one may erect the moulds without scaffolding, as provision is made for the support of brackets or planks on which the workmen may stand while building up the moulds.

After examination of all parts of the house it was found that the concrete was equally dense at the top and bottom.

On the day of pouring two blocks of concrete were moulded for examination at the Laboratory of the Ponts et Chaussées, M. Mesnager, the Chief of the Laboratory, witnessing the operation of moulding. We both recognised the perfect homogeneity of this product, employed for the first time in France; the said homogeneity was still more evident on the breaking of one of the blocks.

Tests made by M. Mesnager at the Laboratory of the Ponts et Chaussées showed the concrete to possess the crushing resistance of 75 kg. per cm.² (1,066 lb. per square inch).

The cost of a house of ordinary materials, as usually built on the outskirts of Paris, and of superficial area equal to that built, would be from 9,000 to 10,000 francs. The cost in poured concrete in accordance with the tender of the Société Française des Maisons et Constructions Moulées being 7,500 francs, there follows an economy of from 1,500 to 2,500 francs, or about 17 to 25 per cent., a very appreciable saving in economical buildings."

Fig. 1. Poured Concrete House, Paris: Interior of the Mould.

NEW METHOD OF TESTING WELDED JOINTS.

IN a paper presented by M. C. Frémont, of Paris, at the Congress of the International Association for Testing Materials the author advocates the impact test for determining the strength of welded joints. For the purpose of his experiments test pieces measuring 8 mm. x 10 mm. in cross-section were employed, the welds having been made in France and elsewhere by smiths specially selected on account of their skill. The welds were of the scarf-jointed type so as to obtain large contact surfaces. Micrographical etchings of the welds showed that a line of demarcation existed between the two metals at the seat of the weld in every case, thus indicating that the portions in contact had not interpenetrated.

The iron adopted for the various welds had a tensile strength of from 35 kg. to 40 kg. per square millimetre, and the mild steel a tensile strength of about 40 kg. per square millimetre. Impact tests on the unnickel test prisms measuring 8 mm. x 10 mm. in cross-section gave from 26 to 32 kilogram-metres for the iron and about 50 kilogram-metres for the steel, the test pieces not exhibiting fissures in any instance.

Similar test pieces were prepared from the welded metal in such a manner that the bending test could be applied in line with the welds to enable the strength of the latter to be determined. Under the impact test these pieces exhibited in all cases a strength inferior to that of the original metal. In most of the tests the pieces failed by the opening of the weld, their resistance being very small.

Among the better results obtained the steel-on-steel test pieces exhibited a fair amount of deformation before failure, the force required being from 15 to 16 kilogram-metres, or less than one-third of the strength of the original metal.

From the results obtained by M. Frémont it appears that the static strength of the forged scarf-jointed welds is equal to the static strength of the metal only when the welded surface is sufficiently large to compensate for the lower strength per unit area.

Antogenous welds are still weaker than forged welds, not only because of the smaller surface of adhesion, but also on account of the lack of continuity in the added metal, and the lack of strength imparted by hammering in ordinary welds.

CONSTRUCTION NOTES.

Asphaltic Road-binders.

THE chief feature of the natural asphalt industry, as set forth in the record of mineral resources by the United States Geological Survey, is the great extension of the use of residues from the asphaltic varieties of petroleum as binders in the surface of macadam roads. The asphaltum used for this purpose was 159,424 tons in 1910, and 234,951 tons in the year 1911. The use of a soft asphaltum from Venezuela, which is admirably suited for this purpose, is increasing.

A by-product of the oil industry is fast supplying the demands for asphaltum in the United States, whilst the petroleum from California and Texas have furnished, in the course of their utilisation, large supplies of asphaltic residue, which, when treated with air, becomes sticky and even elastic to a certain extent. Elastic material for roofing and substitutes for rubber in automobile tyres have been obtained from asphaltic residues by this blowing process or by treating with sulphur; whilst this sulphurisation of asphaltum has been applied with good effect to elaterite and similar hard asphaltums.

The consistency of materials, such as pitch, asphalt, coal-tar, and the like, used as bituminous road formers or binders, may be ascertained by an appliance devised by Mr. W. Crosby, and described in detail in the specification of the English patent No. 16,997 of 1911. The operation is determined at temperatures from 0 deg. to 100 deg. C., or any convenient temperatures above or below these, by measuring the distance travelled through the substance that is being tested, by plungers under known loads, in a fixed period of time, say, five seconds. The apparatus may also be used to measure the period of time required for the plungers, under known loads, to travel a fixed distance through the substance to be tested, which is contained

in a box of fixed dimensions, and is maintained at a known temperature. In this case the time required by the plunger to travel the fixed distance is taken as the measure of the consistency. The apparatus consists essentially of an accurately balanced wheel, around the circumference of which a thread passes, which is attached at one point to prevent slipping. The plungers are attached to one end of the thread, and a pan for counterpoising weights to the other, and means are provided for accurately measuring the arc through which the wheel turns. The specification referred to contains dimensions of the plungers and other parts.

Artesian Wells, Company, of Pentonville-road, N., have constructed a well at Wembley for the London and North-Western

Railway Company to supply the proposed electricity generating station for the Watford and Euston and Broad-street line. A 15-in. bore was made to 250 ft., and the bore was then reduced to 12 in. for 250 ft. deeper. The well is steel lined to 300 ft., to which depth are also taken down a 4-in. supply pipe and a 2-in. compressed air main, for the air lift method of raising the water. A flow of more than 15,000 gallons per hour is obtained, and if the results continued to be as favourable additional borings will be proceeded with.

The Great Western Railway Company have effected considerable improvements at their Central Station, Snow Hill, Birmingham. The old single-span roof was removed,

beginning at the north end, as the new one was erected. The new roof is of the ridge and furrow type, carried upon girders of parallel-flanged open-web type, running transversely to the direction of the main line. About two-thirds of the station is covered by this roof, which has a length of 500 ft. and a superficial area of 108,000 sq. ft. The steelwork carrying the railway and platforms aggregates about 500 tons. In one of the brick arches, which has been constructed beneath the lines, is the transformer station, with two motor generators for the electric signalling system which has been installed. The estimated cost of this work is about a million pounds, and has taken over three years to execute.

A REPORT issued by the British Fire Prevention Committee gives full details relative to the testing of a concrete floor reinforced by an American type of steel meshing,

the patents claiming that such reinforcement is less liable to be affected by heat than reinforcing rods, owing to the smaller diameter of the metal sections used. The floor was exposed for three hours to fire, the temperature reaching 1,800 deg., but not exceeding 2,000 deg. Fahr., followed by the application of water for five minutes. The concrete was composed of 3 parts furnace clinker, 2 parts sand, and 1 part Portland cement, its behaviour having been such as to justify classification as affording "Full protection."

An interesting feature was the supplementary load test, of which particulars are given in an appendix to the Report. This test, conducted three weeks after the fire test, showed that the load-bearing capacity of the construction had not been seriously reduced, the floor having been loaded to the extent of 560 lb. per square foot, without causing excessive deformation.

A FURTHER letter on this subject appears in the Times Engineering Supplement from Mr. R. W. Vawdrey, of the Indented Bar and Concrete

Engineering Company, who supports the views expressed by previous correspondents relative to the unfair differentiation by the Local Government Board between reinforced concrete and other materials. The writer also enters a timely protest against the mistaken comparison instituted by a previous correspondent in the same journal of the strength of reinforced concrete and timber. To say that plain concrete possesses about half the resistance of timber such as fir is quite justified by well-known data, but reinforced concrete is quite a different material, the tensile and compressive strength of which can be raised far beyond that of fir, by increasing the proportion of steel, and which, as Mr. Vawdrey says, can be, and is, so designed as to obtain advantages which are

impossible in any other material. Lack of confidence in reinforced concrete can only result from ignorance of the satisfactory results that have attended its use, and perhaps in some measure from unfamiliarity with theoretical principles and methods of calculation such as those given years ago in the R.I.B.A. Reports, and which ought to be as readily understood as the methods employed for the calculation of structures in timber and steel.

Reinforced Concrete Screw Piles. In a "Note" published on June 9, 1911, we described and illustrated the reinforced concrete screw piles patented by Mr. G. C. Vernon-Inkpen, F.S.I.

We have now received a copy of a patent specification setting forth the details of certain improvements upon the original design of the piles. The principal points are (1) the employment of ordinary commercial sections of steel for the purpose of reinforcement; (2) the provision of additional coils placed in the shaft, in the same direction as the screw threads and in conjunction with the spiral reinforcement; (3) the provision of tangential arms in a reverse direction, and in addition to those following the descending screw, so as to enable the piles to be screwed out of the soil without risk of fracture; and (4) the provision of radial and tangential arms passing wholly or partially through the concrete of the shaft.

DESIGNS have been prepared by two German engineers for the erection at Düsseldorf of a steel tower 1,640 ft. high, 656 ft. higher than the Eiffel Tower.

The principle adopted is one embodying girders without diagonal bracing, introduced years ago by Professor Viereck, of the University of Louvain. It is claimed that the use of these girders gives a lighter appearance and better architectural effect than the ordinary diagonal system. The base will be 640 ft. square, and the sides of the tower will slope slightly inwards for the first 312 ft. of its height, and above that level up to the height of 1,476 ft. the structure will assume the form of a graceful spire. It will widen out into a platform 32 ft. square, on which it is proposed to establish a restaurant, and to which access will be obtained by means of two lifts, while two spiral staircases will lead to the summit. Apart from its structural interest the tower should be useful as a meteorological observatory and a wireless telegraphic station.

A NEW storage reservoir now under construction at Wilpshire, at Blackburn, shire, in connexion with the waterworks system of Blackburn,

will be supplied direct from the reservoirs at Whitewell, and is intended to augment existing supplies in the districts of Little Harwood, Bastwell, Wilpshire, and Langthorpe at present drawing water direct from the mains. The site of the new reservoir includes some 58 acres, of which 38 acres will form the water surface area of the reservoir. The capacity of the reservoir will be 140 million gallons and its maximum depth 53 ft. At the Blackburn end of the site it is necessary to construct a dam 2,000 ft. long, and at the opposite end the roadway will be raised 20 ft. The work of excavation involves the removal of 23 cubic yds. of earth. It is estimated that the construction of the reservoir will occupy two and a half years, and that its completion will have the effect of postponing for some years the necessity of extending the water works in the Whitewell district. The contractors are Messrs. R. M'Alpine & Sons, of Glasgow and London, and the cost of the works is stated at 65,000l.

CONSIDERABLE trouble has been given at Rochdale by Subsidence of a Waterworks Waterworks, whence the town of Buckle is mainly supplied with water.

Three years ago a dam was constructed, about 2 miles from the town, comprising an earthen embankment, with a puddle core 60 ft. high, holding up about 47 ft. of water. A valve tower is connected with the middle of the embankment by a steel bridge, and, owing to the undermining of the embankment by water, the concrete foundations of the bridge have subsided, throwing the superstructure seriously out of position. As a temporary expedient the water level has been lowered so as to reduce the pressure, and expert advice is being taken with regard to the measures necessary for effecting a permanent cure of the defect that has developed.

THE BUILDING TRADE.

E DURABILITY OF WIRE ROPES.

THE durability of wire ropes for use in cranes, lifts, and hoisting apparatus generally is of much importance to engineering contractors and other classes of our country.

The life of a wire rope depends to a considerable extent upon the quality of the material and the size of the wire itself.

As a general rule, the wire used in the manufacture of lifting ropes is of crucible steel, with the tensile strength of from 150 to 175 tons per square inch. If the rope is of very hard steel, it is desirable to have a large factor of safety, and the interests of durability that the winding should be of proportionately larger diameter.

Another point of importance is the ratio of the wire diameter to the diameter of the pulley. If the wires are too large they suffer from strain in passing over pulleys, and if too small they are quickly worn away by the action of the pulleys and against each other in the body of the rope.

In discussing this question in a paper read before the Institution of Mechanical Engineers, Daniel Adamson points out that abrasion is the principal factor in limiting the life of wire ropes, and discusses its effects upon ropes of different diameters.

When a rope so constituted is passing over a pulley, the pressure at each point of contact between it and the pulley, and between the individual wires, may be assumed to be equal to the pressure occurring in a rope of the same diameter, but made of wires of double the diameter. The damage done by the smaller wires by contact, even under the same pressure, will probably be half that of a rope of double the size in a rope of the same diameter, and will result in the life of the rope being doubled. The life of the rope, making the effect of abrasion proportionately greater.

When the diameter of the pulley is increased, the pressure at the points of contact between the rope and the pulley will be proportionately increased, so that it may reasonably be expected that with a pulley diameter proportional to the wire diameter the life of the rope with fine wires will be one-quarter that of a rope with coarser wires, and working over a pulley of correspondingly larger diameter.

Manufacturers of wire ropes usually publish recommendations as to the minimum sizes of ropes for adoption, but give no information as to the effect of using pulleys of different diameters—a point on which precise information would be particularly valuable. The experience of users is extremely valuable, owing to the different conditions under which wire ropes are employed. The most reliable data of the kind have been given by Mr. Andrew S. Biggart, M.Inst.C.E., in a paper read to the Institution of Civil Engineers, and obtained as the result of tests made with the object of determining the best type of rope for use in the construction of the Forth Railway Bridge.

The apparatus used by Mr. Biggart consisted of two pulleys round which the rope was passed under tension, and the tests were made by passing the ropes to and fro until they were broken.

From the results obtained with various sizes of rope working under different conditions, the general conclusion may be drawn that by increasing the diameter of the pulleys to an extent equal to two circumferences of the rope the life of the latter can be doubled. It should be borne in mind, however, that, in proportion to the ratio of pulley and rope diameter, the user must also take into account the arrangement of the rope and pulleys, and the allowance for the relatively heavy wear on the ropes, by complicated arrangements, with several of them, by increasing the diameter of the pulleys.

Biggart's experiments also show the beneficial effect of oiling wire ropes, this benefit increasing the life of a given kind of rope by two or three times, by reducing the

cutting action of the wires upon each other. The experiments indicate further that ropes which are subjected to reverse stresses may be expected to last only half as long as similar ropes worked under conditions which involve bending stress in one direction only.

Those of our readers who desire to study the subject fully may be referred to the text of Mr. Biggart's paper, and also to the recent paper by Mr. Adamson, where a series of useful deductions from the experiments will be found.

STRIKES AND LOCK-OUTS.

THE twenty-fourth Report of the Board of Trade Labour Department on Strikes and Lock-outs in the year 1911 has recently been issued. The number of workpeople affected (961,930) was the highest recorded during the period 1893-1911; and the loss in working days (10,319,591) has only been exceeded in four previous years—1893, 1897, 1893, and 1903. In connexion with the above figures we may quote those published for the first ten months of the current year in the *Board of Trade Labour Gazette*, as they show an unfortunate record, 1,386,978 workpeople having been involved in disputes, at a loss of 39,816,200 working days.

The principal strikes and lock-outs of 1911 were those amongst seamen, transport workers, and dock labourers, and the cotton-weaving industry. Questions of trade involved 46 per cent. of the workpeople thrown out of work, but trade union questions 39 per cent. The aggregate number of working days available for the whole industrial population, exclusive of agricultural labourers, is estimated as 3,100,000,000, so the loss of time spread over the whole industrial population is computed as about one day per person. So stated the loss does not seem very considerable, but we prefer to represent the loss to the wage-earning classes in money, and if the moderate figure of half-a-crown is taken as representing the average value of a day's work the loss of 10,319,591 working days totals a sum of about 1,280,949. The disruption of work, as we recently showed in our article on changes in rates of wages, moreover tends to lower wages over the whole country, whilst some trade is lost never to return. Employers and employees cannot too carefully consider these facts with a view to seeing whether less costly methods of settling disputes cannot be resorted to.

Disputes affecting about one-third of the total number of workpeople involved were settled by conciliation, arbitration playing a very subsidiary part, affecting only 7,485 workpeople.

This Report dealing with strikes and lock-outs, of course, furnishes no account of the number of disputes settled by conciliation and other methods without a stoppage of work.

It may be noted that sympathetic disputes directly and indirectly involved 6,773 workpeople at a loss of 72,025 working days.

In the building trade only 2,789 workpeople were directly or indirectly involved in disputes and the loss in working days was 74,962. These figures coincide very closely with those for 1908. In 1910 very few workpeople were involved in disputes (only 880), but the loss of working days was 35,475. In 1909 1,692 workpeople were affected, but the loss in working-days was even less, being but 19,060. In 1911 the disputes involving 49 per cent. of the workpeople in the building trade ended favourably to the workpeople, disputes involving 5.9 per cent. in favour of the employers, whilst those involving 45.1 per cent. were compromised. In this trade conciliation and arbitration settled the disputes affecting 1,822 employees.

POLICE ORPHANAGE, REDHILL.

It has been decided to erect an addition to the Provincial Police Orphanage, Redhill, Surrey. The new building will provide dormitories for forty-eight girls, with extensive bath and lavatory accommodation on each floor; eleven rooms for staff, new boiler-house, stores, etc. The cost of the works is 4,000*l.*, and the architect, Mr. J. Augustus Souttar, of Bishops gate, E.C.

LABOUR IN THE COLONIES.

FROM the monthly statement drawn up by the Emigrants' Information Office, 34, Broad way, Westminster, S.W., we take the following:

In Canada there has been plenty of work lately for railway navvies and mechanics, but the demand for more hands has now ceased for this year. In Sydney, New South Wales, and suburbs the building and furniture trades have been fairly well employed, and competent men in these trades (except stonemasons) and strong railway labourers can get work. In Victoria there is a limited demand for bricklayers, carpenters, plasterers, cabinet-makers, and capable navvies; but no demand in the engineering trades. In South Australia the building trades continue to be very active. There is a fair demand for competent joiners and bench hands. Plasterers are in very strong demand, and good men can command up to 15*s.* per day. Bricklayers, brickmakers, galvanised ironworkers, plumbers, and masons (wallers) are in fair request. Stone-cutters quiet. The demand for painters has improved. In Queensland there is a good demand for strong men for railway construction work. The demand for mechanics and miners is fairly well met locally. In Western Australia there is not much demand for more mechanics, but in Tasmania there is a scarcity of general labourers for the construction of tramways in new districts, and for other public works. Very few competent mechanics are out of work in New Zealand, but there does not appear to be any special demand for more men. Employment in the building trades at Johannesburg continues brisk, and bricklayers and stonemasons are well employed; carpenters are always plentiful, and many plasterers and men in the engineering trades are idle. At Pretoria there is no demand for more men. Employment in the building trades at Cape Town there is a continued demand for competent plumbers and plasterers. At Durban skilled plumbers and plasterers are scarce, but bricklayers are plentiful. A report has been received to the effect that the labour market in the United States of America is overstocked; that unemployment, especially among unskilled labourers, is very prevalent; and that competition for a vacant berth is as keen in New York as in London. British emigrants would be ill-advised to go to New York in search of employment, especially in view of the high cost of living and the heavy general expenses.

BELFAST BUILDERS' ASSOCIATION.

AT the monthly meeting of the Council of the County Borough of Belfast, held in the City Hall on the 2nd inst., the Town Clerk (Mr. Robert Meyer) said he had received the following resolution from the Belfast Builders' Association:—"The Belfast Builders' Association, having had brought under their notice the greatly increasing practice of the Works and Surveyor's Departments of the Corporation carrying out work of considerable magnitude by direct labour, desire to protest against the practice, as not only extravagant in cost, but also as an interference with the legitimate business of the members of this Association, and hereby appoint a deputation to place their views before the Corporation at their next monthly meeting." It was decided to receive the deputation, which consisted of the following members of the Builders' Association: Messrs. R. B. Henry, J.P. (President); W. H. McLaughlin, J.P. (Vice-President); Henry Martin, J. M'Ilroy, J. O. Campbell, S. B. Thompson, W. J. Stewart, John Smith, C. Murdoch, James Lees, and J. Alfred McAuley (Secretary).

Mr. R. B. Henry said the resolution passed by the Builders' Association was one of protest against the practice of the Works and Surveyor's and Tramway Departments of the Corporation carrying out work of considerable magnitude by direct labour. They held that this mode of carrying out work was not fair or reasonable to a body of contractors such as they were. They were not only contractors, but were also amongst the largest ratepayers in the city. They did not make this protest with entirely selfish motives, but they also made it as ratepayers and on behalf of the ratepayers, and they considered that the work that the Corporation had hitherto carried out by direct labour had been done in an extravagant manner, and had cost much more than

if they had let it out to tender. They also considered that municipal trading—or, if they liked to so call it, direct labour—interfered with their large business, and members of the Builders' Association felt that the City Council, representing the ratepayers' welfare, should pause before continuing the practice into which they had been gradually getting. They, as contractors, had been keeping in close touch with the work which the Corporation had been doing, and they regretted to say that the manner in which the various works had been carried out had cost 30 per cent. more than if they had let it out to contract. Was it likely that the members of the Corporation, in their individual capacities, would go on with work without first knowing the cost of it? Undoubtedly they would not. Under the system of direct labour or municipal trading they instructed the City Surveyor, Tramway Manager, or Works Superintendent to put in hand work of a large magnitude, and the cost was not known until the work was finished. They should bear in mind that a contractor who faithfully wished to carry out his contracts with credit to himself and his clients must give his personal supervision at all times; now, was it possible that the City Surveyor, Tramway Manager, and the Works Superintendent, if they attended to their proper duties, could in any sense of the word divide a certain amount of their time to carry out large works.

Mr. W. H. McLaughlin, who also spoke, said the members of the Builders' Association honestly believed that the system of which they complained was costing more than the plan they advocated. There was a great deal of work which must perhaps be done by direct labour, and the deputation did not object to its being so done; but when large works—like the building of the City Hall, for instance—could be done by contractors at competitive prices, sometimes at a figure below the actual cost, why should the Corporation use direct labour?

The Lord Mayor said they were glad to see the deputation, and he was sure their views would be fully considered by the Corporation.

The deputation then withdrew.

MASTER BUILDERS' ASSOCIATION, WESTON-SUPER-MARE.

The annual banquet of the Master Builders' Association, held at the Bungalow Hotel recently, under the Presidency of Mr. H. C. Sheep, was largely attended. To the toast of the "Naval and Military Forces of the Empire," proposed by Mr. G. W. H. Pearce, responses were made by Colonel Sidney Keen and Mr. J. S. Walker, while "The Urban District Council," honoured on the initiative of Mr. H. Butt, was acknowledged by Councillor H. Ward, Councillor J. J. Bond, Mr. S. C. Smith (Town Clerk), and Mr. H. A. Brown, C.E. (Surveyor). Dr. Duncan Grey proposed "The Association and Honorary Members," and replies were forthcoming from the President, Mr. C. Penny, Mr. C. Addicott, and Mr. E. Stradling.

GENERAL BUILDING NEWS.

POLICE BUILDINGS, INVERNESS.

The enlarged buildings for the Inverness police have now been completed. The buildings have been entirely reconstructed, the interior is on modern lines, and the old frontage has been retained. The new work has been executed from the plans of Mr. R. I. Macbeth, architect, at an estimated cost of 4,000l. The contractors were:—Mason, Mr. Alexander Campbell; carpenters, Messrs. Alexander Anderson & Son; slater, Mr. A. C. Fraser; plasterer, Mr. William Johnstone; plumber, Mr. A. J. Russell; painter, Mr. D. Macdonald; bricklayer, Mr. James Macdonald; street foundry Company, Ltd.; heating, Messrs. Mackenzie & Moncur, Edinburgh.

NEW DOCK, NORTH SHIELDS.

Messrs. Smith's Dock Company, Ltd., have had a new dock erected for them at North Shields under the direction of Messrs. Moncrieff & Co., of Newcastle. The dock is 525 ft. long, and the entrance is 71 ft. wide. The contractors for the work were Sir John Aird & Co., and resident engineer was Mr. Goldson.

THE FLEETWAY HOUSE, E.C.

These new premises for the Amalgamated Press Ltd. were recently inaugurated by Lord Northcliffe. The Fleetway House is situated in Farringdon-road, and the area of the site is 22,000 sq. ft., the height of the building from basement to roof 90 ft. The architect was Mr. Herbert O. Ellis, of Fenchurch-street, E.C.; the quantity surveyors were Messrs. John Leaning & Sons, John-street, W.C., associated with Messrs. Robinson &

Roods, New-court, Carey-street; the consulting electrical engineer was Mr. Albion T. Snell, 6, Lawrence Pountney-hill, E.C.; the general contractors were Messrs. Allen Fairhead & Son, Enfield; and the clerk of works was Mr. J. Spooner. The following firms were concerned in the erection or equipment of the building:—Steel construction, Messrs. R. Moreland & Son, Ltd., Goswell-road, E.C.; asphalt, the Limmer Asphalt Paving Company, Ltd., Caxton House, S.W.; glazed brickwork, the Middleton Fireclay Company, Ltd., 27, Chancery-lane, W.C., and the Leeds Fireclay Company, Ltd., Norfolk-street, Strand; carving, Mr. C. H. Mabey, 150A, Vauxhall Bridge-road, S.W.; fireplaces, Messrs. George Wright, Ltd., Queen Victoria-street, S.W.; fireproof partitions, Messrs. F. Jones & Co., Ltd., Parren-street, Ryland-road, N.W.; fire appliances, Messrs. Mather & Platt, Ltd., Queen Anne's-chambers, Westminster, S.W.; fire alarms, the Associated Fire Alarms, Ltd., Jevon House, Rodcross-street, E.C.; flooring, the Durato Asbestos Flooring Company, Ltd., 25A, Soho-square, W.C., and for the rubber paving the New York Belting and Packing Company, Ltd., Southampton-row, W.C.; glass, the British Luxfer Prism Syndicate, Ltd., Hill-street, Finsbury, E.C.; granite and marble, Messrs. Penning & Co., Ltd., Palace Wharf, Rainville-road, Hammersmith, W.; heating, Messrs. Richard Crittall & Co., Ltd., Wardour-street, W.; lifts, the Otis Elevator Company, Ltd., Queen Victoria-street, S.W., and Messrs. Smith, Major, & Stevens, Ltd., Queen's-road, Battersea, S.W.; lighting, Messrs. Rashleigh Phipps & Co., Oxford-street, W. (the indirect light fittings are the registered design of the Adnil Electric Company, Ltd., Adnil Building, Artillery-lane, E.C.); ornamental plastering, Messrs. J. M. Bookbinder & Sons, Ltd., Crown-place, Kenish Town, N.W.; sanitary work, Messrs. George Jennings, Ltd., Lambeth Palace-road, S.E.; sanitary fittings, Messrs. Shanks & Co., Ltd., New Bond-street, W.; Portland stone, Mr. F. J. Barnes, Nine Elms-lane, S.E.; tiles and terrazo work, Messrs. Diespeker & Co., Ltd., Holborn-viaduct, and Messrs. Rust's Vitreous Mosaic Company; room decoration, Messrs. H. H. Martyn & Co., Cheltenham, and Messrs. Ropley, Duke-street, Manchester-square, W.; locks and fittings, Messrs. Kaye & Sons, Ltd., High Holborn, W.C.; window gearing, Messrs. W. & R. Leggett, Ltd., High Holborn, W.C.; vacuum cleaning, the British Vacuum Cleaning Company, Ltd., Parsons Green-lane, S.W.; artesian well, Messrs. Le Grand & Sutcliffe, Bunhill row, E.C.; electric clocks, the Synchronome Company, Chancery-lane, E.C.; lightning conductors, Messrs. J. W. Gray & Co., Philip-lane, E.C.; flagslating, Messrs. Piggott Brothers & Co., Ltd., Bishopsgate, E.C. The exterior bracket clock-case, with some interior metal-work for lift enclosures, etc., was supplied by Messrs. W. T. Allen & Co., 132, Queen Victoria-street, E.C.

TRADE NEWS.

Mr. William Ghasler (of Pall Mall East) announces the sale of the freehold estate known as "Priory Lodge," Barnes, which covers an area of upwards of 120,000 ft. with frontage to the main road, immediately opposite the old Parish Church of St. Mary, Barnes. Under the direction of Messrs. George Kay & Co., architects, Douglas, the "Boyle" system of ventilation (natural), embracing Boyle's latest patent "air-pump" ventilators and air inlets, has been applied to Finch-hill Church, Douglas, Isle of Man.

APPLICATIONS UNDER LONDON BUILDING ACTS, 1894 to 1909.

At Tuesday's meeting of the London County Council the following applications under the London Building Acts were dealt with. Names of the applicants are given in parentheses:—

Lines of Frontage and Projections.

Clapham.—Erection of a building at 145, High-street, Clapham, abutting also on Wirttemberg-street (Mr. J. S. Beard for S. H. Beard).—Consent.

Dulwich.—Erection of a one-story building at the Grove Hotel, on the northern side of Dulwich Common-road, Dulwich (Messrs. W. Son & Ellwood for the Norman Engineering Company).—Consent.

Finsbury, East.—Illuminated advertisement case at the Old-street station of the City & South London Railway, next to City-road (T. C. Jenkin).—Consent.

Hamstead.—Retention of an iron land and step-ladder at the New Kilburn Emporium on the south-western side of Kilburn-empire (Mr. C. Gulliver).—Consent.

Hamstead.—Addition to a conservatory on the eastern side of Fitzjohn's-avenue (Mr. S. C. Lathbridge).—Refused.

Marylebone, East.—Erection of an iron glass shelter at the premises of Messrs. Waring & Gillow, Ltd., Castle street, East, Marylebone (Mr. R. F. Atkinson for Messrs. Waring & Gillow, Ltd.).—Refused.

St. Pancras, South.—Erection of a projecting crane at the premises of Messrs. Volpert, Bidborough-street, St. Pancras (H. B. Hale).—Consent.

Westminster.—Retention of an illuminating sign at Caxton House, Tophill-street, Westminster (Cabins, Ltd.).—Consent.

Westminster.—Erection of eight windows and a projecting cornice at a proposed building to abut upon Millbank (Dean Stanley-street, Westminster (Messrs. Gordon & Gunton for the British American Tobacco Company, Ltd.).—Consent.

Width of Way.

Finsbury, East.—Retention of lavatory buildings in the yard of Messrs. Carter, Paterson & Co., Ltd., abutting upon the northern side of Pear Tree-street, Finsbury (Messrs. Oast Paterson & Co., Ltd.).—Consent.

Woolwich.—Erection of a cinematograph building to abut upon Beresford-street, Beresford-square, and Salutation-alley, Woolwich (Mr. R. M. Allen).—Consent.

Width of Way and Lines of Frontage.

Kennington, South.—Entrance steps and coal-bin at No. 4, Ouslow-mews East, So Kennington (Messrs. E. K. Wilson & Son, Ltd.).—Consent.

St. George, Hanover square.—Erection of projecting features at the Berkeley Hotel Piccadilly, next to Berkeley-street (Mr. Griggs for the Berkeley Hotel Company, Ltd.).—Consent.

Width of Way and Widening of Street.

Waltham.—Widening of Tisdall-place. Messrs. builders erection of a house on the south-eastern side of Heatt's-building, and a fence on the south-western side and a fence the north-eastern side of Elsted-street, each less than the prescribed distance from the centre of the roadway of the street; and erection of a house on the south-western side of Tisdall-place with an irregular open space about such building (Mr. R. Dickinson).—Consent.

Windsor Station, Canadian Pacific Railway Company, Montreal.

An illustration is here given of the Windsor Station, of the Canadian Pacific Railway Company, Montreal, the tunnel's and subways of which have been waterproofed with Ceresit, supplied by the British Ceresit Waterproofing Company, Ltd.

Dwellings for the Working Classes.

Bedford.—Blocks of dwelling houses upon the eastern side of Brookmill-road, for (Mr. E. Cannell).—Consent.

Uniting of Buildings.

London.—Uniting of Nos. 117 and 119, Fern-road, Brixton (Mr. E. Hastie).—Consent.

London.—Uniting of Nos. 15, 16, 18, Moorgate-street, City, with No. 20, Moorgate-street, and the "White House," siting upon Telegraph-street (Mr. L. U. E.).—Consent.

London.—Opening in the party wall between the ground-floor level between Nos. 27 and Falcon-square, City (Mr. C. Gordon Smith Messrs. Watts, Payne, & Co.).—Consent.

London.—Formation of openings in vision wall at No. 15, Aldersgate-street, (Mr. H. Knight).—Consent.

London.—Uniting of No. 12, Holborn No. 1, Furnival-street with Nos. 2 and 3, No. 1, Furnival-street, by means of openings at first and second floor levels (Messrs. Gilbert Constans).—Consent.

London.—Floors of special construction in lieu of iron doors to an opening in the vision wall at Nos. 5 to 11, Holborn (Artisan Construction Company, Ltd.).—Consent.

London.—Uniting of No. 14, Blom-street and No. 46, New Broad-street, City, means of an opening at the ground-floor level (Mr. A. R. Conder for the W. T. Telegraph Works Company, Ltd.).—Consent.

London.—Formation of an opening exceeding the statutory size in division wall between Nos. 23 and 24, Old Bailey, City (Messrs. M. W. King & Sons).—Consent.

London, Central.—Opening and the formation of openings in the party wall between Nos. 102 and 104 and Nos. 106 and 108, Clerkenwell, Finsbury (Mr. E. F. King).—Consent.

London, Central.—Uniting of Nos. 60 and Spencer-street, Clerkenwell (Mr. R. Shaw).—Consent.

London, Central.—Formation of four openings exceeding the statutory size in division wall at proposed new workshops and offices, Finsbury-street and Jerusalem-passage, Finsbury, and the construction of steel-framed iron walls 14 in. thick (Mr. J. G. Gridley Messrs. E. Pollard & Co., Ltd.).—Consent.

London, Central.—Formation of an opening between Nos. 477 and 479, Finchley-road, Hampstead, at the ground-floor level (Mr. S. C. C. bridge for Mr. A. F. Cherry).—Consent.

London, Central.—Opening exceeding the statutory size in division wall at the premises of Finsbury, Ltd., North-crescent, Tottenham Court-road (Messrs. Dennison, Kett, & Co.).—Consent.

London, Central.—Relocation of openings in a party wall at Nos. 235 and 236, Tottenham Court-road, Holborn (Mr. F. H. Shaan for Lloyds & Co., Ltd.).—Consent.

London, West.—Opening exceeding the statutory size in division walls at the premises Messrs. J. Tylor & Sons, Ltd., Tileyard, Islington (Mr. E. L. Hall for Messrs. J. Tylor & Sons, Ltd.).—Consent.

London, West.—Formation of an opening between Nos. 219 and 221, Wandsworth-road, Islington, at the ground-floor level (Mr. E. E. tie for Messrs. Smith & Chapple).—Consent.

London, West.—Formation of an opening in party wall between Nos. 190 and 192, Wandsworth-road, Kennington (Messrs. Green & Cracknell for Mr. F. C. Greenfield).—Consent.

London, East.—Formation of an opening in the party wall at the first-floor level between Nos. 33 and 34, Union-street, St. Marys (Mr. John Slater for Messrs. Abdulla & Co.).—Consent.

London, South.—Formation of an opening 6 ft. wide by 3 ft. 6 in. high, with double shutters, in a division wall at the first-floor level next to the staff dining-rooms at the premises of Messrs. W. Whiteley, Ltd., Whitechapel, E. London (Messrs. John Schofield, R.A. and J. J. Jones, and Milners & Company, Ltd. for Messrs. W. Whiteley, Ltd.).—Consent.

London, South.—Formation of openings exceeding the statutory size in the division walls between Nos. 407 and 409, Oxford-street, City, at the first and second floor levels (Messrs. Smith & Co. for Messrs. Naylor & Thiers (London), Ltd.).—Consent.

Whitechapel.—Formation of openings exceeding the statutory size in the division walls between Nos. 10 and 12, Whitechapel, E. London, and the provision of iron doors in lieu of iron doors to such openings (Messrs. Grant & Dolley, and Mather Platt, Ltd.).—Consent.

*The recommendations marked * are contrary to the views of the Metropolitan Borough Councils concerned.*

PROJECTED NEW BUILDINGS IN THE PROVINCES.*

Aldridge.—Domestic science centre, etc. (8000).—The Aldridge School Board.

Aldridge.—Proposed hall for St. Martin's Mission; Rev. T. A. Moxon, Vicar, Parish Church, Aldridge.

Amersham.—Additions to grammar school (2,300). Mr. W. Riley, architect, County Hall, Aylesbury.

Atherton.—Extensions to works, Bag-lane, for Mr. James C. Prestwick, bolt and nut manufacturer.

Ballyward.—Dispensary residence; Clerk, Guardians' Offices, Banbridge.

Barnsley.—Proposed institute; Vicar, St. John's Church, Barnsley.

Barrow-in-Furness.—Proposed school; Mr. A. Hawkrick, Education Offices, Barrow.

Batley.—Additions to Bottom Mill for Messrs. G. & J. Stubble, Ltd., woollen manufacturers.

Belvedere.—School (600 places). Lower-road; Mr. A. T. Flux, Education Offices, Erith.

Bishop Auckland.—Offices for Rural District Council and Guardians (3,200). Mr. S. Adams, Auckland Guardians' Offices, Bishop Auckland.

Blackburn.—Tower to St. Silas's Church (5,000). Messrs. Austin & Paley, architects, 24, Castle Park, Lancaster.

Blackpool.—Alterations to premises at corner of Wellington-road for the Blackpool Industrial Co-operative Society.

Brain-tree.—Additions at new swimming-bath (356). Mr. W. Potter, builder, Brain-tree.

Brierley Hill.—Infants' school, Moor-street (350 places); Mr. J. Hutchings, Architect, County Education Offices, Stafford.

Bromsgrove.—Proposed conversion of isolation hospital into children's home. Mr. H. D. Holloway, Clerk, Guardians' Offices, Birmingham road, Bromsgrove.

Caledon.—Dispensary residence; Clerk, Guardians' Offices, Dungannon.

Carnarvon.—Twenty-five workmen's dwellings; Mr. E. Hall, Surveyor, Town Hall, Carnarvon.

Chelmsford.—Houses, Danbury, Sandon, and Little Baddow (3,000). Mr. J. Dewhurst, Surveyor, Rural District Council Offices.

Chester.—Cookery centre; Mr. H. Johnson, builder, 30, London-road, Chester.

Claydon.—School; Mr. W. T. Watkins, Education Offices, Ipswich.

Cold Norton.—School (1,155). Mr. J. Rayner, builder, East Hanningfield, Chelmsford.

Consett.—Proposed aisle to church (1,500). Vicar, Parish Church, Consett.

Coventry.—Second part of housing scheme (10,560). and enlargement of tramway depot; Mr. J. E. Swindlehurst, Engineer, Town Hall, Coventry.

Cramlington.—Remodelling Cramlington Colliery Council School (566). Mr. J. Caruthers, builder, Tynemouth.

Deal.—Pavilion in front of Victoria Palace; Mr. T. C. Golder, Surveyor, Town Hall, Deal.

Elsecar.—Additions to Market Hotel for Mappin's Masborough Old Brewery Company, Ltd., Greatborough-road, Masborough, Rotherham.

Essex.—School, Brentwood, and additions to school, Hadeleigh; Mr. F. Whitmore, architect, Duke-street, Chelmsford.

Fishlake.—Proposed restoration of church; Vicar, St. Outhbert's Church, Fishlake.

Foot's Cray.—School (140 places) and alterations to existing school for the Managers, Foot's Cray and Chislehurst Church School.

Gloucester.—Vicarage House (1,500). Vicar, St. Luke's Church, Gloucester.

Govanhill.—School (18,000). Mr. A. Balfour, architect, 110, Mains-street, City, Glasgow.

Greenland (Halifax).—Sunday-school; Rev. G. W. Flower, Vicar, St. Thomas's Church, Greenland.

Halfwhistle.—Proposed children's home; Mr. T. Dryden, Clerk, Guardians' Offices.

Heysbam.—Houses and shops, Main-street and Barrow-lane, for the Lancaster Co-operative Society.

Hove.—Plans have been passed for the erection of five houses in Glendale-road, and for alterations to "The Brambles," Bigwood-avenue, for Mr. W. H. Overton.

Kent.—Special instruction centre, Seven-oaks, and improvements to school, Wilmington; Mr. W. H. Robinson, Architect, Kent Education Offices, Caxton House, Westminster, S.W.

Lifford (Birmingham).—Stables (3,452). Messrs. T. E. & Son, Naden-road, Schofield, Birmingham.

Liscard (Cheshire).—Proposed additions at hostel at Y.W.C.A. Institute and Holiday Home (1,500). Miss M. Pescod, Secretary, Withenfield House, Withen's-lane, Liscard.

Malton (Yorks).—Laundry at workhouse; Messrs. H. Oldfield & Son, Bridgfoot, Malton.

Middlesbrough.—Premises, corner of Albert-road, for Messrs. Freeman, Hardy, & Willis, boot and shoe manufacturers, 57, Rutland-street, Leicester.

Montrose.—Proposed improvement of Burgh Hall (3,000). Surveyor, Burgh Hall, Montrose.

Nechells (Birmingham).—Stables (1,711). Mr. J. E. Harper, builder, 76 to 80, Lombard-street, Birmingham.

Newsham.—Proposed mission buildings; Trustees, Presbyterian Church, Waterloo-road, Blyth.

Newton Abbot.—Proposed additions at workhouse, Mr. F. Horner, Clerk, Guardians' Offices, Newton Abbot.

Newtown (Mon.).—Welsh memorial offices for the Welsh National Memorial Association.

North Saxon.—School; Mr. C. Williams, County Education Offices, Newcastle.

Ongar.—About 168 houses; Mr. W. N. Jarvis, Surveyor, Rural District Council Offices, Ongar.

Pemberton.—Picturedrome near Halfway House, Ormskirk-road, for Mr. G. Wadsworth.

Pittodrie.—Pavilion (900). Secretary, Caledonian Golf Club, Aberdeen.

Prestatyn (Flint).—Workmen's dwellings; Mr. Fred Wilkinson, Surveyor, Urban District Council Offices, Prestatyn.

Rhuallt (Flintshire).—School; Mr. J. Bevan Evans, County Education Offices, Mold.

Roomfield.—Alterations to Manse for the Trustees, Roomfield Baptist Church.

Rotherham.—Proposed extensions to tram-car shed, Rawmarsh-road; also enlargement of tuberculosis dispensary; Mr. E. B. Martin, Engineer, Town Hall, Rotherham. Plans have been passed as follows:—Eight houses, Lord-street, for Mr. B. Bool; miners' aid and rescue station, St. Ann's-road, for the Rotherham and District Rescue Station Board; four houses, Church-street, Kimberworth, for Mr. W. Lodge. A plan has been lodged for eleven houses, Gerard-road, by Messrs. Ball & Waite.

Rugby.—Garages, Pennington-street, for Messrs. Samuel Robbins, Ltd., furniture and cycle manufacturers, Rugby.

Rutherford.—Additions to works for the River Bolt and Nut Company, Ltd.

Sheerness.—Enlargement of manual institution centre (677). Mr. A. W. Phillips, builder, Sheerness.

Sheffield.—The following plans have been passed:—Addition to premises, Newhall-road and Carlisle-street, for Messrs. Cammell, Laird, & Co.; power-house, Broughton-lane, for the Brightside and Carbrook Co-operative Society, Ltd.; four houses, Springvale-road, for Mr. Parkin; four houses, Vale road, for Miss Hewitt; additions, Steam Clock Inn, Newhall-road and Brightside-lane, for Messrs. Strouts' Brewery Company, Ltd.; six houses, Linburn and Osmonston roads, for Mr. H. Holland; alterations to premises, Bantock-road, for Messrs. G. A. Shipman & Co., Ltd.; alterations to premises, Bantock-road, for Messrs. J. E. & F. S. Marsden, Ltd.; additions, Hermitage Inn, London-road, and Hermitage-street, for Messrs. S. H. Ward & Co., Ltd.; four houses, Horndean-road, for Mr. J. H. Smith; six houses, Eccleshall-road, for Messrs. J. E. & A. S. Wilbraham; additions to premises, Stanforth-road, for Messrs. Cravens, Ltd.; additions to premises, Warren-street, for Messrs. W. Spencer & Co., Ltd.; additions to premises, Rockingham-lane, for the Sheffield Electrical Engineering Company, Ltd.; alterations to premises, Eyley-lane, for Messrs. Newby & Sons, Ltd.; seven houses, Eyley-avenue, for Mr. H. E. Fern; four houses, Redmires-road, Sandgate, for Mrs. Peace; additions, Old Shakespeare Inn, Gladless and Well roads, for Mr. W. H. Ward; additions to premises, Mowbray-street, for Messrs. W. Spital-hill, for Mr. W. T. Gent; cinematograph theatre, Cravens and Catley roads, for Mr. J. P. Earl.

Silverdale.—Cookery centre; Mr. E. Hollingshead, Education Offices, Wolstanston.

South Chingford.—School (4,177). Messrs. Mattock Brothers, builders, Winkfield-road, Wood Green, N.

Stafford.—Works, near Dorey-road railway bridge, for the Universal Grinding Wheel Company, Sheffield.

Sunderland.—School; Mr. H. Reed, Education Offices, Sunderland.

Todmorden.—Alterations to Cattle Market Hotel for Massey's Burnley Brewery, Ltd., Westgate, Burnley.

Torquay.—The following plans have been passed:—Seventeen houses, Hington-road, for

* See also our list of Competitions, Contracts, etc., on another page.

Mr. W. A. Perring; additions to laundry, Newton-road, for the Devon Steam Laundry; four houses, Redden Hill-road, for Mr. H. Cruse; additions to Hele Cross Laundry, for Messrs. Gridley & Lutton; picture-drome at Allacombe for Mr. R. Tucker.

Tydisley.—Turbo and boiler house, Union-street, for Messrs. C. Wright & Co., Ltd., cotton spinners, Barnfield Mill, Union-street, Tydisley.

Walsall.—Plans have been passed as follows:—Factory, Wolverhampton-street, for Messrs. J. Bailey & Co., Ltd.; warehouse, Lower Rushall-street, for Mr. William Barst; additions to premises, Stafford-street and Green-lane, for Messrs. J. Birch & Sons; warehouse, Stafford-street, for Mr. W. Oswin; electric theatre, Bridge-street, for Mr. F. H. Dore; additions to factory, Bath-street, for Messrs. H. Mossley & Sons.

Westbrook (Margate).—Bathing pavilion (5,500^l); Mr. E. A. Borg, Surveyor, Town Hall, Margate.

Willington (Durham).—Forty houses; Mr. J. H. Armory, builder, Lydia-street, Welling-ton.

Woodford.—Special instruction school (1,748^l); Mr. F. J. Coxhead, builder, Bulmer-road, Leytonstone, E.

York.—Proposed offices for Electricity and Tramway Departments; Mr. F. W. Spurr, Surveyor, Town Hall, York.

Yorkshire (West Riding).—Extensions at school, Mexborough (730^l); enlargement of school, Oulton-with-Woodlesford (1,260^l); additions to schools, Outwood (620^l), and Wrenthorpe (620^l); and temporary school, Woodlands (1,150^l); Mr. J. Stuart, architect, County Hall, Wakefield.

FOREIGN AND COLONIAL.

Building Trade in Morocco.

Mr. Consul Madden, in his joint Report for the years 1910-11 on the trade of Casablanca (Morocco), states that owing to the continued expansion of the town and environs the demand for building materials of all sorts is very much on the increase. Cement, lime, and plaster were imported in 1911 to double the value of the importations in 1910. Cement comes chiefly from France and Belgium. Belgian cement arrives in wooden casks of 180 kilos, weight, costing from 7 fr. 50 c. to 8 fr. per cask (called artificial Portland cement), c.f. Casablanca, payment at three months or 25 per cent. discount for cash. French cement is about the same price. British is better, but rather dearer, at about 8s. 3d. the cask of same weight. Lime chiefly comes from Belgium and France, and plaster from France and Spain. As the population, both native and European, is still largely increasing new suburbs of the villa class of house are appearing on all sides, mostly flat-roofed constructions on the ground floor only, but some in European style, quite altering and greatly improving the environs of the town, gradually driving out of existence the mud-brick Moorish villages that used to cluster round the town, these giving place to native settlements comprising small stone rooms. Accommodation for newcomers is very difficult to obtain, so that on all sides numbers of wooden shanties are springing up and are immediately occupied. Building is very expensive owing to the cost of materials, which are scarce by reason of the immensely increased demand, and owing to wages being very high, as a result of the cost of living, and the relative scarcity of skilled workmen. Notwithstanding the activity displayed in the building trade, all rents have gone up considerably and are always rising. In town small houses of four to five rooms (including kitchen) are let at 90 fr. to 100 fr. per month. Houses of seven to nine rooms fetch 125 fr. to 150 fr. and even 200 fr. per month. Larger houses are let at from anything between 250 fr. to 500 fr. (10^l. to 20^l.) per month. Outside the town small villas of four to five rooms, with a small garden patch and yard at back, let for 125 fr. to 150 fr. per month. The labouring class pay about 14. per month for a single room dwelling of the type above referred to. At the beginning of the season 1910-11 the main streets were taken up in turn for the purpose of installing new drains. The benefit of this has undoubtedly been felt in the far better state of health of the population this year, though during the work it was an anxious time, as the old Moorish drains had been partly useless and in shocking condition for a great number of years.

Bombay Waterworks.

The original supply of water for the city of Bombay came from Lake Vehar, and was inaugurated in 1859, the supply amounting to 7 million gallons daily, which was increased in 1865 to 10½ million gallons by means

of a second pipe line. In 1879 an additional supply of 3½ million gallons was obtained from Lake Tulsi, and in 1892 the Tansa scheme was completed, giving a further supply of 17½ million gallons daily. Owing to the increase of population and the large quantities of water used for municipal and trade purposes, the existing supplies are very inadequate, and works are now about to be undertaken for increasing them, and, at the same time, of improving the quality of the water. In the first place, Vehar Village is to be removed, so as to take away a source of pollution, the lake is to be fenced in and weeds removed, additional filter-beds are to be built at the same place, and a storage reservoir of 4,000,000 gallons capacity for the filtered water is to be constructed in Bombay. At the Tansa works, four villages are to be removed from the catchment area, and the Tansa Dam is to be raised by 7 ft., which together with an additional 48-in. main, will permit the supply of water to be brought up to double the amount hitherto available. The project now brought forward also includes the construction of two large service reservoirs, one at Ghatkopar capable of storing from seven to ten days' supply, and the other on Golangi Hill, with the capacity of 20 million gallons. The total cost of the works is estimated at 615,466^l, by Mr. H. J. Trivess Smith, the Water Engineer to the Corporation of Bombay.

TRADE CATALOGUES.

The Guildcor Hinge Company, Ltd., 28 Newman-street, Oxford-street, London, W. send us a booklet describing the Guildcor hinge. This contrivance is a jointed steel barrel, extending from the floor to the top of the door; a hinge, in fact, which, in addition to its cardinal function, effectually seals the space between the door and the frame, rendering it soundproof, draughtproof, and sightproof. In its simplest form it consists of two or three metal joints connected by a wood extended rod, the whole forming a rule joint. When a self-closing door is required, the hinge is supplied with a patent spring contained in the barrel, extending the whole length of the door. In its third and most elaborate form, it is supplied with a check action in addition to the spring; the mechanism in the case, as well as in the former, being contained in the barrel of the hinge. The Guildcor wind bolt, another speciality of this firm, is designed to obviate the necessity of employing a powerful spring, where it is required to hold swing doors in position against the wind. A door so hung requires the application of considerable force to open it; the Guildcor wind bolt enables a free and easy working spring to be used, with only sufficient tension to bring the door back to its closed position where it is automatically bolted.

Section of Hinge.

BRISTOL SOCIETY OF ARCHITECTS:

ADDRESS TO YOUNG ARCHITECTS.

At the second sessional meeting of this Society held on Monday evening, November 11, for the reconstruction and improvement of the Fine Arts Academy being in the headquarters of the Society, the meeting was held at Messrs. Fort's, No. 6, Alipromenade, Clifton, the President, Mr. J. Ostley, F.R.I.B.A., presiding, the Hon. Secretary announced the election of new members.

Graham C. Awdry, F.R.I.B.A., read a paper entitled "Some Practical Remarks to the Assistants, and Young Architects." The course of his remarks he said: "The pupil should make up his mind from very first that he has to be a thinking, sensible individual, and not a mere fragment of the machinery of an office. He must not take trouble to find out as he goes day by day and hour by hour the thing of what he sees or hears, and the reasons why certain things are done. Let him begin to put aside any feelings of pride he may have and freely ask of those who know."

As there is often but little time to spare in later life the many books that are available on the various subjects required he knows the pupil should devote all the time he can to reading them in his early days. He should advance, and especially when he is preparing for examinations, he will find the taking of notes as he reads a most useful aid to memory. He found this himself from actual experience. He will ask himself: What shall I note? All the book is valuable information. Shall I select? "Well," I said to myself when I was reading for examinations, "I have come across a lot of things I knew before, I don't think I shall forget them easily, here and there I find things I do not know; I shall only reading these once probably I shall not forget them." So I determined to make notes of the things I didn't know before. I got a book for each subject. One for history, architecture, one for materials, one for carpentry and joinery, one for sanitary engineering, and so on, and after reading a passage and understanding it, and the illustrations accompanying it, I put the substance of it shortly in my own words, underlining the most important, and sketched the illustrations in the book entirely by hand, so that the fact of doing it carefully at the detail as I drew it would impress the thing on my mind. I kept my note-books, and read them over and over again, for the entries being so condensed, didn't occupy so many pages as you might suppose; and even now I find them useful to refer to occasionally. I always carry a small sketch-book in my pocket, and make sketches of everything I see, whether old or new, that you come across. The grouping of roofs, little bits of architecture and detail, clever fittings and things; and make notes on colour and the position of colour schemes.

The Assistant.

The pupil develops into the assistant ought to endeavour to make himself an expert in the full meaning of the word, not a mere drawing machine. Those of you who are not yet practising on your own account will find when you come to that, and then to be really busy, how very much a desirable is the assistant who is capable of thinking out and putting through the office what is wanted by the chief than the assistant who is merely a drawing machine, even though very excellent one, because if long explanations have to be given to him as to how he must about the matter, . . . Then he will find that he could have made the detail for himself with his own hand and done more surely and correctly (though perhaps roughly) in the time that he has expended in having the assistant how to set about it. I know, for instance, how much of the full detail drawing of a batch of joinery must be done all over again when the thoughtless assistant has allowed nothing for the planning of the job, and has shown all the finished thickets fitted together, and every one of them $\frac{1}{4}$ in. too thick; or when the careless has omitted to refer to specification or to the notes for the scantlings and thicknesses of the work, and has simply enlarged a drawing without any regard for the size

of material, or for the value of it, as provided for by the contract.

As the assistant improves, if not from the very first, he ought also to get into the way of writing a proper business letter, one that will be concise, properly punctuated, free from ambiguities and loop-holes, free from undue committal. An architect in busy practice may not have time to write or even to dictate any but the more important letters, and a careful assistant ought to be capable of composing and writing for him, at his request, many of the less important ones, bringing them to him all together for his signature; but if they are carelessly composed, and the intention badly expressed so that the precise meaning is not clear, the hard-pressed architect will have to alter them, sometimes from beginning to end, and much of his valuable time will be wasted.

Hints on Surveying Work.

Let me advise the young surveyors to go to work in this, as in all the numerous other branches of our profession, on a definite system and in a methodical manner, not in a haphazard fashion, as so many do. If you will keep to one settled way of proceeding you will find you will rarely be hung up afterwards in plotting your plan, by finding out that you have omitted to take an important measurement, and so must either go on another long railway journey, perhaps, incurring much extra expense of time and money, or run the risk of much trouble and increased cost in the building operations hereafter. Make your sketches carefully, with care as to the proportion of length of one line to another, the area of one room proportionate to that of the preceding one, and so on, for not only can you by this means avoid the annoyance of discovering as you go further and further in rambling premises that there is no space left on your plan into which to fit the last room—the remaining pieces of the puzzle—but you will also have the correctness of your sketch to help confirm the correctness of your plan when you have drawn it to scale in the office. You will find that you have sketched the angle formed by the junction of two walls as a slightly obtuse angle, or a slightly acute angle, and that the diagonal, or tying measurements also, when plotted, produce this result; whereas if you had carelessly sketched it—as at a first glance it appeared—a right angle, you might wonder whether after all you had or had not made a mistake in your dimensions.

I do not think many assistants of young practising architects take the precaution of testing their measuring tapes, but it is of great importance to do it, especially if they are to be used for accurate surveys of town property. Many a tape that has had a good deal of use in its day will be found to have stretched 6 in. in its length of 66 ft. If you are taking a frontage of 132 ft. there will be an error of a foot, and if the tape is being sold or let by the foot of frontage at a high price the difference may amount to a large sum. For this reason it is well never to use a borrowed tape for an important survey. There is also a little mistake in calculation possible when using a tape that has by constant extension become strained beyond its proper length.

Unfortunately, I myself was once a delinquent. I wonder if any of you here have had a similar experience? Probably you are wiser than I was. It was a good many years ago. I was surveying some building land in a country town, fronting on a road and bounded at each extremity by a road at right angles to the frontage road. I had previously tested my tape, the only one available, and found it was 9 in. too long. I measured the frontage—some few hundred feet—and entered the total length as read from the tape in my book, with a note that the tape was 9 in. too long. A few days afterwards I laid down to scale the frontage for the purpose of dividing it into plots for a series of attached houses, and as the tape was 9 in. too long I deducted 9 in. from every tape length and a proportionate amount from the odd dimension. Well, some weeks later I came to peg out the plots on the actual land, to my astonishment I found, after starting at one end of the frontage and giving 25 ft. or so to every house, I had a surplus of 15 ft. of frontage at the other end of the row. Not enough for another house and yet I had to do something with it. Ultimately I let it go with the end or corner house as garden ground, thus increasing the value and rent; but what puzzled me was how came there

to be a surplus? I hunted up my papers and carefully examined my survey. I found the old tape I had used when I first measured the land and which was the only one obtainable at the time, and tested it again, finding I was quite right, and that it actually was 9 in. too long. Then I reckoned up the deduction I had made of 9 in. from every tape-length measured, and that was correct, and the total deduction I noticed was, curiously, exactly half the surplus frontage to an inch. Suddenly I saw my error. The tape was too long, so I had deducted from the readings the extra 9 in. of length. I ought to have added it on. The result of deducting it had been to double the difference in the wrong direction. . . .

I thoroughly believe, too, in every designer of a building personally writing the specification for it. It is irksome, monotonous, wearisome work, deserving of no end of fragrant puffs of tobacco and the respect of one's fellows, I am sure, but it is the proper thing to do. You who have designed the building must know better than anyone else what materials and what workmanship are necessary in order to produce the desired effect and in order that it may serve its purpose. No one else can see into your heart and brain. A little curve left out here and a little bareness or meanness in the dimensions of the timbers, there may make all the difference, and quite alter, and indeed spoil, the character of your cherished work, which you have dreamed about for months, and have, with your mind's eye, gazed upon with fond hope and anticipation ever since you first conceived the scheme.

Suppose your client to be one who will not spend a penny beyond the amount of the contract, and as your building grows you find day after day that your deputy specification writer has either omitted certain details altogether—never having thought of them as of any consequence, if indeed he had ever known you wished for them—or has so under-sized them and so meanly dealt with them that they will in no way fulfil your intentions. What can you do? You rage inwardly, but you must put up with it.

Or, again, suppose your deputy writer omits a most important item of workmanship or material, quite small in itself, but one that applies to a vast number of parts. It is an omission easily passed over unnoticed, because so small. One sentence might almost have been sufficient to describe it, and its cost to carry out once is a matter of a few shillings. It has, however, to apply to some hundreds of parts, and is, as you find when the particular things to which it belongs are about to be carried out, absolutely necessary. Your client believes he is going to have the work done properly for a sum he has agreed upon. Then in the middle of it all you spring upon him this extra of perhaps a very large sum. He naturally blames you, and yet your deputy specification writer or your quantity surveyor has caused all the trouble. Of course, sometimes you cannot help deputing work, even of this important nature, to others; but my advice is, after long experience, always write your specifications yourself if you possibly can, no matter how much you dislike the occupation, and write them in a businesslike way, in careful order as regards clauses, in proper sensible terms so expressed that by no stupidity or cunning on the part of those who have to execute the work can they be misinterpreted or made to mean anything else but what you intended them to mean, and in proper division under various trades.

Extras and Dimensions.

The young architect will find it difficult at first to deal fairly and tactfully with the somewhat intricate work of the measurement, valuation, and adjustment of extras and omissions. I would advise him to settle all the really small items—those too small to measure—with the builder on the spot, agreeing with him upon a definite sum for each separate small matter, and writing it down in his book as he goes about over the building with the contractor, on completion of the work, showing him the entry; and, if the latter happens to be of a shifty disposition, getting him to initial it. This saves a lot of time. If the contractor suggests a sum for a certain small item which, from your knowledge of what has been done, you consider less than the work is fairly worth, do not pass it over, but say you think it worth more, and increase it to the amount you feel it is worth. The builder sees by this that you are considering his interests as well as

those of the employer, and when you come to perhaps a much larger item which you feel he is over-charging, and which you have to reduce, he is much more ready to agree to the reduction. The contract may be one for many complicated alterations in a rambling country house, and both he and you become very tired of standing about. The business is a very trying one for his temper and yours, and the occasion is one calling for a great exercise of patience and tact. . . .

Whenever one is looking into these questions of extras one should, of course, carry the specification about with one and constantly refer to it. Many things for which a builder asks extra payment will be found, on looking into the document, to be quite clearly covered by the clauses contained in it, and the claim will at once fall to the ground. Wherever, while a building is in progress, there is extra work being done which will afterwards be buried out of sight, such as in foundations, for instance, however pressed for time you may be, measure it at once before you leave the work, and put it all down clearly in your book in the presence of the builder or the foreman in charge. This is a rule which should never be broken.

Visits of Inspection.

In speaking of these matters I am supposing that there is no clerk of works, and that the architect has to rely entirely upon himself. When under these circumstances he pays his periodical visits of inspection he must, of course, be more than ever careful to probe into the executed work. It is well always to select parts where the men, and perhaps the builder also, least expect you to peer into what is no longer visible on the surface. Naturally they do not like you even suggesting that you are going to do it, but, of course, you must be firm. If a man makes a great deal of fuss over my suspicions are aroused at once. . . . Sometimes I have found that the workmen desire to do the work well, but are hampered by the builder. . . .

Clients.

There are a few points with regard to dealing with clients that I think I may venture to bring before you. I have found from experience that it is always wise to consider their particular characteristics, and to try to see things from their point of view as well as from one's own. No two persons are exactly alike. Try to know each one, and don't let your judgment and your temper be upset by what is probably, after all, only their usual, though peculiar, way of looking at and speaking or writing of things. For instance, one man will write a letter that makes one burn under a sense of injustice when one receives it, and yet he probably had no intention of producing such a strong effect as that. His embroachment is of the strength he has been accustomed to use on thick-skinned builders and horny-handed workmen, and for the moment he forgets that the application of it to your sensitive skin will stir every nerve and leave a raw place.

Whenever you receive such a letter try to imagine the writer and his peculiar temperament, and think of him as perhaps just returned to his house tired with a long day's work or a long journey, bothered by several little worries which have nothing to do with his business with you, upset by his wife possibly, or by talking over and magnifying in his own mind the annoyance concerning which he is bound to write to you at once or miss the post; and then put the letter aside and think it over calmly. When you are yourself feeling quite comfortable physically, and the sting of the embroachment has passed away, take a scrap of paper and a pencil and draft a reply. Put it in your pocket, and later on draw it out and read it over again. You will still see in it, even after that, expressions that may well be softened; little words that you know will touch him up and make him feel he has been unjust to you in writing as he did, but which on second thoughts you feel you can well afford to alter. Until you have got rid of all the smart of the embroachment, believe me, you are not in a fit state to write. You cannot be. Your cool judgment is upset. You will afterwards regret it if you do. Think to yourself that he is in all probability already regretting that he wrote to you as he did. Remember also that a written sarcasm or a written bitter word, or even a written strong word, does not pass away or become softened by time as spoken words do, but it remains at hand, to be read

again and again. You cannot get it back. You cannot unwrite it. Again, we should do well to remember that unless we write what we have to write in such a way that it cannot be read by the recipient so as to mean anything but what we intend it to mean there is always the danger of that peculiarity of temperament in the recipient asserting itself, and causing the true meaning, your meaning, to develop into something quite different in his less practical and more excitable brain. And, again, if you do have a few days' satisfaction in thinking that you have made another man who has treated you most unfairly and unjustly, in a moment of irritation, ashamed of himself, you are paying a very high price for it if you lose thereby a client who might have been the source of six or twelve months' profitable work for you. Of course, occasionally you might be better off without certain men as clients, and without their work, but there are very few instances so flagrant, I think, as to make it your honourable duty to cut off your relationship with them, and even then the feeling of personal injury and insult should be carefully subordinated to the feeling of dishonour to the profession and your fellow architects as a body.

Nothing is so disappointing to a client as the discovery that he will have to pay a thousand pounds for what his young architect has told him he can probably get for seven hundred. Yet young architects, and many elderly ones, too, I fear, are constantly bringing about this disappointment. It is not always their fault, but in most cases it is. . . .

Having secured your client, and we will assume it has been done, as it ought always to be, with his eyes wide open, take care not to lose him. Be entirely open with him. Just as there ought to be no "secrets apart" between solicitor and client, so ought there to be none between architect and client. Humour him. Get him to confide in you, showing him always that you are worthy of his confidence. He will come to understand that your work is carefully done, and is fully worth what you will get for doing it. Sometimes it will happen that he is not fond of spending money, and feels justified in hoarding it because he has seen such bad use made of it. . . .

Mistakes and Errors.

And now at the end I want just to say a word on the subject of mistakes and errors. Who does not occasionally make a mistake? Who of us does not now and then forget something which should have been remembered? Well, if it so happens that we have done so, let us not try to throw the blame upon another. Let us own up at once that the fault is ours. Believe me, a client or an employer will, so far from thinking less well of you on account of the error you have made, think far more highly of you for telling him straight about the matter. He will think to himself, "This is a man I can trust. He is honest with himself and with me. He knows how it came about, he feels keenly the position, and will not forget it, and so will be unlikely to make that mistake again. Another is much more likely to make it than he is. I will continue to believe in him." Let us remember, too, that a great man has said words like these, "He who never makes a mistake rarely makes any."

In conclusion, let us do our best in small things just as carefully as in great things. The opportunities of dealing with the great things depend upon the careful treatment of the small things. And let us bear in mind always this great fact:—when this short life is over the thing that will really matter, so far as we ourselves are concerned, is not what we have succeeded in accomplishing, but what we have tried to accomplish.

The President thanked Mr. Awdry for his lecture. Mr. Mowbray Green, F.R.I.B.A. (Bath) proposed, and Mr. C. F. W. Denning, Lic.R.I.B.A., seconded, a very hearty vote of thanks. This was supported by Messrs. Maynard Froud, Lic.R.I.B.A., and J. Foster Wood, F.R.I.B.A.

SCHOOLS AT CAERPHILLY.

The new higher elementary schools at Caerphilly were opened last week by Lord Pontrypit. The buildings have been erected from the designs of the County Architect, Mr. D. Pugh Jones.

THE MUNICIPAL ENGINEER.

At a recent meeting of the Institution of Municipal Engineers Mr. F. Latham, M.Inst.C.E.I., in the course of his Presidential address, referred to the status of the municipal engineer. "The municipal engineer of to-day," he said, "is the expert of less than a quarter of a century ago. Works which would have necessitated the knowledge and experience of the specialist a quarter of a century ago are undertaken by the municipal engineer of to-day as a duty. Municipal authorities expect the best and most up-to-date advice from their engineering officers on all subjects, whether it be sewerage, water supply, sea defence, public buildings, or building and sanitary law. The experience required by the municipal engineer is extremely wide, and he has an everyday routine in which that knowledge has to be speedily directed from one subject to another by an active, level-headed mind. . . .

We have only to look back in history as far as the introduction of the turnpike system in England to realise the enormous advances in modern engineering. At that time the roads throughout England were so bad that the North, in the year 1770, rutted 4 ft. deep were measured in their surface. The Newcastle road appears to have been in even a more disreputable condition; it was stated "a more dreadful road cannot be imagined." When it is remembered that everything that was transported on land in those days had to be sent by road in the absence of railways and canals it will be realised what a state existed.

In 1763 it took a fortnight to travel from London to Edinburgh. No wonder that it has been said: "Twenty miles of slough and an unbridged river between two parishes were greater impediments to intercourse than the Atlantic Ocean now is between England and America." The men who came forward after another to make roads, bridges, canals, railroads, steamships, telegraphs were all engineers of natural ability, with love for their calling in life.

These men were the founders in modern days of that particular constructive and mechanical science of civil engineering which has advanced with such leaps and bounds as to have a universal application. By its cultivation and development such progress in wealth and civilisation and healthy conditions has been made throughout the world as without this would have been absolutely impossible.

These modern engineering instincts, however, did not spring up like Autochthonæ from nothing of like character. On the contrary, we have evidence of the cultivation of similar arts and sciences from time immemorial. That the ancients were well skilled in engineering matters is evidenced by the works of the Egyptians, the Greeks, and the Romans have likewise left sufficient evidence of their inventive abilities to prove the advance which that nation made in engineering. England was devoid of an engineer's services throughout the Dark Ages which followed the downfall of the Roman Empire, and even the great Roman roads of this country, and, in fact, throughout the whole world, were allowed to go to ruin. The world, however, was not devoid of engineering skill. At the breaking up of the Roman Empire the Roman Colleges of Artificers and Guilds of Builders and Masons became spread over Europe, and developed a mixed character of the practical and the religious. These instincts were in turn retained and imitated by the mediæval architects. Thus by the Normans and within the monasteries during those ages were retained the secrets of the science and arts of the Roman Guilds of Builders and Masons, but these were chiefly utilized in the building of religious edifices, strongholds, and castles. These were, indeed, the works of constructive architects and masons of first-class order, which fact must have preserved for us the basis of an inventive mind, to be matured and developed by science as we now see it in the profession of the engineer. It will be evident that those guilds of constructive architects who could erect such magnificent buildings as cathedrals, castles, and strongholds in this and other countries must have possessed engineering instincts.

The civil engineer of to-day, however, does not profess to be an architect, but the municipal engineer cannot afford to neglect this very

Mr. Hannen informed the defendant that Mr. Addis had been in their employ, but he was not very competent, and they waited for an opportunity of terminating the employment without hurting the employee. This opportunity came when he fell ill, and certainly there was no resignation. Time went on, and no particulars had been received from the plaintiff. Then there came the meeting at Sefton Park between plaintiff and Mr. Morle. Plaintiff took Mr. Morle to nineteen places where there were matters he objected to, and the next day Mr. Morle reported to Mr. Farquharson. They went through the lists point by point, and in two cases obvious mistakes had been made, which were at once corrected. With regard to the rest, Mr. Farquharson could only say those objections struck him as frivolous and unfounded, and as showing on the part of Mr. Addis unfamiliarity with the details of the surveyor's profession.

Mr. Farquharson, as he had withheld the certificate, found himself in a position of great difficulty, until at last he felt he could no longer withhold it, and he felt also that Lord Decies might be placed in a position which would involve much litigation. With regard to the objections made by the plaintiff, he said those other seventeen queries of plaintiff's were, in his judgment, the result either of ignorance or misconception, and if that was his honest opinion it was his duty to express it. It was also an unreasonable attack upon the builders by a gentleman who had been in their employ.

Defendant, giving evidence, said he personally inspected the work all through. The total cost came to 19,800*l.*, according to Messrs. Evill & Morle's quantities, and the balance at the end of December was 6,800*l.*

Evidence was also given by Mr. Benjamin Hannen, Mr. Morle (the quantity surveyor under the contract), and Mr. T. E. Bare, of Messrs. Bare, Leaning, & Bare, quantity surveyors. The last named expressed the view the plaintiff had raised points which were not necessary in the matter, and that he had not had the requisite experience as a quantity surveyor.

The jury found the statements in the letter defamatory, and that they were not true. They assessed damages at 50*l.* His Lordship entered judgment accordingly.

KING'S BENCH DIVISION.
(Before Mr. Justice BANKES and a Common Jury.)

Builder's Slander Action.

On Thursday, last week, an action was heard in which Mr. Alfred George Cook, builder, of Keat's-grove, Hampstead, claimed damages from the defendant, Mr. George Gradon, of Hill View, Parliament-hill, Hampstead, for slander alleged to have been uttered concerning work carried out at defendant's house. Plaintiff further claimed 90*l.* balance for work done and materials supplied. The slander was denied.

Mr. Marshall Hall, K.C., and Mr. Scarlett appeared for the plaintiff; and Mr. Ralph Bankes, K.C., and Dr. Hibbert were for the defendant.

Mr. Marshall Hall, in opening the plaintiff's case, said the house in question was a somewhat old one, and near it in the garden was a wooden shed, which was used as a billiard-room for a small-sized table.

The defendant, who was a chartered accountant in the City, apparently wanted the shed enlarged, and about September 14 or 15, 1911, he handed to the plaintiff a sketch plan showing what he desired to be done, and giving the positions of the wooden shed and also of another building, which was used as a laundry. The plaintiff went into the matter, and on September 23 sent in an estimate for building a new billiard-room for the sum of 487*l.* 7*s.* This estimate was accepted, and the work was proceeded with. The moment they began Mr. Gradon thought he would have a bigger building, and eventually a bigger one was decided upon. The plaintiff considered that the old estimate had been done away with, and the work, in fact, could not possibly be done at the old price. It was a question whether an existing boundary wall could be used, but as the local authority would not allow if the plaintiff accordingly had to build a new wall.

Running underneath the building was an old drain, which Mr. Cook pointed out would have to be tested.

In the course of operations he received a letter from Dr. McCleary, the Medical Officer of Health for Hampstead, and then saw Mr. Kershaw, the principal sanitary inspector. The defendant told plaintiff he had better test the drain, and the test was carried out with water, and defects were found. A report was made to the defendant, who said: "I cannot

help it. You must do your best for me." The existing pipes were earthenware, and Mr. Gradon agreed the best thing would be to relay the drain with iron pipes, and that the plaintiff should do the work.

In reply to a letter from the defendant the Medical Officer of Health wrote:

"I think you have been misinformed. The drains were tested and found to be leaking. . . . It may be possible to remedy the defects without relaying. If, however, it should be necessary to relay, I should recommend you to have iron pipes."

The drains, continued Counsel, were actually seen in their defective condition by Mr. Gradon himself. During the month of December the work was in progress, and no complaint appeared to be made against the plaintiff.

In course of time the billiard-room was finished, and there was no complaint about it except in regard to the price.

Several letters passed, and on January 1, 1912, the defendant wrote to the plaintiff:—

"It surely cannot surprise you that I am concerned about the heavy expense. You will also remember that Dr. McCleary said he did not require the drains to be laid anew in iron pipes, but only required the leakage found. It has all along occurred to me that by taking the drains in sections the leakage might have been located. Instead the whole has been taken up with serious loss to me."

The plaintiff sent in his account for the billiard room, and defendant, in reply, complained that the plaintiff had given a tender and then departed from it in his charges. There was no suggestion, said Mr. Marshall Hall, that any of the work was fraudulent, but only that there was an overcharge.

Defendant wrote again:—
"I returned this morning to find another part of the garden had been taken up. I hereby give you warning that as I have not authorised this work, I am not prepared to pay for it."

In the first week in February the workmen left the job, and Dr. McCleary sent a complaint that the work had been left in an unfinished condition. Mr. Gradon then wrote:—

"No one is more tired or annoyed over Mr. Cook's work than I am. I have spoken to, written to, and threatened the builder until I am tired. The only thing I could do was to call him off the job."

On February 5, said Counsel, the defendant went to see Dr. McCleary, and then uttered the words complained of in the case. In discussing the matter of the drains with him defendant said: "He (Cook) fraudulently made the job. There was no necessity for it."

Then in a letter to the plaintiff the defendant said:—

"I find what I all along suspected, that this work was not demanded by the local authority. . . . You determined to open up the whole drainage system, and relay it contrary to my instructions. I have not the slightest doubt now in my own mind that from the first you intended to manufacture this job. Before you had opened up one particle of ground you had delivered in my garden eight or ten long iron pipes, when, even if there were a leakage, one or two pipes would have been sufficient. I have every ground for doubt whether there was a leakage at all."

Counsel added that there was a balance of about 90*l.* due to Mr. Cook upon the building transactions.

Plaintiff gave evidence in support of this statement, and said the Hampstead sanitary inspector, Mr. Kershaw, told him he must get the drains tested to see if they were watertight. Witness found they were open at the collar, and he thought iron pipes were necessary on account of the nature of the soil.

Mr. Bankes, K.C. (cross examining): Did you break up every drain-pipe with a sledgehammer, so that no one could see whether they were defective or not?—Witness said the pipes were broken in the trench, as they were certain.

Did your man tell you some of the pipes were sound, and did you say they were to be broken up all the same?—Nothing of the kind.

Mr. Gradon ultimately told you not to go on with the work. Why did you go on in defiance of his orders?—It had to be finished by somebody. For one thing, I should like to complete my own work.

Isn't that making a job?—I don't think so. Dr. McCleary, who was in February Medical Officer of Health at Hampstead, spoke to the defendant on the subject, and said something to the effect that plaintiff had done work he had not been authorised to do.

Mr. Bankes: Could the leaks be filled by pouring in liquid cement?—It might have been tried.

At the conclusion of the evidence for the plaintiff Mr. Bankes submitted that on this question of slander there was no case to go to the jury. There was, he said, no sort of evidence to go upon.

The Judge said he thought he must rule. Mr. Marshall Hall asked leave to amend and substitute libel alleged to be contained in a letter from the defendant.

His Lordship, however, said he could not allow that course.

For the defence, Mr. Bankes said the plaintiff had no authority from the Borough Council, and, moreover, had none from the defendant. When he continued doing the drainage work it was in absolute defiance of defendant, who ordered him to stop. Mr. Cook's attitude was that he did go on because somebody would have to do it. The drainage system, as it had existed, had given no cause for complaint of any kind, either of leakage, smell, or danger to health. The defendant was never shown a leakage from beginning to end, and the policy adopted was to open the drains, smash them up, put in iron ones, and make Mr. Gradon pay. The latter had said they were to be put right if leaking. If on the strength of this added Counsel, the builder is able to break up the whole of the drains, we have arrived at a point beyond which it is impossible to go.

Mr. Gradon, the defendant, said he was told all along by plaintiff it was the sanitary authority which was compelling the work.

With regard to the billiard-room, witness never authorised a bigger building.

Other witnesses were also called. His Lordship, having decided there was nothing to go to the jury upon the slander issue, left a number of questions upon the rest of the case.

The jury's findings were:—

1. That the defendant gave the order to plaintiff's employee, King, to be repeated to the plaintiff, that the billiard-room was to be made larger;

2. That defendant knew the building erected was more expensive than that which plaintiff estimated;

3. That the relaying of the drains was necessary;

4. That plaintiff did represent to the defendant that the district authority had required him to relay the drains, but that defendant did not act upon that representation in allowing the plaintiff to relay the drains.

The Judge: That is judgment for the plaintiff. There is the question of the amount, and I advise the parties to settle it between themselves. Dr. Hibbert, for the defendant, asked for the costs on the slander issue.

The Judge: I won't enter judgment now, but the case can be mentioned again on Wednesday.

On Wednesday the case again came before the Judge, and it was announced that the parties had not been able to agree as to the amount.

After hearing Counsel, his Lordship said he would enter judgment for the plaintiff for 67*l.* 19*s.* 7*d.*, and costs upon the claim for work done, and on the counterclaim judgment for defendant for 15*l.* 11*s.* 3*d.*, with costs. Defendant was granted costs upon the issue of slander.

Solicitors:—Mr. E. L. Greaves, Fleet-street, for the plaintiff; Mr. J. Tucker, Bedford-row, for the defendant.

District Surveyors' Fees.

At Lambeth Police Court on the 9th inst., before Mr. Hopkins, Messrs. Spiers & Son, Ltd., builders, of Hill-road, St. John's Wood, were summoned by Mr. Bernard Dickes, District Surveyor, for the recovery of 1*l.* 19*s.* 9*d.* fees alleged to be due to him in respect of a building at New Kent-road. This was a friendly dispute brought before the Court in order to obtain a decision as to the fees payable to District Surveyors in respect of skeleton-frame buildings. Before the London County Council (General Powers) Act of 1909 all the London Building Acts were based on the assumption that the buildings would be of brick construction. In order to meet the case of steel-frame buildings the Act of 1909 was passed. Sect. 26 of that Act provides that the amount of the fee payable to District Surveyors in respect of such buildings shall be equal to two and a half times the amount of the fee specified in regard to new buildings in Part I. of the third schedule of the Act of 1894.

The contention of Mr. Passmore, on behalf of the District Surveyor, was that that fact was not in substitution of the fee specified in the Act of 1894. The

of Mr. Dicksee was put in. It included an item of £2. 6d., the fee charged under the old Act, in addition to the fee of £s. 3d. payable under the 1909 Act, and to the former item that the defendants' exception.

Dicksee, in giving evidence, said the cost of extra work entailed by steel-framings was perfectly enormous. On behalf of the defendants, Mr. Price said that the natural interpretation of the 26 of the Act of 1909 was that the fee in stated was in substitution for the fee payable by the Act of 1894. Mr. Hopkins took that view, and gave judgment for the District Surveyor for the amount of, less the £2. 6d., in dispute.—*The*

OFFICIAL REFEREE'S COURT.

(Before Mr. EDWARD POLLOCK.)

The Defence to a Contractors' Claim:

Black Brothers v. Metropolitan Water Board.
EDWARD POLLOCK, who last week decided his decision in the claim by Messrs. Black Brothers, contractors, of Plymouth, against the Metropolitan Water Board (a party of the hearing of which has appeared as *Builder*), summoned the legal advisers of the parties to the court on December 11. Mr. Pollock said he understood now that Holman Gregory, K.C. (for the Board), did to rely on Clause 20 of the agreement of defence to the claim. He thought that the pleadings now stood the Board could rely upon that clause, because it seemed that if that had been put forward by the Board the advisers of the contractors (plaintiffs) might have taken a different line. Therefore, if the Board desired to do so, the point concerning Clause 20, he thought it would be necessary to amend the pleadings. Whether the Board desired to do so was another question.

Holman Gregory, K.C. (for the defendant Board), said that if it came to a question of costs, he was not prepared to ask for amendment. His submission, however, was that if that had been put forward by the Board under Clause 24, it did not preclude (Counsel) from referring the Referee to the terms of the contract.

Official Referee said that a new agreement would have had to be made under the terms of the Board. He added that, in his opinion, the contractors could not have set that there was any fresh agreement, because there was nothing in any way which would bind the Board. Therefore the Board could not set up any fresh agreement to bind contractors.

Hudson, K.C. (for the plaintiffs): In addition to Clause 20, you have, sir, offered me to amend, and you do not propose to do so. If you look at the pleadings you will find that the Board's counterclaim is founded on Clause 34 of the agreement. Now, defendant's Counsel added, wished to raise this point of law.

Gregory said he had only introduced the matter when Mr. Hudson himself raised it.

Pollock: I shall deal with the case as it stands then.

In Counsel: We are much obliged to you.

LONDON COUNCILS.

Acton.—Plans have been passed for Messrs. Hed & Vignolles for the extensions to a factory in Cunningham-street, Acton; also for Mr. G. A. Gale for the erection of twenty-three houses in Dordrecht-road. The Surveyor has been instructed to prepare plans for the erection of a convenience at Mount at an estimated cost of 700l.

Acton.—The Surveyor has been instructed to report as to the cost of paving the footway on Johnson-avenue.

Battersea.—Electricity mains are to be extended in various parts of the district at an estimated cost of 322l. The portion of the in Sheepcot-lane, between Culverland Henley-street, is to be taken up and with 9-in. pipes at an estimated cost of 100l.

Battersea.—Plans for the Borough Engineer have been approved for making up a portion of the main road at an estimated cost of 100l. Also, a portion of Chesley-gardens and Chesley-gardens at a total estimated cost of 100l.

Battersea.—Plans have been passed for Mr. J. on for the erection of twenty-three houses in Chesham-road.

Greenwich.—The roadway of the new street connecting Wellington-street with Creek-road, and also a portion of the roadway of Wellington-street, is to be paved with random sett paving, and the footways made up, at a total estimated cost of 250l. The tender of Messrs. J. Mowlem & Co., Ltd., Grosvenor Wharf, Westminster, S.W., has been accepted at 855l. for forming and paving Vanbrugh fields as a new street. Plans have been passed for Mr. S. A. Yeo for the erection of "Earl Grey" public-house, Straightmouth, and for Mr. A. Shore, for seven houses, Highmore-road.

Hackney.—New street works are to be carried out in portions of Ashstead and Lingwood roads. The sewers in Pendar-road is to be reconstructed for a length of 400-ft., or thereabouts, with 9-in. glazed stoneware pipes, at an estimated total cost of 91l. The tender of the Strand Building Company, 200, Strand, W.C., has been accepted, at 1,151l., for the construction of an underground convenience in Kingsland-road. Other tenders were received from Messrs. W. Silk & Son, 13, High-street, Homerton, N.E., 1,611l. 10s.; Messrs. Brand, Pettitt, & Co., 247, West Green-road, Tottenham, N., 1,690l.; Messrs. Barrett & Power, St. Thomas' Works, Lyme-grove, Hackney, N.E., 1,469l.; Messrs. J. E. Whiter & Co., 89, Newington Butts, S.E., 1,371l.; Messrs. William Shurmer & Sons, Ltd., Riverside Works, Upper Clapton, E., 1,360l.; Mr. Herbert Mann, 13, High-street, Collier's Wood, Merton, S.W., 1,285l. The sixteen stanchions on which the coal bunkers at the Council's Electricity Works rest are to be stiffened and lengthened at an estimated cost of 1,400l., and the work is to be carried out by Messrs. W. J. Jenkin & Co., Ltd. The following plans have been passed:—Mr. D. S. Barclay, forty houses, Leadale-road, and twelve houses, Lingwood-road; Messrs. Moon & Ballinger, nine shops and flats, Lea Bridge-road; Mr. A. Dixon, on behalf of Messrs. Whitbread & Co., Ltd., alterations to "The Harvelock" public-house, Albion-road, London Fields; Mr. C. R. Price, additions to factory, Culford-mews, Balls Pond-road; Messrs. Goodall & Son, rebuilding 73, Kingsland High-street; Messrs. J. Garey & Sons, cinematograph hall, Brooksby-av. walk; The tender of Mr. F. J. Gorham, Point-hill, Greenwich, S.E., has been accepted, at 3,995l., for the erection of a library in Northwood-road, Clapton. Other tenders were received from: Messrs. F. & G. Foster, Camden Works, Norwood Junction, 4,121l.; Messrs. J. E. Whiter & Co., 89, Newington Butts, S.E., 4,224l.; Messrs. A. & S. Wheeler, 193, High-street, Stoke Newington, 4,273l. 12s.; Messrs. W. Lawrence & Son, 21, Finsbury circus, E.C., 4,394l.; Strand Building Company, 200, Strand, W.C., 4,454l. 10s.; Messrs. Davey & Armitage, Elmer-avenue, Southend-on-Sea, 4,485l.; Mr. F. Coxhead, Bulwer-road, Leytonstone, 4,496l.; Messrs. W. Shurmer & Sons, Riverside Works, Upper Clapton, 4,563l.; Messrs. H. & G. Taylor, Hayes-lane, Beckenham, 4,566l.; Messrs. F. Webster & Son, Grove Vale Works, East Dulwich, 4,599l.; Messrs. J. Smith & Sons, Ltd., 106, New Bond-street, W., 4,643l.; Messrs. Brand, Pettitt, & Co., 247, West Green-road, Tottenham, 4,652l.; Messrs. E. Lawrence & Sons, Ltd., 15 and 16, Wharf-road, City-road, N., 4,655l.; Messrs. C. Wall, Ltd., 4, Lloyds-avenue, E., 4,904l.; Messrs. Markham & Markham, 79, Essex-road, N., 4,953l.; Messrs. J. Waddington & Sons, Ltd., 6 and 7, Creed-lane, E.C., 5,095l. 5s.; Messrs. Allen & Co., Picnic Wharf, Westminster, S.W., 5,250l.; Mr. S. E. Moss, Southend-on-Sea, 5,577l.

Hendon.—Application is to be made to the Middlesex County Council for a contribution towards the cost of paving the footway of Cheapside, between Golder's Green-crescent and Finchley-road. The Surveyor has been directed to submit plans and estimates of the cost of carrying out improvement works in Bell-lane. The Surveyor has submitted plans and estimates amounting to 4,470l. for making up Golder's gardens, Gainsborough-gardens, Powis-gardens, Hampstead-gardens, Alyth-gardens, Forbes-gardens, and Temple gardens. The Highway Committee, before definitely deciding upon the execution of this work, have asked the Surveyor to prepare an alternative specification for making up the roads in a less expensive manner. A report is to be brought up by the Surveyor as to the making up of Armitage-road. Sanction has been received from the Local Government Board to borrow 5,798l. for private street improvements at Langney Park, Tennyson-road, Shakespeare-road, and Milton-road, Mill Hill; also 606l. for street improvements in Castle-street and Sunny Gardens-road. The tender of Messrs. J. E. Whiter & Co. has been provisionally accepted for the erection of the Central Fire Station. The contract price is 6,113l.

Hendon and Isleworth.—Electricity mains are to be extended at an estimated cost of 250l. Sanction has been received from the Local

Government Board to the borrowing of 8,258l. (1) for replacing the existing Jarrah wood-paving in High-street, Hounslow, by crescoted deal blocks, and (2) for laying "Durax" paving in the margins of the road outside the tramway tracks between Brentford Bridge and Isleworth Railway-station. Hounslow-avenue and Murray-avenue, Whitton, are to be made up at estimated costs of 1,029l. and 603l. respectively. Plans have been lodged by Messrs. J. Dorey & Co., Ltd., for additions to a factory in Brentford End, Isleworth.

Islington.—A portion of the sewer in Pembroke-street is to be demolished and replaced by one constructed of 9-in. stoneware pipes, imbedded in Portland cement concrete, and laid to an improved gradient at an estimated cost of 235l. Electricity mains are to be extended at an estimated cost of 170l.

Lambeth.—The General Purposes Committee have under consideration the question of the utilisation of ground at the rear of the Town Hall for the provision of public baths. Plans have been lodged with the London County Council by Messrs. E. W. & E. S. Caldwell for the erection of a building on the site of Nos. 124-26, Denmark-hill. Repairs are to be carried out to the wood-paved carriageway of Kennington Oval at an estimated cost of 100l.

Lewisham.—Plans and estimates have been approved for making up a portion of Perry-rise as a new street. For kerbing and channelling a further portion of this road the tender of Messrs. Fry Brothers has been accepted, at 840l.; as has also the tender of the Thames Stone Company, Ltd., for paving the footways with artificial stone at 3s. 10d. per super. yard. The offer of the Stanford's House Property Investment Company, Ltd., to kerb and pave with artificial stone a portion of the footpath on the north side of George-lane, has been accepted. Artificial stone in lieu of tarmac-paving is to be laid in Brownhill-road and Stanstead-road at a total estimated cost of 163l. The tenders of Mr. W. Pearce have been accepted for kerbing, channelling, and making up the carriageway of Arran-road, at 2,558l., and for paving the footways with artificial stone at 3s. 9d. per super. yard. The following plans have been passed:—Messrs. W. J. Scudamore & Sons, eighteen houses, Parkcroft-road, and nine in Newstead-road; Mr. J. Hughes, six houses, Braidwood-road; Mr. W. M. Proudfoot, shops, etc., Perry Vale; Mr. F. A. Walters, addition to Roman Catholic Church, Sydenham-road; Mr. J. Nicholls, six houses, Manwood-road; Mr. J. Watt, construction of 736 ft. of 12-in. pipe and concrete sewer in Bellingham-road, Catford. Mr. A. Roberts has lodged plans with the London County Council for the erection of additions to a factory in Hither Green-lane of Messrs. Newcombe's Taps-tre, Ltd.; as have also Messrs. Norfolk & Prior, for buildings at the corner of Bellingham and Thornsbeach roads.

Marblebone.—The sewer in a portion of Oxford-street is to be rebuilt at an estimated cost of 240l. The carriageway of Albert-road is to be re-coated with macadam. The cost is put at 665l. It is probable that in the near future, owing to motor bus traffic, the question of laying down a more improved system of paving will be considered. Mr. A. C. Wheeler and Messrs. Smith & Son have lodged plans with the London County Council for the erection of a building in Lodge-road, Park-road, N.W., and for additions to No. 27, Grove End-road, respectively.

Paplar.—Tredegar-road Bridge is to be reconstructed at an approximate cost of 6,000l. Plans have been passed as follows:—Mr. William Bailey, rebuilding 305, High-street; Messrs. Holman & Goodham, motor garage, Fairfield Works, Old Ford-road; Messrs. Holloway Brothers (London), Ltd., additions at St. David's Wharf, West Ferry-road; Messrs. Perry & Co. (Bow), Ltd., erection of Gilbert Bartholomew's Girls' Club, corner of Wrexham-road and Neve-street; Messrs. W. Johnson & Co., Ltd., extension to Borough Electricity Station, Violet-road.

Richmond.—Plans submitted by Messrs. Clark Brothers have been approved for constructing a new street to be known as Dickinson-avenue, Croxley Green.

Southgate.—Plans have been passed for Mr. T. Morgan for the erection of eight houses in Greenwood-gardens; as have also plans for Mr. H. C. Keene, for four houses in The Rise, Palmer's Green.

Southwark.—A plan has been lodged with the London County Council by Messrs. Bryant & Son, 200, Kennington Park-road, S.E., for sanction to the formation and laying-out of a street in continuation of Ambergate-street.

Stepney.—Mr. D. P. Hayworth has lodged plans with the London County Council for the erection of building upon the site of No. 264, Burdett-road.

Tottenham.—Tenders are to be invited for LONDON COUNCILS—continued on page 732.

List of Competitions, Contracts, etc.

For some Contracts still open, but not included in this List, see previous issues. Those with an asterisk (*) are advertised in this number: Competitions, iv.; Contracts, iv. vi. viii. x.; Public Appointments, xvii.; Auction Sales, xxi. Certain conditions beyond those given in the following information are imposed in some cases, such as: the advertisers do not bind themselves to accept the lowest or any tender; that a fair wages clause shall be observed; that no allowance will be made for tenders; and that deposits are returned on receipt of a bona-fide tender unless stated to the contrary.

The date given at the commencement of each paragraph is the latest date when the tender, or the names of those willing to submit tenders, may be sent in.

*. It must be understood that the following paragraphs are printed as news, and not as advertisements; and that while every endeavour is made to ensure accuracy, we cannot be responsible for errors that may occur.

Competitions.

DECEMBER 20. — **R.I.B.A. Competitions.**—All work for the Studentships and Prizes, 1913, must be delivered before 4 p.m. at 9, Conduit-street, W.

LONDON COUNCILS—continued from page 729.

making up a portion of South-grove and road between Avenue-road and South-grove. The passageway at the rear of Nos. 745 to 757, High-road, is to be made up and paved.

Twickenham.—Plans and estimates by the Surveyor for making up Cole Park-road, Cole road, Hill View-road, and a portion of Denton-road, have been approved. The respective estimated costs are: 5,117*l.*, 462*l.*, 821*l.*, 341*l.*, and 768*l.*, and tenders are to be invited for carrying out the work. Plans have been lodged by the London General Omnibus Company for alterations and additions to their motor garage in Cambridge-road.

West Ham.—The tender of Mr. J. T. Luton, 138, Romford-road, Stratford, has been accepted, at 69*l.*, for the erection of a new handicraft centre at Upton-lane School.

Wimbledon.—Repairs are to be carried out to the carriageways of Grosvenor-road (sets) and Haymarket (wood) at a total estimated cost of 215*l.*. About 147 ft. of new 15-in. pipe-sewer is to be constructed, 3 ft. lower than the existing sewer, in Albany Court-yard (which is to be filled up), at an approximate cost of 160*l.*. The consent of the London County Council has been obtained to the straightening of the southern side of Beak-street, between Regent-street and Warwick-street, and to the widening of such street at its junction with Regent-street. Plans have been lodged with the London County Council by Messrs. Thompson & Walford for additions to Albert Hall-mansions.

Willesden.—The Education Committee have been asked to prepare a scheme for the provision of shower baths at the Council schools.

Wimbledon.—Plans prepared by the Surveyor have been approved for making up Sherwood-road at an estimated cost of 144*l.*, and a portion of Lancaster-road at an approximate cost of 850*l.*. Sanctions have been received from the Local Government Board to the borrowing of the following amounts for making up the streets mentioned:—Portion of Broadway-news, 192*l.*; portion of Havana-road, 154*l.*; portion of Langholm-road, 1,450*l.*; Olive-road, 182*l.*; Strathmore-road, 406*l.* Plans have been passed for Mr. T. W. Moss for alterations at "Hillbrow," Murray-road; also for Messrs. A. Luff & Sons for the erection of a motor garage at The Drive. Mr. J. S. de Vulder has lodged plans for alterations to Nos. 45 and 46, Hartfield-road.

Woolwich.—Two hundred yards of the carriageway of Footscray-road is to be placed at the disposal of the Road Board for resurfacing with ordinary macadam. Electricity mains are to be extended in various parts of the district at an estimated cost of 318*l.*. The tender of Mr. J. W. Ellingham has been accepted, at 567*l.*, for the construction of a convenience at North Woolwich. Plans have been lodged with the London County Council by Mr. W. Pearman, 5, Leghorn-road, Plumstead, for additions in front of Nos. 124 to 130, Plumstead Common-road, as have also plans by Mr. J. O. Cook, 1, Eleanor-road, Woolwich, for the re-erection of the North Kent Brewery Tap public-house, Lakedale-road, Plumstead.

OBITUARY.

The Late J. T. Bressey.

Supplementing our remarks in our issue for November 29, p. 661, on the decease of Mr. John Thomas Bressey, we may add the following, taken from the last issue of the R.I.B.A. Journal.—Mr. Bressey "had practised in the City at Ethelburga House, Bishopsgate, for nearly fifty years (latterly in partnership with his son, Mr. C. H. Bressey, F.S.I.). During a period of forty-five years he acted as Surveyor to the Wandstead Local Board and its successor, the District Council, for which authorities he designed the Council Offices, Isolation Hospital, the sewerage system of the district, and other public works. He also held the appointment of architect to the Wandstead School Board during the whole term of that body's existence, carrying out a number of large elementary schools in Cann Hall-lane, Carey-road, Down-sell-road, Trumpington-road, Cobbold-road, etc. The churches of Holy Trinity (Wandstead Ship), St. Gabriel (Walthamstow), and the Wesleyan Chapel (Wandstead) were of his design, as well as the spire of Christ Church, Wandstead. His firm was responsible for many domestic and commercial buildings in London and its suburbs, such as the Holborn Silk Mart, depots for Messrs. Pickford & Co., factories at Bow and Poplar, and the development of several building estates. He was a Past-Master of the Coopers' Company, and took a deep interest in the growth and welfare of the Parish of Wandstead, in which nearly his whole life was spent."

PATENTS.

APPLICATIONS PUBLISHED.*

24,991 of 1911.—Thomas Edward Farrands: Derricks.

25,287 of 1911.—John Todd: Construction of chimney-pots, chimney-cowls, and ventilating terminals.

9,114 of 1912.—Oswin Hansom: Water-heating apparatus.

10,038 of 1912.—Arthur Haywood: Window fastener.

10,088 of 1912.—Joseph Southall: Fall bars for cooking ranges.

10,141 of 1912.—James McCulloch Ross: Means for completing and economising the combustion of fuel in stoves and the like.

12,153 of 1912.—Florimund Vereycken: Flushing cisterns.

15,759 of 1912.—Jens Peter Larsen: Locks.

15,789 of 1912.—Jean Ravasson-Mollien: Flushing mechanism for water cisterns.

17,497 of 1912.—Henry Donald Hope: Glazing windows and the like and devices therefor.

TO CORRESPONDENTS.

NOTE.—All communications with respect to literary and artistic matters should be addressed to "THE EDITOR" (and not to any person by name); those relating to advertisements and other exclusively business matters should be addressed to "THE PUBLISHER," and not to the Editor. All communications should be authenticated by the name and address of the sender, whether for publication or not. No notice can be taken of anonymous communications. The responsibility of signed articles, letters, and papers read at meetings rests, of course, with the authors. We cannot undertake to return rejected communications, and the Editor cannot be responsible for drawings, photographs, manuscripts, or other documents, or for models or samples, sent to or left at this office, unless he has specially asked for them. All drawings sent to or left at this office for consideration should bear the owner's name and address on either the face or back of the drawing. Delay and inconvenience may result from attention to this.

Any communication to a contributor to write an article, or to execute or lend a drawing for publication, is given subject to the approval of the article or drawing, when received, by the Editor, who retains the right to reject it if unsatisfactory. The receipt by the author of a proof of an article in type does not necessarily imply its acceptance. N.B.—Illustrations of the First Premier Design in any important architectural competition will always be accepted for publication by the Editor, whether they have been formally asked for or not.

In re the Royal Commission Enquiry into the Retention or Abolition of the Intercepting Trap.

H. P. Boulnois, Esq., M.I.C.E., in summarising the long discussion on this matter at the ROYAL SANITARY INSTITUTE, Nov. 12 and 19, 1912, EMPHATICALLY advocated "That the water-closet MUST be doubly sealed."

JENNINGS' Gold Medal "CLOSET OF THE CENTURY," with syphonic discharge, IS doubly sealed and secures absolute disconnection from the soil pipe or drain and ensures at all times CONTINUOUS FRESH AIR CIRCULATION BETWEEN THE TRAPS.

THE NEED FOR CRITICISM.

CRITICISM is the herald of art; without it there can be no great creative work; no important change can ever take place in any of the spheres of man's activities without a preparatory period of initiation and selection. The mind as naturally tests the new and strange as it accepts what is familiar and tried. There is no time more than the present when there has been a greater need for that discriminating intelligence, which is the essence of criticism, to guide and direct. We are lost in a whirlpool of conflicting theories, of bizarre and strange opinions; what appears to be the direct way of advancement has a hundred divergent ways, each leading into a cul-de-sac. No better instance of our indecision and uncertainty can be given than the debated subject of the architectural style that should be given to the buildings which are to adorn the new capital of India; opinions as to what is appropriate range from the Indian-cum-English style, the style of officialdom, to the latest style of American classic, whilst Italian

Renaissance and Competition-Palladianism are favourites.

This confusion of thought is not caused by want of interest, but rather from a lack of any real force of cultured opinion, from any criterion of taste which should serve to enlighten and guide us. The national mind, the slave of the accomplished fact, so clamorous for results, so much more concerned with immediate realisation than with the inner meaning or spiritual significance of the thought behind the act, is apt to regard criticism with suspicion if not with active dislike.

The chief function of criticism is creative as opposed to its negative or destructive side; and of constructive or creative criticism we have had very little experience.

Attacks of virulent brutality and hastily-expressed individual preferences are not criticism; they are fundamentally opposed to that calmness of judgment and equability of temperament which is the nature of the truly critical mind that ever seeks to form and mould opinion by appealing to the reason rather

than to the prejudice of man. Appreciation is the goad of art, but to be of any value such appreciation must be critical and intelligent. To see things as they really are, stripped of all that is false and non-essential, to discover the underlying motives, this is the work of the true critic.

Platitudes and superficial comparisons, false enthusiasms and sickly sentimentalism are to the vigorous intellect stupefying and deadening; they are the weeds and undergrowth which choke, and if not cleared away eventually destroy the new-sprung corn. The shibboleths of the schools, the catchwords of the studios confuse and mislead us; in place of clear thinking and right reasoning we have violent likes and dislikes, the votive offerings of blinded devotees to the fickle fashion of the hour.

All art is selection, and it is as important to know what to reject as what to retain—the one is the corollary of the other—and it is in this discovery that criticism can do yeoman service. We are as enthusiastic as we are industrious,

but the object of our enthusiasm is ever changing, and our industry serves but too often to send us another step in the wrong direction. Enthusiasm undirected, uncontrolled, without that spirit of penetrative curiosity, which is only another name for criticism, can but take us further from the truth. Enthusiasm is not devotion, neither is zeal fervour.

Art demands our lifelong service, our very heart's blood; she spurns with disdain our hot-headed impulses of the moment, our gusts of wayward and fitful passion. Humility is the artist's best guide, an eager desire to follow after perfection; the ever open mind, a faculty for critical inquiry, these qualities lead to work of permanent and lasting value.

Nothing that is well done is easily done, and to find out what is to be done and the way to do it is the eternal problem.

We are the heirs of a great tradition, a splendid inheritance. Our national architecture, both Gothic and Classic, is a stimulus and incentive, and if for a time we have been led away by false doctrines, signs are not wanting of a more chastened mood, in which we are not so ready to stand on our own sufficiency, but to seek for and discover anew those everlasting principles which underlie all that is best and most worthy of acceptance.

English architecture did not—as many would have us believe—come to an end about the year 1800, neither did the world stand still at the culmination of the Italian Renaissance. Some periods in man's history, it is true, have been more sympathetic to the encouragement and development of the arts than others, but the soul is ever progressive, and if for a time it rejects, it is only later on to renew, and with greater eagerness to pluck from the past what it needs for its furtherance and enlargement. The masters of the early XIXth century, both in this country and abroad, found in the study of classic themes that inspiration which gave distinction and direction to their work; it was a return to first principles, which explained and enriched their inherited ideas.

Neither should we limit ourselves to the study of the works of our own country; the world is an open book, the beauty of France is at our doors, the wealth of Italy is to be had for the asking, and the more recent achievements of our cousins on the other side of the Atlantic excite our wonder and admiration. The danger is that when introduced to the great works of a past or present people we lose our sense of proportion and fitness, only to be carried away on a flood of unreasoning emulation which can but find expression in a weak imitation.

We should look beyond mere differences of style and expression, to trace out cause and effect, to find out what is the common human denominator that makes their work of special interest for us, to discover for ourselves how the manners and customs of a particular race are reflected in the architecture to which they give birth. Unless we can make a thing our own it does not exist for us, it will always remain something aloof and alien, until the key of sympathy unlocks the door of under-

standing, when we enter into possession, and what was foreign has become intimate, part of ourselves, something that can never be taken from us.

We may admire the refined elegance of the buildings erected in France under Louis Seize, but this does not mean that we want French mansions under the guise of hotels in Piccadilly. The work of the Italian Renaissance is ever a fruitful source of beauty, but is a Venetian palace designed for a water front the best realisation we can give to a West-end club or a town hall?

America has of recent years produced buildings so full of beauty, so infused with the vitality of Classic art, and withal so expressive of the needs and ideals of to-day, that it is little wonder if we fall under their spell and thoughtlessly hasten to deck ourselves in borrowed plumage.

It is the superficiality of our study that is our real weakness; we do not probe deep enough; we have but half learned our lesson, and are repeating, parrot fashion, that which properly acquired would become part of our natural expression. What should be knowledge has become pedantry. Should we admire the American, we deck our competition drawings all over with innumerable Greek frets, and the orders march apace, though not always in a very orderly and regular manner. Should we seek inspiration from the French, our façades are at once doleful with tearful Ionic columns and heavily-weighted swags; we retain the French licence and lose the French charm. Should we aspire to Greek culture, Doric columns of ponderous proportion are at once in evidence, probably supporting light iron balconies!

It is this patchy and fragmentary stringing together of motives that so often makes our designs poor and commonplace. We aim to dazzle by our learning and to astonish by our originality rather than to please with our sincerity. The one great objective of education should be to awaken our sense of criticism, to accustom us to the balance of opinion, to the comparison of men and periods, to that free play of the intellect that in all our studies we may seek for latent beauty and intimate knowledge rather than for that which is evanescent and accidental. Our sketch-books should be filled with the analysis of motives and buildings rather than with the merely picturesque, and a taste for delectable tit-bits should be rigorously suppressed. We should not be content with a mere surface acquaintance. If we wish to understand the richness of Italian art we must know something of the fullness of Italian life that produced it; if we seek to obtain the refinement we admire in certain buildings of the French we must realise something of the manners and tastes of those whose delight they were; and, above all, if we hope to tread in the footsteps of the Greeks, to gain something of that culture and marvellous perfection which is shown in the least of their works, we must find their view-point, we must have something of their elemental simplicity, we must endeavour not so much to copy their work as to understand something of the spirit and

temper in which they carried it out. We cannot become Greeks merely by learning their language; we can only approach them through a knowledge of their character, their aims and ideas.

It is impossible to draw any distinction between the critical and creative faculties of the mind; criticism or appreciation must in some form or other always precede creation; it may be conscious or it may be instinctive, but conception is impossible without selection. The great masters in all the arts have always been intensely critical. Peruzzi lingered over each moulding with loving care; in none of his buildings is there a single piece of extraneous or ill-considered detail. Raphael's paintings are the result of many trials and essays, and with Leonardo da Vinci criticism was carried to such lengths that the completion of a specific work was often impossible. Again, when we consider the sculpture of the Greeks—probably of all races in all times the most critical—are we not amazed at its perfection of finish, at the careful consideration and proportion of parts? In its wonderful completeness it would seem that nothing could be added or taken away. With all Greek art the determining factor was criticism; in sculpture, in architecture, and in literature the one outstanding quality of the Greeks was their intense love of exactness and excellence.

NOTES.

Exhibition of Drawings by French Architects at the A.A. THERE is good reason to believe that the idea of exhibiting in London a selection of studies by French students of architecture in Paris will be realised next spring. To the Architectural Association must be given the credit of formulating the scheme, and we understand that the President and Vice-Presidents of the Société des Architectes Diplômés par le Gouvernement have given it their most cordial support. It is proposed to arrange the exhibition in the Galleries at Tufton-street, and the drawings sent over will be carefully selected with a view to illustrating the course at the Ecole des Beaux-Arts which leads up to the work required to obtain the diploma granted to successful students by the French Government on the termination of the course. Such an exhibition cannot fail to be most interesting, and it should make clear to all who take advantage of it how wide are the differences underlying the systems of architectural education which have grown up in the two countries. Our own building traditions are not likely to be assailed by any attempt to impart methods which are altogether foreign to us: all through the ages we have been ready to learn from the other side of the Channel, but we have never failed to impart a touch of national character into anything that we may have borrowed. We welcome such an exhibition, not only for the interest in all quarters it is sure to arouse and for the lessons it should teach, but also as an indication of the friendly spirit prevailing between the two countries. We wish every success to the project, and should like to think

it may be possible for our own authorities to return the compliment in course by sending to Paris a collection of students' works gathered from the leading schools in England.

The Danger to St. Paul's. THE threatened danger to the fabric of St. Paul's by the construction of a subway near its east end, to which we referred last week, is receiving consideration that the gravity of the situation demands. We are glad to learn that Conferences are being held between the Chairman of the Parliamentary Committee of the London County Council, the Chairman of the Highways Committee, and Canon Alexander and Mervyn Macartney as representing Dean and Chapter. In the *Times* of 16th inst. Mr. Macartney points out that all through the negotiations—which have already extended over a period of 10 years—the reports of the engineers consulted, who foretell no danger to the Cathedral by the execution of their scheme, have been accepted as more trustworthy than those of the architects whose opinion the risks incurred are formidable. That the present "surveyor" to the Cathedral has good grounds for anxiety apart from those based on his own knowledge and experience—were any needed—is afforded by evidence he has produced of what happened in 1831, when Mr. Cockerell was the Surveyor, and it was proposed to construct a sewer on the south side of the Cathedral. Such famous engineers as G. B. Sneyd and Brunel then supported the architect in opposing what would appear to be a far less dangerous undertaking than that now proposed. Scientific methods may have greatly improved in the meantime, but in dealing with a subsoil charged with water, as that beneath St. Paul's is known to be, the risk of serious disturbance cannot be eliminated, and experiments in that particular spot might lead to a national disaster.

St. James's Palace and the Peace Conference. THE State apartments of the Palace have been prepared for the purposes of the Balkan Peace Conference. Delegates. They will hold their full conferences in the Picture Gallery, in which is preserved Holbein's portrait of King Henry VIII., who built what was formerly called "The Manor House," reputedly, after Holbein's designs and under the directions of Cromwell, Earl of Essex, upon the site of the 15th-century leper hospital, dedicated to St. James. Some remains of the ancient hospital chapel, which Charles I. set up for the private chapel (now the Chapel Royal) of the Palace, were found in the course of the enlargement and alterations made by Sir Robert Smirke in 1836; Holbein, it is said, painted the ceiling (1540), and there Sir Christopher Wren married his second wife. The Picture Gallery has a Tudor fireplace bearing Queen Elizabeth's coat-of-arms. The adjoining Tapestry-room, or Old Presence Chamber, together with the Entrance-room, Guard Chamber, Queen Anne's Drawing-room, and the Banquet Hall will be used by the delegates. In the Tapestry-room is a fireplace the stone head of which is sculptured with the

initials "H." and "A." (Henry and Anne Boleyn), and with other devices; the tapestry, made for Charles II. in the Mortlake works, represents the amours of Venus and Mars. In this room the new Sovereign is received by the Privy Council, and is proclaimed and presented from the bay window to the people assembling in the Friary Court.

Downside College.

WE congratulate the *Morning Post* on its endeavour to arouse public interest in architecture by a weekly article on some one modern building, and in Mr. March Philipps they have obtained a writer who is always interesting and forcible, though we cannot always accept his conclusions. Downside College, which is the subject of his first article, is an excellent example of the work which has given Mr. Stokes a deserved reputation, and in this building Mr. Philipps sees a reversion to a national and reasonable type of architecture. We may say at once that we find the writer's thesis more interesting than his actual criticism of Mr. Stokes's work. Of the change from Gothic to Tudor architecture he says: "The sudden shifting from the exaltedly spiritual to the comfortably mundane point is one of the most striking mental revolutions recorded in history. What was wanted for the easy social and civic life in vogue at the time was spaciousness, breadth, and amplitude; not a vertical style in a word but a horizontal one." Mr. Philipps's point is that the architecture of the Tudor period was suited to the national character and wants, that it presents a medium through whose means modern life can express itself reasonably and naturally, and he says of the Renaissance: "It never took root. It never grew. Tended by professional experts, and often in their hands producing important results, it remained alien to the national sentiment; and that the consequence of that alienation has been that by degrees the experts have worked their inspiration dry, and there is now a feeling gathering head that the classic ideal is about played out." The adoption of the Renaissance here is put down to Inigo Jones. "It had genius for a champion. As surely as the Sparrow killed Cock Robin, so surely did Inigo Jones kill Gothic, and kill it with an architrave." If all this indeed be true it would be another instance of the trite saying that outsiders see most of the game, but in any case we welcome such able and picturesque criticism as Mr. Philipps's, as we feel that, though truth may not necessarily result from thought, it cannot be arrived at without it.

ROYAL ACADEMY SCHOOLS EXHIBITION OF STUDENTS' WORK.

AN exhibition of students' work is always interesting, since it is among the students of to-day that we may expect to find those who will make a name in the future. We are inclined to think that among the work in the most recent exhibition there was little trace of marked merit, but, on the other hand, much of it reached a very praiseworthy standard of excellence.

We notice, in examining the works of students of the Architectural School, that

they can be divided into two main divisions—that of students who grasp the fact that the traditions and usages of the past have fixed definite standards of classical proportion and detail, and that the first great essential for the student is to arrive at a thorough understanding of such standards, and, on the other hand, the work of those students who appear to think that design consists partly of taking liberties with those standards—an error which will vitiate the success of their later efforts. It is truly written that a man cannot add a cubit to his stature, and it is equally true that he cannot play with and alter the proportion of features of architecture with wisdom or hope of success. Originality worth the name must always mainly consist in the possession of an unusual grasp of the possibilities of combination and grouping, and not of the employment of unusual detail—a fact which is often not sufficiently understood by the student.

The Travelling Studentship (England) and 60*l.* go to Mr. Oliver Frederick Savage for his design for a Detached Town Residence for a nobleman. The subject is quietly and soberly treated in a manner somewhat reminding us of the river fronts of Greenwich Hospital. A fault in the terrace, or garden front, is that it is too much cut up by the three pilastered bays which repeat, with smaller plain intervals, between them. This front would have been a better composition had the central feature been omitted. The plan is reasonably and well laid out, and the whole of the drawings show a nice sense of proportion and detail, though the windows of the principal story are a little narrow for their height. One of the outstanding designs is No. 25, in which the author has planned his buildings on three sides of an open courtyard, the opposite or terrace front being marked with a pediment in the centre. The architectural treatment of this design is very pleasing, particularly that of the ground floor, with its rusticated Order, the attached columns of which are well disposed. The whole design shows a real grasp of the principles of proportion, and the detailing is excellent. More than any other rendering of the subject it suggests a great town house. No. 124 submits a good set of drawings, admirably detailed, but there is a lack of a domestic note about the design, whose author has spent considerable ingenuity in varying his Order, an ingenuity which might have been more profitably employed. No. 128 submits an admirable set of drawings and a clever plan, and No. 129 a quiet design characterised by the omission of pilasters and columns and wide wall spaces at the angles of the fronts. Generally, we feel that there is in most of the designs submitted a want of a sufficiently-marked domestic note.

Mr. Geoffrey P. Agnew Fildes obtains the first prize of 15*l.* and silver medal for architectural students (First Term) for a very well-planned and proportioned Memorial Church with columned porticoes. The author has evidently studied classic proportion with some effect, and, although his detail is in places a little weak, the design is an admirable and meritorious piece of work. Mr. William Henry Hanlyn obtains the second prize of 10*l.* and a bronze medal for a well-considered design for a Loggia. In No. 160 we have a praiseworthy and well-proportioned study for a Town Church. No. 157 shows a very cleverly arranged and grouped design for a Customs House, illustrated by slight but effective drawings. No. 156 is another design for a Customs House on simple, well-proportioned Georgian lines. No. 154 in his design for a vaulted Loggia submits a scheme not without merit, but characterised by a weird sense of proportion showing a want of training. In No. 155 we have a study for a Memorial Chapel to Commemorate the Indian Mutiny, which contains some good work, of a neo-Grec type; the treatment of the dome and its drum is not, however, entirely successful. No. 147 is another design for a Memorial

Chapel; the lower part of the design is extremely well-proportioned and pleasing; but the upper part is weak. The detail submitted with it, though simple in character, is very well thought out; indeed, it may be said to show more knowledge of Renaissance detail than any other drawing in the Exhibition. In No. 169 we have a design for a Loggia, the proportions of which, though somewhat too attenuated, are on the whole pleasing and characterised by great refinement.

The Town Church shown by No. 167 is quiet and pleasing; the voussours round the arched openings are unduly long, and would not look well in execution. No. 139 submits some very clever drawings illustrating his design for a West-End Club House in a late Renaissance manner. A prize of 20*l.* and silver medal goes to Mr. Charles F. Butt for an ambitious design for a Picture-Gallery which has considerable merit.

Mr. Charles F. Butt also obtains a first prize of 20*l.* and silver medal for his drawings of the west front of St. Martin's-in-the-Fields, including the tower and one return bay. They are well and sympathetically drawn. An outline perspective drawing of the east end of the same church is submitted by Mr. Walter Llewellyn Clark, and obtained a silver medal.

Mr. Augustus Gaffett Bryett obtains a prize of 5*l.* and silver medal for his design for one bay of a hall for a City Company or Guild, with colour decoration, and also the first prize and silver medal for a set of architectural drawings, and Mr. Harold Thomas B. Barnard is awarded a prize of 5*l.* and silver medal for the original composition in ornament for his treatment of the end of a stone staircase. The sketches of the travelling student which are exhibited show, as might be expected, both great facility and industry, but do not call for any special mention. The work submitted in the Architectural School is, as we have said, excellent on the whole, but none of it is of unusual distinction or merit.

In landscape painting the Creswick prize, 25*l.* and silver medal, is awarded to Miss Evelyn Muriel Young, the subject being "In an Orchard," and an extra prize of 5*l.* is awarded to Miss Una Hook. In the design for the Decoration of Part of a Public Building Mr. James Williams obtains the first prize of 30*l.* and a silver medal for his treatment of the subject "Romans Disembarking Slaves," which is admirably treated, and far in advance in composition to that of any other competitor. The second prize of 10*l.* and a bronze medal go to Gerald Leslie Broochurst. No. 15 submits a design for the same subject characterised by very pleasing colour. The Armitage first prize, 30*l.*, and silver medal are awarded to Mr. Horace Edward Quick for a design in monochrome, "Joseph's Brethren Bringing the Coat of Many Colours to Jacob," while the second prize, 10*l.*, and bronze medal go to Miss Hilda Marion Hechle. The prize, 10*l.*, and silver medal for composition in colour are awarded to Miss Florence Margaret Walden for a clever impressionist sketch of what appears to be a ball scene.

The cartoon prize (An Orator: to be treated classically) is withheld, as is also the first prize and silver medal for painting from the life, the second prize and bronze medal for which is awarded to Mr. R. J. Swan. Only the second prize for two paintings of a head from the life is awarded to Miss Florence Margaret Walden, while no one competed for the perspective drawing in outline of the Bromley Room in the Victoria and Albert Museum, open to painters and sculptors only. Mr. Horace Edward Quick and Mr. Hilary F. Cleveland Skinner obtain the first and second prizes and medals for drawings from the life, and Miss Hilda Marion Hechle the silver medal for studies of drapery. The prize and silver medal for drawing from the antique are awarded to Miss Nancy Wordsworth Arnold.

For the model of a design, the subject given being "Sisera and Jael," Mr.

Alfred Henry Wilkinson obtains the first prize for a very spirited and artistic composition full of action and strength, while the second prize and bronze medal are awarded Mr. Joseph Herman Cawthra. The first prize for a model of a bust from the life is withheld; the second goes to Mr. Alfred Henry Wilkinson, while a prize of 5*l.* and silver medal is awarded to Mr. Allen Howes for a model from the antique. The first prize and silver medal and second prize and bronze medal for a set of three figures from the life are awarded to Mr. Allen Howes and Mr. Peter Induni respectively. For painting from still life a prize and medal are awarded to Miss Sylvia E. Gamlett.

On a general survey the sculpture appears to us to be of a higher quality than the painting, but in common with the architectural exhibits there is little of outstanding merit and much which shows praiseworthy work and fair achievement.

THE RECORD OF OXFORD.*

To write a book on Oxford a man should be an archaeologist, an artist, and an alumnus of the University. Mr. Aymer Vallance is all of these things. He was educated at Oriel, is a recognised authority on antiquarian subjects, and we know him both as a designer and a writer. It is, therefore, no surprise to find that he has handled his great subject with knowledge, with discernment, and, best of all, with reverence. Indeed, if I complain a little further on of his brevity, it is with some admiration in the complaint, realising that an Oxford man who finds his pen let loose on Oxford must have greater difficulty in restraint than in expansion.

There is no question about the beauty of the volume which Mr. Aymer Vallance has written and which Mr. Batsford has published. Its beauty, in fact, has to be reckoned with as a large part of its value. No pains have been spared in the production; and the author makes a graceful acknowledgment to the publisher as both initiator and helper. The cover is designed by Mr. George Kruger, who also draws, and draws excellently, the coats-of-arms in the Heraldic Supplement. The title and decorative frontispiece are by Mr. Harold Nelson, the end-papers—a design of Oxford fritillaries—are by the author, and a group of well-known names, ancient and modern, represent the artists whose work, supplemented by the excellent photography of Mr. A. E. Walsham, makes up the graphic portion of the volume.

Oxford men have waited long to have something which they can place without shame on their shelves beside the monumental Cambridge work of Willis and Clark. Have they now got it? They have got what the prospectus quite truthfully describes as "the most beautiful, interesting, and complete book" yet issued on the Colleges of Oxford; but their new possession cannot honestly claim—perhaps it would not wish to claim—a position parallel to that of its great Cambridge predecessor. In giving the work the fullest praise for its attractive and engaging survey of England's finest group of architectural treasure it is impossible to state that it fulfils the service which its rival did for the sister University.

The title—a small matter this—is unfortunate. In the first place, it will be noted that the scope of the work is not confined to colleges, for it includes, very properly, the University Church of St. Mary and the Bodleian Library; and, secondly, the term "old" is one which should be avoided by a writer who expects his work to be of more than passing interest. Let Mr. Vallance imagine the survival of his volume for 100 years, and he will perceive at once the inefficiency of an expression the significance of which is always changing. The choice

* "The Old Colleges of Oxford: Their Architectural History Illustrated and Described." Aymer Vallance, Oriel College, M.A. (London: B. T. Batsford. 1912. Four guineas net.)

of a title is generally the result of a process of elimination. I should like to select one from those which have probably found their way to the wastepaper-basket. In any case, "old" as applied to any art is an inadequate and rather ladylike term wholly lacking in historic meaning.

A shortcoming which more seriously affects the value of this splendid work is the author's partiality. One recognises that it is the price to be paid for the warmth and interest of his text. A man can hardly write vividly without enthusiasm, and he can scarcely have enthusiasm without strong likes and dislikes. It would, therefore, seem that we must choose between a history and an essay, and, as each kind of work has its value, it is perhaps unwise to complain at getting the latter instead of the former. Still, were the choice fully offered, Oxford seems to deserve, and her lovers seem to demand, an account of her treasures which would set them down in historic catalogue rather than in selective criticism.

Mr. Vallance is hard on most modern work, very hard on all those who have altered things mediæval, and justly hard on destroyers; but we mistrust his power of fair record when we discover that he has no tolerance for that Classic period of the XVIIIth century which, with all its faults, is an intensely genuine reflex of a phase of Oxford learning, and, when all is said, is undoubtedly a living element in the beauty of the ancient place.

For example, the High-street frontage of Queen's (to which honour is done in a beautiful photograph) falls under the author's lash. With him, we deplore that the XVIIIth-century owners of the college thought fit to destroy the XVth-century chapel; and probably most of us, with our tender love for antiquity, would like to have back again the quaint huddle of buttresses, dormers, chimneys, and gables which are shown in Loggan's print. But to go beyond this and to describe the stately composition by Wren (or Hawksmoor) as robbing the college "for evermore" of its "noble aspect" is surely to under-rate a very stately and beautiful work which stands most worthily in the street which all acclaim as the finest in Europe. To Mr. Vallance the expression of Oxford's culture in the age of Anne is merely a "corrupt fashion."

Even if we agree with his taste, it is impossible to avoid criticising the justice of his method in this connexion. He is dealing, he says, with buildings, not with men; therefore he will avoid chronicling those worthies who had no share in the architecture of these colleges. Wyclif, and Johnson, Newman, Burne-Jones, and William Morris are to find no place in his book, for they had no control over the building craft of the place. This is understandable, and, if true, is reasonable. But it is strange that a chronicle of Oxford buildings and builders should contain no mention of Dean Aldrich as the designer of Peckwater Quad at Christchurch. The Dean's rather problematic share in the buildings at Trinity is recorded, but there is no hint given of his work in his own college, nor of his claim to be the designer of the contemporary erection at Corpus. Some may not like these things, but the fact that they were designed by a man who, besides holding high ecclesiastical and University office, was an excellent musician and the author of a book on logic that held sway for 100 years, is at least a very noticeable symptom of the connexion between a learned corporation and its outward architectural show.

The absence of plans is a defect in the book which a later edition will probably rectify. The plans in the Cambridge book—distinguishing ancient from modern by a tracing placed over an engraving—are supremely valuable. In the present volume plans are almost wholly absent. There are, it is true, some chapel diagrams in the introduction, and outline plans are given of Magdalen and New College; but, strange

it may seem, there are more Oxford plans Clark and Willis than are to be found in an Oxford monograph.

This is enough by way of complaint. Readers will enjoy the author's introductory chapter, which is not merely a general description of the growth of Oxford as a diversity town, but a very good account of the evolution of the college. In this he gives special attention to the development of certain features; for example, the college chapel, in connexion with which he points out as others have previously noticed, that, as the chapel was valued in mediæval collegiate life, it was not a sanctioned element in the earliest colleges, which were originally attached for purposes of worship to neighbouring churches, and only attained, after years of effort, to the dignity of having their own oratories. Mr. Vallance also gives an interesting account of the origin and use of those wide ante-chapels which are a social feature of our English collegiate churches.

From the subject of general development the introduction passes to architectural details, and gives a good, though not very exhaustive, account of certain particular features of Oxford design in various materials. The main body of the book is made up of chapters on the buildings treated college by college. These separate discourses are, it must be admitted, not very lengthy. The most extensive is on Magdalen, and this occupies more than ten pages of text, some of which are largely absorbed by inset illustrations. In fact, the whole story of twenty colleges, one Hall, and three independent buildings is disposed of in a hundred pages, ably interspersed with generous illustrations. It is obvious, therefore, that in respect the work cannot pretend to be a rival of the Cambridge record, which provides, besides its volume of plans, three to four books of some 600 pages each. It would by no means suggest that the present publication is merely a collection of illustrations strung together by a stream of prose. It is certainly much more than that; and at times the letterpress does seem almost as if it were created by the profusion of graphic and photographic matter, it certainly must be acknowledged that the author has very skilfully performed the task of compressing a large measure of history and criticism into the narrow compass left at his disposal. And, to allude once more to his precision of dislikes and regrets, I find it impossible to withhold sympathy from some of his strictures. That chapel by Gilbert Scott which appears to have been opposed by an angry Heaven into the stranglehold of Exeter, and so hurled into place as to leave a merely accidental footway between its eastern end and the adjoining buildings—what an exotic accident it is! And it been built for a college that as yet had no chapel one might even so murmur at its inappropriate character; but we must not go further and mourn with Mr. Vallance the loss of that fair Caroline building—shown so tenderly in Nash's sketch—rich, far from justifying the excuse of decay, yielded only to blasts of gunpowder. In the way, the two views of Exeter are ascribed as "from the south." Both are from the west.

Keble is to Mr. Vallance a thing abominable. In calling it "a suburban seminary" it is, one supposes, substituting the language of gentle scorn for some hotter epithets of oppression. I am halfway with him in his error; but one winter evening, when all one and brick stood grey against the glow of sunset, it seemed to me that Butterfield there flung up a bit of shape which in 10 years, when time had done the taming of its rude colour, Oxford would admire. Since at evening a seventh part of those two centuries has gone by.

It is interesting to see the use made of the Turner drawings among the illustrations. Their inclusion is perhaps one of the signs that mark the character of the work, for

their appeal is to faculties much less prosaic than our historic sense. Any of us could make a drawing which would prove a far better record of Magdalen Tower than is Turner's delightful romance on this theme. But I for one do not regret the introduction even of that wanton sketch of Balliol which the publishers of the "Oxford Almanack" rejected on the ground that it had too little regard for the facts of the subject. As to its shadows, one can only say in excuse for them that the picture is a kind of cinematograph representing progressively morning, noon, and evening. (The touches of northern sunshine one cannot so readily defend.)

One of the Turner drawings—the well-known view of Brasenose—pre-serves the memory of the lost Cain and Abel group. Mr. Vallance says it was a coarse copy. Perhaps it was. My own memory of it dates from those days of youth which do not know a coarse copy of a John of Bologna from an original. If Mr. Vallance had had room in his book for frivolities he would have told the story of the final end of that work of art. This is the oral tradition. A distinguished Continental writer, engaged upon a monograph, visited Brasenose to inspect the college's example of the work of Giovanni di Bologna. He was informed, perhaps with a little embarrassment (the college had Walter Pater among its Fellows), that the statue had been disposed of to a specialist, whose name and address (in a suburb of the city) were given. The foreigner visited the specialist and found him to be in very truth an expert in lead—in fact, a plumber. "Where," said the visitor, "is the Brasenose example of the art of John of Bologna?" "The what?" said the plumber. "The Cain and Abel," said the cognoscente. The tradesman, understanding at last, led his guest through the shop to the house, through the house to the yard, and, pointing to certain coils of pipe (some of it, the story says, was 4-in. pipe), exclaimed dramatically: "Them's your Cain and Abel!"

PAUL WATERHOUSE.

The usual fortnightly meeting of the Royal Institute of British Architects was held on Monday at No. 9, Conduit-street, W. the President, Mr. R. Blomfield, A.R.A., in the Chair. The Secretary announced that the Council had admitted the South Australian Institute of Architects to alliance with the Institute.

THE WALLS OF VISBY.

Mr. Horace Porter, M.A. Cantab., then read a paper on "The Walls of Visby," of which the following is an abstract:—

"The wonderful City of Visby is in the Island of Gotland, which is a low-lying plateau of limestone rock some 70 miles long by 35 in breadth, in the middle of the Baltic Sea. The island has been a part of the Swedish kingdom since 1645, and during the last two centuries the modern little town of Visby has come into being among the ruins of the past. Along the ramparts thirty-eight towers and bastions have survived out of the original tale of over fifty. Very striking is the impression which these towers produce as you approach the town. It is the Queen City of the Baltic that confronts you, the Visby of the XIIIth century, during which those ramparts grew up, and I shall divide their history into three

periods, coinciding more or less with the beginning, the middle, and the end of the century.

I.—First Period.

Only those Gotlanders who were established at Visby were allowed to share in its life and privileges. The rest found their goods taxed and themselves shut out from its markets, as much by its exclusive laws as by the wall with which, at the beginning of the XIIIth century, the town was enclosed. Only a wall of moderate height was built at first, varying from 15 ft. to 18 ft. The masonry was squared, uncounted rubble of local limestone, the lower part being built with very large stones. It was finished at the top with wide battlements, alternately plain and pierced with a loophole. For a short distance at the north-east corner the later work has been cleared away, so that the wall stands out in its original line.

The line of this enclosing wall seems to have been determined by the ridge of rock over which the famous "Vis" formed the southern extremity. It is built along the edge of this ridge, on the landward side, and down the slope to the sea at the north and south ends of the town. Along the sea-front it followed what seems to have been the old line of the shore for a distance which I find given as 1,950 yds. The three landward sides are estimated at 2,400 yds., making a total circuit of 4,350 yds. A considerable portion of the south and west walls has disappeared, but the rest of the line remains standing, with only a few breaches.

Three buildings, at any rate, along the ramparts seem to have been in existence before the wall was marked out. The square, solid fortress now known as the "Krut Torn," or Powder Tower, down by the sea; the so-called "Mint-House" on the slope at the north-east corner; and a remarkable building between the east and south gates, evidently deserving of a worthier title than the "Tjörhof," or tannery, by which it is now distinguished. I should conjecture that we have here one of the oldest buildings which still exist at Visby. Certainly it must have been already standing when the first wall was planned, for this buttresses against it with straight joint on either side. Also it cuts obliquely through the line of the wall, instead of projecting at right angles, as do all the other buildings along the ramparts, with the exception of the "Mynt-hus."

Certain other buildings—six in number—I take to have been erected together with that first city wall, and the first point to notice about them is that they are all ranged about the south-east end of the rock ridge, which formed the first focus of the town. There is the south gateway tower, giving on to the main road into the country, and two square towers just beyond this, where the wall turns westward: all simple structures of only a moderate height. I measured the tower next to the south gate, and found its dimensions as follows:—Projection, 15 ft. 3 in.; face, 30 ft. 6 in.; height, about 43 ft. Northward of the south gate, between it and the Tjörhof, are two more buildings which seem to have been erected together with the wall. One, the "Kejsar Hus," is a striking example of a XIIIth-century house possibly a storehouse and hall of exchange for the German merchants. A short distance beyond the Tjörhof again stands a semicircular tower which I think was also built with the wall. It is the only one built with a rounded face, and the masonry is of a bold and simple character.

II.—Second Period.

This period in the history of the ramparts I should place, roughly, at about the middle of the XIIIth century, a time of great building activity within the city. The towers which seem to have been erected together with the wall stand round about the important south-east rock plateau, and the six which, from details in their construction, I should place in the second period are ranged along the remaining section of the east wall. The two towers which give the impression of being the earliest built along this stretch occupy the two most commanding positions at angles in the wall, at either end of a slightly projecting platform of rock. The importance of these towers (Nos. 9 and 13) is further emphasised by the bastions built on to the face of No. 9, and along the north side of No. 13, apparently for the purpose of enfilading the ditch in between. They are pierced with loopholes, and are somewhat roughly built up to the height of the rectangular bases of the towers, which are the only two

thus fortified. The towers themselves are constructed on the plan adopted with the majority of those added later, as projections outside the rampart. They are open towards the town, and present, on the outside, a rectangular base up to the lower level of the battlements, or about 13 ft. above the ground. Above that level the walls are carried up as five sides of an octagon, the change in form being effected by cutting off the external angles with what I may perhaps term *broaches* sloping sharply back against the diagonal faces. Each face is pierced with narrow embrasures, one above another, and access to the different levels, on the inside, was evidently obtained by means of wooden floors and ladders, the sockets for which can still be seen.

This type of structure is repeated in thirteen of the towers still standing, with no essential differences, but with certain variations of detail which help to suggest the order of their erection. The rectangular base in the later towers is carried up above the level of the battlements to the height of the raised rampart—i.e., about 30 ft.

The growing anxiety for the safety of the town also found expression in the building of gateway towers over the east and north entrances. The latter presents some interesting features.

III. Third Period.

The work done to the ramparts during this period comprised the raising of the city wall and the addition of forty or more new towers of various types. They are all open on the inside, with the one exception of the north-west corner tower, popularly known as "Cames." The two small towers between this and the "Krut Torn" (known as the "Jungfru Torn") are also practically enclosed. They are built as battlemented buttresses against the outer face of the wall, which apparently was not raised along this seaward side. It is only about 15 ft. high here, on the inside, with wide battlements.

Two more square gateway towers were built (Nos. 12 and 1). A number of rampart towers were also added, with rectangular base and five-sided upper part. Four of these were built along the north wall and six along the east wall.

The most remarkable feature of the later work is the type of balcony tower, or bartizan, evolved in the raising of the ramparts. These "saddle" or "hanging" towers, as they are termed locally, are, so far as I know, peculiar to Visby. They were added as further defence midway between the taller towers (i.e., from 120 ft. to 140 ft. distant from these, on either side), and must originally have been about twenty in number. But only eight now remain, the rest having fallen down—in most cases bringing the wall with them—owing to their unusual method of construction. This is aptly described by their popular name of Saddle-towers, their side walls being perched across the top and astride of the raised rampart for some 6 ft. above the summit of this. They are carried about halfway down the wall on either side, and rest upon large stone corbels. Like the other towers, these "saddles" are open at the back, and the battlemented face is supported by a wide arch built against the rampart wall.

The arch on the outer face springs from corbels, but it apparently was not bonded into the rampart wall. A portion of this has been left standing in one instance, showing the corbels, and also a fair face against which the arch had rested.

The simplicity of outline forms one of the most striking features of these bartizans. Another characteristic point to note is the absence of uniformity in the height, span, and form of their supporting arches. Most of them are pointed, but they are rounded in one or two of the smaller "saddles" on the east wall. The span of these is barely 20 ft., while those on the south wall measure 25 ft. These variations give rise to some interesting questions of construction, and I believe the explanation is to be found in a feature of the original city wall which was almost entirely obliterated by the work of raising and thickening done at this third period. That work included a strong buttress of fairly rough masonry built against the inner face of the wall, round the three landward sides, and supported upon a row of low pointed arches springing from the ground. These arches form another striking and, I believe, unique—feature of the Visby ramparts, and in the references to them that I have come across in the guide-books of the place it seems taken for granted that they belong to this third

period, and that the buttress was arcaded in this unusual fashion either to economise materials or possibly to provide space for storage.

The general effect in most parts—and especially inside the north wall—certainly suggests the impression of the arches being simply a part of the buttress, but various details, taken together, point to an earlier origin. I believe that the first city wall was provided on the inside—for a great part of its length, at any rate—with a projecting ledge or platform from 2 ft. to 3 ft. in width, supported upon a line of arches built against the wall up to a convenient height for looking out between the battlements. On the slope above the Mint House just such a ledge has been exposed, and it would have been a feature of obvious utility in so large a circuit of wall with so few towers as were in the original scheme. Outside some of the oldest towers the buttress stops a few feet short, leaving a small platform open immediately above the arches, and below a doorway in the side wall, which projects, in these earlier towers, inside the rampart. Also here and there along the inner face of the south and east walls a line of flat stones can be distinctly traced immediately above the arches. It seems clear that these were in existence before the raising of the rampart, and that the ledge above them was utilised as a base for the later buttress work and for the side walls of the saddle-towers. The corbels supporting the front arches of the "saddles" are built in with the later masonry between the old battlements, and rest upon the lower level of these.

The line of inner arches was interrupted by the earliest towers, but the later ones were built against the outside of the rampart up to this height, and then carried up, with faced masonry, flush with the interior face of the wall. The towers stand open now down to the ground, but the broken masonry at their inner angles affords undoubted evidence of the arches having been originally carried across. The great height of the north wall would require a thicker buttress, and I suggest that here it may have been found needful to ease over the original arches, so as to obtain a broader base than the narrow platform would afford.

The author concluded his paper with an interesting account of Visby's Fall.

Mr. Axel Haig,

in proposing a vote of thanks to the author, said he was a native of Gotland, and could confirm everything which had been said. He knew the place from a boy, and well remembered hearing terrific noises at night and in the morning finding that portions of the wall had fallen. Mr. Porter had told them a great deal, but there were certain things he had not dealt with. He would have liked to have heard a reference to the old castle built by King Eric, of which there were still some remains. In the XVIIth century Charles XI. of Sweden wanted linc, and many of the stones of the castle were taken for that purpose. There was also once an interesting building in the middle of the west wall built by a prince, and a residence, but only the cellar walls remained.

Mr. Geoffrey Lucas,

in seconding the motion, said the walls were most romantic and interesting, and the town itself was fascinating. The churches were remarkable, and would repay a great deal of careful study, as they revealed aspects of mediæval work which they were not acquainted with in this country to any great extent. They had, he believed, one or two churches in this country with central columns in the nave, as was frequent in Gotland, but the churches there were vaulted, and the column arose from the system of vaulting; they were not truly twin-nave churches. Mr. Porter said the walls of Visby safeguarded a rich mercantile community, and that was the impression they conveyed. If one might criticise them at all, he would say they suggested the idea of amateur fortifications having to be amended to suit later methods of attack. One did not find any great military science displayed, such as was to be seen in some of the great fortified centres of France. Perhaps the Visby walls were earlier in date than the scientifically fortified towns one found in other mediæval cities, and were first built to protect the foreign merchants from the attacks of the Gotland peasantry. One aspect of the walls which had not been touched upon was the moat or ditch. There was an immense ditch cut from the limestone. It was three-

fold on the north side and quite wide and spacious on the east side. Probably the inhabitants got their material from the ditch for building the walls, and there could be no doubt that they relied on it to prevent the invaders reaching the base of the fortifications. Visby conveyed a splendid idea of the appearance of a mediæval fortified town.

Professor Beresford Pite

said the subject was a very interesting one. It was scarcely artistic, except in an indirect sense. After wide travel they seemed to come to the conclusion that there was no architectural style about fortifications at all. The walls of York did not differ from those of Visby, of Dover, of the Tower of London, and many of the great continental cities, except perhaps in a few details which lay around the doorways. They were all about the same height, and had about the same scheme of military towers, and were much about the same thickness. Visby, from all they had seen in the photographs, might have been some unknown English town. But there was a great deal of fascination about these fortifications. When they looked at the photographs one wondered what was the use of the towers. What was it all for? How did the machine work? Probably the most enlightening publication on the subject was the series of articles by Viollet-le-duc in the *Dictionnaire Raisonné*. Mr. Burgess thoroughly understood the fascination of walled cities, and that extraordinary example at Cardiff showed them really what a patch of Visby might have looked like when it was in fighting trim. He would like to commend the whole subject to architectural students from the point of view of the purpose and usefulness of these fortifications. These were not new vistas to their architectural otherwise; their picturesqueness was somewhat of the Battersea Park Grotto order. Their main lesson was the entire directness and purpose of the whole thing. It meant war and defence, and unless they took the point of understanding, the military purpose which lay at the back of it all, it was not a profitable study. The York walls were very interesting, for they could go round the walls on top and through the towers and form an idea of how it all worked, but he would invite members of the Institute residing in London to not forget that they had a live fortress in London still. If anything really went wrong with the dockers or anyone else, the point of which attention would be drawn was the old mediæval fortress—the Tower of London—which was still the military centre of London, and was one of the few old mediæval fortresses still kept in fighting trim. He suggested that students would do well to get an order from the Governor and spend some hours on the curtain walls, and try to follow the "hang" of the old tower. Of course, London was not Visby, but it occupied much about the same position with regard to an important port that Visby did. There was one broad and general distinction between these continental towns and this country, which was that the former were practically independent States, and had to arm themselves not only against pirates, but against their next-door neighbours, and that accounted for the complete fortification of continental cities.

Mr. Fitzroy Doll,

who remarked that it was just forty years ago since he had spoken in that building, said the what interested him much more than the walls was what happened within the walls of Visby. Within them the seed of the "Third Estate" was sown and germinated and grew up. The merchants went there to protect themselves against hordes of robber knights and the clergy who overran the whole of Germany. In one of the churches of Visby was deposited the chest of the Hanseatic League—that great League to which the people of England were mixed in a manner that few had taken the trouble to find out. Visby had the chest, and three other cities had aldermen appointed to hold the keys. There was no doubt that the whole of their municipal government in London emanated from that combination; they even gave this country its money, and to this day they spoke of their money as "sterling," which came from the Hanseatic merchants, who were called "esterlings." Nearly all the Guilds of London also came from that organisation. That League influenced them enormously as a Teutonic race, and, curiously, whilst this country had retained the influence, Germany had adopted more the French system of that municipal government. He wished more of

young men would go to the towns in the north instead of all going South, and coming back and making bad Italian architecture. If they would only go to towns like Lubeck, Rostock, Visby, and so on, they would find that many of those who now had the greatest reputation in the architectural profession had in the past filled their sketch-books with drawings in those cities.

The President

remarked that the discussion had branched out in all sorts of directions. Mr. Fitzroy Doll was extremely interesting, but he felt it was drawing long how to trace the origin of their local movement to Visby.

Fitzroy Doll

said he would refer the President to the Bodleian Library.

The President

said, as a modest historical student, he would only say it was a surprising generalisation. The old German towns were immensely interesting historically, and were picturesque, but he could not recommend students to study in them except for historical purposes. If they wished to study their art they must go to the quarters in Italy and France. Professor Doll had directed their attention to the interesting question of military fortification and engineering, and by implication pointed out the futility of constructing such works except for a special purpose. He thought this question of development of military fortification might be carried forward. They thanked Mr. Porter for the way he had worked out the history of the dead city, and he would suggest that there be other dead cities the history of which might be taken up.

The motion was carried.

Porter,

said that if anything he had said would result in others going on to deal with the subject he was rewarded. Mr. Haig might perhaps look into the very interesting work now being carried out at the churches of St. Clement and St. Nicholas. In regard to St. Clement, the foundations of three former churches had recently been discovered. The President announced that the next meeting, a business one, would be held on January 6.

CHAPEL OF SALTLEY COLLEGE.

A CHAPEL has long been desired for the Saltley College of the four dioceses of Worcester, Lichfield, Hereford, and Birmingham. The present building is on a part of the College grounds adjoining the east village, and is built of mottled Hollington walling with ceilings of white Hollington, to harmonise with the College, and is roofed with red tiles. A very extensive scheme of colour decoration is intended in the interior. Messrs. Arncliffe and Sons, of Birmingham, are the builders.

VICTORIA AND ALBERT MUSEUM.

The following additions to the Department of Architecture and Sculpture which have recently been placed on exhibition are of particular interest.

A recumbent effigy of a knight in Reigate (A 10-1912), painted, gilt, and decorated in gesso, was purchased from the Lesnes Abbey Excavation Committee of the Woolwich Archaeological Society, with the consent of the vicars of Christ's Hospital, the owners of the freehold. This figure, which may be identified as commemorating a knight of the Lucy family, is an admirable example of an English monumental effigy of the London School, dating from about 1320-1340; the head unfortunately missing, but the rest of the effigy is well preserved, and the remains of the effigy are extraordinarily brilliant. Three finely-designed capitals and one shaft of transitional type, dating from the end of the 14th century, were purchased from the same source. The Augustinian Abbey of Lesnes, between Plumstead and Erith to the east of London, founded by Richard de Lucy in 1178, was suppressed in 1525; the effigy was excavated from the site of the Lady Chapel.

Two candle-bearing angels of carved lime-wood (A 16, 17-1912) by the great Franco-German sculptor, Tilman Riemenschneider (born about 1468, died 1531), were bought out of the funds munificently bequeathed by the late Capt. H. B. Murray. These angels had long been known to special students of Riemenschneider's work, but their position in the remote village of Wolferstetter, near Kulsheim, in Baden, made them difficult of access, and their high qualities could hardly be discerned under a disfiguring coat of modern paint. The colour has now been carefully removed, and the beautifully-carved surface of the figures revealed; they may be dated about 1510. The Museum has possessed for many years a large group of two figures forming part of an altarpiece of the Holy Kindred, by Riemenschneider, and two little heads of Adam and Eve which, if they are admitted as his work, must be considered his masterpiece in sculpture on a small scale.

A further acquisition out of the funds of the Murray bequest has been that of a small and exquisitely-finished group in wood of the Lamentation over the Dead Christ (A 15-1912), the work of a sculptor of the Middle Rhine district in the first half of the XVth century; the treatment of the heads to some extent recalls the work of Conrad Meit of Worms. It was formerly in the Spitzer and Dollfus collections, dispersed in Paris in 1893 and in March of the present year respectively.

Besides the acquisitions by purchase, the department has been generously presented by Miss S. Mary Forbes with a life-sized terra-cotta group of a mother nursing her baby (A 27-1912), by Jules Dalou (born 1838, died 1902).

"THE TRIANGLE CLUB."

A SMALL, but interesting exhibition by members of this Club is being held this week at the Maddox-street Galleries. The Club consists of an equal number of architects, sculptors, and painters, all of whom have been members of the R.A. Schools; and its special object is the association of the "Three Arts" with a view to encourage co-operation and to form a mutual bond of sympathy between their various exponents. Although it has been in existence about eight years, this is the first public exhibition that has been held. Architecture is represented by scale drawings of designs and some photographs of executed work, mostly by Mr. Basil Oliver, Mr. S. C. Ramsey, and Mr. Alan Brace. The sculpture and paintings are also the work of young men who have not been influenced by any of the later more violent art movements. The general atmosphere suggests serious, unaffected effort, and the result in one or two instances is striking. The most important piece of sculpture is Mr. John Angel's group of three figures entitled

"Rescued." The composition of this group is singularly harmonious, while the modelling is restrained without any loss of character. This work suggests the advance that British sculpture has made in recent years. Mr. Angel should go far. Mr. Allan G. Wyon's "Heracles Rescuing Alectis from Hades" is a vigorous imaginative work; and physical energy is well portrayed in the modelling of Mr. J. A. Stevenson's nude figure of a man pulling at a rope. We were glad to notice the expression of considerable decorative power in some of the paintings. The work of Mr. W. Beck Savage and Mr. Charles V. Holder is particularly interesting in this respect. The former artist's "Susannah and the Elders" and "Passingford Bridge" are not so much the painting of subjects as decorative compositions; the comparatively low tones are combined in a certain effective and sympathetic form of arrangement. Mr. Holder's small picture, "In the Studio," an artist's model reclining on a couch, is quite masterly in the disposition of mass and colour. Mr. Douglas Gray's work is as yet a little immature, but his "Summer Evening" and "View near Croydon" show pleasant promise. Mr. Hugh de Poix's "The Bathers," a group of nude figures in a classic landscape, is also, decoratively, very promising. There are numerous portraits at the exhibition. Mr. J. Blair Leighton's three-quarter figure, "C. White, Esq., Expounding Progress," is probably the most capable in treatment and expression. Mr. Hugh de Poix's "Unmasked" is a striking work, although both the colour and treatment are a little crude. With the exception of the mural tablet to the memory of the late Ernest Crofts, R.A., the joint work of Mr. Allan G. Wyon, sculptor, and Mr. Basil Oliver, architect, we do not notice that collaboration which might be expected to result from membership of such a club, and we would commend the possibilities of such co-operation to its members.

SUMMER SCHOOL OF TOWN PLANNING.

IN view of the success of the first Summer School of Town Planning held at the Hampstead Garden Suburb in August last, under the auspices of the University of London, it has been decided to hold a second summer school next year at the same centre. It will last for a fortnight, commencing August 2 and continuing till August 16, and during that time the lectures and demonstrations on town planning and subjects practically connected therewith will be given by some of the leading authorities. Last summer certificates were awarded to the students by the Extension Board of the London University, and a number of architects and engineers have already found these certificates of great advantage. Particulars can be obtained upon application to the Hon. Secretary of the Summer School, Mr. J. S. Rathbone, The Institute, Hampstead Garden Suburb, London, N.W.

Scarcroft Grange, Yorkshire.

Mr. Sydney D. Kitson, F.R.I.B.A., Architect.

SCARCROFT GRANGE, YORKSHIRE.

This house was practically rebuilt several years ago, the only remaining portion being the twin bay windows to dining-room and school-room on the north. All the new walls are of brick covered externally with rough-cast, with wood cornices and Westmorland slate roof. At the same time a formal garden was laid out to the front of the house. Mr. Sydney D. Kitson, F.R.I.B.A., was the architect, and Messrs. G. Nettleton & Sons, of Roundhay, were the contractors.

THE EFFECT OF RECENT DECISIONS UPON THE ARBITRATION CLAUSE.

At a joint Southern and South-Eastern District meeting of the Institution of Municipal Engineers, held at No. 4, Southampton-row, London, on the 27th ult., Mr. W. Valentine Ball, M.A., Barrister-at-Law, read a paper on "The Effect of Recent Decisions upon the Arbitration Clause." In the course of his remarks he said, referring to the form of contract approved by the Royal Institute of British Architects, that the difficulty with which it was his object to deal, was not likely to arise if the R.I.B.A. form

was adopted in its entirety, because the arbitration clause which was there used expressly provided that the "architect" and the "arbitrator" shall be two distinct persons. The question between the employer and the contractor when the contract was being prepared would be, "Whose name is to be inserted as arbitrator?" That the parties would easily agree to the appointment of a person who was familiar with the kind of work to be done under the contract might be conceded. They would also find it easy, if a perfectly independent person was to be chosen, to select a person eminent in his profession, whose decision would be satisfactory to ratepayers on the one hand and to shareholders on the other. But in recent years the practice had grown up of appointing an engineer or surveyor who was actually in the employment of a municipal or other local authority to act as sole arbitrator under a contract to which that authority was a party. There were probably hundreds of such contracts in existence at the present time.

In actual practice the arbitration clause with which we have to deal to-day closely affected the engineer or surveyor who was employed by a local authority in connexion with the execution of a contract. When disputes arose they were referred to that engineer or surveyor, and the contractor—not unnaturally from his point of view—sometimes tried to get away from the decision of the very man with whom he had

been at issue. He brought matters to a head by ignoring the "agreement to refer." This he did by commencing an action. The local authority then took out a summons pursuant to sect. 4 of the Arbitration Act, 1889, to stay the proceedings on the ground that there was no sufficient reason why the matter should not be referred in accordance with the submission.

The Allegation of Bias.

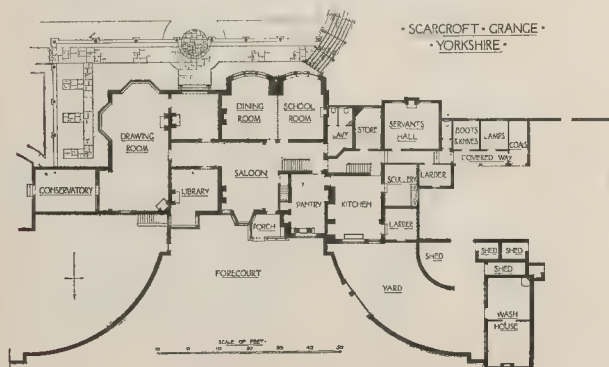

The question was: What would the Court hold to be sufficient reason? It was obvious that bias clearly proved would be sufficient to justify the Court in refusing to allow a particular man to sit as arbitrator; but the question of bias was not easy when considered in relation to a man who was a servant of the employer when the contractor agreed to his name being inserted in the contract as arbitrator. *hypothesis* such a man was obviously bound to his employer to some extent. What, then, was sufficient bias in the legal sense?

The author then dealt with a number of recent and very important cases on this subject, with a view to showing that the time had arrived for local authorities to reconsider their whole position. He said:—

"In order to succeed because of alleged bias a probability, not a mere possibility of bias, must be shown (*Eckersley v. Mersey Docks*, 1894, 2 Q.B., 667). The mere fact that the arbitrator is the servant of one of the parties is not sufficient to disqualify him; for this is a fact which must have been known when the contract was signed.

A distinction is to be drawn between circumstances known to exist at the time of the contract and those which afterwards supervene. For instance, in a Scotch case, a firm of contractors who had undertaken to build a public building agreed with the Town Council that a particular gentleman should act as arbitrator in case of disputes. The gentleman subsequently became elected "Dean of Guild," and thereby, *ex-officio*, a Town Councillor. It was held that this disqualified him from acting as arbitrator (*Edinburgh Magistrates v. Lowndes*, 1903, 5 F., 711).

The case of *Belcher v. Roedean School*, 1901, 85 L.T., 469, shows that the Court will be reluctant to revoke a submission to arbitration on the ground of interest. In that case a contract provided that all disputes and differences arising on a building contract were referred to the decision of the architect appointed by the building owners. The builders issued a writ against the architect for fraud and misrepresentation, and took out a summons to revoke the submission to arbitration. The

itect declined to admit the charges made inst him. It was held that an application revoke a submission to arbitration was one be granted with great caution, and that the mission ought not to be revoked.

here the Arbitrator is Practically Judge in His Own Cause.

It is important to notice that Belcher v. Dean School Board (*supra*) was decided on principle that to have made the engineer arbitrator would substantially have made him go in his own cause. Where, however, the matter in dispute is something in which the arbitrator is only indirectly interested, a pretence to him would not be prevented. For instance, in Skinner v. Uziel, 1898, 24 T.L.R., the plaintiff had employed the defendants underwriters under an agreement. Disputes were to be referred to a member of Lloyd's as arbitrator. A dispute arose, one of the questions being whether it was the general practice at Lloyd's to charge commissions. The Court awarded the arbitration to proceed upon the ground that members of Lloyd's were the most convenient tribunal to decide the fact whether alleged custom to take commissions at Lloyd's existed. It was not impressed with suggestion that a member of Lloyd's would be inclined to find in favour of a practice which followed himself.

It has been held that a mere expression of opinion in favour of one party is not sufficient to disqualify an arbitrator unless it appears that he has so made up his mind as to be open to argument (Jackson v. Barry Lwy Company, 1893, 1 Ch., 238). . . . In a later case (Freeman v. Chester Rural District Council, 1911, 75 J.P., 132), the facts were as follows:—There a contractor brought action to recover the price of certain works constructed for a local authority under a contract which provided for the reference of disputes thereunder to the engineer of the local authority. In answer to a summons to proceedings under sect. 4 of the Arbitration Act, 1889, he challenged the conduct of the engineer in relation to the works, the question being whether the engineer had not eluded himself by his own admissions from stating that the works had not been completed to his satisfaction, and that the period of time had not expired.

The Court (affirming the decision of Mr. Justice Lush), in the exercise of the jurisdiction conferred upon it by the Arbitration Act, 1889, refused to order the action to be continued.

Where the Personal Conduct of the Arbitrator Comes into Question.

In cases already cited have this common feature: the conduct of the arbitrator himself does not form the subject-matter of any of the disputes. In certain recent cases, however, the Courts have laid down a very clear principle applicable in such circumstances. It is that in considering the question whether a person who is the servant of one of the parties to a dispute, the Court should consider the nature of the question which has to be decided. In Blackwell & Co. v. Ormerod, 1909, 75 J.P., 129, the plaintiffs had contracted to carry out certain masonry work for the defendant corporation. The engineer had given a certificate, but had withheld a sum of 1,500*l.* under a penalty clause for delay. The company having brought action, the corporation objected that under the arbitration clause the dispute must be referred to the arbitration of the engineer. To the company's objection on the ground that the case was that the engineer did not allow the company to have proper facilities for proceeding with the work. The Court of Appeal refused to allow the action.

To this extent, then, have contractors secured protection from the arbitration clause; but the principle laid down by the Court of Appeal is likely to be extended. The Courts are very jealous of any interference with contract. The fact that this jealousy exists makes it possible for a contractor to hope to escape the obligations imposed upon him by the contract. If he has under-estimated the amount of excavation necessary, or the amount of materials to be provided for completion, the loss will be his. Again, if he has over-estimated the time which the works will take, or if unforeseen circumstances for which the employer are not responsible have arisen to delay the work, the loss is the loss of the contractor. It is difficult to see how any of the losses arising

from these causes can be avoided if the contractor has signed a contract which binds him hand and foot.

The most recent case on the subject which was heard by the Court of Appeal in March last—namely, Aird v. Lord Mayor of Bristol, Court of Appeal, 1912, shows that the Court will not extend, although it still adheres to, the principle above laid down. If the conduct or dealings with the engineer himself is in question, the matter will be taken from his hands. In that case the dispute arose under a contract entered into between the plaintiffs and the defendants, and dated March 17, 1902, for the construction and completion of a new wet dock at Avonmouth, and entrance lock, two entrance piers, a new wall, and other work in connexion therewith.

The contract contained an arbitration clause referring all disputes arising during the progress, or after the completion of the works, concerning the works or their cost, or the quantity or quality of the materials, or in respect of any additions, omissions, alterations, or deviations made to, in, or from the works or any part of them, to the engineer having the superintendence and control of the works of the Docks Committee of the Council of the City of Bristol, who should be competent to enter upon the subject-matter of such dispute with or without formal reference or notice to the contractors or the corporation. The value of the work done and materials supplied under the contract was 1,923,977*l.* 9*s.* 4*d.* In respect of which the defendants had paid 1,752,761*l.* 10*s.* 11*d.* and the action was brought by the plaintiffs to recover the balance—namely, 171,215*l.* 18*s.* 5*d.*—and damages for breach of contract.

The summons taken out by the defendants for an order staying the action, so that the dispute between the parties might proceed to arbitration in accordance with the arbitration clause, was opposed by the plaintiffs on the grounds (*inter alia*) that the engineer had, by his conduct in his capacity as engineer under the contract during the progress of the works, rendered himself unfit to be arbitrator.

Lord Justice Vaughan Williams, after pointing out that there was nothing in the facts as disclosed to show that the engineer had been guilty of any misconduct, said that of all the matters which had been alleged against the engineer, there were really only two of any substance. As regards these, they did not arise out of the original agreement between the parties; they did not fall within the schedule of prices where the price paid depended on the original schedule. The affidavits stated that specific agreements had been entered into, and that the engineer had departed from them. In such a case it was true to say that in so far as the engineer differed from the statement that agreements had been entered into and actually denied it, he was really acting as arbitrator in his own case. The question therefore to be determined was whether the engineer had in fact entered into these agreements, and whether he had departed from them. In his judgment, there was a strong *prima facie* case made as to the existence of these agreements, as well as a *prima facie* case of a departure from them. He would not go into details, because the action would have to go on, and it was not desirable at this stage to discuss the evidence. Putting it shortly, he was of opinion that in these two matters it was not desirable that the engineer should act as arbitrator. Under these circumstances, therefore, the appeal failed. In the event the trial as allowed to proceed. The last case to which I desire to refer is the decision of the House of Lords in Roberts v. Hickman. . . . It was there held that the grant of a certificate by an architect will not be a condition precedent to the builder's right to sue, if, by writing letters to the employer, and allowing himself to be influenced by his views, the architect has disqualified himself from acting judicially, although guilty of no fraud or improper conduct.

It appears that in this case the architect had written to the contractor: "I regret I cannot enclose certificate, my clients' instructions being that the certificate I next give you is to be a final one, including for a complete settlement of the work done, into which I shall be prepared to go after Easter." He also wrote on another occasion: "Had you not better call to see my clients, because, in the face of their instructions to me, I cannot issue a certificate, whatever may be my own private opinion in the matter."

In this case, as will be seen from the above extract, the conduct of the architect as arbitrator was not considered; it was his conduct in

relation to the grant of certificates which was under discussion.

The Court held in effect that he had so mistaken his position and lost his independence by listening to the employer that the grant of a certificate could no longer be considered a condition precedent to the contractor's right to sue.

Summary of the Cases.

Let me attempt to summarise the cases to which I have alluded. The contractor will not be compelled to submit to the decision of the employer's engineer as arbitrator (1) if the matter in issue is an unseemly personal dispute raising a vindictive feeling between the engineer and the contractor, and the engineer has so strongly expressed his view that it amounts to a prejudgment (*Nuttall v. Manchester Corporation*, 1893, 8 T.L.R., 513); (2) if the nature of the dispute is such that the cross-examination of the engineer is essential; (3) if the matter in issue is something outside the original agreement—e.g., a dispute as to whether the engineer and contractor had agreed to vary the original agreement; (4) if the conduct of the engineer himself is practically the only point in dispute.

Suggested Reforms.

I hope I have said enough to show that, although there are probably hundreds of contracts now in force in various parts of the country in which the arbitrator is the engineer of the employer, circumstances may arise at any time which will prevent his acting when the time for his services arrives. Is it not therefore time to consider what alternative to adopt? I propose to consider a few of them.

(a) *The Deletion of the Clause.*—Deletion of the arbitration clause would involve recourse to legal proceedings for the settlement of all disputes. Doubtless it might open a vista of litigation, and would therefore be rejected on that ground; but there is one fact in this connexion which it is well to bear in mind—namely, that a dispute arising under a building or engineering contract would not come before the Court and a jury, but before a special referee (i.e., an engineer appointed by the Court), or before an official referee. In the result the proceedings would be very similar to those which would take place before the arbitrator named in the contract. It is a trial of this kind which takes place if litigation ensues owing to the failure of an arbitration clause. Save that a reference to an official referee is reference to a lawyer, it very much resembles a reference to arbitration.

(b) *Reference to an Independent Arbitrator.*—Reference to an independent arbitrator appears to present almost if not quite as many objections as a reference to the Court. An independent person, even if he is an eminent engineer, has to be taught all about the nature of the work at the expense of the parties to the dispute. Witnesses to fact must be called in enormous numbers, while the expert witness, whose fees are considerable, must also be called at the expense of both parties. In the result the proceedings may drag on for days or even weeks. There are various ways of selecting an independent arbitrator. He may be named in the contract. If named, his independence may to some extent be affected by his being brought into business contact with one or other of the parties; but they would no doubt select a man who was not likely to have any such dealings with them. His appointment or selection may also be left to the President of the Institution of Civil Engineers for the time being, or to some other eminent personage. To leave it to a person who may happen to be President of an institution for the time being does not appear to be a very wise proceeding, inasmuch as the capacity of such person to select and appoint an arbitrator is a matter of pure speculation. It is much wiser, if it is desired to have an independent arbitrator, to leave him to be selected by agreement when the dispute arises, or, failing agreement, to be nominated by some eminent engineer of known capacity.

(c) *An Amendment of the Arbitration Clause.*—All the above proposals are open to the objection that they entail the expense inseparable from the appointment of an independent person. Numerous questions might arise in relation, say, to a sewerage contract, which could be decided by the engineer on the job without any objection being raised by the contractor. Suppose, for instance, the question was whether the cement supplied was capable of withstanding the prescribed tests. To have to refer such a matter to arbitration would be ridiculous.

Again, the question whether a delay of, say, two days was justifiable could be decided in five minutes by the engineer who had been on the job, but could not be decided until after a long hearing by an independent arbitrator. Short of arbitration by the engineer "on the job," I have endeavoured to make it plain that the next best thing is for the parties to retain their hold over the selection of the arbitrator by means of one or other of the above methods. At present the alternative to the arbitrator mentioned in the contract is settlement of the matter in dispute by litigation. It would seem that by slightly modifying the usual form of arbitration clause the desired result can be attained.

I venture to make the following suggestion: Frame the arbitration clause so as to leave the decision of every question arising under the contract to the engineer, but subject to a proviso that, should it appear to the Court on an application to stay any action or proceeding brought in relation to the contract that the engineer is disqualified from acting as arbitrator, the matters in dispute will be referred to an engineer, to be agreed between the parties, or, failing agreement, to be nominated by the President of the Institution of Civil Engineers. Another alternative is suggested by Mr. E. J. Rimmer, in his "Arbitration Clause in Engineering Contracts" (Constable & Co.). It is that, while preserving the finality of the decision of the engineer upon certain special points, a proviso should be added to the arbitration clause, stating that if any action is brought the defendant may either (a) have the action stayed and remitted to the engineer, or (b) have the matter referred to an independent arbitrator appointed in one or other of the manners above suggested. The same gentleman suggests that the decision in *Aird v. Bristol Corporation (supra)* may be got over by a new clause preventing the engineer entering into any agreement with the contractors unless certain conditions are complied with. I do not attempt to draft a form of clause: the actual wording would have to vary according to the other conditions of the contract and the circumstances of the case.

It might be argued that such an agreement would operate as an attempt to oust the jurisdiction of the Court; but it really would not have this effect. It simply means that the various steps above mentioned must be taken before the law courts can be asked to decide a dispute or refer a matter to an official or other referee.

My researches in this matter have led me to think that what the local authority, which is responsible to the ratepayer, desires in relation to a contract is certainty. Certainty, so far as humanly possible in the matter of price and time; certainty that work shall be done under trustworthy supervision; and last, but not least, reasonable certainty that disputes shall be settled economically and expeditiously by a man in whom they have confidence.

ARCHITECTURAL SOCIETIES.

Manchester Society of Architects.

Mr. H. T. Buckland read a paper on the 11th inst. on "Pitfalls in Professional Practice." Addressing himself to the younger members, he dealt with the small mistakes which architects would make. He said that these stood out in their memory after years of practice as the missed putts to the golfer. Dealing first with damp in walls, he described the bricks of the Midlands, and went on to recommend cement mortar in proportions of 8 to 1, in preference to ordinary hair mortar. He condemned the present tendency to design with flush sills and unthroated copings, and described how a tile creasing in one case had led the water right through the wall. Dealing with roofs, he referred to the unreliability of tiles. Passing on to foundations, he described the dangers of clay in dry weather. After touching on the shrinkage in timber, particularly maple, he went into the question of the responsibilities of architects in law.—A vote of thanks was proposed by Mr. Hardisty, seconded by Mr. Lodge. In responding, Mr. Buckland admitted that he knew a perfect remedy for a smoky chimney, but unfortunately he was unable to publish it to the profession at large.

Leeds and Yorkshire Architectural Society.

A general meeting of this Society was held at the Institute, Cookridge-street, Leeds, on the 12th inst. The President, Lieut.-Colonel Kirk, A.R.I.B.A., was in the Chair. Mr. J. H.

Foggitt's and Mr. Piet de Jong's drawings of a "Tour in Italy" were on view, and a paper on the tour was read by Mr. Foggitt.

Mr. de Jong (who was the joint winner of the Soane Prize last year) shows great versatility in his work, which comprises measured drawings in pencil and colour of palaces in Florence, tombs and fragments from the Forum at Rome, water-colours in Venice, and numerous examples of work in Assisi, Genoa, Siena, etc.

Mr. Foggitt also has a fine and interesting show, his drawings and sketches in pencil being crisp and the detail truly rendered. His measured drawings of the Church of S. Maria del Popolo are very well executed.

A vote of thanks was proposed by Mr. A. Winch, A.R.I.B.A., seconded by Mr. J. Braithwaite, A.R.I.B.A., and supported by Messrs. C. B. Howdill, A.R.I.B.A., and Douglas Bowman.

The Architectural Association of Ireland.

An ordinary meeting of this body was held at the Rooms, 15, South Frederick-lane, on the 10th inst., the President, Mr. Geo. L. O'Connor, F.R.I.A.I., in the chair. Messrs. Thomas B. Lowey and Horace F. S. Clay were elected members of the Association. Mr. Hubert Briscoe delivered a lecture, entitled "Through the Balkans to St. Petersburg and Moscow," consisting of an architectural, geographical, and historical survey of the vast northern kingdom. The lecture was fully illustrated with lantern views descriptive of Russian life and architecture. Mr. J. H. Webb, M.R.I.A.I., and Mr. Edwin Bradbury, M.R.I.A.I., proposed a vote of thanks to the lecturer, which was supported by Professor Seymour and carried with acclamation. The President announced that the next ordinary meeting would be held on Tuesday, January 14, 1913, when Mr. J. Hubert Worthington, M.A., will deliver a lecture on "The Culminating Period of Italian Renaissance."

The first visit of the session to buildings in progress was paid on December 5 to the new play centre, St. Patrick's Park, Dublin, which is being erected through the generosity of Lord Iveagh. Mr. Reid, member of the firm of Messrs. MacDonnell & Reid, architects for the building, conducted a large party over the works and explained the various interesting features of the scheme.

THE SURVEYORS' INSTITUTION: ENGLISH TIMBER: ITS MARKETS, VALUE, AND PRODUCTION.

At the ordinary general meeting of the Surveyors' Institution, held on Monday, December 16, Mr. M. C. Duchesne read a long and interesting paper on "English Timber: Its Markets, Value, and Production." We take the following extracts from the paper:—

"English timber—as is shown by the daily decreased demand—is continually being ousted by the foreign timber in almost every market. I know of existing markets for English timber which will be lost in the near future. Some of these have been looked upon in the past as the backbone of the local trade. In very few of these instances is this loss due to the inferiority of English timber to foreign, but either to the natural change of market demands and altered conditions, or, more often, as in the case of underwood, to unorganised marketing. There are new and good markets in plenty to take the place of existing ones as the latter die out, but all these are captured at once by foreign timber owing to its superior organisation. The out-of-date methods of many English timber merchants have compared most unfavourably with the foreign trade, both as regards converting and marketing the timber, and especially studying the consumer's requirements.

The processes by which English timber markets were captured by the foreigner were gradually developed over a number of years. The latter's whole policy has been to market timber by the best and most economical methods, to organise the supply to meet the demand, to advertise the advantages of the produce offered for sale, to find fresh uses for it, to cultivate new markets, and especially to consult the requirements, convenience, and wishes of customers. In the result architects now almost entirely omit English timber from their specifications, even when they might be anxious to specify it.

One may ascribe this partly to the ease with which any particular variety and quality of foreign timber is obtainable, partly to the many

incorrect impressions about English timber that have obtained a firm foothold. Should an architect wish to specify English oak he is usually informed by the contractor that there is none to be obtained. Again, many absurd and incorrect beliefs are held by architects regarding the sizes, and especially the quality, of English timber. This is mainly the result of unfair comparisons between English and foreign timber made by those who are interested in the latter. What should have been everyone's business has been no one's business, and hitherto nobody has taken steps to ensure fair treatment for English timber.

English timber has also been hit by the methodical marketing, which failed to ensure a regular supply. On many estates it has been the usual custom to sell timber only when money was wanted for payment of death duties or for other special purposes; at other times no timber was sold. If such methods were applied to other industries—if, for example, iron-ore were to be sold only when the mine-owner needed money—I think you would appreciate the serious effect such a policy must have on any industry.

The fluctuating and uncertain supply of English timber assisted the foreigner. It enabled him to provide just what was required at any time, and thereby secure our markets. He was competing against a local, disorganised, and small trade, and so could defeat the English timber merchant almost everywhere. It must be admitted, of course, that the foreigner enjoyed many great advantages; the chief of these he had very large supplies of cheap but excellent virgin forest available. Moreover, this country being an island, many of our best markets could be reached by water transport, the cost of which is small in comparison with conveyance by road or railway, and our large shipping and coal industries insured low freights. The many advantages the foreigner possessed were often advanced to excuse us for not taking steps to compete with him. One should remember, however, that the foreigner also had great difficulties to surmount which we are spared in this country. For instance, the problem and expense of transporting timber from the mountains to the seaports; difficulties as to power, labour, shipping, keeping in touch with our markets, and many other matters.

By organisation we should ensure constant and regular supplies. Not until these are forthcoming for a given purpose can we expect consumers to purchase supplies grown in this country. As in the case of underwood, instead of relying on local competition by local buyers with local demands for comparatively local industries we must proceed on much broader lines. I would remind you of the unlimited home market for timber—totalling approximately 30,000,000, per annum—which illustrates the fallacy of an argument I often hear advanced to the effect that English timber realises a poor price in a particular district on account of "the glut of English timber in the market." The actual fact is usually quite the reverse. The difficulty is more often to obtain sufficient supplies.

Another fallacy which I should like to expose is that the consumer always purchases foreign timber, because it is cheaper than English. Study the quotations in the various building and other journals where the current prices of imported timber are given, and you will realise the falsity of this statement.

There is one great advantage which we possess, viz., the great natural superiority of the varieties of our timber, especially our hardwoods. All authorities admit that there is scarcely a country in the world where timber of finer quality can be and, in many instances, is grown. This may be due largely to our climatic conditions and geographical position and to the superior timber produced by our indigenous trees. All authorities are agreed that for tensile strength, durability, and other important qualities there is no oak in the world to compare with English oak. The same remark applies to other of our native timber, especially English ash. The unique qualities of our native timber for special purposes points to the advisability of advertising the fact to the consumer. I attribute the loss of several of our best markets to the fact that we do not advertise our goods sufficiently to induce the consumer to pay a higher price for an admittedly superior article.

I have heard of English oak being set aside and a contract placed for foreign oak merely to save 1d. per cubic foot, notwithstanding that the timber was required for constructing railway goods wagons. Anything more ridiculous is

possible to imagine, and I shall contend that such purposes English oak is worth 50 per cent. more than any other oak in the world. The reason for this fact is not properly appreciated by the consumer in many cases does not appreciate it; and, to use a simile, because he has been so used to getting 1L for 10s. he thinks it only worth 10s. In any case, what is a 1L increase in the cost of the raw material compared with greater liability to repairs or in breakdowns?

Timber for Building Construction.

I have already referred to the unfortunate fact that architects at present almost entirely use English timber from their contracts. There are many varieties of English timber which might be more extensively used, but I, too, must confine my remarks to the question of oak, using this timber as an illustration. There is no question that for oak (selling, oak beams, oak entrance-gates and sills, and oak block floors there is no oak which can compare with our native wood, and its fine qualities and rich appearance are a figure.

One of the principal objections advanced against our native oak is that it is harder to work than the foreign. Speaking generally, it is quite true, but it is at once a proof of superiority. Nearly all valuable woods are so difficult to work than inferior. The prejudice against English oak under this head is very responsible for other objections advanced against its use, such as that it is more likely to split or warp. But consider the lovely old English oak of which there are so many examples everywhere. I am certain that if we will use as much care, knowledge, and skill in the conversion to-day as our forefathers used there would be little foundation for these objections. There is no branch where less knowledge and skill is brought to bear than in seasoning, and also the conversion of English oak for such purposes as interior work.

I have often argued the undoubted advantages that quartering oak has over our present methods of converting it, but I seldom get an experienced man who has ever considered the question seriously. About the only reason for oak not being properly quartered is that there is more waste in conversion. If this is to be advanced as an excuse, I would suggest that it is actually an excuse for incompetence, and an illustration of the disadvantage of conducting the timber trade on too small a scale.

If a business is conducted on a large scale, and a man knows his business, there is nothing which he cannot make use of in the oak-tree, even excepting the sawdust or the bark, as we are capable of being utilised to-day. Again, in this case the quartering of oak depends on the diameter of the log; but, as the London contractor—so one informed me—has to pay more for inch boards of English oak than for Spanish mahogany, I am convinced there is a large and lucrative trade to be done by architects. This conviction has been confirmed by conferences which we have held with them during the past twelve months.

Timber for the Furniture Trade.

It is common knowledge that the timber in demand for this industry is beech, as in the case of High Wycombe, Chesham, and other centres. There is also invariably a good demand for the best beech to be cut on the interior for wren-planks for pianofortes. Where such is converted for this last purpose it is desirable to include in the conversion the fitting of brush-backs, so as to utilise the upper or inferior parts of the tree. The furniture trade's demand for English nut for veneers and reproduction of old-time furniture, such as Jacobean, far exceeds supply.

Yew is another tree which has value for the furniture trade, partly for veneers for desks, etc., but also largely for export to France or Paris to go through the process of turning. Owing to the rich appearance of yew when treated in this manner a greatly increased consumption may reasonably be expected.

English oak is not popular generally in the furniture trade, being so hard to work. I am prepared to admit that for many details furniture foreign oak is more suitable than English, except for reproductions of old styles of English oak. At present I do not look to the furniture trade for a greatly increased demand for English timber except in one direction.

I should like to have treated in detail the one exception to which I refer, namely, the cutting of veneers and the manufacture of two and three ply wood, but it is far too extensive a question. There is undoubtedly an enormous future for this branch of the trade; in fact, the whole system of veneering opens up enormous possibilities for the use of substitutes in the place of solid wood. I have recently seen a log of English oak converted into leaves of veneer, of which there were 110 thicknesses to an inch. It might interest you to know that veneers of this thickness are sold in the trade at 2s. 6d. per 100 super. ft. Although this may seem a cheap rate, I will leave you to estimate what is the value of the raw material. I need scarcely add that it is only specially selected burls, mature and absolutely free from knots, that are suitable for veneers.

The various branches of the furniture trade cover a very wide range of goods, and there is scarcely a single wood which is not valuable for some purpose or other—lime, pear, hornbeam, and even holly being included in this remark.

The English Forestry Association.

It is impossible to explain in a few words the detailed policy of this Association, but its objects may be summarised briefly under two heads:—

1. To encourage the demand for English timber (and coppice), to advertise its superior qualities, to encourage its use by consumers, to organise the markets, and to assist the consumer to secure sufficient and regular supplies with the least possible trouble.

In pursuance of this first part of our policy the following are a few of the special steps we are taking (or have taken):—

(a) We are holding conferences with architects, railway and colliery managers, and representatives of other special markets to which I have alluded.

(b) We propose to distribute in the proper quarters information dealing with the different varieties of English timber and pointing out its special qualities for any particular purpose, and its advantages as compared with other timber—e.g., English oak for railway goods wagons, etc., English or Russian larch for fencing, etc., larch or Baltic fir for barge building, etc.

(c) We shall endeavour to give the fullest publicity to some of these points, so that the general public will insist on purchasing, and be willing to pay more for, the superior article—e.g., English oak for panelling, block flooring, entrance-gates, etc.

(d) We hope to act as a central bureau to which consumers can write on any point relating to English timber, and especially as to where supplies can be obtained. Architects wishing to specify English oak for panelling, or coopers desirous of purchasing English barrel-copps, will then know where to apply for information.

(e) We hope to organise new and to revive old woodland industries, and to take all necessary steps to ensure proper markets for our coppice and timber.

The above steps must have a beneficial effect on English timber: in fact, we can already point to good results. Moreover, we shall do everything to ensure a proper supply of the timber to meet the demand, and endeavour to bring about a proper organisation of the marketing.

2. To supply all information relating to English timber (and coppice), especially its marketing, and to assist members in every way possible in the sale by placing them in touch with the best buyers and taking steps to ensure them the best price obtainable.

To remove any misapprehensions I wish to emphasise that this is not a trading association, and we do not propose as a body to buy or sell any timber. We do not, therefore, compete with timber merchants. On the contrary, by creating a healthy demand for English timber, and improving the present position, we must do them a great deal of good, especially as we leave it to the recognised channels to supply this demand.

We do not charge commission on the sale of timber or otherwise, so we do not conflict with agents or auctioneers. We prefer in all cases to leave the actual negotiations on the sales of timber to be carried out between agent and purchaser. It is quite impossible for agents, with their numerous and increasing duties, unaided to keep in the close touch with markets that is so necessary to-day.

We limit our ground to the marketing and the commercial utilisation of timber, so that we do not interfere with the Arboricultural or any

other existing society, and we hope to work in cordial co-operation with all other bodies.

Let me now enumerate some of the advantages to be gained by

Combination in the Sale of Timber.

1. Permanent improvement in prices, by ensuring a full and regular supply of any description of timber for any special market. In many instances the greater the quantity of timber that can be relied on the better the price for every cubic foot.

2. Wider markets, since the larger the supplies of English timber from any district to any distant market such as collieries—the lower would be the cost of transport. A special traffic could be inaugurated, or special rates obtained, and alternative method, such as combined road haulage and shipping, could be organised.

3. Increased competition in the sale of timber by the introduction of buyers from a distance that it facilitates.

4. Additional strength obtained in fighting foreign timber or coppice.

ENGINEERING SOCIETIES.

The Society of Engineers (Incorporated).

The third annual general meeting of the Society of Engineers (Incorporated) was held at the Society's offices, 17, Victoria-street, on the 9th inst. Mr. John Kennedy, President, being in the Chair.

The Report of the scrutineers of the postal ballot for the election of Council and officers for 1912 showed that the following had been duly elected:—President, Mr. Arthur Valon; Vice-Presidents, Messrs. H. C. H. Shenton, Norman Scorgie, T. E. Bower; Members of Council, Messrs. Henry Adams, C. F. Walrand, Percy Griffith, H. C. Adams, J. R. Bell, S. Cowper-Coles, H. P. Maybury, B. H. M. Hewett, F. H. Hummel, G. A. Becka; Associate Member of Council, Mr. E. J. Simpson; Hon. Secretary and Treasurer, Mr. D. B. Butler.

It was announced that premiums for papers read at meetings and published in the *Journal* during 1912 had been awarded as follows:—The President's Gold Medal to Mr. W. P. Durnall for his paper on "The Generation and Electrical Transmission of Power for Marine Transportation."

The Bessemer Premium, value 5l. 5s., to Professor Herbert Chatley for his paper on "Resistance to Rolling."

The Clarke Premium, value 5l. 5s., to Mr. Gerald O. Case for his paper on "Ligno-Concrete."

The Burnays' Premium, value 2l. 2s., to Mr. J. P. Harris for his paper on "The Construction of a London County Council Low Level Sewer from Battersea to Deptford."

A Society's Premium, value 2l. 2s., to Mr. P. J. Waldram for his paper entitled "Test Deflections in Reinforced Concrete."

GENERAL NEWS.

The Christmas Holidays.

Next week the *Builder* will be published on Tuesday, the 24th inst., and to ensure attention all communications should reach the Editor not later than first post on Monday morning.

The Late R. Norman Shaw's Estate.

The estate of the late Richard Norman Shaw, R.A., is of the gross value of 104,627l., whereof the net personality has been sworn at 99,461l.

The Late E. B. I'Anson's Estate.

The estate of the late Edward Blakeway I'Anson, M.A., F.R.I.B.A., F.S.I., Surveyor to St. Bartholomew's Hospital and the Charterhouse, etc., is of the gross value of 87,194l., of which the net personality has been sworn at 70,746l.

The Late Mr. George Wilson's Estate.

The estate of the late Mr. George Wilson, F.R.I.B.A., of Edinburgh, has been sworn at 30,405l. gross.

Carpenters' Company Lectures.

The Carpenters' Company has again issued particulars of a course of lectures to be delivered in their hall on the arts connected with building. The names of the lecturers are a guarantee for the excellence of the intended lectures, and the whole series is an interesting one to artists

and craftsmen connected with buildings. The first lecture will be given on January 8 next at 7.45 p.m. by Sir Alfred East, R.A., the subject being "The Value of Colour to the Crafts."

Rebuilding of the G.P.O.

At a meeting of the Corporation at the Guildhall on the 12th inst. the Improvements and Finance Committee reported that the Postmaster-General had inquired if the Corporation had any schemes for public improvements as a result of the rebuilding of the General Post Office beyond the widening of Aldersgate-street, as in rebuilding on the site at St. Martin's-le-Grand it would be necessary to adapt the buildings to any widening improvements in the locality. The Committee suggested that Cheapside should be widened to 95 ft. at "Sweeting's Corner." That would involve the acquisition of additional land belonging to the Post Office and the setting back of Nos. 157, 157A, and 158, Cheapside. The Committee recommended that that course should be taken, subject to the London County Council's paying half the net cost. Mr. Seville moved the adoption of the Report. Mr. Deputy Wallace suggested that the Report should be reconsidered with especial reference to the necessity for simultaneously widening Newgate-street. The Court eventually adopted the Report.

Richmond Bridge.

A town's meeting was held at Richmond on the 17th inst. to consider resolutions urging upon the County Councils of Surrey and Middlesex the necessity of either widening the existing bridge across the Thames at Richmond or building a new one. The bridge is only 16 ft. 9 in. wide in the roadway, with footpaths barely 4 ft. wide on either side. After the meeting had expressed itself in favour of the erection of a new bridge a resolution was adopted declaring that the Middlesex and Surrey County Councils should be asked to consider the best means of improving communication between Richmond and Twickenham. A second resolution, recommending the authorities responsible to seek assistance from the Road Board, was carried unanimously. It may be of interest to mention that a plan showing a scheme proposed by Mr. Sydney J. Tatchell, F.R.I.B.A., for the improvement of Richmond, including the provision of a much wider bridge, was given in our issue for March 20, 1909.

A New Municipal Art Gallery, Dublin.

At a meeting held in the Mansion House, Dublin, a few days ago, a resolution moved by Sir Walter Armstrong was carried unanimously to take the necessary measures to enable the Corporation to avail themselves of an offer made to them by Sir Hugh Lane. Sir Hugh Lane has offered to present his collection of pictures, provided that before the end of next month some practical steps shall have been taken to erect a permanent gallery in a good situation for the collection as a whole. The Municipal Art Gallery is at present housed in Harcourt-street; it is suggested that a fresh site be chosen in the centre of the city, namely, in the park in St. Stephen's-green, presented by Lord Ardilaun many years ago. A subscription list has been opened, towards which a contribution of 2,500*l.* is conditionally promised by a resident in Canada.

United Service Club.

The "Senior," the oldest of the Service clubs in London, reopened their club-house in Pall Mall a few days since upon the completion of the enlargement, with many alterations, carried out by Messrs. Thompson & Walford, the architects. To Nash's structure of 1826-8, since extended on the east side (in 1842-60, by Decimus Burton), a further frontage of 40 ft. is added upon the site of two adjoining houses in Pall Mall. That site was taken for a large dining-room, with which is incorporated the old smoking-room, on the ground-floor, with a private dining and committee room on the first floor; and, on the second floor, thirty-nine bedrooms and bath-rooms. The old dining-room (south), facing the garden, is converted into a fine smoking-room; a new cardroom and a second billiard-room are provided. Messrs. Haines have cleaned and glazed many of the pictures, including the naval and military portraits. The new heating and ventilating arrangements are by Messrs. Kirkland & Capper.

Whitgift Hospital, Croydon.

The further widening of North End, Croydon, near the Whitgift Hospital, was again discussed by the Borough Council on the 16th inst., with the result that the old Elizabethan almshouses, as far as that authority is concerned, are now saved from demolition. The Council adopted, by thirty votes to eighteen, a plan of widening which will carry the new line of frontage across to the other side of the road opposite the hospital, thus leaving it intact. The scheme is estimated to cost 164,000*l.*

BOOKS.

An Account of Medieval Figure Sculpture in England. With 855 photographs. By EDWARD S. PRIOR, M.A., F.S.A., and ARTHUR GARDNER, M.A., F.S.A. (Cambridge: At the University Press. 1912.)

OUR first words are those of congratulation to the authors of this handsome volume. However apparent those influences which cannot be claimed as indigenous, influences which may be recognised alike in the Gothic architecture and sculpture of England, we cannot doubt that an indisputable case has been made out for the recognition of a distinct "school," or style, of native sculpture. Should it still be doubted, so careful has been the present survey, so closely-drawn a net has been cast around the subject, that it may be safely asserted that no further evidences can be forthcoming. It has been approached from the standpoint of motive, story, development, local peculiarities, materials—from every aspect which can complete the thoroughness of its treatise. All those acquainted with Mr. Prior's "History of Gothic Art in England" will be sure that he will prove as jealous a custodian of national prestige with regard to sculpture, as he showed himself in architecture. And this, indeed, is the case. There are, however, those who regard medieval art as something which is primarily, at least, beyond any one national claim, who look at it as a manifestation embracing the whole of western civilised Europe, and note its differences as secondary characteristics only. We would rather take this view of it ourselves—a view that is far more ready to admit the introduction of outside influences, than the authors of this book would possibly admit. Yet at the outset they make a bold concession in ascribing the style and the carving of Anglo-Saxon crosses of the VIIIth century to foreign sources. But this spirit of concession does not extend far, for they claim the Bradford-on-Avon angels, and the Romsey rood, as evidences of a Saxon school of sculpture. We find it difficult to isolate and establish English characteristics much before the XIIIth century, while in many examples of that period we must recognise French influence. But, broadly speaking, the sculpture of that period displays a style not only that is individual, but a style that is of the highest order. While preserving its traditions, traditions handed down from Greek sculpture, a style was evolved that was entirely new and original. It was the work of the mason. But with the XIVth century came the sculpture imagers, and under their hands the new and original was torn from the traditional to which these elements were bound, and the result belonged no longer to that high order of which we have spoken. These imagers must be classed with the shop sculptors, the producers of effigies, although this particular trade adhered to the traditions of their calling and continued to turn out good work throughout the century. These effigy-makers had their headquarters at London and Purbeck, and established what the authors speak of as the London School. Such a term of distinction may reasonably be applied in this instance. French influence is noticeable here as is Flemish in the Eastern counties. But the number of local "schools" distributed throughout the country to which our attention is drawn is something new to us. We find it difficult, for instance, to identify an "Exeter School," and relate the evident decadence exhibited by the sculpture upon the western screen with other local examples. We fail to notice the dominant contrast of handling that one meets with in Greek sculpture between examples that are contemporary, such as the style in which the Phigalean frieze is conceived, and that of the Temple of Victory, although many of the groupings are identical.

But comparative methods such as these, as employed by the authors, show the thoroughness

with which they have dealt with their subject, and, whatever classifications may be adopted, the splendour of the XIIIth century sculpture at Wells, Salisbury, Durham, and Westminster emerges, and arouses the admiration of the reader.

Staircases and Garden Steps. By GUY CADOGAN ROTHLEY. (London: T. Werner Laurie. Price 6s.)

OF all the features of interior building construction, stairways and fireplaces have been the most backward in development.

Regarding the latter, a writer says, in 1557, that in his young days there were not above two chimneys in "all uplandish towns." The dangers attendant upon their use prevented the advance of both; of attack in the one case and of conflagration in the other. Advance in house planning was kept at bay by these two considerations. It is the first case we are now considering. So long as dwellings were fortified it was necessary for stairways to be capable of defence, for which reason they were often external, or if admitted into the dwelling, were narrow and spiral, confined to a turret or within the thickness of the wall.

The protection offered by the courtyard plan of the Tudors was taken advantage of. Staircases were multiplied leading to the various parts of the building. Abroad, where this method of planning was more common, a broad flight led up from the yard, as at the Bargello, Florence. Broad flights were no new thing. They date back to the earliest Assyrian palaces, but they could have no place in defensive architecture. Even when the change came, stairs were relegated to the most obscure corners, and a descriptive term rather than "staircase" was "stairhole." That a staircase could offer welcome rather than defiance, was a conception reserved for a later style of architecture, when it took its place as an integral part of house planning. The ample and serviceable staircases of the Elizabethans, and the noble flights which figure in the palatial architecture abroad, and the Georgian at home, made this feature one of the most important in the hands of the skilful planner.

Such is the history of the staircase as it is set forth in the book before us. It would have been greatly assisted by additional plans, which might with advantage appear in a subsequent edition.

"Garden steps," again, for which a chapter is reserved, when treated with the science and success that they were in Italy, calls for fuller illustration and deserves ampler treatment.

BOOKS RECEIVED.

THE ART AND CRAFT OF GARDEN-MAKING. By G. H. MANSION. (London: B. T. Batsford. 2*l.* 10*s.* net.)

INSURANCE SHAREHOLDERS' DIRECTORY, 1912-1913. (Manchester: The Policy-Holder Journal Company, Ltd. 2*s.* 6*d.*)

A HISTORY OF ENGLISH GLASS PAINTING. By Maurice Drake. (London: T. Werner Laurie. 2*l.* 2*s.* net.)

THE LONDON COUNTY COUNCIL.

THE usual weekly meeting of the London County Council was held on Tuesday in the County Hall, Spring-gardens, S.W., Lord Chylesmore, Chairman, presiding.

Loans.—The Finance Committee recommended and it was agreed that loans should be made to Borough Councils as follows:—St. Pancras, £1,76*l.* for electricity undertaking; Stepney, 7,150*l.* for site for depot; Shoreditch, 5,200*l.* for housing; and Westminster, 56,000*l.* towards improvements.

Regent's Park.—The attention of the Chairman of the Parks and Open Spaces Committee was called to "the large buildings which have been erected in Regent's Park in connexion with Bedford College," and was asked if he would take steps with a view to an urgent representation being made against the erection of any additional buildings in the Park. The Chairman replied that the whole matter was being considered by his Committee.

New County Hall.—In a Report presented by the Establishment Committee it was recommended that tenders should be invited for the erection of the superstructure of the new County

After some discussion, during which the Chairman of the Committee stated that eighteen members were to be invited to tender, of whom seven were London firms, the recommendation was agreed to. It was also decided, in order that the execution of the masonry and stonework might be effectively supervised on behalf of the Council, a form of contract should provide for a joiner and stonework, except granite, to be prepared within a radius of 20 miles from the Cross.

The next meeting of the Council will be held on Tuesday, January 21, 1913.

CORRESPONDENCE.

"A Thoroughly Up-to-Date Society."

SIR,—In common, I believe, with nearly all members of the R.I.B.A. I share the regret expressed in your leading article of November 29 which my attention has recently been drawn to on the policy of the Society of Architects officially enunciated in the President's annual address.

Mr. Tubbs is correct in stating that the main object of the Society's creation and the source of its early success was the promotion of the stipule of the compulsory training of all architects, and we know that it has since done no service in this cause. That this was a feeling and much-needed movement twenty years ago when the R.I.B.A. was against reform of the kind has been amply proved by subsequent conversion and its present efforts to obtain an Act if a workable one can be devised. It is a pity that instead of holding a watching brief for the fulfilment of its ideal it should be proposing to trespass on the principal functions of these examining teaching bodies.

Such a movement as the establishment in London of ateliers on the Parisian plan is feasible. It is without doubt in the best interests of architecture (which the Society professes to be) that the Architectural Association or the London University should organise such additional facilities for study. But your article offers very sufficient reason for pause before interfering with a rapidly maturing and thoroughly English system of training in the form of a continental course.

The Society originally laid down for its object the following lines:—

"That the R.I.B.A. was the proper body to promote and pilot such a Bill through Parliament."

"That the Institute should, if possible, be the sole examining body under any registration of architects. The Society wisely deprecated the multiplication of avenues into the profession, greatly increasing the difficulties of training, and hindering unanimity of the profession in efforts to uphold high ideals of practice and discipline. Many of us feel that a false step taken by the Society some years ago in publishing an examination of its own in opposition to these first principles, and, in my humble opinion, it will be making another false step in the same direction if it should pursue its projected scheme; though no one can expect to succeed in face of the present ample training facilities."

The Society would seem to have plenty of work before it in forming professional opinion, and in criticising or assisting the R.I.B.A. in the great and difficult project which it has undertaken.

W. H. SEFT-SMITH, F.R.I.B.A.

Should the Names of Assessors be Known?

SIR,—I have read in your issue of the 13th inst. a pleasure and interest the two kind critics of my open letter to the R.I.B.A. by my friends, Mr. W. A. Pite and Mr. P. Morley, and, would like, in reply, simply to ask a question. What ghost of a chance would the name of a really good English design with a touch of flavour of Tudor have had in the recent competition for the Manchester Art Gallery, or any other public building competitions—London County Council Offices, for instance? Mr. Pite's suggestion, with regard to the R.I.B.A. in making the assessing of all competitions, is admirable, if the Institute could be induced to give up its present advocacy and bias in favour of a particular style. I quite agree that no architect should compete unless a competent professional referee or body of assessors be called in to judge the work. But if

those judges, or that judge, is pledged to a Classic style, no English need apply! In short, the Tudor man has no chance.

Can it, then, be truly said that the influence of the assessor is negligible? It is not a question as to whether the lay public care or do not care if it is so. But it matters awfully to the future of architecture if all those are excluded who will not hold the candle to the devil and try to work in the fashionable style of the period.

I agree with Mr. Morley Horder that it would be far more difficult to make a modern town hall on Tudor lines than on Renaissance lines, because in the one case the elevation grows out of the plan, but in the other the plan is squeezed into the elevation. One system is creative, the other is adaptive. C. F. A. VOYLES.

Logic in Architecture.

SIR,—Your leading article under the above title in your issue of December 6th must commend itself to everyone who perceives and deprecates the lack of that quality general in British contemporary design. There is, however, one passage therein which I do not suppose that the writer either expects or desires to pass unchallenged.

Rejecting the school of Cockerell as "more or less exotic," he says, "we believe that in our own Renaissance, in the work of Inigo Jones and Wren and Chambers, we have models on which to base our work, and from which we can reasonably hope to develop a suitable style for the needs of to-day, and that such work is a much safer basis on which to build than that of the Neo-Grec or any so-called 'revival.'"

This is a point of view held by very many people, and the exact opposite is also held by very many people. Are we to have "the battle of the styles" again? I trust not. Nevertheless, I ask your indulgence for presenting the contrary standpoint.

I take it that the Jones and Wren school put their trust in the union of a sober and restricted classical vocabulary with the charms of colour and texture. They will endure no attenuated orders, no flat-pitched pediments, no pilasters of very slight projection, no shelf-like cornices bereft of bed moulds, no extremes of bas-relief externally or internally, no stucco, no thin iron sash bars, no "44-in. window reveals," etc. All these to them are "marks of the beast." They would have their buildings well quoined and corniced, thoroughly key-blocked and sash-barred, externally of honest red brick or Portland stone, internally wainscoted and plentifully garnished with pendent green-grocery; like this, and only like this, may a house or a town hall or a public library be.

Now we cavillers are not content with such limitations. The heavy entablatures get in our way sometimes, and we sigh for the licence of Mr. Robert Adam in this respect. We want broad three-light windows without the obligation to arch the middle light, we want to apply pilasters without immensely thickening the basement wall on which they stand, we want to use stucco without having to construct heavy projections, we want plate-glass French windows sometimes, bay windows often, we want trellis verandahs, stairs with continuous handrails, deep-shelved chimney-pieces, and rooms in which the decoration is in scale with delicate furniture.

All these Messrs. Jones, Wren, and Chambers withhold from us, no matter how ungratefully we receive the insistent keystones, the shouldered architraves, the broken pediments, and trophies of edible objects which are offered to us as the all-in-all of decoration.

Since the death of Chambers what has been added to the resources of his style? Something by Bonomi, something by Brydon, something perhaps by Norman Shaw. But Cockerell's was no limitable repository of this kind—he was no imitable quarry of unnumbered mines. And this is what we, too, must endeavour to achieve.

I do not suppose for an instant that the modern movement in England, most improperly called the "Neo-Grec," is destined to supplant anything worth having in our older "English Classic" tradition. But I do suppose and trust that it will make much that to-day escapes criticism beneath the loose cloak of "Jones and Wren" impossible. The new manner is a rigorous one in which mere colour and texture avail nothing, and in which the bad work will stand forth naked, and, let us

hope, ashamed. The tide rises, soon it will be at the flood, and soon, too, it will have ebbed. What may succeed then none can tell now, but it would seem safe to prophesy that the waves of "Neo-Grec" will leave some treasure on the sands. And the funds of architecture at present are very low.

H. S. GOODHART-RENDEL.

Pugin and Ruskin.

SIR, Mr. Randolph's letter in your issue of December 6 courteously points out that to speak of Augustus Welby Pugin as "the ardent lieutenant" of Ruskin is misleading. Its meaning clearly is that Ruskin led the way, and that Pugin supported.

It may, therefore, be useful to give a few dates. Pugin published his "Contrasts" in 1836; his "True Principles" in 1841. In both works he denounced shams and advocated truth in architecture in clear and vigorous English, and with no little humour.

It was not till 1849 that Ruskin's "Seven Lamps of Architecture" appeared; nor was the first volume of his "Stones of Venice" published before 1851. In these John Ruskin proclaimed, in poetical and beautiful language, the principles which Pugin had laid down many years before. The charm of Ruskin's prose was already famous through his "Modern Painters" and other writings, so that he certainly commanded a larger audience; but to speak of Pugin as his "lieutenant," in any sense, is an injustice which, as one who knew the man, I would correct. For this injustice does not stand alone. Even in the able article in the "Encyclopædia Britannica" the writer speaks of Pugin having designed much of the detail of the Westminster Palace "when he was working as paid clerk" to Barry. Pugin was living at Ramsgate and carrying on his own practice as an architect while supplying Barry with the details for the new building at Westminster. Those details included stone carving, wood carving, metalwork, tiles, stained glass, furniture, paperhangings, stuffs; besides many architectural schemes for the internal treatment. It is not many months since I deposited in the Victoria and Albert Museum a considerable number of these very designs. But to describe Pugin as Barry's "paid clerk"! On the whole, it is perhaps lucky for the writer that Pugin is dead.

INTERCOMMUNICATION COLUMN.

Clay Foundations.

SIR,—Having to do with an estate with clay foundations, I was much interested in the correspondence in the *Builder* of October 13, 1911, as I found that some of the buildings had sunk, leaving cracks. I was not anxious to do any underpinning work, partly owing to the expense and partly owing to my hope that with wet weather the clay would swell again and push the buildings back into their proper position. This had happened on a former occasion some years ago, though I regret I did not take notice of the dates. It may, therefore, be of some interest to you to know that, probably as a result of the recent exceptionally wet summer, the portions of the buildings which had subsided have almost resumed their normal position, and the cracks are almost filled in. I hope that with further wet weather, which may be anticipated during the winter, the cracks will entirely close. If this experience is borne out by others, it should be possible to prevent buildings erected on clay foundations from moving, by letting pipes vertically into the ground, one end just below the foundations, and the other at the ground level, and pouring or forcing water into the clay in exceptionally dry seasons. M. B. C.

TOWER AND STEEPLE, ST. MARY-LE-BOW, CHEAPSIDE.
Messrs. Dove Brothers, of Tokenhouse-buildings and Islington, are restoring the tower and steeple of St. Mary-le-Bow, Cheapside, and reinstating with new the stone worn by exposure to the weather and fractured by the iron cramps inserted when the spire was first erected. The defective slate covering to cornices is also being removed and replaced by sheet lead. Some thirty years ago the same firm removed and renewed two of the large stone columns to the base of the steeple, effecting this drastic restoration without the slightest settlement in the structure. The work has been carried out under the superintendence of Mr. E. S. Underwood, of Queen-street, Cheapside, E.C.

ILLUSTRATIONS.

Stockport Police Buildings.

WE illustrate herewith the first promulgated design, by Messrs. J. T. Halliday, A.R.I.B.A., & C. Paterson, A.R.I.B.A., for the Stockport Police Buildings. The unusual nature of the site largely dictated the planning of the scheme. The front portion adjoining the main street consists of a bank rising some 25 ft. above the rest of the site, as shown in the section. The opportunity thus presented was taken to arrange the courts, public rooms, offices, etc., on the street level, and to place the cells and police quarters on the lower level, approached from the drill-yard, which occupies the lower portion of the site. By this means the cells are quite distinct from the part of the buildings to which the public have access, and at the same time have easy approach to the docks in the courts.

The accommodation consists of two courts and children's court, magistrates' rooms, solicitors', barristers', and witnesses' rooms, police and licensing offices—all in the upper portion of the building—the police constables' department below containing a large parade-room, mess-room, recreation room, etc., caretaker's and jailer's houses (the latter containing two detention-rooms for juvenile offenders), and two tiers of cells for male and female prisoners respectively. The prisoners' exercising yards are enclosed between the parade-room and main block.

The children's court and its approaches from the detention-rooms and for interested parties is quite distinct from the general working of the police courts.

The facings are of red bricks with Portland stone dressings. The roofs are of concrete covered with asphalt. The estimate cost is 23,000.

Parliament Buildings, Winnipeg.

In the competition for this important building Mr. F. W. Simon, F.R.I.B.A., was declared to be successful, and his design was illustrated in the *Builder* of November 22. The competition

was open to any British subject practising in the British Empire, and among the architects who entered was Mr. G. A. Bligh Livesay, F.R.I.B.A., whose design we illustrate in this issue.

Baroque Architecture.

The illustrations of the two buildings in Salzburg are in connexion with our seventh article on "Baroque Architecture," which begins on p. 749.

MEETING.

FRIDAY, DECEMBER 20.

The Institution of Mechanical Engineers, Mr. J. Wenys Anderson on "Vapour Compression Refrigerating Machines," and Mr. John H. Grindley on "A Contribution to the Theory of Refrigerating Machines," 8 p.m.

COMPETITION NEWS.

A list of current competitions is printed on page 765.

Glasgow Municipal Buildings.

The preliminary sketch designs submitted to the Corporation of Glasgow for the proposed extension of the municipal buildings have been considered by the assessor, Dr. J. J. Burnet, A.R.S.A., whose report has been adopted. There were 103 competitors, and the following architects have been invited to submit completed drawings in the final competition at an honorarium of 100 guineas each: Messrs. P. H. Keys, A.R.I.B.A., and Dowdswell, Beaconsfield, Bucks; Messrs. E. Vincent Harris, A.R.I.B.A., and T. A. Moodie, A.R.I.B.A., London; Messrs. Watson & Salmon, Glasgow; Mr. J. B. Fulton, A.R.I.B.A., London; Messrs. James Wright, jun., and W. J. Blain, Glasgow.

School Buildings, Llanelli.

The competition for school buildings, Llanelli, has been decided as follows:—First promulgated design, by Messrs. Woodhouse & Dean, 100, King-street, Manchester; second, Mr. Harold Brakspear, High-street, Corsham, Wilts; third, Mr. A. J. Shaw and T. H. Vowles, 35, St. James street, Burnley.

Baths, Balham.

We are informed that Mr. H. W. Wills, A.R.I.B.A., has been appointed assessor for the competition for baths at Balham.

Workmen's Dwellings, Dursley, Glos.

Mr. A. W. Probyn, of Gloucester, has been named as the successful architect in this competition, and he has been engaged by the Dursley Parochial Committee to carry out the work of erecting thirty-eight new dwellings.

New Guildhall for Devonport.

The Devonport Town Council have adopted the report of the Municipal Buildings Committee recommending that plans and designs be invited for the erection of a new Guildhall and municipal offices, at a cost not exceeding 70,000, exclusive of furnishing.

Designs for a National Palace, Hayti.

The Acting Consul-General at Port-au-Prince reports the announcement in the *Mondieu* that a competition of designs for a National Palace at Port-au-Prince is announced. Plans will be received by the "Département des Travaux Publics," Port-au-Prince, up to February 4, 1913, and premiums of 500 dols. (about 103L.), 250 dols. (about 51L.), and 200 dols. (about 40L.) will be awarded for the best three designs, after which the Government will call for tenders for the execution of the work. The building and furnishing of the new palace is expected to cost about 80,000L. The *Mondieu* containing further particulars, may be seen by British architects at the Commercial Intelligence Branch.

FIFTY YEARS AGO.

From the *Builder* of December 20, 1862.

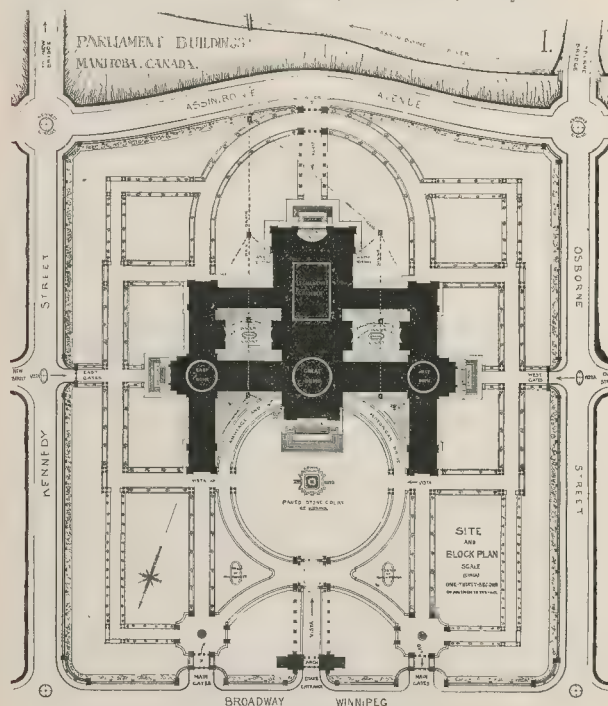

LIGHTING STREETS BY PHOSPHORUS.—I have alluded to the fact that houses freshly painted with lime-wash are frequently luminous at night, though slightly, after exposure to the sun's rays during the day. If by chemical and physical research means were discovered capable of rendering this phosphoric light more powerful, by employing sulphides of calcium, or barium, etc., and superadding, if necessary, the action of an electric current when the sun is hidden by clouds, a street might be effectively illuminated by phosphorescent light alone.—*Physon on Phosphorescence.*

* * This note prophetically anticipated developments that occurred some years later. Balmain's "Luminous Paint," the bases of which were phosphorescent compounds of barium and calcium, proclaimed great possibilities. It was employed for such confined spaces as the interiors of railway carriages and ships' cabins, while such small articles as match-boxes were attractively and usefully treated with it, that they might be recognisable in the dark. There used to be a room at the Crystal Palace, which one might visit for the sum of 2d., lighted by an arc lamp, and upon the light being switched off, one enjoyed the surprise of finding the room still illuminated by wall radiation. Self-luminous compounds, however, appear to decompose under the action of the atmosphere, and, losing their virtue, they have been robbed of their commercial value.

Experiments have also been made towards the construction of a lamp in which an electric discharge is directed upon a block of phosphorescent lime, but the high tension required proved an obstacle. Were radium so easily obtainable that it could replace the electric discharge, we might have lamps which would shine indefinitely, and a less divided attention could then be turned upon the problem of perpetual motion. An effective phosphorescent lamp is, however, no unlikely discovery.—*Ed.*

SEAMEN'S INSTITUTE, DUNSTON.

This new institute has been erected on a site given by Lord Ravensworth, and has been designed by Mr. J. H. Morton, F.R.I.B.A., architect, of Newcastle. The contractor was Mr. William Harbrow, of London.

Parliament Buildings, Winnipeg.

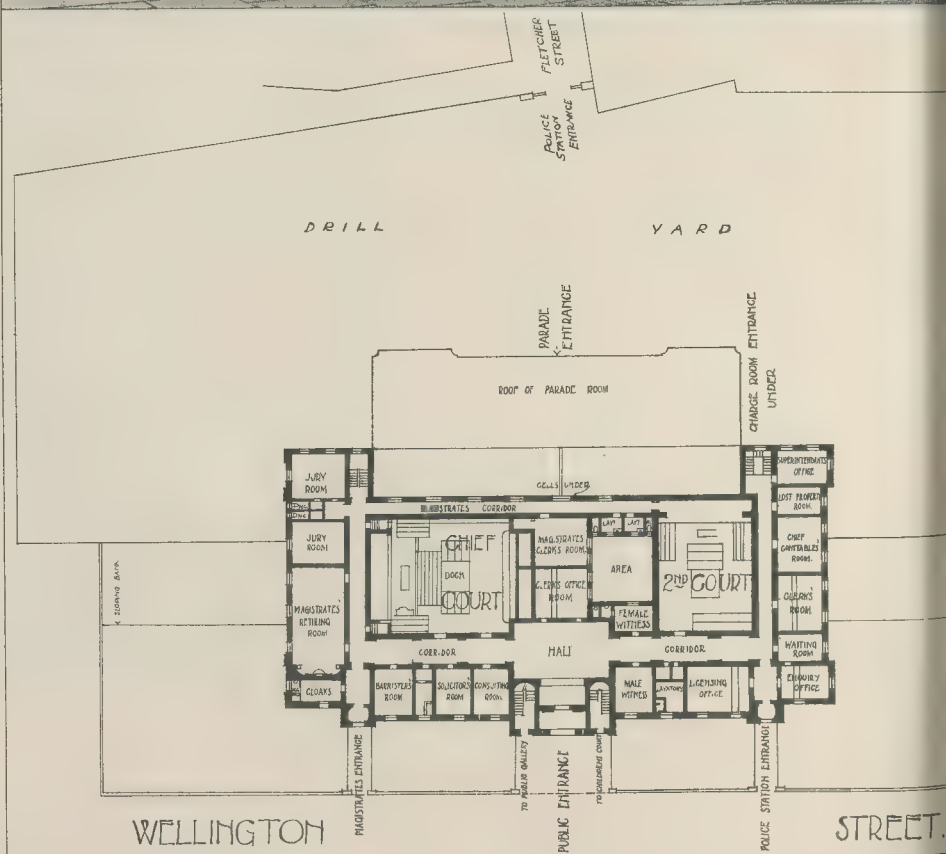

Design by Mr. G. A. Bligh Livesay, F.R.I.B.A.

BAROQUE ARCHITECTURE:

VII. -BAROQUE ARCHITECTURE IN GERMANY AND AUSTRIA.

(Continued from page 581.)

It is so generally recognised that geography may influence architecture that one would naturally expect to find a striking difference between the buildings of Italy and those of the Teutonic lands. That is less easily realised perhaps is the overwhelming importance of the Alps in history. This vast and threatening wall through the past, right up to the days of XIXth-century engineering, made intercourse between north and south so precarious, so slow, and so expensive that the difference between Italy and Germany—neighbours as they are—a wide and distinct divergence. In no way is this more apparent than in their art; in no branch of art more than in their architecture. The Italian the German was in ancient days simply a barbarian.

It is perhaps the very fact of his barbarianism which has made his architecture difficult to understand, for he has borrowed it from France, then from Italy, and has dom created a whole series of normal development for himself. There is, of course, the glorious exception of his earlier days, when the iron-crowned Lombard kings took them into the fertile plains of Northern

Italy those grand brick churches which they had thought out for themselves on the banks of the Rhine. But, save for this distant age, we must admit that German architecture has only at times been really national. And this brings us to another problem which faces every student of this country—what is Germany? Are we, in reading of the Middle Ages or the Thirty Years' War, in writing of the buildings produced in those great periods, to take up our atlas as it is to-day to see where the boundary of Germany lies? Rather is it necessary to forget our modern ideas and to remember that there was no such definite thing as Germany in the present-day sense 300 years ago, not even such a thing as Prussia; just a looser federation of petty kingdoms—some secular, some ecclesiastical—under the feeble and weakening rule of that ridiculous historical anomaly, the Holy Roman Empire. But even if we agree that it was not Holy nor Roman nor an Empire, we find that it included almost throughout its long existence the German-speaking peoples—that is to say, the Dutch, the Swiss of the northern cantons, the Austrians, and the Bohemians. Holland and Belgium will be

discussed in a future article, but Germany, as it will be treated here, will be held to comprise Austria, Bohemia, the Tyrol, and part of Switzerland, its natural geographical limits and its actual extent in the period of which we are treating. The centre of gravity in Germany to-day is Berlin; in the XVIIth century it was further south, and the wealth of the country lay rather in the Bavarian cities and along the Rhine. The hegemony of Prussia—a comparatively recent growth—has made it difficult for us to-day to realise the Germany of old.

Moreover, every traveller in Italy and student of her art finds on reaching France, or England, or Germany that what is meant by the Renaissance in these countries is very different from the Renaissance he left at Rome or Florence. Except for the originalities of the Baroque period, he had found but little of unconventional form to distract him, and indeed if he had been a really enthusiastic traveller, and had only looked up when his guide-book told him to do so, he might have escaped seeing Baroque buildings at all. Yet on arriving at any famous city of these more northerly lands he finds himself as much at sea as he would in a *plateresque*

Munich : St. Michaelskirche.

palace in Spain. He is surrounded by all the eccentricities of the Elizabethan manor-house, and all the freakishness of De l'Orme. This, he is told, is German Renaissance of the purest period. Then what on earth can it be in its Baroque forms, he silently wonders? It is a considerable mental struggle to dissociate one's mind from its groove in leaving Italy and to reconcile oneself to the environment of so-called barbarianism.

Perhaps the explanation lies in the fact that, whereas Italy had no really important Gothic period of her own, nothing of really epoch-making value, the Middle Ages were of paramount importance north of the Alps. Conversely, the Renaissance grew the more rapidly in Italy, not alone because her spirit was receptive, but because her slate was more or less clean. What Gothic ideas she retained were in a sense of alien growth; the classic tradition was not. In Germany, on the other hand, the churches and town halls of the mediæval builders had become very much a part of national life. Adopted somewhat late from France, German Gothic architecture had a great vogue just at the time when the new spirit was regenerating Italy. That the Renaissance was never introduced into Germany in a pure form cannot be denied. There are, for instance, the Residenz at Landshut, the Belvedere in the Schlossgarten at Prague, and the Fürstenthof at Wismar—all erected within some twenty years (1536-1555), and all of them in the dainty cinquecento style. Or one might mention the Zeughaus at Plassenburg (1607), a Palladian building recalling the hand of our own Inigo Jones. But these are, on the whole, exceptions, and the freedom of German Renaissance must be attributed not to Baroque influence from Italy, but, as in other northern countries, to the strength of the Gothic tradition

which hampered the growth of the new fashion and prevented it ever becoming as much of an upheaval as it had done south of the Alps. There could be no real native Baroque style in Germany, for there was no need for a revolt against pedantry where no pedantry existed. That the Baroque spirit was introduced is unquestionable, else why devote two articles to it? That the origin of it was German is quite a different matter. Our first object is to define to some extent the German Renaissance in architecture so as to show the point at which Baroque influence may be detected, and later the point at which that influence became supreme.

Three buildings have been mentioned as exceptional, displaying the influence of Italy with little admixture of mediæval elements. The majority of examples, however, are of a heavier and more whimsical type, and may be placed between the Elizabethan style in England and that of Henry IV. in France. Few churches were erected, but a great number of large and important houses, grouped for the most part in towns, often round a market-place. That these market-places were laid out on any scientific principle one rather doubts; yet they have been copiously illustrated in modern books on town planning as though such was the case. It seems more probable that intentional and systematic town planning as we know it dates from no earlier than the XVIIth century, when the craze for vistas and for a lay-out first became fashionable. A walk through the quaint streets of Rothenburg—one of the most typical and picturesque of all German cities—does not leave in the mind any impression of studied effort of this sort, rather a very delightful haphazard result, for which the various styles of its architecture seem particularly well adapted. The corporate spirit of these towns, on the

other hand, was as strong as in any other country at any period of history. Their principal monuments in most cases are the Rathaus (or town hall), the Zeughaus (or arsenal), and the residences of the merchant princes rather than of great nobles. The castles on the Rhine are mainly mediæval; the great country mansions and palaces are in the French Rococo style of the XVIIIth century.

The change from Gothic to Renaissance was a very gentle transition, perceptible in detail rather than in general principles. The great roof remained, with its ranges of dormers to air the space within where the family linen was dried after the famous monthly wash. Sometimes the ridge ran parallel with the line of the street, sometimes at right angles to it, in which case a great gable resulted. In Cologne and other cities these gables were stepped, and almost everywhere the exterior was richly decorated. But generalising is easy, and the reader may still demand a reason for denying that these picturesque Renaissance buildings are to be regarded as of the Baroque class.

The answer may be found by a careful study of their detail and carving, as well as of their construction and leading lines. The Renaissance spirit predominates, but the freedom of its manifestations is due to the slowly-dying influence of the Middle Ages rather than to the revolution south of the Alps. Here we have a justification for contending that Baroque architecture is not simply eccentric or simply florid. In its most florid forms it is not more florid than that of the *plateresque* period in Spain, the period of Louis XIV. in France, the Elizabethan age in England, nor is it more eccentric than any of these. It has indeed an entity of its own, and the preceding articles will have shown how its character may be recognised in Italy, without retracing our steps through lengthy definitions. Suffice it to say that any departure from the purity of conventional Renaissance models which can be attributed to lingering Gothic tradition shows conclusively that a building is of an imperfectly-developed rather than of an over-ripe Renaissance type, whereas the Baroque influence followed the Renaissance.

The position is greatly complicated in Germany by the fact that few buildings remain which show the same purity as Palladio's in Italy or Wren's in England—the mediæval tradition affecting architecture even up to the time when the standards of revolt were brought over the Alps by the Jesuits.

A few examples may be cited from places familiar to most English travellers. The Castle at Heidelberg possesses two wings, adjoining one another at right angles, which are typical of their period. The Heinrichsbau (1556-9) is in the Italian cinquecento manner, but with decoration and rusticated pilasters of less familiar form, more akin indeed to English Elizabethan. The Friedrichsbau is fifty years later (1601-7), and is almost Baroque in many of its details, yet tinged with mediævalism, as in the tracery of the ground-floor windows. The ornament is rich and florid, the gables boldly and strongly designed.

The Rathaus at Cologne possesses a loggia or porch which is frequently cited as a remarkably pure example of Renaissance architecture, but can only be so regarded outside Italy, for it transgresses classic rules in sundry details, and the arches of its upper story are slightly pointed. Built in 1569-1573, it was won in competition by Wilhelm Vernyken.

Other good examples of this "Elizabethan" period are the gymnasiums at Ansbach (1563) and Coburg (1605), the town halls of Görlitz and Rothenburg-o.-d.-Tauber (1572-90), the Bishop's palace at Bamberg (1563), and many of the houses at Hildesheim; while further north the town hall at Bremen (1612), the arsenal at Danzig (1605), and various houses in Lubeck are characteristic of the style in Prussia, where brick is the usual material.

The next class includes those buildings which Baroque elements are found, though they do not preponderate—a sort of transitional period. Some we may merely mention, as, for instance, the palaces at Jaffenburg (1605-13) and Mainz (1627-8), plus early XVIIth-century houses in Jelen and Nuremberg, the Baumeister's house at Rothenburg (1596), and the University Church at Würzburg (1580). All these show a normal progress towards Baroque, but it may be noticed that theirs are only slightly later than those in the last category, and an isolated example of Baroque architecture near Torgau (Schloss Hartenfels) may be mentioned as being apparently more advanced than most of these, though built only as late as 1532! Two churches of note—Marienkirche at Wittenbuttel (1608-11) and the Franciscan Church at Jaffenburg (1553-63)—are worthy of comment at this juncture, because they seem to defy classification, having as much in them of the ethereal as of Rococo, of Gothic as of Baroque, yet not enough of any one of these styles to be easily recognisable as belonging to it. Thus is a student of Baroque architecture handicapped by its very variety! A good example of this class is to be found in the famous Pellerhaus at Jaffenburg, the façade of which dates from 1579 (p. 749). The interior is also interesting, typical of the period, but what we can get of the front applies to most of the rest of the building. From a heavy and severe Gothic basement story the eye finds at each successive stage an increasing freedom and lightness, a loosening of restraint and an increase of treatment which in the plastic outlines of the gable—notably picturesque even in these quaint streets—leads into the flowing scrolls and the jocose sculpture of the Baroque period. And at this point we will abandon further study of transition, crossing the faintly-marked border-line to meet the Jesuit church-builders. To understand adequately the extraordinary influence on architecture wielded by the Jesuits the reader should recall what has been said of XVIIth-century Christianity in an earlier chapter. But in Germany these battles of the Counter-Reformation had a harder struggle than in Italy or Spain. Many had, during the Reformation, become largely and genuinely Protestant, and she did not become wholly so was due much to dissensions within her ranks as to attacks from without. Quarrels among keen theologians disposed the people at length to consider the plausible teachings of these new apostles, who at first had been met with fierce opposition and bitter animosity. It was in 1550 that a pious Catholic prelate, attending the Diet of Jaffenburg, first heard of the Jesuit Colleges, and advised the Emperor Ferdinand to found an institution on these lines in Vienna. Within a few years of their coming in the following year, their success was remarkable. No longer was made of their mission. It was, as we are told, "to restore the declining tenets of Catholicism by learned and pious Catholic teaching." Some of them were Spaniards, some Italians, few of them really understood the country or its language. Yet by their energy and their devotion, their great intellectual knowledge, and their courteous and their urbane manners and their perfect civility, they captured German education, day by day, in its southern provinces. From Jaffenburg they moved to Prague, to Ingolstadt, to Moravia, from Cologne to Trier, Mainz, Jaffenburg, Würzburg, and even to Protestant Frankfurt.

But, as in other countries, the architectural labours of the Jesuits are to be seen a generation later, when those whom they had educated were old enough to help them in their work. Then we find a long series of churches erected after church building had been a standstill for a century. Nor was the movement confined to churches alone. Still more significant are the new Universities and seminaries, the real key to their power.

It is in these buildings that we first see genuine Baroque architecture as we have learned to know it in Italy. The true source of the style being in Rome, it was only natural that the Jesuits who had been trained there should come to Germany imbued with its principles and longing to carry them into execution. All that their movement implied, its confidence, its militant spirit, its brilliance, its exaggerated appeal to the plain man through his intellect rather than through his heart—all these things, as well as the motives of pride and self-sufficiency—could be expressed in Baroque architecture as in no mediæval style.

Moreover, there was an actual need for building. Education was making rapid strides, and the accommodation for students was inadequate. The active Catholicism which came into collision with Protestantism in the terrible Thirty Years' War required new palaces for its great territorial prelates, new statues of the Virgin for their cities.

German architecture had already proceeded so far on the way towards the new fashion brought from Rome that her builders eagerly adopted from the rapidly rising churches and schools ideas which transformed their town houses and town halls into Baroque buildings. The greatest change, however, is to be seen in a comparatively small part of the great German and Austrian empires of to-day, in the parts which are most accessible from Italy, and which in the XVIIth century were the most wealthy and prosperous. In many places palaces continued to be erected in a more classical

manner, something, in fact, very nearly akin to the work of our own Wren in England, but on a smaller scale and in isolated cases. The Zeughaus at Plassenburg (1607) has been cited. To this one might add much later examples, the Schloss at Ansbach (1713), and that at Biebrich, the royal palace at Berlin, the Schlosskapelle at Eisenberg (1680-92), the Landhaus at Innsbruck (1728), and the Rathaus at Nuremberg (1613-19). A parallel instance in Italy is the Palazzo del Gran Guardia Vecchia at Verona, dating from 1609, when Baroque architecture had become usual in that country. But in Bavaria and in the provinces of Austria and Bohemia adjoining, where the people never have been wholly Teuton, the new movement emanating from Italy found the readiest response and made great strides. Perhaps the two cities in which it may best be studied are Salzburg and Prague, the former lying almost on the boundary-line between Germany and Austria, the latter being the capital of the ancient kingdom of Bohemia.

Salzburg.

Salzburg is in many ways unique, both in its situation and in its history. It stands at a bend in the Salzach River where the last foothills of the Austrian Alps melt into the great valley of the Danube and its sister streams. It is commanded by two of these hills, one crowned by a convent, the other by that wonderful fortress which has so often saved the town below. In classic days capital of the Roman province of Noricum, in modern times of an Austrian

VILLA AMERIKA : PRAGUE

province, Salzburg was in the XVIIth century the head of an independent and important ecclesiastical State, acknowledging only the suzerainty of the Emperor and the Pope.

An old chronicler of 1555, however, writes:—"The archbishops of Salzburg had been unable to maintain their territories in obedience to the Catholic rule. They did not as yet endure the presence of Lutheran preachers, but the disposition of the people was none the less explicitly declared. Mass was no longer attended in the capital, nor were fasts solemnised or festivals observed; those whose dwellings were too far removed from the preachers of the Austrian localities bordering on their country remained at home, reading for their edification from the homilies and critical commentaries of Spangenberg."

Some thirty years later there appeared on the scene a new Archbishop, who was responsible not only for a complete change in administrative methods, but for commencing what eventually became a complete rebuilding of the city. Wolf Dietrich von Raittenau was only twenty-nine years of age when he left the German College at Rome for his new archiepiscopal throne in 1587. His uncle had just become Pope, but the pontiff whom he made his model was Sixtus V., the founder of papal magnificence. Arrived in Salzburg, he proceeded at once to call upon all the citizens to make immediate profession of the Catholic faith, allowing them only a few weeks for reflection. No alternative was allowed but exile, and a compulsory sale of the recusant's property by the Archbishop's agents to approved customers! A few deserted their faith, a great number, including many wealthy burghers, preferred to leave their homes. Nor was this all. The young prelate next introduced an elaborate system of taxation on incomes, legacies, and commodities of every sort, quite foreign to German finance, also quite regardless of immunities and privileges already in existence. Having reduced Salzburg to the level of the tame and tribute-paying Papal States in Italy, he then proceeded to devote the vast income to the glorification of his power.

Historians vary as to whether he really burned down the VIIIth-century cathedral or not; they agree that he took no pains to dissemble his joy on that occasion. He appears to us as a second Nero, but his ambition was frustrated, for he died before it could be rebuilt. Indeed, though this great Jesuit was perhaps more ambitious than any of Salzburg's archbishops, he lived to see few of his schemes completed.

The Schloss Mirabell, with its beautiful gardens, is ascribed to him, and it is said that he erected it for Salome Alt, the daughter of a wealthy citizen, with whom he seems to have been on cordial terms. Yet this fine palace has been altered many times by his successors, damaged by fire, and largely rebuilt, so that one hesitates to date it so early, especially as its style bears one out in supposing it to be largely due to later prelates. Its rich staircase, with carved figures on the fine pierced balustrade, is particularly worthy of notice. The external details are for the most part restrained, the window-heads being of a light Baroque character.

Another important group of buildings is due to this very worldly Archbishop's love for horses. The Stables (Hofstallgebäude) have actually marble fittings, and, although the exterior generally is very plain, there is an ambitious portal on a curious concave plan, the twin pilasters on either side being diminished downwards and terminating awkwardly in male caryatid figures. Even a casual observer cannot fail to notice that in this work there is more than mere copyism from Italian models, for it has many fresh features, which can only be due to native talent. Adjoining this building on one side is a magnificent horse-pond, surrounded by a charming pierced parapet of Elizabethan style. Behind it is an arcaded stone screen, the panels filled with frescoes of equine

subjects, and above rises the great precipice of the Mönchsberg, in the side of which an excavation is made for this pond. A fine sculptured group of a horse-tamer rises from the water. On the other side of the stables lie the summer and winter riding-schools. The latter is no more than its name implies, but the former is unique, the more so as it consists of galleries several tiers high above the arena cut in the solid rock of the Mönchsberg. The completeness of these stable buildings, with all their facilities for displaying fine horseflesh and fine horsemanship, enable one to realise the better how close Wolf Dietrich was following in the footsteps of his models, the splendour-loving princes of Rome and the Alban Hills.

The new Cathedral at Salzburg was actually commenced in 1614, under Archbishop Paris von Lodron (1619-1653). The architect was Santino Solari, an Italian, but before his plans were finally adopted several schemes had been submitted, including one by Scamozzi. As built, the church is by no means as large as was first intended, probably owing to lack of funds during the Thirty Years' War. This penury may account

of the Cathedral may be seen in the illustration of the exterior given on the Plate, but the interior, though less bizarre, is more masterly and more noteworthy. The scale is colossal, the plan cruciform, filled out to form an oblong shape with four similar oval chapels in the angles. The decoration is florid and all-pervading—the late Jesuit church from floor to ceiling.

There are other Baroque churches of varying dimensions and of varying importance, St. Peter's, with a characteristic tower and an interesting interior (see Plate); St. Sebastian's and the Trinity Church (1699), the latter a very large but not very florid building. In the Franciscan Church, a delicate masterpiece of later Gothic, a range of chapels has been added which are Rococo rather than Baroque, and which do not produce quite so hideous an effect in combination with medieval tracery as might be expected, though we can hardly go the length of a poetical guide-book, which says that these "rich, elegant stucco decorations" help to form an "original, charming, aesthetic effect."

The principal remaining buildings of Salzburg which date from this period are the Residenz (or Archbishop's palace) and the Neugebäude, formerly administrative buildings, and now the post-office. Both were commenced by Wolf Dietrich, yet neither are extravagantly Baroque externally, rich as is their decoration within. Their importance, however, is enhanced by the fine piece of town planning of which they form a part, with the Cathedral as centre-piece. Its western façade forms the east side of the Dom Platz, a square completely enclosed by fine buildings and arcades, with a statue of the Virgin as centre-piece. Out of this square opens a street under an arch, opposite to the main portal of the Cathedral. South of the Cathedral lies the Residenz Platz, so called from the palace on its western side, and here a magnificent fountain, the Hof Brunnen (by Antonio Dario, 1664-80), is the principal feature; while north of the Cathedral is the Kapitel Platz, and here is situated another fountain, the largest of all erected in 1732, and said to be a copy (*sic*) of the Trevi fountain in Rome, which it in no way resembles, and which is slightly later in date. We have already claimed that XVIIIth-century architects were pioneers of town planning; here surely is strong evidence in support of it!

Space forbids detailed reference to the many dwelling-houses in Salzburg of Baroque type, so closely resembling those at Lecce, for Italian architects were employed as often as not; nor can we pause to describe the many charms of Leopoldskron (1736), the beautiful Schloss lying just outside the city.

But no account of this period would be complete which ignored one of the most amusing and charming of all country-houses, Schloss Hellbrunn, a short distance from Salzburg. This extraordinary example of villa architecture was the work of Archbishop Marcus Sitticus, who succeeded Wolf Dietrich. Built in 1613, it rivals the papal pleasure-houses at Frascati or the absurdities at Tivoli and Isola Bella. Its situation is consummately beautiful, and on the whole the lay-out of the garden justifies the application of the quaint Baroque motto, "Nature adorned by Art." The vistas are adjusted to connect the villa with Alpine peaks. The formal garden immediately adjoining the entrance courtyard gives place in one direction to the equivalent of the Italian *bosco*, in the other to an avenue leading directly to Salzburg, three miles away. The villa itself is of no importance architecturally, though of some size if the symmetrically grouped outbuildings be included. But in it, and near it, lies a fantastic system of waterworks, arranged to drench the archiepiscopal guest at various points, to set models working, to set birds singing, and, lastly (though this was an XVIIIth-century addition), to put in motion

Salzburg: Stiftskirche, St. Peter.

for the unfinished state of the flank walls, which look on to important squares and, indeed, form part of a great lay-out, while the west end alone has been faced with the fine stone from the neighbouring Untersberg mountain. This façade is of no great interest, though it is a correct composition, carried out in a refined style, and, with its two flanking towers and triple doorway, admirable in its way. But the interior of the church is planned on monumental lines. The nave is barrel-vaulted in four bays, and entered by a vaulted porch or loggia. On either side lies a range of chapels. The choir and transepts are equal in depth, and terminate in apses, the crossing being domed. The detail internally is thoroughly Italian in feeling, and the vaulting is richly modelled and painted.

Second only to the Cathedral among Salzburg churches is the Collegienkirche (1696-1707), an enormous building by Fischer von Erlach, the famous Viennese architect, who led Baroque architecture into the direction of Rococo, and whose work will form the subject of further attention in the next article. How different is this later work from the more Italian variety

elaborate mechanical theatre, containing
the hundred figures, while a sweet-toned
band of drones through the mellow harmonies
of an old German chorale. High on an
ancient hill, within the wooded park, rises
the little castle built by Marcus Sitticus per
petimento, in one month, near it is the
theatre, where he listened to pastoral
songs, and all around is the gay and whimsical
atmosphere created by the pretty fancy and
inventive genius of the Baroque architect.
M. S. B.

MEDIAEVAL WINDOW GLASS
AND GLAZIERS.

WHITE GLASS.—The window glass used in
medieval England was of several kinds—
Norman, Norman, Flemish, Dutch, and
English. In an account-book, little later than
the year 1500, now in the Public Record Office
(Exch. Acc. 474-3), we find very different prices
paid for white glass. Thirteen feet of
Flemish glass cost 4d. and 6d. a foot; Dutch
glass cost 4d. and 6d. a foot; three panes of
Norman glass cost 54d. a foot; Flemish glass
cost 6d. a foot; and English quarries cost 1d.
a foot.

In MS. 504-2 we read of the setting of old
glass in lead, the mending of eight panes of
glass at 4d. a pane, and the payment to a
glazier at the rate of 4d. a case "for mending
of cases," case probably meaning a casement
pane, for a little farther on we read of "a pane
and a casement of new glass." A somewhat
noteworthy feature in this MS. is the frequent
recurrence of two items referring respectively to
white glass and glass newly set in lead. We give
the following example of each:—

"ii fottes of newe glas, pryce the fotte
iiii ob. q^r (44d.)
"iiii fottes and a halfe newe sett in lede, pryce
the fote iiii."

In another part of the ledger we read of
the glass new set in lede conteynynge v fote
xii. and, and a pane mendinge iiii.," from which
we may believe the glass new set in lead to
have been old glass costing merely so much for
setting, which would account for the low
price.

PAINTED GLASS.—Of painted glass very few
particulars are given in ordinary builders'
account-books. In MS. 474-3 we read of
"painted glass" with my lady's arms," costing
1s. and of two new panes of glass, each pane
containing 4½ ft., with coats-of-arms in them,
costing 3s. 9d. In MS. 465-20 we read of
"windows containing glass in which the King's
arms, posies, badges and bendis" were set.

MS. 504-2 the King's arms in glass were
used in two rooms of the Royal manor-house
at Dartford at a cost of 6s. The sum of 4s.
is also paid for four "sceptuours of the Kinges
ordres" on glass in the same rooms.

Dugdale, in his "Antiquities of Warwick-
shire" (Vol. I, p. 446), prints a covenant in
which a John Prudde, of Westminster, glazier,
consents to glaze a number of windows with
patterns, images and stories that shall be
delivered and appointed by the said Executors
of the said John Prudde, afterwards to be newly
set and pictured by another painting in rich
gilt.

In J. T. Smith's "Antiquities of West-
minster" (published 1807), p. 191 et seq., will

SALZBURG : COLLEGIENKIRCHE

be found a number of entries collected from
medieval documents relating to building.
Amongst these items many record the wages
paid to glaziers engaged in making painted
windows, and they tell a good deal of the way
in which painted glass was made. We read of
a man being paid for "washing the table for
drawing on the glass," of several "master
glaziers" painting drawings of windows on
white tables, of others drawing images for glass
windows, of a labourer being hired to grind
colours, of draughtsmen being paid 1s. a day,
of men laying glass on the tables, of painting
on the glass, of those by whom the glass was
cut and joined on the painted table, of others
joining and cooling the glass, and that the
term "glazier" was applied to almost all
working on the glass.

A good deal of ancient domestic glass is still
remaining in this country. Ockwells Manor
House, in Berkshire, contains a fine series of
windows, filled with painted glass; illustrations
of some of the lights will be found in Garner &
Stratton's "Tudor Domestic Architecture." In
the old city of Salisbury, an ancient house, now
a china shop, contains an exceptionally fine
window of ancient glass.

Of churches retaining mediæval painted glass
the number is even now considerable, some, in
spite of pillage and vandalism, containing one
or more whole windows in very fair condition.
In more than one case this is due to the fact
that in troubled times the glass was taken out
and buried or concealed in safety. At Nettle-
stead, in Kent, Fairford and Tewkesbury, in
Gloucestershire, Malvern, in Worcestershire, and
in many other churches much fine painted glass
still remains *in situ*.

In the Middle Ages, as now, painted windows
were sometimes given by a parishioner or by
two parishioners jointly. Sometimes they were
given by a number of the young men or the
women of a parish. Mr. Grylls, in his "History
of the Windows of the Church of St. Neot, in
Cornwall" (1854), gives particulars which tell a
good deal of the manner of acquisition of
painted glass for a mediæval church. From
this little volume we learn that one of the
ancient windows of this church bears the in-
scription in Latin:—"At the cost of the young
women of the parish of St. Neot, who erected
this window A.D. 1529." Another window is
inscribed:—"At the cost of the wives of the
vest side of this parish of St. Neot, who erected
this glass window A.D. 1530." Another:—"At
the cost of the young men of this parish of St.

Neot, who erected this window A.D. 1528."
Another window in this church bears the in-
scription:—"At the gift and cost of Ralph
Harris and by his workmanship this window
was made," from which the donor appears to
have been either a glazier or someone connected
with that craft.

The windows of Morley Church, in Derbyshire,
have been excellently described by one of the
rectors in a little volume, with two coloured
plates, published in 1879, from which we learn
that the windows originally belonged to the
refectory of Dale Abbey.

The ordinary glazier is by no means so fre-
quently referred to in the accounts of mediæval
builders as would be expected. He was
commonly paid by the piece, but instances of
payment by the day are to be met with. In a
builder's account-book of the time of Henry VIII.
(Exch. Acc. 464-23) we find a payment recorded
of 16d. to a glazier for four days' work, the cost
of his "bord" for that time having been 8d.
in addition. In MS. 484-3 glaziers are paid 6d.
and 8d. a day.

In MS. 504-2 we meet with a copy of a glazier's
bill, which is interesting reading:—

"Glasinge. To Galyon Hane, glasyer,
for xxxiiii fottes of newe glasse set,
whereof—xii fote within the
tower in Grenewiche park; iiii
fotte in the bade chamber next
the newe armery; vii fotte in the
chamber of presentes, and xi fotte
in the greste chamber; at
iiiiid. ob. q^r (44d.) the fotte ... xliis. vd.
To hym more for iii paynes mendede
in the saide lodgings, at iiiiid.
the payne mendede, ... xnd.
To hym more for x fotte of newe
glasse sett, whereof iiii fote sett
in the Keechyn and vi fotte in the
parlour at iiiiid. ob. q^r (44d.) the
fotte ... ius. xid ob.
To hym more for v paynes in cas-
ements mended, whereof iiii in
the wardrope, iii in the chamber
ouer the seller, one in the Keechyn
and one in the parlour, at iiiiid.
the payne or casements mendede
To hym more for xi newe querrill
employed in the stoppynge of holes
in the windows, at ob. (a half-
penny) the pece ... xxxi."

A halfpenny was the common price of a
quarry, though a penny was the cost of a
quarry of English glass. To some extent glass
appears to have been delivered in cradles or
crates. In MS. 484-3 four "cradylles of Nor-
mandye glasse" cost 18s. a cradle. In MS.
464-23 a "cradill of glasse" cost 20s. "A
chest of wyspe glasse" cost 17s. 6d. and "x
wyspes glasse" cost 9d. a wyspe (484-3). We
are unable to explain the term "wyspe."

THE CARRIAGE OF MATERIALS
IN THE TIME OF HENRY VIII.

THE cost of the carriage of the various
materials needed by builders in the Middle Ages
added then, as to-day, very largely to the cost
of the goods purchased. Materials were con-
veyed in "bote lodes" by water and by the
draught of horses and oxen over land.

In the accounts of mediæval builders the
entry of the cost of carriage is frequently set
down immediately after the cost of the article
itself. In some cases, as in a set of accounts
of building costs in the Public Record Office
(Exch. Acc. 489-4), such a system of entry is
seen, each purchase being placed under its
proper heading, and under the heading of
"Carriage" the cost of the conveyance of each
purchase to its destination is set down. The
entries recording the cost of carriage are very
numerous indeed in mediæval accounts, many

SALZBURG CATHEDRAL

of them, however, being of little service for our purpose from the fact of the cost of the carriage of the materials alone being given. To be of service in estimating the expense we want to know the size or weight of the material, the distance traversed, and whether the transit was made by land or water.

Carriage by land is often mentioned. In 1530 five trees were purchased by a master carpenter for the work in hand. The trees cost 8d. each, and "the carriage of the said five trees by lode, the space of half a myle, taking for every tree is carriage vid." Such an account gives us not only the cost per tree, but the cost of its carriage over a stated distance. The proportion between the cost of tree and its carriage is therefore shown, and is exactly what would be expected, the value of the tree in a thinly-populated land being naturally very little (MS. 489-5).

In MS. 488-15 a sum was paid for the drawing of timber by oxen, but such is a rare instance of the use of oxen for draught purposes, in nearly all cases horses being used. Even in this same set of accounts we find mention of the employment of horses to bring clay from the clay-pits.

An interesting entry in account 488-16 records the payment of 8d. to a man for his permission to "draw the said tymbor over his medowe," such a route being "the next and playnest way from the vodde."

In MS. 489-17 we see that 7 tons of boards were carried 27 miles for 11s. by water. The carriage of fourteen great trees a mile over land cost 7s. At another time 6d. a mile per tree was paid. Bringing seven great trees a mile over land cost 2s. 4d. In MS. 489-16 we read of three trees being carried 3 miles for 3s. In MS. 489-15 we see that 25 pecks of lime were carried 2½ miles for 16d., and to bring 17 pecks the same distance cost 12d. To bring 21 pecks 3 miles cost 17d.

In MS. 489-7 three planks 9 ft. long and 1 ft. broad cost each 4d. The cost of carriage by water from Beaumaris to Carnarvon, a distance of 10 miles, amounted to 1d. The thickness of these planks is not given, but, as they were for use on a bridge, we can form some idea of their substance.

The sum of 30s. 4d. was paid to a "boteman" for the "caryage" of "one rode and xxii fote plankes and bordes" "by water the space of xx myles" (489-5).

Carters were generally paid by the amount of material carried, but such was by no means always the case. In MS. 499-22 we find that "for caryage" of some turf a number of "carteres" were hired, "enery cartye berye the dave xiiid."

In MS. 479-9 we find the record of a carter who was permanently engaged, "his yerely styppende xxviii. viiid., as for his bourde wages xii. the weke." Carters commonly received 12d. or 14d. a day, such payment including the hire of the man's horse and cart.

A labourer carrying materials with his own horse was paid 2d. extra in addition to the usual labourer's wage of 4d. In MS. 489-3 the distinction between the cost of the man's labour and the hire of his horse is set down:—

"Item payed to Jernar ap Richard for his wages carying of sande, a day . . . iiii d.
Item for the hyre of his horse, a day . . . iiii d."

In MS. 489-4 we find that the cost of the carriage of half a hundred of iron from Chester to Chirke Castle, near Oswestry, in Shropshire, a distance about 20 miles, was 8d.

At times carts were not used, the load being placed upon the horses' backs. Such a method of carriage is to be noted in MS. 489-16, where we read of the purchase of material and the engagement of men "to lode the same vpon horses." Sometimes ale was given in place of money, this evidently as a slight acknowledgment of assistance casually rendered. In the MS. just mentioned we read of such a form of honorarium being given to some tenants who assisted to carry timber. Some builders kept a sledge or a cart to convey material from one part of the scene of operations to another. In MS. 489-10 we see that 4d. was paid for the mending of a "sleed for the cariage of diuerse necessaries for the workemen." Another entry in the same set of accounts records the outlay of 5d. "for a new carr to carry diuerse necessaries for the workemen."

In MS. 499-19 we read of a John Slyman being paid 9s. a day to bring water in his own cart. In another MS. we find the payment of a certain sum to a man set down regularly for bringing water to slake the lime. The cost of

the carriage of sand and clay for the "mold" and the pan for the purpose of casting lead is entered in MS. 488-27. The carriage of the great "gynne" or engine for lifting weights is referred to in MS. 474-7.

Sometimes an agreement called a covenant was entered into for the carriage of material. We may instance that of Thomas Brad, who agreed to take 6d. for the conveying of a number of slates from one place to another with his own horse.

Though not dealing specifically with materials, we have appended a few notices of the cost of transferring workmen, such being sufficiently germane to our subject to warrant inclusion. In one case a ferryman is paid for taking a workman every day over his ferry for several months. In another set we read of a "watryman" being paid "for bryngyng the said carpenters and their tulles and instruments" (488-26).

The cost of conveying such workmen as were pressed or forced to labour on a certain work is defrayed by those for whom the work was done. An instance of such payment is to be found in the accounts of the building of the great college founded by Cardinal Wolsey at Oxford (479-3-11). The payment is as follows:—

"Condyte Money.—Also deleredyd to sondery artificers aboue rehersed, aresteded and takyn by commysion from sondery places vnto the werkes of the aboue namyd collage. That is to say for their costes and expences comynge from the places where they were aresteded and takyn vnto the said werkes at Oxforde."

HISTORICAL NOTES.

Southwark Cathedral.

THE completed series of statues in the altar screen, erected in the old Church of St. Saviour's by Richard Fox, Bishop of Winchester, in 1520, has just been dedicated. The figures now present a continuous line of famous persons connected with the history of the church since its original foundation in the XIth century as the Augustinian Priory of St. Mary Overie. Mr. William Stirling Lee sculptured the statue of Bishop Talbot; the eleven others, comprising John Gower, the poet, Cardinal Beaufort, St. Thomas à Becket, Bishop Peter de Rupibus, and Prior Aldgoud, are the work of Messrs. T. & E. Nicholls, of Kensington. The recently unveiled memorial to Shakespeare is by Mr. Henry McCarthy, whose design incorporates a semi-recumbent effigy of the poet, executed in alabaster beneath a Gothic canopy, and having a panel at the back representing Southwark as in the XVIth century.

Highgate Archway, 1812-1900.

ON October 31, 1812, was laid the corner-stone of the (old) Archway which was built to carry Hornsey-lane across the present Archway-road. That road was made in order to relieve the steep ascent of the Great North-road up Highgate-hill, in pursuance of Robert Vaize's scheme, 1809, to construct a tunnel, 24 ft. wide by 18 ft. high and about 1,130 ft. long, through the hill of ferruginous clay. The Highgate Archway Company obtained an Act in the following year and adopted Rennie's plans for a tunnel 765 ft. long (to be reduced to 633 ft. if the funds permitted) joining two open cuttings of 135 ft. and 174 ft. On April 15, 1812, after 390 ft. had been bored, the work fell in; it was then resolved to make an open cutting throughout. John Nash's archway, constructed of brick and stone, had some dignity and character of design, and people would make considerable journeys to see it. It was inscribed "Geo. Aug. Fred. Walline Fr. Regis Sceptre Gerenti," and was opened on August 21, 1813 (though not actually finished until several years afterwards, by reason of the watery and treacherous soil, having cost nearly 104,000l., the approaches included). The fabric rose to 65 ft. from the road to the vault of its upper arch, that height being divided, as it were, into two stories, the lower arch 36 ft. high by 28 ft. deep and of 18 ft. span; the main and three minor arches were, it is said, turned underground just as they were turned above. The Hope Insurance Company purchased the undertaking in April, 1819, and in 1876 took on the Archway-road were compounded for 9,000l. in terms of the Holyhead-road Relief Act, 24 and 25 Vict., c. 28. The present structure was built in 1897-1900 as a "county bridge," after designs

by Sir Alexander R. Binnie, the then Engineer to the London County Council, by Mr. C. Wall, who contracted for 25,127l. It is of steel and cast-iron, with abutments of Portland stone, concrete, and brick; it is 40 ft. wide between the parapets, with a span of 120 ft., which admitted of a widening to 50 ft. of the road beneath.

WE learn that it is contemplated to carry out the restoration of Kirby Hall, Northants, which Sir Humphrey Stafford, of Blatherwycke, built for himself and his representatives sold, in 1575, to Sir Christopher Hatton. John Thorpe's plan in the Soane Museum records that he laid the first stone in 1570—on the parapets are the dates "1572" and "1575"; on the gable above the entrance is the Stafford motto: "*Je seray loyal*," and on the parapet is "*Hum Fre Sta Fard*." Sir Christopher's son employed Inigo Jones in 1638 to modernise the house by inserting pedimented windows in the inner court, adding a staircase (for which Nicholas Stone furnished the model) at the south, and altering the entrance front of the outer court. Stone was paid 50l. for a chimney-piece, 1638. The place has been practically unoccupied for one hundred years past. There are drawings in the *Builder* of January 10, 1886, and August 18 and 25, 1906.

At Glasgow, Kentucky, there is a residence built by George Washington in 1790, for General Spotswood, then Governor of Virginia, in which State Glasgow was included at the time. There is nothing remarkable in the architecture of the building, but in respect of construction it is very unlike modern houses. The walls are of solid brickwork, 36 in. thick. The floors are of chestnut, 2 in. thick, and laid with dowels. The original roof covering, part of which still remains, consisted of chestnut shingles, 4 in. thick, secured with wood pegs. The building was constructed entirely without nails, which were not manufactured in the United States when the house was built. The original windows were of glass imported from France; as this material was not produced in America at the time. The windows illustrate the wear and tear of structural materials, for it is stated that the glass remaining intact has worn so that it is no thicker than paper, and is readily broken by rainstorms. The house has not been remodelled in any way, and presents substantially the same appearance as when built 122 years ago.

[From a sketch by Mr. Leslie Barfoot.]

Urn to Gate-pier at Hampton Court Palace.

This well-known example is one of the most beautiful of the many types of Wren's urns. It is found at the east end of the south or river front—at the entrance to the path leading to the Great Vine—and also on the north side of the Palace, there being four urns in all of this type, all carved out in Portland stone.

THE BUILDING TRADE.

THE STATE OF THE BUILDING TRADE.

ALTHOUGH it cannot be stated that there is a "boom" in the building trade, there is every indication of increased prosperity as compared with recent years, and it is obvious that a great trade "boom" must affect that section of the community who are dependent on building for their livelihood, as increased trade has increased enterprise and a necessity for better accommodation. It is not possible to compare one month with another in the same way as a true indication of the prosperity is to be given, as the trade is a seasonal one, and, with few exceptions, it will be found to decline in the winter months and rise during the summer. Any period of the year must be compared with the corresponding period of the preceding years to ascertain whether or not an improvement is present. There have been many changes at work during the present year, and among these the most important of all are the labour troubles, which had a serious and reaching effect on the building trade over the whole country, and allowance must be made for this fact, because it was not possible to proceed with building work in many cases even when work was plentiful, as the necessary materials could not be obtained and works had to be closed down.

The strike of the transport workers prevented proper delivery of materials, and even necessitated the using of more or less unsuitable materials, if they were available, in order to prevent a complete stoppage. One large building which was in progress during the strike was at that stage when certain large steel girders were necessary before the work could proceed, and certain of the steel plates were ordered from the Continent, for the building of these girders, they were duly shipped and arrived in London. They could not be loaded, however, and the vessel, after a period of waiting, made the return journey to the port of shipment, where the steel plates were unloaded and left until such time as the strike was over. In the meantime the whole of the work on the building was stopped and the workmen discharged. The coal strike seriously affected many trades, and the greatest trouble was experienced for weeks after in obtaining a supply of steel for building work, as this material forms now such an important part of every large structure, many building schemes were completely at a standstill on this account. These facts will account for the large amount of unemployment in the building trades long after the strikes were settled, and rather spoil the record of what promised to be the most prosperous year since 1903. Although there is still some evidence of the effects of the strikes, trade is now more settled and bids fair to improve. It is curious to note that there was recently a great disinclination on the part of many workmen to work overtime, apart from the influence of the trade unions, and the explanation of this point lies in the fact that such a good year had been experienced that a sense of independence prevailed.

The Insurance Act has had the effect of increasing the cost of building work in a double sense. The contractor is called upon to contribute for his own workmen, and, in addition, to pay more for materials on account of the manufacturer having to contribute for those workers engaged in the production of the materials. It is extremely difficult to estimate the amount of this increase in cost, but it probably amounts to about 1 per cent. on the value of the contract. As an example, it is interesting to record one case which actually occurred. A contractor gave an estimate for certain work during the month of March, and this was not accepted until the end of July, when he refused to execute the work for the original amount, and stated that the price must be increased on account of the Insurance Act. When he came into operation by '67 per cent., which was the estimated value of his contribution for the men during the time allowed for execution of the contract. At the same time, an increase of 13 per cent. was asked

owing to prices of materials having advanced, and a portion of this advance was undoubtedly due to the Insurance Act.

Many large employers report big increases in business, and one contractor even went so far as to say that he did not feel capable of undertaking any more contracts at present on account of the pressure at which the whole staff was working. Another large employer gave returns which showed an increase of 200 per cent. in the number of employees, but at the same time a note was added to the effect that his profits were less, due to over-competition which exists among the building trades. Nearly all branches of the trade give excellent reports, and many of the manufacturers are finding it difficult to cope with the demand for building materials, particularly so in the case of iron and steel.

The state of employment naturally varies in the different districts and with the various trades, but the general reports are good, with the exception of plasterers, who seem more or less slack all over the country.

The development of garden cities has led to a great deal of building work in certain localities, and has been a great spur to the erection of domestic buildings of an improved type. These buildings are generally superior to the average suburban type of dwelling, and provide more labour and employment on account of the varied design which prevents the reproduction of stock patterns, and they have the effect of drawing residents from the more populous quarters of the city to spots where previously little building had been in progress.

The statistics available will be seen to indicate an improvement in the number of workers employed in the building trade as compared with last year, and this is very important, as the figures for 1911 showed a marked improvement on every year since 1903. As an example of this, it is interesting to note the following figures, which represent the percentage of unemployed amongst those carpenters and plumbers making returns over a period of several whole years:

1903	..	4.9	1908	..	11.5
1904	..	7.7	1909	..	11.7
1905	..	8.3	1910	..	8.6
1906	..	7.2	1911	..	5.0
1907	..	7.3			

It will be noticed that the years 1908 and 1909 were particularly bad, and, in fact, they are the worst that have been known during the period in which records have been kept. The returns for October show a decided increase over the returns for October, 1911, and, although the reports are not quite equal to those for September, this is due to seasonal decline, and ever since records have been kept this fact has been noticeable. The returns do not cover the whole of the employers in this country, but the figures are based upon reports received from over 900 firms, and this should be sufficient to give a correct idea of the state of affairs. The reports cover the whole of the United Kingdom, and it is interesting to note that there was an increase in the number of skilled workmen employed equal to 1.9 per cent. compared with a year ago, while in the case of labourers there was an increase of 13.2 per cent. compared with a year ago. The great increase in the number of labourers as compared with the number of skilled workmen is probably due in part to the more extensive use of reinforced concrete as a building material. This can be executed by unskilled labour, provided efficient supervision is exercised, and consequently more labourers are employed. There have been many large schemes carried out during the present year, and there are very few indeed where this material has not been wholly or partly used for the constructional members.

The figures for November show that, out of a total number of 57,467 workmen, there was a decrease in the case of skilled workers as compared with October of 1.9 per cent., but an increase of 2.2 per cent. compared with the corresponding period of 1911.

In the case of labourers there was a decrease of 1.9 per cent. compared with October, but an increase of 13.5 per cent. as compared with November, 1911. It will be seen by these figures that the increase in the number employed

during the present year is well maintained, particularly so in the case of the labourers.

There has been very little alteration in the rates of wages during the present year, although certain sections of the trade have endeavoured to obtain higher rates; and during the early part of the summer months there were indications of a strike occurring among these sections, and this would have spread in all probability to other branches, and apparently culminated in a universal stoppage.

The carpenters and joiners in London obtained an increase of 1d. per hour, bringing the rate up to 11d., and they hold a promise from the employers that there shall be a further increase of 1d. per hour in March next.

There is certainly a general tendency on the part of the workmen to press for an increase in the rate of pay, and in many cases this is being obtained, as, for example, in Cardiff, where practically all classes were successful in obtaining an increase of 1d. per hour on October 24 last, and in Hull, where an increase of 1d. per hour was given on October 30. There are many instances of this kind on record during the last few weeks in various parts of the country.

During the period from January to November reports show that 86,477 workmen in the building trades received increases which amounted in all to 8,049s. per week, and this fact is evidence of the upward tendency in wages.

There has been a large increase in the prices of nearly all building materials, and, although this is due partly to the increases in wages and the Insurance Act, there is no doubt that the great demand has enabled the manufacturers to obtain firm prices and keep up the cost to the buyers. A comparison with the current prices of materials issued during the first week in January last shows that steel joists, for example, have advanced about 15 per cent. in price, sheet lead has advanced about 14 per cent., timber 10 to 12 per cent., and glazed bricks about 13 per cent. These are merely given as some indication of the very large increases that have occurred with some of the materials, and there are very few that have not risen in price through some cause or other.

There is undoubtedly a very fair increase in the prosperity of the industry generally in which the employers and workmen alike are participating, although some of the former are suffering from the effects of reducing their prices to a minimum devoid of a fair profit when entering into competitive tendering.

WORKMEN'S COMPENSATION STATISTICS.

THE Home Office has recently issued the fourth volume of statistics relating to Workmen's Compensation since the Act of 1906 came into force. Under sect. 12 the Secretary of State has power to order compulsory returns to be made as regards any industries, and this power has been exercised in connexion with seven great industries, viz.—(1) Mines; (2) quarries; (3) railways; (4) harbours, docks, wharves, and quays; (5) factories; (6) constructional work; and (7) shipping; and in respect of such undertakings, therefore, the statistics published are more or less complete.

The number of persons engaged in these seven groups of industries is estimated as 7,305,997, and during the year compensation was paid in respect of 4,021 cases of death and 419,031 cases of disablement, the total amount so paid representing a sum of 3,056,404s., an increase of 356,079s. on the previous year.

In these seven groups the charge per person employed works out—Shipping, 14s. 3d.; factories, 4s. 6d.; docks, etc., 11s. 9d.; mines, 11s. 3s. 8d.; quarries, 10s. 9d.; railways, 7s. 11d.; constructional work, 13s. 5d. But the Report states that even in these grouped industries, the expenses of management, etc., represent at least another 1,000,000s., so it is apparent that the above estimated charge per person must be increased by about one-quarter. In the absence of compulsory returns in other than these grouped industries it is impossible to arrive at any estimate as to the total cost of compensation in the country. That a very

considerable sum must be added to the above total is apparent; only a very small proportion of cases come into Court, but we find in lump sums alone shop assistants received 2,442l.; domestic servants, 4,218l.; agricultural labour, 5,246l.; transport workers, 10,800l.; whilst memoranda were registered in respect of the above classes for lump sums totalling over 98,000l.; and the weekly payments total a large sum.

We may note here that "constructional work" includes construction of railways, tramways, canals, harbours, etc., bridges, tunnels, sewers, roads, and works of engineering, but not the construction of buildings.

In the building trade we find that lump sums were awarded amounting to 12,635l., and memoranda were registered as to 46,177l. in lump sums. The weekly payments respectively being 100l. 15s. and 321l. 0s. 6d.

As regards industrial diseases it should be noted that for lead poisoning returns are not obtained for the house-painting industry, but 130 certificates of disablement were given by certifying surgeons in that industry.

The more certain remedy provided by the Workmen's Compensation Act is superseding the more speculative action provided by the Employers' Liability Act, 1880. Since 1906 the cases have declined from 476 to 170, but the old form of action is chiefly resorted to in the industries of factories and building. The difference of the two remedies may be said to lie in the fact that under the Employers' Liability Act a lump sum can be obtained in respect of personal injuries, but under this Act the burden of proof laid upon the plaintiff is much more onerous. In this connexion it may be noted that under this Act the solicitor's costs average 27l. 5s. 7d., whereas under the Workmen's Compensation Act they average 11l. 12s.

SCAFFOLDS FOR PAINTING NEW YORK BRIDGES.

The maintenance of the four bridges across the East River, New York, with an aggregate length of 12,900 ft., provides work for some 650 engineers and workmen, and involves an annual expenditure of 200,000l. A considerable proportion of this amount is devoted to painting, on which 177 men are regularly engaged. In order to facilitate the work of painting the steelwork of the Manhattan and Queensborough bridges, and to obviate the risks incidental to working in difficult positions at a great height above the river, travelling suspended scaffolds have been provided for these bridges. Each scaffold consists essentially of two riveted steel girders extending across the full width of the bridge and carrying a platform about 5 ft. below the underside of the bridge. The platform is protected by steel railings, and the scaffolds are moved as required along the entire length of each span.

Under each of the three spans of the Manhattan Bridge there is a scaffold of the kind having a platform 60 ft. long by 7 ft. wide. The scaffolds are fitted with trolley wheels travelling on runways attached to the bottom of the bridge, and are driven by chains, operated by hand or by electric motors installed on the platform.

The five spans of the Queensborough Bridge are equipped with similar scaffolds, about 95 ft. long, suspended from runways attached to the ends of the cantilever brackets supporting the roadways outside the main trusses of the bridge. These platforms are provided at each end with ladders giving access to the bridge floor, and are moved from point to point by hand.

The scaffolds cost about 6,660l. and 3,660l. each for the Manhattan and Queensborough bridges, respectively, and were designed by the City Bridge Department.

EXHIBITION OF SAFETY APPLIANCES FOR WORKMEN.

A PERMANENT exhibition in Copenhagen, promoted by the Danish Association for the Protection of Workmen, contains exhibits devised for the prevention of accidents by machinery and in industrial operations generally. It includes an exhibition of water gauges, illustrating measures to be taken in attending steam boilers, and an instructive collection for the enlightenment of the worker on dangers incidental to steam generation. The exhibition also covers exhibits relating to the improvement of hygienic working conditions, insurance against accident and illness, and it is the intention to change the exhibits from time to time, so that they will illustrate advances made toward the end in view by the promoters.

TYNE AND BLYTH DISTRICT BUILDING TRADES FEDERATION.

THE annual dinner of the Tyne and Blyth District Building Trades Federation was held at the County Hotel, Newcastle, on the 3rd inst. The Chair was taken by Councillor John T. Armstrong (South Shields), President of the Federation. In proposing the toast of "The National Federation of Building Trade Employers," Mr. W. T. Weir, Vice-President of the Northern Counties Federation, gave a short account of the career of the National Federation since its formation. He said the national body was composed of the leaders of the building trade of the country. In the old days there were builders who held aloof, but now those early waverers were the most fervent supporters of the Federation.

Mr. James Wright, President of the National Federation, replying to the toast, congratulated the Northern Federation on its officials. He said they possessed a most capable and energetic Secretary, who had often forwarded to the National Federation most useful and practical suggestions. Then, again, one of the best delegates sent to the National Conference was Mr. A. G. White, of Sunderland. Turning to the work of the National Federation, Mr. Wright said that he agreed with a remark made last year by Mr. White, who stated that if the National Federation had done nothing else but establish a Conciliation Board, it had fully justified its existence. There could be no doubt that the scheme had done a great deal to prevent disputes in the trade, and employers and employees would only abide loyally by the decisions arrived at, then nothing but good could come from the scheme. Another scheme fixed up by the National Federation was an agreed form of contract. This had proved to be a very valuable document indeed, and had removed a great deal of friction which previously existed between the builders and architects. During the past few years a good deal of legislation had been passed which affected very seriously the position of the building trade. It had the effect of keeping the National Federation busy working on behalf of the builders. The first item of this legislation was the Budget of 1909, by which undeveloped land was to be taxed; valuations had to be made, and then there was the increment duty to be paid. Whilst the undeveloped land tax had not greatly affected them, there could be no doubt that the valuation of property had a most serious effect. The way in which the Government valuers had done their work was lamentable. Mr. Lloyd George had promised that no part of the profit of the builders' industry in developing an estate should be taxed, but that promise had not been carried out in practice.

Mr. W. H. Hope proposed the toast of "Our Municipal Authorities," and Alderman J. F. Weidner replied.

Councillor Stephen Easton, proposing the toast, "The Architects, Engineers, and Surveyors," said there were a good many people who were never content with things as they were, but, personally, he thought the relations which existed between the builders and the architects, engineers, and surveyors were such as gave general satisfaction.

Messrs. W. Milburn, W. J. Steele, and E. J. Connell responded.

The toast of "The Tyne and Blyth District Building Trades Federation" was proposed by Mr. A. G. White, Secretary of the National Federation, and was responded to by Councillor J. T. Armstrong and Messrs. George Douglass, A. V. Jary, George A. Lock, and J. Simpson.

THE INTERNATIONAL BUILDING EXHIBITION, LEIPZIG, 1913.

ONE of the principal features of this exposition will undoubtedly be town building and town planning, and the interest taken in this matter is shown in the applications from municipalities of both German and foreign cities. Amongst notable German towns the following have already announced their intention to be represented as exhibitors—Leipzig, Dresden, Mannheim, Posen, Bremerhaven, Darmstadt, Halberstadt, Aachen, Krefeld, Stuttgart, and Frankfurt-on-Main.

The last mentioned will exhibit interesting photographs, pictures, models, plans, and statistics showing the development of the town from the year 1636 up to the present day; and important subjects, such as water supply, canalisation, erection of smaller dwellings, houses, regulation of traffic, hygienic and benevolent institutions, hospitals, the laying out of playgrounds and parks, etc., will receive special attention.

Amongst the many other nationalities participating in this exposition, the United

States of America will be represented. A special Committee has been formed, under the Presidency of Mr. Glen Brown, Secretary-General of the Association of American Architects, to take up the preliminary steps, and also to give facilities to intending exhibitors, as well as to the general American public desirous of visiting the exhibition.

A feature of the American section will be the exhibition of pictures, models, and plans of "skyscrapers," amongst which will be a model of the "Woolworth House," the architect of which is Mr. C. Gilbert. The municipality of San Francisco will have a prominent place.

A NEW ASPHALT FACTORY.

A NEW asphalt factory and bitumen refinery has been erected for Messrs. Engert & Rolfe, Ltd., Poplar, London, E. The firm, who were established in 1854, originally at Millwall, installed the latest asphalt-making and bitumen refining plant in the new works, which are of substantial construction, and in which economy of labour has been studied in the general arrangement of the plant, while arrangements have been made so that extensions can be added at comparatively slight cost. The plant consists of a specially constructed and powerful asphalt rock crusher with its accompanying disintegrator or mill. Both of these machines are provided with elevators, so that the asphalt rock, when reduced to powder, is automatically conveyed to the battery of mastic cookers, from which the asphalt in due course is run off for moulding into cakes or delivery to the "locos" for transport to the jobs. Only Trinidad Lake bitumen refined on the premises is employed as a flux. The asphalt rock is water-borne from Sicily, France, and Limmer, and is removed from the craft by a steam loco. crane, which places the material in any position desired. Care has been exercised in the selection of responsible workmen, who have had lengthy experience in the trade. The firm invite any architect or engineer interested to visit the factory at any time to see the operation of asphalt-making in its various stages.

WIGAN MASTER BUILDERS' ASSOCIATION.

THE annual dinner in connexion with the Wigan and District Building Trades Employers' Association was held at the Clarence Hotel. This year the President of the Association is Mr. Frank Eyre, and there were among those supporting him the Mayor of Wigan (Alderman E. Dickinson), Mr. A. Lyman, J.P. (Chairman of the Ince District Council), Mr. William Johnson, J.P., Mr. J. A. Johnson, J.P., Councillor A. E. Baucher, Councillor James Walkden (Deputy Mayor and Vice-President of the Association), Messrs. G. S. Corlett, R. G. Dawson (Hon. Treasurer), J. H. Rigby (Hon. Secretary), W. Webster, A. Wood, J. Livesley, O. Filling, James Howard, etc.

The loyal toasts having been honoured, Mr. Pilling submitted the toast of the President, who suitably replied.

Mr. James Howard submitted the toast of the Vice-President, Councillor Walkden responded.

BANKRUPTCY OF BUILDERS.

MR. WATT, in the Parliamentary Paper asked the President of the Board of Trade what was the number of bankruptcies of builders during the three years preceding January, 1906, and during the three years following that date; and, if further statistics were available, would he give the number for the years 1909, 1910, and 1911.

Mr. S. Buxton said that the following statement gave the information asked for so far as related to England and Wales. The jurisdiction of the Board of Trade in bankruptcy did not extend to Scotland and Ireland, and they were not in possession of corresponding particulars for those countries.

Number of Receiving Orders, including administration orders under sect. 125 of the Bankruptcy Act, 1883, made against builders in each year from 1903 to 1911, inclusive:—

Year.	Number of Receiving Orders.	Year.	Number of Receiving Orders.	Year.	Number of Receiving Orders.
1903	330	1906	309	1909	298
1904	313	1907	309	1910	298
1905	288	1908	291	1911	240
Total	941	Total	908	Total	647

GENERAL BUILDING NEWS.

CHURCH, LIVERPOOL.

A new Church of St. Barnabas, Smith-road, Liverpool, is being erected from design of Mr. T. F. Doyle, of Liverpool, was exhibited at the Royal Academy exhibition this year. Its principal feature is a ver, standing at the corner where five meet at the outward end of Smithdown. The style is Perpendicular treated

NEW SCHOOL, ATTERcliffe.

Mrs. Chapman & Jenkinson are the architects for the new school which has been erected at High-street at a cost of 1,325l. The scheme dealt the building of a new school section for the conversion of the old into modern ones. The large hall on the ground floor accommodates for 500 persons.

NEW POST-OFFICE, BISHOP'S STORTFORD.

A new head post office has been erected at Bishop's Stortford, and was opened for the public on the 9th inst. The building comprises, amongst other accommodation, a office, sorting offices, telegraph and telephone rooms, and battery house. Master's offices, postmen's, linesmen's, and telegraph boys' rooms, rest-rooms for the mail staff, lavatories, cycle house, truck engineers' stores house, and numerous storerooms, etc. Provision has been made for future extension and enlargement. Buildings have been erected by Messrs. J. & Son, of Bishop's Stortford, from the plans and under the supervision of Mr. M. Atkin-Berry, F.R.I.B.A., of the firm of Messrs. Kidner & Berry, London.

NEWSPAPER OFFICES, LIVERPOOL.

A new *Daily Post* building facing Whitehall, Liverpool, has been constructed on the same site as the old building, with extension to other offices. The building is a story high, with a basement. The building is a frame, all loads being transmitted by the beams to the columns, and thus to the foundation. The walls are carried from floor to floor by the ferro-concrete frame. The basement of the new building extends for 25 ft. below the street pavement. The ground floor, 1 ft. high, was a ground floor. Access to the various floors through openings guarded by automatic roof doors in the wall of the old building and by an electric lift in Preston-street. The lift will be used both for goods and passenger traffic. The outside of the building is covered with Burnham's stone-coloured-cotta, supplied by the Leeds Fireclay Company, Ltd., Leeds. The details of the ferro-concrete work were designed by Messrs. T. Mouchel & Partners, of London, in consultation with the architect, Mr. W. Aubrey Jones, the contractor being Messrs. Edmund Atkin & Co., of Manchester. Mr. John Atkin, of Liverpool, was the builder.

NEW BRIDGE AT HALSTED.

An improvement has been effected to one of the principal streets in Halstead by the widening of the bridge crossing the Colne at the end of High-street. The work has been carried out under the direction of Mr. P. J. Jones, the County Surveyor, and the estimated cost is 1,200l. The new work has been carried in Portland cement concrete, faced with red Ruabon bricks, and the parapets have been constructed of Portland stone and Ruabon bricks, with solid stone pilasters. The contractor for the work was Mr. A. T. Ryan.

CINEMATOGRAH THEATRE, SUNDERLAND.

A new picture hall has been erected in High-street, West, Sunderland, from the designs of G. T. Brown, architect. The building includes seating accommodation for 1,500 people, and a special feature is a balcony at the back of the hall, which has been fitted as a lounge and a tea-room. The contractor for the work was Mr. J. Huntley.

NEW HIPPODROME, BRISTOL.

Messrs. Frank Matcham & Co. are the architects for this new music-hall, which was opened on Monday last, and has been erected at St. Augustine's Bridge, Bristol. An interesting feature of this hall is the stage mechanism. Sixty feet in depth alone, it is made to rise and fall by the touch of a lever, and the rear part of the stage can be made like a drawbridge and the fore part can be back.

NEW GOVERNMENT OFFICES, WESTMINSTER.

The offices of the Crown Agents for the Colonies, at present situated in Whitehall, will be removed in course of time to a new building to be erected from the designs

of Messrs. J. W. Simpson, F.R.I.B.A., and Maxwell Ayrton, A.R.I.B.A., on a site near the Houses of Parliament and the new Embankment-gardens. The work is in progress.

THE FLEETWAY HOUSE, E.C.

With reference to our paragraph on this subject in our last issue (p. 722) we are informed that in the first part of the constructive work the contractors for the asphalt were the Seyssel and Metallic Lava Asphalte Company, of 42, Poultry, E.C.

TRADE NEWS.

Under the direction of Mr. J. A. Marsden, architect, and surveyor, Doncaster, the "Boyle" system of ventilation (natural), embracing Boyle's latest patent "air-pump" ventilators and air-inlets, has been applied to the picture palace, Doncaster.

The extensions to the Bucknall Isolation Hospital are being supplied with Shorland's warm-air ventilating patent Manchester grates, patented exhaust roof, and special inlet ventilators, by Messrs. E. H. Shorland & Brother, Ltd., of Failsforth, Manchester. The Welton Church School is being supplied with the firm's warm-air ventilating patent Manchester grates.

We are informed that the title of the firm of John Tann, safe and strong room engineers, 117, Newgate-street, E.C., has been altered to John Tann, Ltd., having been registered as a limited company on the 2nd inst.

In reference to the article in our last issue on St. Andrew's Hospital, Dollis-hill, N.W., we are informed that Messrs. J. E. Lucas & Son, Tanner's-hill, New Cross, S.E., erected the folding partitions in the building.

We are informed that the patent powder Pullo, for rendering cement waterproof, the makers of which are Messrs. Kerner-Greenwood & Co., King's Lynn, is being used on a flat roof at Hardwick Hall on the Duke of Devonshire's estate.

The Express Dairy Company, Ltd., are opening a fresh depot at Bovey Market. The necessary alterations, etc., are being executed by Messrs. E. A. Rooms & Co., of 36, Basinghall-street, E.C., under the supervision of Mr. Frank Rudkin, 25, John-street, Bedford-row, W.C.

In our description last week of St. Andrew's Hospital, Dollis-hill, we mentioned that the private wards and other apartments are warmed by open wall fireplaces, though we stated in another part of the article that the stoves were supplied by the Tesle Fireplace Company, of Berners-street, W., and Leeds. We are asked to mention that the wall stoves throughout are "Teale's" latest patent Diver fireplaces, and that the whole of the fireplaces were supplied by the firm.

The Civilian Urban District Council have accepted the tender of Messrs. Faulkner & Son, Ltd., of Walton-on-Thames, at the sum of 377l. 7s. 11d., for the supply only of iron fencing and gates for Stamford Brook Common.

Messrs. William Potts & Sons, Ltd., Guildford-street, Leeds, are now making a large Cambridge quarter clock, with three dials, for Halifax Northwam Church, and a Cambridge quarter chime clock, with four illustrated dials, for Mill-hill Congregational Church, Blackburn. Plans and an illustrated clock for the South Shields Corporation.

PAINTING BY SPRAYING AND DIPPING.

In a paper read before the Paint and Varnish Society Mr. A. S. Jennings showed the immense saving which might be effected by spraying and dipping methods as compared with painting by means of brushes, and gave as an example the carriage department at Woolwich Arsenal, where forty-one men are now employed in painting, as against two hundred some years ago, when the work was done by hand. Painting by both dipping and spraying is used largely in the manufacture of agricultural implements, wagons and carts, furniture and enamel ware. In some cases the first and second coats are applied by dipping the article to be treated in a tank, while final coats of varnish or paint are sprayed on. The smallest articles can be dipped in the same way by enclosing them in wire baskets. Special quick-drying paints have to be used, and in most cases the tank is provided with agitators to keep the paint of uniform consistency.

BUILDING ACCIDENT IN NORTH LONDON.

A serious accident occurred last week at a building which is being erected in Dalston-lane. While several men were hoisting a piece of stone to a height of about 14 ft. from the ground, it fell from the planks supporting it, and dashed on to the scaffold, which collapsed, carrying the men to the ground. Seven men were found to be so injured that they had to be removed to the German Hospital close by.

APPLICATIONS UNDER LONDON BUILDING ACTS, 1894 to 1909.

At Tuesday's meeting of the London County Council the following applications under the London Building Act were dealt with. (The names of the applicants are given in parentheses):—

Lines of Frontage and Projections.

Camberwell, North.—Erection of a projecting balcony at Verney House and Verney flats, Verney-road, Camberwell. (Messrs. Cross, Curtis, & Largent for Messrs. B. Young & Co., Ltd.).—Consent.

Clapham.—Oriel-windows and bargeboards at the rear of buildings on the western side of Park-hill, Clapham, and to a deviation from the plans approved on March 5, 1912, for the erection of buildings next to the western side of Park-hill, the southern side of Abbeville-road, and the eastern side of Briarwood-road, Clapham. (Messrs. H. F. Buchan & Co.).—Consent.

Hackney, North.—Bay-windows, oriel-windows, porches and eum half-timber work to ten houses on the south-western side of Lingwood-road, Hackney. (Mr. R. A. Reader for Mr. D. S. Barclay).—Consent.

Hamstead.—Erection of bay windows in front of three houses on the north-eastern side of Bracknell-gardens, Hamstead. (Mr. C. H. Saunders for Mr. J. Tomblin).—Consent.

Hamstead.—Retention of glass screens to a porch and wooden balustrading over the bay-windows and porch at No. 22, Belgrave-avenue, Hamstead. (Messrs. F. Troy & Co. for Mr. J. C. Biggs).—Consent.

Holborn.—Retention of an illuminated iron and glass sign in front of No. 11, High Holborn. (Cabins, Ltd.).—Consent.

Islington, East.—Erection of a projecting illuminated sign at No. 12, Seven Sisters-road, Islington. (Mr. P. D. Morris).—Consent.

Limhouse.—Erection of a building on the western side of Burdett-road, Limhouse, to abut upon the northern side of Clemence-street. (Mr. D. P. Hayworth for the Bow Common Estate Company, Ltd.).—Consent.

Marylebone, East.—Iron and glass covered way in front of No. 29, Portland-place, St. Marylebone. (Mr. R. W. Schultz for Sir Edward Stacey, Baronet).—Consent.

Marylebone, East.—Two bay-windows in front of the Heart Hospital, Westmoreland-street, St. Marylebone. (Mr. H. Goslett).—Consent.

Marylebone, East.—Erection of an illuminated sign at No. 34, Oxford-street, St. Marylebone. (Messrs. Stanley Jones & Co., Ltd.).—Consent.

Paddington, North.—Iron and glass hood at the entrance to No. 188, Sutherland-avenue, Paddington. (Mr. D. B. Hedderwick for Mr. I. Abraham).—Consent.

Peckham.—Building upon a site on the northern side of Peckham-road, Peckham, to abut upon the western side of Camden-grove. (Messrs. Adshad & Ramsey for the Trustees of the Hanover Congregational Church).—Consent.

St. George, Hanover-square.—Projecting iron and glass shelter, and an illuminated sign in front of such shelter, at the entrance to No. 152, Victoria-street, Westminster. (Mr. G. Odono).—Consent.

Strand.—Erection of a projecting illuminated clock in front of No. 225, Oxford-street. (Messrs. O. C. Hawkes, Ltd., for Electric Theatres, Ltd.).—Consent.

Strand.—Retention of a projecting shop front at No. 15, York-street, Covent-garden. (Mr. W. Nightingale for Mr. A. Atkins).—Consent.

Wandsworth.—Three buildings on the southern side of Mitcham-road, Wandsworth, abutting also upon the eastern side of Bickneth-road. (Mr. H. B. Michell for the British Land Company, Ltd.).—Consent.

Wandsworth.—Wooden cycle shed in the garden of "Lingwell," Putney Heath, Wandsworth. (Mr. J. Henry).—Consent.

Lines of Frontage and Construction.

Clapham.—Retention of a showcase upon a part of the forecourt of No. 81, Clapham Park-road, Clapham. (Mr. A. Brown).—Consent.

Dulwich.—Erection of a showcase at No. 24, Half Moon-lane, Dulwich. (Mr. E. C. P. Monson).—Consent.

Kensington, North.—Building of a temporary character at No. 49, Bassett-road, Kensington. (Mr. G. M. Lindner).—Consent.

Lewisham.—One-story shop of a temporary character between Nos. 296 and 300, High-street, Lewisham. (Mr. G. Court).—Consent.

Lewisham.—Retention of a wood and glass showcase in front of No. 213, High-street, Lewisham. (Mr. J. M. Major).—Consent.

Lewisham.—Showcase in front of No. 66, High-street, Lewisham. (Messrs. J. Sears & Co. (True Form) Boot Company).—Consent.

Norwood.—Iron and glass shelter in front of No. 232, Knight's hill, Norwood (Messrs. Carl Henschel, Ltd.).—Consent.

Paddington, South.—Retention of a temporary lean-to building in front of No. 134, Queen's-road, Bayswater (Mr. W. J. Arkcoll).—Consent.

St. George, Hanover-square.—Temporary wooden kiosk on the forecourt of Victoria Station, abutting upon Wilton-road, Pimlico (Mr. L. H. Livesey).—Consent.

St. Pancras, South.—Temporary wooden bookstall at Gower-street Station, abutting upon Euston-road and George-street, St. Pancras (Messrs. W. H. Smith & Son).—Consent.

Space at Rear.

Marylebone, East. Erection of a building to be known as the Heart Hospital, Westmoreland-street, St. Marylebone (Mr. H. Goslett).—Consent.

Space at Rear and Alteration of Buildings.

Chelsea.—Studio addition on a flat roof at St. Leo-mansions, St. Leo-avenue, Chelsea (Mr. A. Roberts).—Consent.

Finsbury, East.—Alterations at No. 24, New Charles-street, City-road, Finsbury (Messrs. Moore & Hunter for Mr. W. Jupp).—Consent.

Paddington, South.—Addition at the rear of No. 7, Leicester-gate, Paddington (Mr. A. Gillett for Mr. F. P. Longman).—Refused.

Strand.—Addition at the rear of the Monto Carlo Hotel, Leicester-street, Leicester-square (Messrs. Dennis Adams & Co. for Messrs. D. Rocca & C. Riva).—Refused.

Alteration of Buildings.

Hamptonstead.—Erection of an additional story at No. 9, Rosemont-road, Hamptonstead (Mr. G. E. Ellis for Mr. W. T. Pearce).—Consent.

Kennington.—Alterations at No. 72, South Lambeth-road, Kennington (Messrs. Searle & Searle for Messrs. Brand & Co., Ltd.).—Consent.

Kennington, South.—Alterations at No. 5, Holland-park, Kennington (Messrs. Kemp & How for Mr. O. Gerdes-Hansen).—Consent.

Paddington, South.—Erection of an addition at the rear of No. 49, Westbourne-gardens, Paddington (Mr. M. Reincke).—Consent.

St. Pancras, North.—Addition at the rear of No. 52, Mansfield-road, St. Pancras (Mr. W. E. Sanders for Mr. W. King).—Consent.

Southwark, West.—Re-erection of a building upon the site of Nos. 145 and 147, Borough High-street, and certain alterations at No. 149, Borough High-street (Messrs. S. Haskins & Brothers, Ltd.).—Consent.

Cubical Extent.

City of London.—Additional cubical extent at a building upon the site of Nos. 22 to 25, Farringdon-street, City (Mr. H. O. Ellis).—Consent.

City of London.—Additional cubical extent in connection with the erection of a printing office and factory building abutting upon Shoe-lane and Plum Tree-court, City (Messrs. J. W. Beaumont & Son).—Consent.

Poplar.—Alterations and additions at building "K" at the premises of Messrs. C. & E. Morton, Ltd., Cube-street, Poplar (Messrs. C. & E. Morton, Ltd.).—Refused.

Width of Way, Lines of Frontage, and Projections.

City of London.—Iron gangway to connect two blocks on the premises of Messrs. W. & D. Harvey over the public way of Brewer's-lane, City (Messrs. Hall, Biddall, & Co. for Messrs. W. & D. Harvey).—Consent.

Hackney, South.—Temporary wood and iron building and iron screen at No. 122, Lea Bridge-road, Hackney (Messrs. J. Livermore & Son).—Consent.

Woolwich.—Retention of wood and canvas structures in front of Nos. 124, 123, and 130, Plumstead Common-road, Woolwich (Mr. W. Pearman for Messrs. Buckley Brothers and C. E. Soder).—Refused.

Lines of Frontage and Cubical Extent.

Poplar.—Building at St. David's Wharf, West Ferry-road, Poplar, to exceed 250,000 cubic ft. in extent, without a layer of concrete over the site (Mr. T. A. Watson).—Consent.

Uniting of Buildings.

City of London.—Uniting of Nos. 71 and 73, Fore-street, City, so far as relates to the formation of further openings in the party wall at the first, second, and third floor levels (Messrs. Moeller & Condrup, Ltd.).—Consent.

Finsbury, East.—Uniting of Nos. 54 and 55, Bunhill-row to No. 53, Bunhill-row, Finsbury (Messrs. W. Woodward & Son).—Consent.

Holborn.—Uniting of premises abutting upon Great Earl-street and Castle-street, Holborn (Mr. Lewen Shary for Messrs. Lepard & Smiths, Ltd.).—Consent.

Holborn.—Reduction of openings in the party walls at the basement, ground, first, second, third, and fourth floor levels between Nos.

13, 14, and 15, Robin Hood-yard, Holborn (Mr. J. Sawyer for Messrs. A. W. Gamage, Ltd.).—Consent.

Kennington, South.—Double rolling steel shutters in lieu of double iron doors to an opening in a division wall at the second-floor level of the premises of Messrs. Pontings, Ltd., Kennington High-street (Messrs. J. Barker & Co., Ltd., for Messrs. Pontings, Ltd.).—Consent.

Cubical Extent and Uniting of Buildings.

Wandsworth.—Additional cubical extent at a proposed garage at Gothic Wharf, Brewthorpe-lane, Putney, and to openings exceeding the statutory size in the division wall (Mr. G. A. Lansdown for the National Steam Car Company, Ltd.).—Consent.

Westminster.—Alterations at the premises of the Army and Navy Co-operative Society, Ltd., No. 107, Victoria-street (Mr. W. J. Falkner for the Army and Navy Co-operative Society, Ltd.).—Consent.

The recommendations marked + are contrary to the views of the Metropolitan Borough Councils concerned.

PROJECTED NEW BUILDINGS IN THE PROVINCES.*

ABRAM.—Proposed church; Mr. F. Freeman, architect, 15, Bowdler-street, Bolton.

ACKNOWLEDGMENT.—Picture theatre for the Alhambra Picture House Company, Ltd.

AIRDRIE.—Police-station, Clarkston (8501); Mr. H. Inglis, Surveyor, Town Hall.

road (4,960); Mr. J. Greenwood, builder, 2,
Wood-street, Mansfield.
West Hartlepool.—Swimming-baths on site
south of Carr House; Mr. Nelson F. Dennis,
Engineer, Town Hall, West Hartlepool.
Westoning.—School (1,495); Messrs. Smith
& Son, builders, Thorpe-street, Raunds,
Northants.
Weymouth.—Improvements at Harbour
(12,000); Mr. W. Barlow Morgan, Engineer,
Town Hall, Weymouth.
Willenball.—Church, Temple-road; Vicar,
St. Anne's Church, Willenball.
Woodford-cum-Membris.—School (2,700);
Mr. George H. Lewin, Architect, County Edu-
cation Offices, Northampton.
Yeovil.—Adaptation of premises, rear of
Town Hall, as fire-station; Mr. Warren, archi-
tect, care of the Town Clerk, Town Hall,
Yeovil Buildings, site of Recklesford School,
for Messrs. Petters, Ltd., oil-engine manufac-
turers, Nautilus Works, Yeovil.
York.—Thirty houses, Alma-terrace, Fulford-
road (6,395); Messrs. G. Lough & Co.,
builders, 11, Waterloo-road, Blythe.

fire. Among the many forms of barless fires
now on the market, the "Hue" fire claims
the distinctive advantage of being designed
and manufactured to suit the base area of
existing grates, so that the economy of fuel
and increased heating power which result
from the adoption of a barless fire may be
obtained without the added cost and labour
of removing existing chimney-pieces and
scrapping existing stoves. The fire is clean
in use, the ashes finding their way into a
specially constructed closed pan under the
bottom grate, which can be removed and
emptied without inconvenience. For hotels,
offices, waiting-rooms, and dwelling-houses, and
indeed in every case where a bright and
cheerful fire is required at the minimum of ex-
pense, its introduction should usher in a period
of heat, utility, and economy unknown before.
Where existing grates possess very shallow
fires, under 8 in. from back to front, the firm
recommend the use of their special heavy
brick backs for deflecting the heat. The iron
backs can in most instances be readily re-
moved and the new bricks inserted without
taking out the existing stove or touching the
mantelpiece and surroundings. In cases where
it may be undesirable to remove the back and
sides, a "Hue" fire can be specially cast to
fit. In addition to the adaptable "Hue" fire,
complete "Hue" interiors are supplied in
many styles. Among other important con-
tracts, Messrs. Young & Marten have recently
supplied the Three Counties Asylum with over
150 of their fires.

FOREIGN AND COLONIAL.

Agricultural College, South Africa.

H.M. Trade Commissioner reports that,
according to information received from the
Commissioner of Customs and Excise at
Pretoria, it has been officially announced that
the Government intend to proceed with a
scheme for establishing an Agricultural
College at Pretoria, 700,000, having been set
aside for the construction thereof.

Wharves, etc., Mexico.

H.M. Consul-General reports, on the
authority of the local Press, that the Mexican
Department of Communications has signed a
contract with Messrs. S. Pearson & Son, Ltd.,
for the construction of two wharves and several
warehouses at the port of Coatzacoalcas. The
work will be begun as soon as the Chamber
of Deputies approves the contract.

Building Materials and Plant for Arsenal, Switzerland.

The *Feuille Fédérale Suisse* (Berne) of
December 4 contains a decree earmarking a
credit of 766,000 francs (30,640*l.*) for the con-
struction at Lyes of an arsenal, together with
magazines and other departments.

TRADE CATALOGUES.

We have received a supplementary list of
electric-light fittings from Messrs. A. Emanuel
& Sons, Ltd., of George-street, Manchester-
square, W. The illustrations in this list have
been arranged so as to show each particular
fitting as accurately as possible, and very many
of the fittings illustrated have been specially
designed by the firm.

Messrs. Young & Marten, Ltd., Caledonian
Works, Stratford, E., send us a descriptive
booklet dealing with the "Hue" adaptable

The "Hue" Fire adapted to an existing stove.

The "Hue" Barless Hearth Fire.

THE LONDON ALMANACK.

Mr. Monk's *Calendarium Londinense*, 1913, hand-printed and published at 72, New Bond-street, has for headpiece an etching of the Guildhall, with a portion of the Church of St. Laurence Jewry in the foreground. It will be seen from the small illustration on this page how this classic building dominates Deane's elevation to the Guildhall. The etching includes also a view of the eastern wing and the entrance to the Art Gallery, the proposed rebuilding of which, from the design of Mr. Perks, is being discussed so exhaustively by the Corporation.

The London Almanack, 1913.

By Mr. W. Monk, R.E.

Mr. Monk's etching, therefore, is not only of topical interest, but, assuming that alterations will be made shortly, is of value as a record of the existing building and its surroundings. This, indeed, is one of the objects the artist has in mind in issuing the broadsheet every year, namely, to perpetuate the appearance of contemporary London. Since the calendar is worthy of preservation, the series forms an historical record. It has now been published for eleven years, and should be known to all Londoners. The size is 15 in. by 11 in.

QUESTIONS IN PARLIAMENT.

Victoria and Albert Museum.

In Tuesday's Parliamentary papers Mr. Grant asked the President of the Board of Education whether he would say what use had been made of Rooms 101-106, formerly Jones Collection, in the Victoria and Albert Museum since the date when the new fireproof roofs were completed in 1911; and how long such valuable exhibiting space was to remain closed to the public, seeing that the need for more room was referred to in the Report on the Victoria and Albert Museum for 1911.

Mr. Pease said, in answer to the first part of the question, the rooms referred to had been used for temporary purposes such as the preliminary display of objects offered on loan or for purchase. With reference to the last part of the question, he hoped to make a statement early next year.

Mr. Grant also asked if the President would state when the repairs to the ceiling of the gallery leading to the lecture theatre of the Victoria and Albert Museum and the replacing of the flooring in that gallery, recommended by the Committee in their Report lately presented to Parliament, would be taken in hand; and whether the original colouring of the walls of that gallery, to match the colouring of the twelve ornamental columns of the gallery, could now be proceeded with.

Mr. Pease said, in regard to the ceiling and the flooring of the gallery in question, steps were being taken to carry out the recommendations of the Committee referred to. The question of the colouring of the walls was reserved for the present.

Regent's Park.

Answering a question from Mr. Cassel, Mr. Runciman said the attention of the Commissioner of Woods, who had charge of the

Crown estates in London, had been called to a resolution of the Marylebone Borough Council. It was intended to retain, but not to increase, the number of residences at present in the Park, and before the surrender or falling in of the lease of such a residence careful consideration was given by the Commissioner, in communication with the Office of Works, as to whether any, and, if any, what, land held with the house could with advantage be added to the area open to the public without unduly affecting the letting value of the residence, and wherever that could be done land was added to the open area before granting a renewed lease.

In the Parliamentary papers Mr. Cassel asked the representative of the First Commissioner of Works whether his attention had been called to a resolution passed by the Marylebone Borough Council protesting against the erection of any additional buildings in Regent's Park, and desiring that its value as an open space might be preserved for the use of the public; and whether the Government were prepared to give effect to this resolution by refusing to allow any buildings to be erected on any lands to be enclosed in the Park, and throwing open to the public any lands now enclosed whenever leases fall in and a suitable opportunity arose. Mr. Wedgwood Benn replied that the resolution referred to had been seen by the First Commissioners. The control of buildings in the private enclosures were not, however, within his control but that of the Commissioners of His Majesty's Woods. It was the policy of the First Commissioner to acquire, as opportunity offered, parts of the enclosures and to add the land so acquired to the area of the Park.

New Delhi.

Mr. King asked the Under-Secretary of State for India whether the estimate of 4,000,000, which had been made of the amount to be expended by the Government of India on the new Delhi was adhered to; and, if so, whether a statement of such estimated expense could be given, distinguishing the sums for purchase of ground, for laying-out, draining, and clearing the site, for building Government House, for building other Government buildings, and for fittings and furniture.

Mr. H. D. Baker: "In the course of the Budget discussion in the Legislative Council the Viceroy, on March 25 last, stated that he had good reason to believe that with proper care and supervision the sum of four millions sterling would be in the end but little, if at all, exceeded by the time the city is built. The Secretary of State is not aware of any fresh circumstance suggesting a modification of this figure, but no detailed estimates of expenditure under different heads are as yet available."

Town Planning.

Mr. J. Taylor asked the President of the Local Government Board if he would state how many cases of the compulsory purchase of land for the purpose of housing and town planning had been sanctioned since the passing of the Housing, Town Planning, etc., Act; the price paid for the land so acquired; and the relation such price bore to the annual value as shown by the rate-books or by Government valuation.

Mr. J. Burns said that only one order for the compulsory purchase of land for housing purposes had been confirmed by the Board under the First Schedule to the Housing, Town Planning, etc., Act, 1909, viz., the Erpingham Order, parish of Edgefield. In that case the arbitrator had awarded 382l. The sum was thirty and a half times the gross estimated rental of the property bought. He was not, of course, aware how the sum awarded was arrived at, and whether any sum was included in it for severance or injurious affection.

Edinburgh Buildings.

Mr. Hogge asked the representative of the First Commissioner of Works whether he could state the precise nature of the offer made by the First Commissioner of Works to the Edinburgh City Council in adjusting the building line in connexion with the laboratory at the Royal Botanic Gardens; and whether he could state why it was now proposed to make additions at the rear of the laboratory, seeing that when the building was erected originally it was stated that such space could not be taken from the gardens. Mr. Wedgwood Benn, in reply, said the whole matter of the building line in Inverleith-row was now the subject of negotiation between the First Commissioner and the Edinburgh Town Council, and a satisfactory outcome was anticipated.

Government Buildings, Scotland.

Mr. Hogge, on Tuesday, asked the Hon. Member for St. George's-in-the-East, as representing the First Commissioner of Works, whether the designs for any new Government buildings in Scotland would be thrown open to competition among Scottish architects; whether, in the case of the proposed Scottish offices to be erected in Edinburgh on the site of the existing Calton Gaol, it was proposed to invite outside competition; whether, seeing the existing buildings were at present in use as a prison, for which no new site had been acquired, there was ample time for competitive designs to be invited; and whether, if the designs were not to be thrown open for competition, the First Commissioner of Works would at an early date place the model of the proposed buildings in the Tea Room, so that all Scottish Members might see what was contemplated.

Mr. Benn said the First Commissioner invited the assistance of a small Committee of Members of Parliament, who decided against an open competition. The Calton Hill Buildings would therefore, be designed in the Office of Works. An independent Scotch architect of high standing would be asked to advise on the matter. The First Commissioner would be happy to give all the Scottish Members an opportunity of inspecting the plans and model before the building was put in hand.

Lord Balcarras asked if this meant that the independent Scottish architect of high standing was going to be allowed to reverse the plans which had been prepared.

Mr. Benn said he would be consulted as to the merits of the plan which had been prepared. Lord Balcarras asked if it would not be better if he were to prepare the plans himself.

Mr. Benn: That is a matter of opinion.

ROYAL COMMISSION ON SEWAGE DISPOSAL: EIGHTH REPORT.

It was in August, 1893, that the *Builder* first referred to the bacterial purification of sewage in connexion with the evidence given by Professor Sims-Woodhead before the Royal Commission on the London Water Supply, and five years afterwards, in the sixty-first year of the reign of Queen Victoria, the Royal Commission was appointed that has now issued the eighth Report.

By far the greater part of their labours has been devoted to the investigation of the application of bacterial processes to a solution of the sewage problem, and it was this aspect of the subject that first led to its appointment.

Fourteen years seems a long time for the work of any Commission, and only three out of the eight original members have survived to sign the latest Report.

What they have done and the methods they have adopted have been the subject of some severe criticism, and, in the light of their latest production, a good deal of this has been well deserved.

Many persons who were in a position to form a sound judgment soon came to the conclusion that the Commission were not well equipped for the work they had undertaken, but this opinion was greatly qualified by the fact that it was really pioneer work they were called upon to deal with, and that only men of altogether exceptional training and ability could have mastered the situation. The result of this inadequacy has been only what might have been expected. The Commission, having taken a vast amount of conflicting or inconclusive evidence, set themselves simply to observe what was being done all over the country under the pressure of statutes which there were no means of complying with, and without raising a word of protest against prodigious sums of money spent upon schemes that might well have been held back until the Commission were in a better position to form a definite and approximately final opinion.

This attitude of observation entailed an amount of scientific research that would have been quite proper subject-matter for a national laboratory, but it has had the effect of retarding the practical objects the Commission were called upon to deal with. If there were any doubt about the justice of these observations before the production of the latest Report they have been quite set aside by its appearance, and embodies an absolutely common-sense view

whole subject which might have had effect to it within a few months of their appointment. This would, at any rate, have secured modification of the law that has led to these disputes, and which, after fourteen years of laborious investigation, they at last seem should be altered.

There is now good reason to believe that their Report will be heartily welcomed, and that one more than the ratemayer.

The first paragraph of their summary of discussions runs as follows:—"The law should be altered so that a person discharging sewage into a stream should not be deemed to have committed an offence under the Rivers Pollution Prevention Act (1876) if the sewage is discharged in a form which satisfies the requirements of the prescribed standard." The prescribed standard, both as regards undissolved matter and dissolved oxygen, taken over five days, should be regarded as satisfactory, and the more so as it includes the effect of dilution which, although obvious to the first hand, is not given to it.

The Royal Commission on Sewage Disposal started on the lines of the classical investigations of Pettenkofer, carried out long before their appointment, they might have reached at their present conclusions many years ago.

The recommendation in a previous Report of a Central Authority should determine the law to be applied was positively alarming, but a very different matter now that reasonable means are to be determined before its appointment.

Experts will still await the issue of the Report to the eighth Report with some interest, seeing that the technical details involved in carrying out the proposed tests are what difficult, and an apparatus previously recommended by the Commission has been the cause of unfavourable criticism. No doubt proposed arrangements have now been suggested, so that there is good reason to expect the very expensive anomaly of the law of pollution, being impossible to comply with, will no longer exist.

It is well that ends well, and there should be general sense of satisfaction that the Royal Commission on Sewage Disposal has at last reached at such common-sense conclusions.

METROPOLITAN ASYLUMS BOARD.

At the fortnightly sitting of the Metropolitan Asylums Board on Saturday evening matters were dealt with:—*Green Hospital*.—A letter was received from the Local Government Board, assenting to the structural alterations involved in proposals regarding the Joyce Green site of six iron bridges of two tiers each, and asking for a complete estimate of cost.

Levensden Asylum.—It was decided, subject to the sanction of the Local Government Board, to accept the tender of Messrs. H. G. & Co., amounting to £5,335, for the erection of four of the double cottage blocks above hospital, and, at the same time, to be furnished with a complete estimate based upon a tender. Tenders had been obtained, and the lowest was that of Messrs. Summers, Brothers, Normanhurst, amounting to £1,247. To this had been added 50l. for incidental expenses.

Report was also presented regarding the plan for isolation accommodation, recreation hall, and schoolrooms at the same hospital. It was recommended that no further action be taken for the present in regard to the isolation accommodation, but that the revised plans for erection of a recreation hall and schoolrooms, at an estimated cost of 7,045l., be referred to the Local Government Board for approval.

METROPOLITAN WATER BOARD.

At the monthly meeting of the Metropolitan Water Board on December 13 the following matters were dealt with:—*Prices*.—It was agreed that the following be added to the schedules of prices in relation to the reinstatement of the broken up by the Board within the Metropolitan district:—Lambeth Borough-sprayed macadam, 3s. 6d. per yard;

Tottenham Urban—Relaxing wood on 12-in. granite, 15s. 6d. per yard; Buckhurst Hill Urban—Tar-sprayed gravel, 6d. per yard; Bromley Rural—Tar-painted granite, 1s. 8d. per yard, and tar-painted flint, 1s. 2d. per yard.

Reinforced Fencing.—It was decided to accept the tender of the Reinforced Concrete Fence Posts Company for the erection of a concrete post and wire fence, 3,890 yds. in length, at the Chingford Reservoir, at a cost of 2s. 1d. per yard.

LEGAL COLUMN.

Workmen's Compensation.

In the case of *Garnant v. Anthracite Collieries, Ltd.* (current "Law Reports") the Court of Appeal had to consider a point under the Workmen's Compensation Act in connexion with industrial disease. A workman employed as a collier suffered from nystagmus, and for a time was paid compensation by consent. The employers then applied for a review, and at the hearing evidence was given that, although the man was no longer actually suffering from the disease, the previous attack rendered him liable to a recurrence. The Court on this evidence held that as there was evidence that the effects of the disease still continued, the County Court Judge was justified in holding that the applicant was entitled to compensation.

This decision must be compared with that in *Jones v. New Brynally Colliery Company, Ltd.* (5 Butt. W.C.C. 375), by which a workman in similar circumstances, but where no medical evidence was offered as to the predisposing effects of the disease, was held not to have satisfied the burden of proof laid upon him, since the tendency to nystagmus alleged in that case might have been due to a personal susceptibility not common to all colliers. In the argument in *Garnant's* case some point was endeavoured to be made as to some diseases being scheduled in the Third Schedule to the Act with their sequelae, whilst others, of which nystagmus is one, are scheduled without sequelae. We may point out that in this case there could be no question of sequelae, because the incapacity was held to be caused by the original disease, which left the patient susceptible to a recurrence of the same disease. The term sequelae is added in connexion with certain diseases in the Act because it is well recognised that certain industrial diseases set up diseases of a different nature. For instance, lead poisoning may set up kidney disease, and some diseases may cause paralysis.

The Insurance Act.

A Divisional Court has recently considered three cases under the Insurance Act—*Hurlock v. Shinn*; *Rex v. Hedderick, ex parte Slate*; and *Morris v. Ashton*. The appellants in each case had been convicted of failure to pay contributions under Part I. of the Insurance Act, in respect of Health Insurance, and in the three cases almost every possible technical objection was raised to the convictions. The Court, constituted of three judges, including the Lord Chief Justice, unanimously decided the cases in favour of the Crown.

It may be well, as shortly as possible, to set out the points decided, for it may prevent employers embarking on useless litigation. It appears first to have been contended that a conviction for an offence and an order to pay a contribution could not be contained in one order. Sect. 68, subsect. 2, certainly gives the Court of Summary Jurisdiction power both to inflict a fine and to order payment of contributions withheld, and the Court held that under the Summary Jurisdiction Act, 1879, the order was rightly made. The second point was one which has been freely aired in the Press, that there could be no obligation to pay contributions until the benefits under the Act were arranged. The Court complimented Counsel on his courage in putting forward the contention, but declined to give effect to it. It was also contended that, as Provisional Regulations, the rules were not authorised by the Act, and that certain regulations, including Rule 6, as to the time of payment, were *ultra vires*, and that the body making them were not a "Government Department" within sect. 4 of the Rules Publication Act, 1893. All these objections were overruled, and it is unnecessary for us to enter into the legal arguments. The general public is hardly likely to impugn the Act on technical grounds such as the above, but one point was decided which is of general interest, and which should be especially noted by those liable to pay contributions. In the case of *Morris v. Ashton*, twenty-eight summonses were issued against one employer, who for seven weeks had neglected to pay contributions in respect of four

workmen. It was contended that this constituted one offence, and ought to have been included in one summons. The Court, without not deciding whether offences committed on different days could be included in one summons, held that each offence could certainly be dealt with separately. Thus it will be seen, if default is made in respect of payments due in different weeks, the person in default is liable to be put to the cost of separate summonses.

District Surveyor's Fees.

In the *Lambeth Police Court* on the 9th inst. a test case was tried to ascertain the meaning of sect. 26 of the London County Council (General Powers) Act, 1909, which prescribes the fees to be paid to District Surveyors in respect of skeleton-frame buildings. The section prescribes that the fees shall be equal to two and a half times the fees specified in regard to new buildings by the Act of 1894. As reported in the *Times*, the contention put forward on behalf of the District Surveyor was that this fee was to be in addition to the fee prescribed by the Act of 1894, not in substitution for it. The magistrate declined to accept this view, and it is hard to see how he could have come to any other conclusion. If a unit is mentioned as a basis of computation, how is it possible, in attaining the result, to reckon in the unit itself?

Land Valuation.

In the case of *Hornby v. Commissioners of Inland Revenue*, recently tried in the High Court, a decision of a Referee under the Finance Act was upheld.

A property, "The Rest," at Aisleburgh, was purchased by Mr. Money in 1856 for 2,150l., and it was asserted 402l. had been expended in improvements. He died in 1885, leaving the premises in trust, his widow being tenant for life. In 1902 the trustees expended 50l. on drainage. A neighbouring landowner was very anxious to acquire the property, and after repeated offers the property was sold to her in August, 1910, for 3,500l.

On September 21, 1911, the provisional valuation was served on the trustees, showing original gross value 2,000l. and assessable site value 600l. On appeal, the Referee fixed the gross value at 2,140l. and the assessable site value 740l. Ever since May, 1908, the adjoining proprietor had been offering 3,500l. for "The Rest" and 500l. for an adjoining cottage and stabling, and it was contended on behalf of the trustees that the original gross value as determined by the Referee was not equal to the price which a willing seller could have obtained in the open market on April 30, 1909. No question was raised as to the deductions made to arrive at the assessable site value 740l., and the Court affirmed the Referee on the ground that the offer in question had not been made to a willing seller in the open market. The tenant for life was extremely unwilling to sell, and the purchaser was anxious to purchase, and had in a letter expressed the opinion that she was offering for the whole property, including the cottage and stabling, which were admitted to be 500l., at least 1,000l. more than it was worth. It is obvious that this was an instance of a "fancy price," but the case suggests some curious reflections on the working of the Act. Supposing this sale to have been completed when the sum was first offered in May, 1908, then it would appear that when the provisional valuation came to be made the purchaser could, under sect. 2, subsect. 3, have applied to have a site value calculated on this fancy price substituted for the original site value, and it is certain that no increment value would then be likely to accrue in respect of the property.

Another point in the case deserves attention as illustrating the difficulties attending an accurate valuation of properties. Two experts gave evidence before the judge on behalf of the Commissioners of Inland Revenue as to the value they considered the value of the property in the open market by a willing seller. One of them placed the value at 2,000l., the other at 1,250l. Assuming these experts to be agreed as to the deductions, and that the value remained unchanged, it is obvious, if the lower valuation of one be taken as the original value, and the valuation of the other on the occasion, there would be an increment value duty charged of 150l. The Referee accepted the value of neither, but placed it 140l. higher. These figures well illustrate the uncertainties of valuation and the "happy-go-lucky" nature of taxation based on pure estimate.

Waterworks Breaking-up Streets.

The Court of Appeal, in the case of the *Mayor, etc., of Swansea v. Harpur* (current "Law Reports"), had to consider a point under the Waterworks Clauses Act, 1847. The Corporation, as the water undertakers, had broken up a certain road and laid down a

water-pipe. The work was properly carried out, and the road was made good under the superintendence of the respondent, the Surveyor to the County Council: but eight months after the completion of the work a portion of the road, and the river bank supporting it, slipped into the river. It was alleged by the County Council that this damage resulted from the pipe having been laid in the road, and they claimed compensation under sect. 28 of the Waterworks Clauses Act. The justices were of opinion that the damage was so caused, and ordered the Corporation to pay 87l. 10s., and taxed costs.

The Corporation contended that sect. 28 had no application, and therefore that the justices had no jurisdiction. The Divisional Court held that the justices were right; but the Court of Appeal have now reversed the judgment of the Divisional Court. The point involved was of some complexity, involving the interpretation of several statutes, but, as simply as we can state it, the decision amounts to this. Sect. 28 of the Waterworks Clauses Act, 1847, gives the undertakers powers to break up the streets for the purpose of laying pipes or repairing the same, "doing so little damage as can be in the execution of the powers hereby or by the special Act granted, and making good before the damage that may be done in the execution of such powers." The Court of Appeal held that the damage here complained of was not "damage done in the execution of such powers," as the authorised work had been properly carried out and made good before the damage occurred. But then it was argued that sect. 85 applied, which provides that, "with respect to the recovery of damages not specially provided for," the Railway Clauses Consolidation Act, 1847, is to be incorporated, and by sect. 140 of that Act, damages are to be ascertained by justices. The Court held that the damages not specially provided for mentioned in this section are not damages by way of compensation under sect. 28, but damages for wrongful acts. This case was practically decided when it was held that the damage occurring long after the work under the statutory powers were completed was not damage under sect. 28. If the damage had been done in the execution of the statutory powers it is not decided whether in such cases the justices would have had jurisdiction; but the Court intimated that unless express statutory jurisdiction was conferred then the remedy would be by common law action.

LAW REPORTS.

Action by the Royal Institute of British Architects to Restrain Use of Letters R.I.B.A.

The case of the Royal Institute of British Architects against Mr. Harry Horatio Reynolds recently came before Mr. Justice Warrington in the Chancery Division upon a motion for judgment.

Mr. Whitney, Counsel appearing for the Institute, stated that the action was brought by the Institute of British Architects for the purpose of obtaining an injunction to restrain the defendant, who practised as an architect and surveyor in Birmingham, from using, in connexion with his business as an architect, the letters R.I.B.A. in such a manner as to lead the public to believe that he was a member of the Institute.

It was agreed that the motion should be treated as the trial of the action, and that an order should be made that the defendant should be perpetually restrained from using, in connexion with his business as an architect or surveyor, or otherwise, from using the letters R.I.B.A. after his name, and from carrying on business in such a manner as to tend to the belief that he was a member of, or that his business was in any way connected with, the plaintiff Institute.

His Lordship made an order for an injunction in the terms asked, and directed that the defendant should pay to the Institute the costs of the action, such costs to be taxed in the event of the parties not agreeing them.

KING'S BENCH DIVISION, DIVISIONAL COURT.
(Before Justices RIDLEY and SCRUTTON.)

Action by Builders:

John Thompson & Co. v. Thompson.

The plaintiffs in this case appealed to vary an order made by Mr. Verey, an Official Referee, in a building dispute. The plaintiffs were builders and contractors of Wood-street, Peterborough, and the defendant was Mr. George Thompson, of Sutton Marsh, Long Sutton, and the action before Mr. Verey was to recover the balance of an account for alterations and additions to

Wryde House, Thorney, Peterborough. This residence was acquired by the defendant as a present for his daughter on her approaching marriage, which took place in the spring of 1911, to Mr. H. S. Dixon-Spain, land agent to the Earl of Leicester. The house was built in 1862, and up to the time of the purchase by the defendant had been used as a farmhouse. It was stated on behalf of the plaintiffs that no architect had been employed in the undertaking, and, save for a rough plan, no plans were ever prepared but those by the plaintiffs, who, consequently, as well as being contractors, were their own architects. Prior to the case coming before Mr. Verey, architects and surveyors of repute—including Sir A. Brunwell Thomas, F.R.I.B.A.—went to Wryde House, and they gave evidence before the Official Referee as to the value of the work done. The claim on behalf of the plaintiffs was 1,741l., and the defendant at first paid them 1,000l. Subsequently, as his Counsel put it, for the sake of peace, he paid a further 400l. into Court, making 1,400l., in satisfaction of the claim. The Official Referee found this sum was sufficient to satisfy plaintiffs' claim, and therefore gave judgment for the defendant with costs, after deducting therefrom the plaintiffs' costs up to the time of the payment into Court.

Mr. Atkin, K.C., for the respondent, took a preliminary objection that there was no right of appeal on a question of costs only.

The Court overruled the objection, and decided to hear the appeal.

Mr. Compton, K.C., for the appellants, said, as his clients had succeeded on the 400l. paid into Court, they were entitled to the costs up to the time of the judgment. The appellants declined to accept the 400l. as a present, as they considered they were entitled to more, and would fight for it as a right. They had fought and won on the 400l., and were, therefore, entitled to the costs of a successful litigant. In pursuing a honest claim a litigant should not be deprived of his costs because he recovered a less sum than he considered he was entitled to.

Without calling on the other side, the Court held that the Official Referee had exercised the discretionary powers vested in him, and he was right in doing so. The Court could see no reason for interfering with his judgment, and the appeal would be dismissed with costs.

KING'S BENCH DIVISION: DIVISIONAL COURT.
(Before the LORD CHIEF JUSTICE and Justices PHILLIMORE and PICKFORD.)

Builder and the Insurance Act:

Important Appeal.

ON Wednesday and Thursday, December 11 and 12, the Court dealt with important appeals under the Insurance Act affecting all employers of labour. One of the appellants was Mr. Walter Slate, builder, of Brecknock-road, Edlington, who was fined 50s. and 5s. costs at the North London Police Court in respect of eight summonses, and 1s. and 2s. costs in respect of others for failing to pay the necessary contributions under the Insurance Act. Mr. Slate was ordered to pay up all arrears of contributions. The appeal came before the Court on a *rule nisi* for *certiorari* to the Stipendiary Magistrate, directing him to show cause why the convictions should not be brought into the High Court to be quashed.

The Solicitor-General (Sir John Simon, K.C., M.P.), Mr. Travers Humphreys, and Mr. Branson appeared to oppose the rule on behalf of the Insurance Commissioners; while Mr. Jellicoe, on behalf of the Insurance Act Amendment Society, represented the appellants.

The Solicitor-General said the appellant was fined for not paying the whole 7d. a week, part of which he could deduct from the employees' wages. The appellant had taken six points, viz.:—(1) That the making and promulgation of the regulations which formed the basis of the magistrate's decision had not been proved, and that they were invalid as not being statutory rules within the meaning of the Rules Publication Act, 1897; (2) that the regulations were *ultra vires* the powers conferred by the Act; (3) that no insurance card was ever issued to the employee within the meaning of the regulations; (4) that the charge did not amount in law to any offence for which the magistrate was entitled to convict; (5) that the combined effect of the conviction and order for payment of arrears was not within the magistrate's jurisdiction; and (6) that the conviction disclosed no offence under the Act. His friend, proceeded the Solicitor-General, seemed to raise the point that there was no power in the Commissioners to demand contributions, because no benefits had been arranged for, and that there had been a breach of Parliamentary trust, and it was also contended that the magistrate had no jurisdiction to order the payment of a fine as

well as arrears in one conviction. There was no doubt, however, that the Act stipulated for the payment of arrears as well as the penalty, and proceedings by summary jurisdiction was the proper thing. The second point seemed to be equally absurd.

The Lord Chief Justice: Can it be really contended that benefits must all be arranged before the 7d. a week can be demanded?

Mr. Justice Phillimore said it looked like an attack on the administration. It may be a breach of duty on the part of the Government in not providing the benefits, but that did not affect the liability of the subject to pay.

The Solicitor-General further stated that Mr. Jellicoe had raised the point that proper times had not been stipulated for the affixing of stamps on the cards, but the regulations, in his opinion, carefully gave these times. In the case of the appellant, they should be affixed weekly when the wages were paid. But the Court would remember that the appellant was not charged with refusing to stamp the cards, but for neglecting to pay the contributions.

For the appellant, Mr. Jellicoe contended that the regulations did not come within the Rules Publication Act, because that Act had not been complied with by the Commissioners. He also argued that the employer could not be sued for each single week's contribution. That was a serious point, as a great many people might be summoned because, and through ignorance, they had not stamped the cards of their employees. If the statute penalised them for not paying every single contribution, some might have hundreds of summonses issued against them. He would also argue that sect. 69 of the Act did not allow of proceedings being taken by summary jurisdiction, and that the non-paid contributions could only be recovered by civil proceedings. His last point was that the contributions were not payable until something had been done to bring about benefits the Act defined.

Mr. Justice Phillimore said this was a tax just as much as Income Tax was, which the Government had said should be collected.

Mr. Jellicoe agreed that it was a tax, but he did not think the Government should leave it until it could give a *quid pro quo*.

Mr. Sanderson, K.C., M.P., then argued a case in which Mr. Morris, a Hertfordshire farmer, was fined in each of twenty-eight summonses in respect of four employees. He said the contention in that case was that in failing to pay the seven weekly contributions for one employee the appellant had only been guilty of one offence, and he should not be summoned for each week's neglect.

Delivering his judgment the Lord Chief Justice dealt with the three points, viz., that the informations laid did not amount to an offence; that the magistrate had no jurisdiction to order the payment of arrears as well as the fine; and that no appeal had been disclosed by the conviction, his Lordship said a close consideration of the Act would give an ample answer to these questions. There was no doubt that the magistrate had the right to fine the employer and deal with it under the Summary Jurisdiction Act. The Lord Chief Justice complimented Mr. Jellicoe on raising points which would not have been raised except in such a case as this, when it was endeavoured to show that the whole thing was bad. He had been contended that the Insurance Commissioners could not levy contributions until they had completed the regulations dealing with benefits. Again, he complimented Mr. Jellicoe on the courage and ingenuity which prompted him to argue such a point; but it was one which he could not uphold, for if he did it would mean the stultifying of the whole operation of the Act. The contention that the Rules Publication Act had not been complied with, and that no times had been prescribed for the affixing of stamps, also could not prevail, for, with regard to the first point, the rules could not be bad simply because they were provisional, and, with regard to the second, the Act did prescribe times for the affixing of the stamps. Lastly, he would deal with the argument that the Commissioners could not issue summonses for each week's contribution. It might be embarrassing and unfair to summon a man for each week he did not pay; but the Act was plain, and it said that the defendant could be summoned for each offence and be liable to a penalty for each offence. Therefore the appeals would be dismissed, with costs.

Justices Phillimore and Pickford concurred.

A Builder's Appeal Dismissed.

THE Divisional Court, on Friday, December 13, also dealt with the appeal of Mr. Hollidge, builder, of Ruislip, as to a conviction against him by the Uxbridge magistrates for an offence under the building by-laws of the Ruislip-Northwood Urban District Council. Mr. Hollidge, who moved on a *rule nisi* for

vari to quash the conviction, alleged that conviction could not stand because the man of the prosecuting Council, who also a Justice of the Peace, sat on the bench during the hearing of the summons, took part in the proceedings, even though may not have adjudicated. The matter has a before the Court previously, and was turned that certain preliminaries might properly carried out. Mr. MacMorran, K.C., contended, on behalf of the respondent, that the appeal could not be pro- duced, because, before setting the appeal in for hearing, Mr. Hollidge had not given necessary notice according to law to the respective parties. After hearing Mr. Pollock, K.C. (for the appellant), the Court upheld that objection dismissed the appeal with costs.

DIVISIONAL COURT.

before the LORD CHIEF JUSTICE and Justices PHILLIMORE and PICKFORD.)

What is an Addition?

An interesting point was raised before the Court on Friday, December 13 as to what was an "addition" to a building. The question came before the Court on the appeal of the Sunderland Corporation against the decision of the Sunderland Justices, who de- cided to convict Mr. Charlton, of 13, Roper- row, Sunderland, for an alleged offence against the Public Health (Buildings in- crease) Act.

Mr. Simey, on behalf of the Corporation, claimed that Mr. Charlton built a porch in front of his house, and the addition extended 3 ft. He had not received the sanction of the Corporation to the building of porch, and he was summoned for a breach of the statute. The magistrates declined to convict, holding that the porch was not an "addition" within the meaning of the section. The Corporation was that it was an "addi- tion." If it was not that, he could not under- stand what it was, for it certainly was not a structure. The porch, as he had said, extended from the front of the house, and was not, but he agreed that it was built on the ground, so that it could be moved. The LORD CHIEF JUSTICE: Then the question is a movable porch an addition to a building?

Counsel said that was so. The respondent moved the porch 3 in. from the house, and showed, he supposed, that it could be moved. Therefore, it was not, attached to the house at all. At the same time, he contended that same within the statute as an "addition." The Court dismissed the appeal, the LORD CHIEF JUSTICE remarking that the justices had decided that the porch was not an "addition" within the meaning of sect. 3 of the statute, which said that a structure was an addition to a house when built on to the main wall. Therefore, he said to him that the respondent erected something which was connected with the main wall of the house, it could not be said to be an addition.

DIVISIONAL COURT.

before the LORD CHIEF JUSTICE and Justices COLLIERIDGE and ROWLATTE.)

What is a "New Building"?

SOMEWHAT amusing point was decided by the Court on Monday, December 16, when the question: "What is a new building?" was discussed. The matter came before the Court on the appeal of Mr. George James, of Coventry, who contended that the local magis- trates were wrong when they convicted him for erecting a "new building" without his being sanctioned by the Bridgford Sur- veyor, and for occupying the building without the certificate of the Council to the point as to whether it was fit for human habitation.

Mr. MacMorran, K.C., who appeared for appellant, explained that his client was occupier of two vans, one of which he used for sleeping and the other for living in. One day he built a dwarf wall, and placed the side of the vans on it while against the other side of a van he built a chimney-stack. He was at once summoned by the local authority for erecting a "new building" without approved plans, and for occupying the new building without a certificate that it was fit for habitation.

The magistrates fined him 40s. in each case. Counsel argued that the fact that a dwarf wall was erected under the vans and a chimney-stack added could not make a "new building" of vans which had been occupied three years, and it was rather late in the day to ask for a certificate to the effect that vans were habitable. The LORD CHIEF JUSTICE dismissed the appeal, thus affirm- ing the decision of the justices. The LORD CHIEF JUSTICE remarking that the magistrates decided question on the facts, and they did not see any way to interfere.

CHANCERY DIVISION.

(Before Mr. Justice PARKER.)

Heavy Claim by and against Contractors:

J. Aird & Co. v. the Tanjong Pagar Dock Board.

As already stated, the plaintiffs claim from the defendants 500,000*l.*, as damages for alleged breach of contract in connexion with the construction of a wet dock at Singapore. Plain- tiffs, who are the well-known contractors, allege that the defendants misrepresented the conditions under which the contract was to be carried out, and, therefore, that they were justified in repudiating the contract. De- fendants denied these allegations, and served a notice on the executors of the late Sir John Aird, who in his lifetime was a member of the plaintiff firm and a party to the contract, making a claim against his estate of about 1,000,000*l.*, as damages for breach of contract.

Mr. Upjohn, K.C., Mr. Macassey, K.C., and Mr. Schwartz appeared for the plaintiffs; and Sir R. Finlay, K.C., Mr. George Cave, K.C., Mr. Romer, K.C., Sir Hugh Fort, Mr. Mathews, and Mr. Hull for the defendants. When the hearing was resumed last week his Lordship said there were two charges of fraud—one, the fraudulent statement that the pits were sunk to a certain level; and the other, concealing facts which they knew re- garding those pits. With regard to the second point, his Lordship said he was inclined to agree there was not sufficient evidence to find there was any fraudulent concealment at all. He believed Mr. Wilson, Mr. Warren, and Mr. Nicholson all thought the angle of repose of the mud was one and a half to one, and they discovered nothing, the results of the sinking of the pits which would lead them to the conclusion that it was otherwise. It was a natural finding, for it was quite incon- ceivable that anyone concerned should forward plans which they knew to be false.

Mr. Cave asked if, in the event of the issue of fraud failing, it would be open to the plaintiffs to seek relief upon the footing of innocent misrepresentation.

His Lordship said he was not going to put the parties to the test of having another forty days' trial on the question of innocent misrepresentation. He intended dealing with the whole matter, and, if necessary, would allow amendments.

Mr. Cave: If the plaintiffs charge dishonesty the Court will not allow them to amend?

His Lordship said if it was necessary to make a precedent, he was going to do so. To tell the truth, having regard to all the circumstances of the case, it seemed to him that if there was a case where a person was *prima facie* justified in charging fraud this was one.

Mr. Cave: I ask that you will not lay it down as a rule that if you are suspicious you make a charge of fraud.

His Lordship: It is more than suspicion. They knew that the defendants must have known that the statement was untrue. Why should the plaintiffs, who must have lost thousands of pounds, be put to any extra cost?

Mr. Cave submitted that, as the pleadings stood, the plaintiffs could not succeed without proving dishonesty.

His Lordship said they had here what he understood to be a Government department, and these people had been misled by what they said were misrepresentations. That was his present opinion. He thought that that was undoubtedly clear from the moment Mr. Liddle had given his evidence, having regard to the line the cross-examination had taken. The serious question of law which arose was whether, under those circumstances, they could retain the bargain. Under the circumstances, it did not recommend itself to him (his Lordship). He would relieve Counsel on the point as to whether anybody intended to deceive. He had made up his mind that they did not.

Other technical evidence was then called, and Counsel for the respective parties then addressed the learned Judge, and the argu- ments were proceeding when we went to press.

District Surveyors' Fees.

FOUR summonses came before Mr. Cecil Chapman at Tower Bridge Police Court on the 11th inst. Mr. Robert John Angel, Borough Surveyor of Bermondsey, was sum- moned for "that he, being a person who ought to serve a building notice, did fail to do so, and did begin to execute work in respect to which he ought to serve a building notice before serving such notice."

Mr. Daldy appeared for the complainant, Mr. Charles Archibald Daubney, District Sur- veyor of Rotherhithe; Mr. MacMorran, K.C., appeared for the Bermondsey Borough Council.

The District Surveyor contended that where the Borough Surveyor, acting for the Borough Council, in laying or reconstructing a sewer,

passed under a structure or building, or within 3 ft. of it, notice must be served and fees paid.

For the defence, Mr. Angel said that in three of the four cases the sewers passed under buildings, but in no case was the fabric touched.

A question arose as to the interpretation which was placed on the word "foundation," and Mr. Daldy, cross-examining, quoted from the Building Act the words: "The footing shall rest on solid ground, or upon concrete, or upon other solid substructure." The witness replied that if the footings rested upon con- crete that would be called foundation, but solid ground was no part of the foundation.

Mr. Cecil Chapman: You say that if it rests upon something natural you don't call that foundation?—The Witness: Yes.

Mr. MacMorran, addressing the Court, said that in one case the work carried out was the relaying of a sewer which ran underneath a building, and then emptied itself into the Thames. In the second case the sewer ran underneath a building, and was then turned into a manhole; in the third case a new drain ran part of the way under a wall, but not through it, and was joined up with the old drain, which was thus connected with the sewer trench; in the fourth case they were dealing with a sewer in a passage.

The claim of the District Surveyor in this case (Council went on) was a novel one. It was not quite a new one, but it was novel, and the Bermondsey Borough Council—as he thought other Borough Councils must be—were in a state of very considerable alarm, because if a local authority carrying out sewerage work was required to give building notices, and to pay fees to the District Sur- veyor, it was a very serious matter. The learned magistrate had to construe one section and one section only—of the London Build- ing Act, 1894, which provided that where a building, or structure, or work was about to be begun, the person who was going to carry it out must give two clear days' notice.

For the District Surveyor, it had been con- tended that in all these four cases something had been done which came within the descrip- tion "building, or structure, or work." Sect. 138 referred to "all work in or upon any building or structure," and it was not, he thought, an unfair inference that the word "work" meant the same in sect. 145 as in sect. 138. The contention in this case as to the 3 ft. limit would apply to the electric cables and to gas-mains. He asked his Worship to say that a sewer was not a build- ing, structure, or work under the London Building Act. The persons here laying the sewers were persons acting under statutory powers, and they were doing this work under statutory powers.

Mr. Daldy argued that there was no exemp- tion in favour of the sewer authority from the provisions of the London Building Act.

Mr. Cecil Chapman said it seemed to him that it would not be necessary for notice to be given of something which was being done in connexion with a building by some person who was not the owner but a perfect stranger. The matter, however, was of sufficient im- portance for him to consider his judgment.—*Morning Advertiser.*

Case under the Building Act:

District Surveyors' Fees.

AT Lambeth Police Court on the 17th inst., Mr. Hopkins heard a summons taken out by Mr. Percy Hunter, District Surveyor for South Lambeth, against Messrs. F. & H. F. Higgs, builders, of Hinton-road, Loughborough Junction, Herne-hill, for the recovery of 22*l.* 16*s.* 3*d.*, being fees alleged to be due in respect of building works carried out by the defendants at the Bon Marché, Brixton. Messrs. Higgs have carried out certain works at the Bon Marché, Brixton, rendered necessary in order to comply with the requirements of the London County Council under the 1905 (Escape in Case of Fire) Act, and the contention of the District Surveyor was that certain of the work done entitled him to charge fees under the Act of 1894, in addition to the fees which will become charge- able under the 1905 Act.

On behalf of the defendants, Mr. Percy Robinson contended that the work was all work which was necessary in order to comply with the requirements of the Act of 1905, and that the District Surveyor was only entitled to the remuneration provided by that statute, and was not entitled to any fees under the Act of 1894.

Mr. H. Payne Wyatt, Consulting Architect to the Bon Marché, gave evidence for the defence.

In the result, Mr. Hopkins said he should make no order upon the summons.

Mr. Percy Robinson applied for costs against the District Surveyor, and Mr. Hopkins allowed 3*l.* 5*s.*

RECENT SALES—continued on page 767.

List of Competitions, Contracts, etc.

For some Contracts still open, but not included in this List, see previous issues. Those with an asterisk (*) are advertised in this number: Competitions, —; Contracts, iv. vi. viii. x.; Public Appointment, xvii.; Auction Sales, xx. Certain conditions beyond those given in the following information are imposed in some cases, such as: the advertisers do not bind themselves to accept the lowest or any tender; that a fair wages clause shall be observed; that no allowance will be made for tenders; and that deposits are returned on receipt of a bona-fide tender unless stated to the contrary.

The date given at the commencement of each paragraph is the latest date when the tender, or the names of those willing to submit tenders, may be sent in.

* It must be understood that the following paragraphs are printed as news, and not as advertisements; and that while every endeavour is made to ensure accuracy, we cannot be responsible for errors that may occur.

Competitions.

TO CORRESPONDENTS.

NOTE.—All communications with respect to literary or artistic matters should be addressed to "THE EDITOR" (and not to any person by name); those relating to advertisements and other business matters should be addressed to "THE PUBLISHER," and not to the Editor. All communications must be authenticated by the name and address of the sender, whether for publication or not. No notice can be taken of anonymous communications. The responsibility of signed articles, letters, and news read at meetings rests, of course, with the authors. We cannot undertake to return rejected communications, and the Editor cannot be responsible for drawings, photographs, manuscripts, or other documents, or for models or samples sent to or left at this office, unless he has specially asked for them. All drawings sent to or left at this office for consideration should be accompanied by the name and address of the contributor to whom the drawing is given, to execute or lend a drawing for publication, is given subject to the approval of the article or drawing, when approved, by the Editor, who retains the right to reject if unsatisfactory. The receipt by the author of a copy of an article in type does not necessarily imply its acceptance. Illustrations of the First Premature Design in the illustrations of architectural competition will always be subject to publication by the Editor, whether they have been formally asked for or not.

PRICES CURRENT OF MATERIALS.

* * Our aim in this list is to give, as far as possible, the average prices of materials, not necessarily the lowest. Quality and quantity obviously affect prices—a fact which should be remembered by those who make use of this information.

THE MASQUE OF COLUMNS.

THE saying that architecture is history in stone is true in that it must inevitably express more or less of the character of the time, place, and folk it springs from. This is not to say that England has been successively Roman, Greek, Saxon, and variously Renaissance in character, according to the varying uses of her architecture in the last century and a half. But the fact that at that period the great generalising character Art has herself so completely succumbed to the caprices of that fickle Fashion—sometimes lightly misnamed the Age—is a phenomenon as notable in this connexion as the development of true styles.

In this period, commencing about the middle of the XVIIIth century, corresponding with what has been aptly called the palæotechnic age of mechanical industrialism, finds no more fitting symbol than the cylinder or heart of

the steam-engine. From its throbbing ventricle, more than from any invention previously sought out by man—who was made upright—has flowed an expansive energy to the piling up of riches and the spreading of men, on the one hand, over the earth even to its utmost recesses; concentrating, hurling them together, on the other, in more or less formless and chaotic conglomerations, which we, architects among the rest, are beginning now against mighty odds to reduce to the order of cities where men may live a common life to noble ends.

Of the same kindred—successors architecturally to those multitudinous refuge towers with which pugnacious mediæval burghers found it useful to adorn their towns—are the business of fighting became a state monopoly forbidden to private enterprise—are those tall dark columns that with fantastic smoke capitals support the murky dome with which the said conglomeration is often crowned. The ancients would certainly have given them picturesque names, as

of infernal monsters, hiding with their foul vapours the blue dome of Father Zeus and the eye of his bright son, so that the affrighted Muses, no longer worshipped, are fled away.

It would be quite easy to show how completely civilised man has, in this mechanical age, fallen under the spell of the cylinder. His food, clothing, shelter, all his instruments of use and beauty own its sway, in infinite variety of dimension and proportion, from the all-potent circulating golden disc to electric cables encircling the earth. Amid a myriad instances we are arrested by the notable phenomenon that, roughly synchronising with the coming of the steam cylinder at the basis of society, and the high hat as its crowning glory, architecture again became completely obsessed with that most noble of cylinders, the Grecian column.

This had, of course, first happened some time previously, especially under the influence of the great Italian architect whose name is reminiscent of that

adopted by Pallas Athene from a reprehensible sort of giant, whom she, as goddess of intelligence and the liberal arts, very properly slew; and then, with taste more questionable in a serious virgin divinity, adopted his skin also.

At the period we speak of the cult of the column received fresh impetus from the published works of Sir William Chambers, Stuart and Revett, and others; and architecture showed a renewed tendency to produce cylindrical forms whenever exigencies of construction or ornament made it possible. That which in its origin had been the noblest and most purposeful of architectural features became the hackneyed drudge of clever draughtsmen and decorators. Colonnades and porticoes, natural and right in the brilliant South, were repeated everywhere as decoration in our duller clime. Scholarly care was taken in proportioning the column and its entablature, but their spacing was treated with an airy freedom no stone architrave could stand, so that they became skewback arches or obvious shams with impossible jointing. The chief beam became no beam at all, which perchance was typical of the time, as architecture we have said must be. Doric and Corinthian columns of huge proportions were duly set on pedestals in lonely state, with the unfortunate statue of a sea lion or royal duke skied upon their abaci; an Ionic column, graceful symbol of massive strength, would be hoisted as a burden on the back of a church to weigh it down to earth, in place of the Gothic spire that did at least point upwards. These and many such like things they did, and we do still; and with our steel construction indeed we often go one better. Imagine, for instance, the shades of Iktinos and Hippiodamos reeling along from vertigo to nightmare and standing agape and speechless at last before the Blondin-at-Niagara effect of a 36-ft. column balanced above an expanse of sheet glass. Recovering from their aphasia, might they not, like a certain great personage, well say, "Wonderful, wonderful! But promise me never to do it again"?

Able, and indeed scholarly, men did these things, believing themselves inspired by the spirit of classic culture. But the cylinder had woven its spell over them. In their scholarship and artistry, while scorning not to use and profit by its power, they affected to despise its base mechanic form, saying loftily that no artistic expression was possible for it and its works; and the swart, restless demon that lurked in it took a terrible revenge and wrought havoc on our cities, towns, and villages. They became bloodless and atrophied, or swollen to shapeless masses and all their features marred with fell disease. Where the goddess of culture and the arts yet lingered she covered herself with the skin of dead giants, and turned against the smitten towns her shining ægis, so that they saw themselves writhing with the horrors of the Gorgon's head, and their heart and its sympathies turned stone-like in the cold glare. Even the brilliant and high-minded enthusiasts of the Gothic revival could not break the spell: and in the Renaissance revived—or still-born—that in many fashions and

individual eclecticism has prevailed since the battle royal of the styles, the classic column survives with even growing effect to-day.

We are so like those intellectual, beauty-loving Greeks, those Imperial conquering Romans—the explanation goes—so like those brilliant Pagans of the Renaissance. And perchance we are: in more ways than we mean, or care to think about. We have no more use—it goes on—for our own home-grown mediæval style; we agree with those men of taste—it is mere Gothic! Classic is much more suitable to our modern requirements and culture. It is a large and comforting assumption which for the moment has the support of appearances. But appearances are not absolutely safe guides for finite reason; as, of course, the ancients were aware in that fable of the Divine Intelligence wrapped in the skin of the earth-born giant. To rest on this assumption is to forget certain other things, as, for instance, that classic architecture, even if it be more amenable to modern wants, had already passed, as Gothic had not, through that mighty hammering and forging and shaping thereto by the giants and Titans of the great Renaissance age; and also that even now it does not fit so very well, but necessitates much padding and screening of the actual construction, much shrinking and altering of the dead skin to give it any semblance of style.

A varying Classicism holds the field; in our public and great commercial buildings at present, after many vicissitudes, tending back again to a severe purity and massiveness of treatment; and this concurrently with the development of progressively scientific methods of construction, enabling us, with perfect security and economy, to combine lightness and strength to a degree undreamed of even by the daring builders of Beauvais. In these circumstances it would be really interesting to learn in what consists the special appropriateness of the classic column which, scarce altered in twenty-four centuries, is now again the dominating feature of our architecture. There is no doubt plenty of archæological precedent, where not in Greek, at least in Roman and Renaissance times, for most of the modern uses and misuses it is put to. But this fact remains—that with the Greeks it was ever a beautiful factor of architecture, not merely expressing but actually one with the essential structure of buildings, and with us it is, for the most part, not so.

We have heard it suggested sometimes that the Greek architects of the Periclean age were probably more qualified to deal successfully with our modern problems than any who have succeeded them. Such propositions can only tease us out of thought. It is at least as probable that in the same conditions as have led us moderns to the present position the old Greeks had all the qualities and defects of character to have landed them in a quite analogous impasse. All such speculations are futile. We can at best only see how they solved the problems of their own requirements with their own methods and materials; and present ideals of architecture seem

to us to show but a limited appreciation of the great lessons of Greek art, a quite unintelligent following of its much admired example, in applying, whatever scholarship and ingenuity its beautiful constructional forms, to much more complex buildings of quite different methods and materials of construction.

The question of Greek, Gothic, Renaissance in relation to modern requirements and ideas is, in fact, of quite secondary and academic interest. The first real problem to be solved in architecture can again take its place as a consistently developing art is the reintegration of the two elements of structural efficiency and beautiful æsthetic expression in its actual factors. These elements were in perfect union in Greek and Gothic, but the development of steel construction emphasised the disharmony between them which exists in with the Renaissance. While it remains there can be no real advance. Pallas Athene must free herself from the skin of the dead giants and appear again in her own rich variously broadened peplos as the patroness of a living culture in which science and art reach in perfect and fruitful accord.

The utilitarian advantages of steel construction are as undeniable as are other mechanical products of the great age we have symbolised by the steely cylinder. That age has given us an unprecedented control of natural resources and powers; but it has used them crudely, wastefully, often cruelly, as giant unaware of his strength. Its motto has been Quantity rather than Quality. The finer æsthetic perception and faculties of art have been divorced from its utilitarian ends and trampled on in the rush of competitive commercialism; the common wealth has been neglected in the struggle for private wealth; machinery has become too much the master of man, instead of his very obedient servant. But there are signs all around of a new day breaking. The Palæotechnic, with its steam power, is merging in the Neotechnic, the symbol of which is the electric cable branching and rebranching into every dwelling and working place.

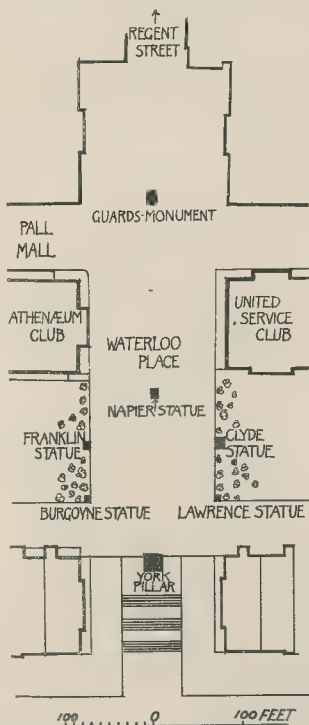

We may not stay now even to hint what this alone will mean in the cleansing and revival of our cities, towns, and villages: once it is politically and administratively, as it already is scientifically and practically, possible. In those marvellous manual tools, delicately subjected to hand and eye and brain of the skilled worker, but supplied with power by its own electric nerve, we see, as in many other evidences, the promise of an era in which technical problems no apparently insoluble will find solution through the truer mastery and application of machinery. The thought upon which we close is that the arrested tradition of architecture is more likely to be restored to a renewed and living development by aiming, both in training and in practice, at an all-round technical efficiency and sincerity, rather than by conscious and direct attempts to create a fitting beauty out of the forms proper to past ages. This, in fact, is the greatest lesson that both Grecian and Gothic building can teach.

KING EDWARD MEMORIAL.

THE much-debated question of a site for the King Edward London Memorial has once more come to the fore, this time with a suddenness which is almost pathetic. There are many who have ended from the first that the proposed site at the Piccadilly end of the grass walk in the Green Park was by any means an ideal one, and others of the *Builder* will remember just after the announcement that had been provisionally adopted we wrote:—"The only thing left now is to try and make the best of a bad job. It is definitely determined to place the monument of this description so that it bores the vista from Piccadilly to the Queen Victoria Memorial and turns its back on Piccadilly, it might perhaps be better to carry the idea to its logical conclusion by ignoring Piccadilly altogether." Similar thoughts have evidently been disturbing those in whose hands the final decision rests, and it is with no slight feelings of satisfaction that we read the letter which the King recently addressed, through Lord Curzon, to the Committee, with the result that at their meeting at the Mansion House on the 19th inst. drastic measures were immediately taken. It was decided then and there to abandon the Green Park site and consequently any designs or contracts that had already been entered into with regard to it, and His Majesty's suggestion the Advisory Committee will proceed to negotiate an equestrian statue of King Edward to be placed in the open space at the bottom of Waterloo-place between the Athenaeum and the United Service Clubs.

If a ready-made site is to be selected, as one has much to commend it, but it is to be hoped that it will not be utilised without due consideration being given to its limitations. From the sketch plan reproduced herewith it will be seen that this locality bristles with monuments of one kind or another already. This is not itself an objection, but when one realises that the York Column dominates, and from its lofty proportions is bound to dominate any monument near by, we feel that a serious drawback presents itself. But this is not all, for the Guards' Crimean Monument stands on the same axial line, and closes the vista—all too soon—as one looks down from the rising ground of Regent-street. The removal of the statue of Lord Napier of Magdala to the vacant pedestal in Trafalgar-square is contemplated as a first step towards the realisation of the scheme, but we are inclined to think that unless an unfortunate gradation in the height of the monuments in a row is to result the Guards' Monument should be removed as well. The question of the removal of this area would also need to be considered very carefully, for, although the space available—no more than about 100 ft. in width between the two clubs—is small, in view of the national importance attaching to the monument of so great a monarch so beloved a Sovereign something must needs be done to correct the drab appearance of what strikes many at

the moment as a dreary waste. By removing the Guards' Monument as well as the Napier statue, and by placing the new memorial on a lofty and spreading podium further forward on the axial line so that it would not be hidden entirely from Pall Mall, and by a general rearrangement of the *entourage*, we can imagine a dignified result, but we would have welcomed a more spacious site allowing of a grandiose scheme giving opportunity for the more expansive co-operation between architect and sculptor. London is not fortunate in the disposition of its open spaces, but

Plan of Waterloo Place, showing the site selected for the King Edward Memorial with its immediate surroundings.

perhaps this one offers fewer disadvantages beyond remedy than any of the others which have been proposed.

We feel that if the exact position and height of the monument are arrived at—preferably experimentally by placing plaster casts *in situ* at an early stage—so that the whole may be in scale with its surroundings, the selection of this site may prove to be the happy solution of a problem that would soon have been settled in almost any other capital city in the world, but one which, characteristically enough, has sorely taxed the resources of the greatest capital of all.

GYMNASIUM AND HALL, LORETO.

A new gymnasium and hall has been presented to Loreto School by Mr. Harry Brook, Dumbarton. Sir Robert Lorimer, F.R.S.E., Edinburgh, was the architect, and the building has cost 2,000*l*. It is fitted with a stage and proscenium.

NOTES.

The Power of Design.

It is undeniable that his knowledge and power of design is what discriminates the architect from other men—is, in fact, his whole art, to which all else that he does is accessory. To avoid misunderstanding this needs some definition; for obviously there are many others of whom the name designer is rightly used. But in no other art does it apply in so rich and comprehensive a sense, or require such varied qualities and attainments. There is but one power of architectural design, not many, nor even two, as might be inferred from the frequent allusions to aesthetic and structural design. It is a unity of two intimately related and interacting elements: the plan—that is, the ordering and arrangement for a definite purpose—and the construction which gives that order enduring form; the first requiring in the designer an intimate and practical knowledge of life in all its different phases for which buildings are required, the second a scientific knowledge of the physical and mechanical properties of materials. These two elements are the essential components of architectural design. Yet the ability of the expert and practical planner and of the scientific constructor may stop short of the power that discriminates the true architect. What is still wanting is not so much another element as a quality or enhancement of the planning and construction, that depends less upon what the designer knows than upon what he is. The most perfect knowledge of the architectural beauties of past times, the highest powers of draughtsmanship, may yet leave a man as much a specialist as a constructional engineer, as merely a decorative artist as a designer of wall-papers. All these things are necessary; but knowledge and power of design is not to be taught or attained by treating them in so many watertight compartments. They will not be learnt or attained at all in the absence of natural aptitude and faculties to conceive an order, purpose, and fitness in architecture that transcends the necessary utilitarian requirements of buildings. Hence the importance, from an educational point of view, of a right understanding of what power of design means in architecture.

Designer and Specialist.

In upholding the importance of architectural design we are very far from wishing to disparage the specialist in the smallest degree. Specialism is one of the most striking phenomena of modern science, art, and industry, and that to which they owe a great development in many directions. But as professor of the great generalising art—the synthesis of useful and fine arts—the architect is something very different from a specialist. He co-ordinates and controls the work of many specialists. His relations to them have been, for the most part, satisfactorily settled by long practice and custom; and if they are less satisfactory in relation to certain of the more modern types of specialists the reason is perhaps to be found—at least, in part—in his tendency to specialism himself, either, as he says, in the practical,

scientific, or artistic side of his profession. Tending towards the more attractive and abstract studies of his art he finds the mathematics of modern steel construction—to take one most characteristic instance—irksome; and so comes to depend too much upon the utilitarian specialist in one of the essential factors of true architectural design. Would architects but study to understand the properties of steel and concrete as they do those of wood, brick, and stone, there is no reason to doubt but that designer and specialist would soon find their normal and true relation, here as elsewhere, with great advantage to architectural design.

Smoky Chimneys.

VERY few persons when they enter into an agreement or lease to take an unfurnished house think of ascertaining whether the chimneys smoke, yet, as there is no warranty on the part of the landlord in the case of unfurnished houses that they are fit for habitation, this is a very necessary precaution, as has been proved in a case recently tried in the City of London Court, *Audoire and Hartree v. Bisgood*. In an action for a quarter's rent for premises let on a three years' agreement the tenant counter-claimed for 180*l.*, the amount of the three years' rent, on the ground that the chimneys smoked so badly that the house was uninhabitable and even dangerous, and the defect was incurable. The defence failed, the judge observing that, although the defects might have justified the defendant in refusing to commence his tenancy, they did not justify him in determining it without proper notice. The law is unquestionable, but intending

tenants will do well either to have the chimneys tested or to obtain an express guarantee from the landlord before entering into possession of unfurnished premises.

SOUTHWARK BRIDGE RECONSTRUCTION.

In previous issues we have referred to the general unsuitability of Southwark Bridge for vehicular traffic and to various proposals made for remodelling the structure so as to render it of practical service as a cross-river communication.

The City Corporation have now decided upon the entire reconstruction of the bridge in accordance with the designs of Messrs. Basil Mott & Hay, M.M.Inst.C.E., and a contract for execution of the works has been entered into with Sir William Arrol & Co., Ltd.

As our readers will remember, the existing bridge, built in 1814-19 by Sir John Rennie, comprises three cast-iron arches of 210 ft., 249 ft., and 210 ft. respectively, with the clear headway of 29 ft. above Trinity water-mark under the middle span. Owing to the position of Upper Thames-street, the northern approach is necessarily short and steep, another undesirable feature being the slope of Queen-street, on the northern side of Upper Thames-street.

The only really effective solution of the problem is to design the northern approach on the lines adopted in the case of London Bridge, levelling Queen-street and Queen-street-place, and carrying the roadway on an arch thrown across Upper Thames-street.

This solution, which we have advocated on previous occasions, would undoubtedly be costly, owing mainly to the alterations entailed to buildings on either side of the remodelled streets, but we are sure that the outlay would be amply repaid by the establishment of a level main thoroughfare between the City and Southwark.

Unfortunately, this idea has not been accepted by the Corporation, and the new bridge will simply modify to a relatively

small extent the inconvenience of the existing structure.

The clear headway under the middle span will be reduced by 3 ft., the gradients brought down to a maximum of 1 in 30 on either side, the roadway increased from 29 ft. to 35 ft. in width, and the footpaths increased from 6 ft. 9 in. to 10 ft. wide each.

An undesirable feature of the new design is the substitution of five arches for the present series of three arches, thereby involving four instead of two piers in the river, where additional obstructions to navigation and the flow of water are clearly undesirable.

We understand that various architectural details, including the ornamentation of the piers and the design of the parapets, are to remain to be settled.

Sir Ernest George will act as consulting architect for the designs of the new bridge. The plans of Messrs. Basil Mott & Hay provide for a structure of five spans (between the present abutments), whereof the central span is 140 ft. 6 in. long, the two next adjacent 131 ft. 9 in. long, and the two at the ends 123 ft., giving a headway above Trinity high-water mark of 26 ft. at the middle, and a roadway with two footpaths of which 6 ft. will be carried on cantilevers, as the width of the existing bridge with the abutments is but 42½ ft. The five spans will be of seven steel ribs from 3 ft. 3 in. to 3 ft. 6 in. deep in the centre, and from 1½ ft. to 5 ft. wide at the springing; spandrel posts at 4 ft. 7½ in. centres will carry the ribs for the flooring. The four new piers, to be encased in granite, will be 42 ft. in total height and 15 ft. wide for the two middle ones and 41 ft. high and 14 ft. wide for the two outer ones; they will rest upon steel caissons 100 ft. long, 29 ft. wide, and 13 ft. deep, supplied with compressed air, and filled with concrete. Sir William Arrol & Co.'s contract, for 278,148*l.*, includes the erection of temporary steel bridges for foot traffic on either side of the present bridge, and the removal of the old piers and piling to a depth of 35 ft. below high water.

Sir John Rennie's bridge was built at a total

Boys' Secondary School, Hereford. (See page 773.)

Mr. G. H. Jack, Architect.

est of some 800,000., and the ironwork, weighing 5,780 tons, was supplied by Messrs. Walker, of Rotherham. Joseph Gwilt laid out the approaches at both ends. In 1868 the Corporation bought the bridge for 200,000.

SECONDARY SCHOOL FOR BOYS, HEREFORD.

This building, which was recently opened by Sir James Rankin, Bart., is the largest school of the kind hitherto established in the county of Hereford. The principal facade, on Wide Marsh-street, has two entrances, for senior and junior scholars respectively. The exterior is of local red brick with Bath stone facings, the roofs being covered with Old Delabole slates.

The accommodation on the ground floor includes a large assembly-hall, six classrooms, a library, and lavatories for senior and junior boys, head and assistant masters' rooms, a cloak-store, stock-room, and manual block. On the first floor are the laboratory, lecture-hall, preparation-room, art-room, dining-room, kitchen, and store-rooms.

The assembly-hall, 47 ft. long by 26 ft. wide, can be increased in size by opening the folding partitions between the hall and two large classrooms. The building is warmed by low-pressure hot water, and ventilation is secured by means of hopper sash windows and extraction ducts in the roof.

The total cost, including land and furniture, was 10,200., the cost of the building alone having been 7,569., or 131. below the architect's estimate.

Mr. G. H. Jack, the County Surveyor, was responsible for the design and construction of the building, which was erected by Messrs. J. W. Wilks & Son, of Hereford.

LONDON BUILDING LAW AND PROPERTY.

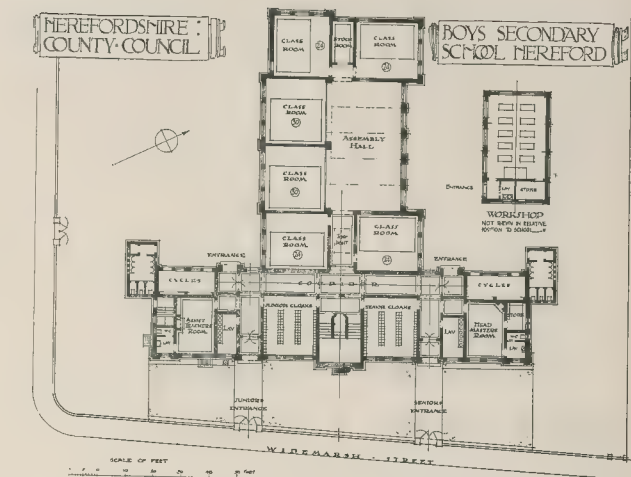

At a meeting of the Auctioneers' and Estate Agents' Institute, held at No. 34, Russell-square, on Wednesday, December 18, a paper, entitled "The London Building Law and the Development of Property," was read by Mr. George Cubitt, A.R.I.B.A., P.A.S.I.

Development of Land for Building.

In the course of his remarks he said:— "Let the development of land for building purposes be first considered. This form of enterprise is admittedly under rather a cloud, and probably comparatively little opening up of new estates is now being done in the London county area. But there is still a good deal of land in London that is available for building purposes, and it may be presumed that, when once it is a little easier to obtain for land development, and when newer districts on the outskirts become more populated, the inner suburbs of London will receive the attention that they deserve.

If the average surveyor were asked off-hand to state the principal provisions of the law that govern the development of land for building purposes, he might possibly refer his questioner to the requirements of Part II. of the London Building Act, 1894, in regard to the formation of streets. He might also draw attention to Act. 103 of the Metropolis Management Act, 1853, in regard to the making up and paving of private streets. A few years ago no one could doubt the correctness of his answer, but it is now open to question whether the provisions of Part II. of the Housing and Town Planning Act, 1909, are not of more importance to a person developing a building estate than those of all other Acts of Parliament. It is open to any person developing an estate in London to apply to the County Council, which is the local authority for the metropolis, to approve a town-planning scheme.

There is a good deal to be said in favour of the adoption of this policy. If the stereotyped course is followed, and the plans for the formation of the streets are submitted under the Building Act, it is probable that, although the County Council have power to allow roads to be formed of any width they may think fit, it is improbable that they will consent to a less width than the case of carriage traffic streets, than the standard width of 40 ft. Whereas, if a town-planning scheme is proposed, it may be reasonably expected that, recognising the public advantages to be gained by a lay-out of the land

on model lines, the Council will be prepared to make very considerable concessions in regard to the width of the roads. Everyone who has developed an estate is aware of the very heavy cost entailed in forming roads of the standard width of 40 ft. Such width for subsidiary streets in a residential neighbourhood is quite unnecessary. A street 24 ft. wide will satisfy all traffic requirements, and if the houses are kept well back from the line of the road all considerations as to light and air space will be properly met. Of course, in a large estate some roads will require to be 40 ft. in width, possibly the width of one or two main avenues may be made as much as 50 ft. or 60 ft., but, nevertheless, it will be found that, in the aggregate, a very considerable reduction in area of road-surface will result.

In addition to the saving on the construction of roads, there is another very important advantage to be gained by the development of an estate under the Housing and Town Planning Act. It is a well-known fact that the supply of houses in London now much exceeds the demand, and the person who develops an estate without using his utmost endeavours to make his property more attractive than that in the immediate neighbourhood is making straight for the Bankruptcy Court. There is an increasing tendency on the part of the modern householder to desire something better than the dead level of uniformity and dullness which is characteristic of most estates developed on the old lines. Not that it follows that the persons who laid out these estates were unwise in their own generation, although they have subsequently proved to be so. In their day the demand for houses if anything exceeded the supply, and it was to the obvious advantage of the owner of property to get as many houses as possible on his land. It was then hardly possible to anticipate the over-production in house property from which we are suffering to-day. It is, however, fortunate for us that most of the older estates have been so laid out that there is very little difficulty in surpassing them in general interest and attractiveness. A new estate laid out with a certain amount of irregularity in the lines of the streets—an irregularity which results naturally wherever undulating ground is encountered—and with a few open spaces, trees, shrubs, street flower-beds, etc., will make a greater appeal to the average prospective householder than one of straight streets and terrace houses all laid out on the old dull draughtboard plan. Not that the crank methods of street and house planning not infrequently met with in some recent garden suburbs need be in any way followed. When any new departure is made there is always a tendency to go to extremes, and the garden suburb movement has proved to be no exception to this general rule. There are ample opportunities for obtaining interesting effects without laying out streets of serpentine

curvature, or planning buildings of which not one single room in a house is square.

It may be accepted as an axiom that no ordinary estate can be economically developed on modern lines unless it is possible to keep the width of the roads within reasonable limits.

Although the regulations governing the procedure of the County Council in regard to the making of town-planning schemes are rather involved, the course of action of owners of land who desire to develop their property under the Housing and Town Planning Act is quite simple. All that is necessary is for the persons concerned to submit an application, with plans, to the County Council. Presumably, it is possible for a single owner to approach the Council in this way, although from the wording of the Act it is apparently considered that, in the majority of cases, applications will be made by several owners acting together. It is worthy of notice that, if the County Council refuse to adopt a town-planning scheme proposed by owners of land, such owners may make representation to the Local Government Board, and the Board, after holding a public local inquiry, may, if it thinks fit, approve the scheme, which will then have effect as if it had been approved by the County Council.

Development of Land Already Built Upon.

Let the question of the development of land which is already built on be now considered. There are here two obvious ways of treatment:— (1) The demolition of the existing buildings, followed by the erection of buildings of a more remunerative character, and (2) the reconstruction and extension of the existing buildings in such a way that they, as far as may be possible, fulfil the purpose of new buildings. It appears that the former of these two courses is the one which finds most favour in Central London, and it will, therefore, be considered first. Usually a large building will require to be erected, and, in consequence, all the ordinary and some of the special requirements of the London building law will be found to be applicable. The provisions affecting the frontage line and distance back from the street will probably have a very important effect on the position and extent of the building. Speaking generally, it will be found that the London Building Act, 1894, safeguards existing interests, and it will be possible to build on all land which for the last twenty or thirty years has been occupied by buildings. Further, it will be possible in streets laid out before 1862 to build without restriction of height up to the ordinary 30-ft. limit, provided that the building is not being erected to house persons of the working class. But very often the whole of the site next the street has not been previously occupied by buildings, and it becomes a question to what extent, if any, it is permissible to extend the new building over previously unbuilt-on land.

There are two important provisions of the

London Building Act, 1894, which govern this point. Sect. 13 of the Act provides that no previously unbuild-on land within the prescribed distance—20 ft. from the centre of the roadway in carriage traffic streets—may have a building erected on it or extended over it without the consent of the County Council. Sect. 22 provides that except with such consent no building may be erected on or extended over unbuild-on land in advance of the general line of buildings.

The operation of sect. 13 is quite straightforward, and there should be little difficulty in determining whether or not a proposed building is affected by this section. The only point that requires watching is the determining of the centre of the roadway, for the definition of this term, as given in sect. 5 of the Act, will show that where a street has been widened the present centre of the roadway may not be the statutory centre. The extent of the operation of sect. 22 cannot in many cases be easily determined. The general line of buildings in a street is often a question of great uncertainty, and unless the position of the line is obvious it will be necessary to apply to the Superintending Architect for a certificate defining the line. If this certificate operates unfavourably in regard to the proposed building, it may be well to exercise the right of appeal to the Tribunal of Appeal.

The provisions as to open space which apply in the case of all domestic buildings, other than office buildings, were originally thought to operate rather unfavourably in the way of the development of property. Increased familiarity with these requirements has, however, reconciled most people to them. Generally speaking, it may be said that if these requirements are thoroughly understood—which is admittedly no easy matter—it will usually be possible to arrange a new building in such a way that the law is complied with, and, at the same time, no very great sacrifice of accommodation is involved. It is worthy of notice that in the case of sites of irregular shape it is possible to apply to the Council to allow some deviations from the ordinary requirements, and in all cases it is possible to take advantage of the provisions regarding "equivalent air space," whereby it is permissible to extend a portion of the rear of the building beyond the diagonal line when such line is drawn from ground level, provided that an equivalent amount of cubic space is elsewhere left unbuild-on.

Prior to 1908 the power of the Council to allow divisions in large warehouse buildings to exceed the ordinary limit of 250,000 cubic ft. was restricted to a maximum limit of 450,000 cubic ft. By the London County Council General Powers Act of 1908 the Council obtained the right to exercise unlimited discretion in regard to this matter, and an obstacle in the way of the erection of buildings with the large open floor areas required in certain trades was thereby removed. The decision as to the allowance of increased cubic extent rests, however, entirely with the Council. There is no appeal in this matter from their decision, and it may be assumed that great increases in cubical extent will not be granted except subject to conditions, such as the provision of automatic sprinklers and the ensueing of structural steelwork, which will tend to prevent the growth of a big fire. This is only reasonable, and is in the interest of the owner of the property as well as that of the general public. We do not want to have the fire risks that are current in the United States, where our methods of subdividing large warehouse buildings are apparently almost unknown.

As regards the question of general construction, although it is not yet permissible to erect buildings with enclosing walls of reinforced concrete, the London County Council General Powers Act, 1909, has legalised steel-frame construction. But, except in the case of very large buildings, it will generally be found cheaper to build ordinary brick walls or piers than to provide a system of steel stanchions.

Less Drastic Method of Developing a Site.

The time has now come to deal with the less drastic method of developing a site on which buildings are already erected. There is a very great deal to be said, in the majority of cases, in favour of adopting the policy of altering and remodelling the existing premises instead of razing them to the ground and starting with a cleared site. Admittedly from the standpoint of efficiency, untrammelled by financial considerations, the more drastic policy is to be recommended. But the financial element is

usually predominant, and in a very large number of cases it will be found, if both sides of the question are fairly considered, that a scheme of remodelling and extending existing premises will show a very much better percentage on the sum expended than a scheme which involves the clearing of the site and the erection of new buildings. A very large portion of Central London was erected during the XVIIIth century, when it was the custom to design on liberal lines, with big rooms, and spacious halls and staircases, all decorated throughout in excellent taste. Numbers of fine Georgian buildings may be met with in the inner districts of London. Their demolition is open to objection on several grounds. From the artistic standpoint it is an act of vandalism. From the practical point of view it is bad business. The fine airy rooms met with in Georgian buildings are becoming to be more and more appreciated by the general public, and could not be built to-day at less than from 1s. 6d. to 2s. per cubic foot. The obvious way in which to deal with a building of this type is to remodel it, retaining the principal main rooms, and adding new sanitary arrangements and any additional accommodation that may be required. By this method not only a cheaper but a better building will in many cases be obtained than if the site were cleared and a new building erected. But work of this kind requires the skill of a trained architect even more than that of constructing a new building. It is quite a mistake to consider that because any proposed works are in the nature of alterations they can therefore be quite very well designed by an enterprising youth in the office who happens to have a little ability as a draughtsman. The work of remodelling an old building is more difficult than that of designing a new one, and even small alterations are worthy of more skilled attention than they usually receive.

Now as to the effect of the provisions of the London building law on any works of alterations and remodelling. Stowed away in an unlooked-for place in the 1894 Building Act is a section which is of vital importance in regard to such works. It is provided in sect. 207 of the Act that "it shall not be lawful (unless with the consent of the Council) to make any alteration of any building in such manner that when so altered it will by reason of such alteration not be in conformity with the provisions of this Act applicable to new buildings." The most important parts of the section are the words "unless with the consent of the Council." It follows that, with the consent of the Council, any form of construction or arrangement may be adopted, and the Council frequently exercise their powers under this section, and allow deviations from the ordinary requirements of the Building Act. Whenever in works of alteration some requirement is encountered which seems rather difficult to comply with, an attempt should be made to look at the case from an impartial standpoint. If, when thus viewed, no grave disadvantage will appear to result from a relaxation of the requirement in question, the Council may with advantage be approached. The application should not, however, be, as it were, slung at the heads of the officials of such body, but the reasons which make the requirement unsuitable in the case in question should be consensually explained, and everything possible should be done to induce the Council to see the matter from the standpoint of the applicant.

As regards the provision of additional accommodation, the extension of a building can, of course, take place in two directions—horizontally and vertically. Horizontal extension in the direction of the street will often be barred by the "prescribed distance" or "general line" provisions of the 1894 Building Act. Horizontal extension in the rear is usually a much more feasible proposition. Very often the property in the rear of a building is of a comparatively low class, and can be acquired cheaply. In the case of a domestic building, for which an open space at rear is required, it is a great advantage, where possible, to extend the building through to a street in the rear. Then this rear street will itself constitute the required open space, and the diagonal line, which limits the height of the rear portion of the building, may be drawn from the centre of such street, either at the level of the surface of the roadway of that street, or 16 ft. above the level of the pavement of the front street, according to the age of such front street.

The obvious difficulty in extending a building vertically is the probable insufficient thickness of the walls for any such increase in height.

And it must not be thought that the question may be dodged by putting a story or stories in the roof, for in London the statutory height of a wall, on which the required thickness to some extent depends, is from the base of the wall to the top of the topmost story. But sometimes two of the walls are thicker than the others, and there may be some strong piers suitably disposed in either of which cases it may be possible, by means of girders, to arrange that the weight of the new story or stories will come upon a portion of the structure which is well able to bear it. Or possibly in an exceptional case it may be desirable to erect steel stanchions or reinforced concrete pillars from the foundations upwards in order to support the new load. None of these contrivances will, of course, obviate the technical objection as to the walls being of insufficient thickness. But if a sound scheme of practical construction is devised the Council may then be approached with a view to obtaining their consent under sect. 207 of the 1894 Building Act.

THE ARCHITECTURAL ASSOCIATION CAMERA, SKETCH, AND DEBATE CLUB: INTERNAL DECORATION.

On the 12th inst. (Ladies' Night) a meeting of the Architectural Association Camera, Sketch, and Debate Club was held, when Miss Cohen read a paper on "Internal Decoration," Mr. P. H. Adams, Chairman, presiding.

Miss Cohen divided her paper into two parts—the first, attacks on the architect, and the second, attacks on public taste. She made these attacks because the house-decorator suffered by the misunderstanding and the mistakes both of the architects and of the public, and sometimes felt a little bitter about it. The decorator worked under a double limitation. There was the limitation which he and the architect had in common: each worked for a client. That was to say, each had the double duty of directing the taste of the client while satisfying it. But the architect was less restricted in this than the decorator, who worked on that part of the house with which the client lived most closely, about which he thought that he had a right to know something, and on which he would probably have fixed ideas, so that the house-decorator, in a stricter sense than the architect, worked solely to please other people. She did not, of course, mean by this that he must abandon his own taste and his own knowledge to the ignorance or false ideas of somebody else; but that, however beautiful he may make the interior of a house in itself, he had failed unless he had made his client feel that it was beautiful. Again, the house-decorator was rarely so fortunate as to work with an empty house. There would usually be furniture and pictures from a previous house which had to be fitted into the scheme. He might perhaps find a beautiful picture up to which he could decorate; on the other hand, it was more probable that he would have thrust on him ugly pieces of furniture which would tax his ingenuity to hide away. These were difficulties which the architect did not share.

But suppose that the house-decorator had the freest hand which, in the nature of things, is possible. He still had to work with the material which had already received the impression of another mind; he must take the room with the shape, the proportions, and the woodwork as it left the architect. He was limited by the architect's ideas and often hampered by his mistakes. She had seen rooms spoiled, even before the decorator entered them, by ill-designed mouldings, heavy mantelpieces, and ornate cornices. It was rare to find a mantelpiece that was well designed. The modern mantelpiece was often heavy in design and crowded with ornament. The decorator might, it was true, correct some mistakes if he did not like a room's proportions; and many a time had she had to do it.

It was a generation since house-decorating began to be practised seriously. It was now recognised as one of the professions: it was even accepted as an art in itself. But it had still to be accepted as a high and serious art, that was, which required long and careful study. Decorating would not be taken seriously by the public as long as architects took it lightly.

Let them consider two of the most important parts of decorating—the designing of woodwork and the choice of colours. She did not believe that to either did the majority of architects

ve proper study. She had come across much woodwork in modern houses that was ill done; was of poor design in itself, and it was even badly placed in the room. Nor had she formed any opinion of the neglect of woodwork only on her own experience, but from the confession of architects themselves. On the question of paint she would call one witness, he complained to the head of a large wallpaper manufacturers of the vicious fashion for white paint. One would see hundreds of houses which had all their woodwork painted a glaring white, altogether out of harmony with the other colours. She was told it was an architect's fashion; that architects chose white as an easy way out of the difficulty of matching and shading colours, because white might be thought to go passably well with any paper. He had read in the *Builder* a paper on "The Decorating of a Small House," by Mr. Arthur Seymour Jennings,* Fellow of the Institute of British Decorators, which contained some pertinent criticisms. But there was a suggestion in it on this subject of paint with which she strongly disagreed, and she mentioned it because it seemed to be another example of the errors which come from taking the business of decorating too lightly. The suggestion was that the Institute should offer, for a small fee, to give professional advice; that it should send one of its members to any tenant who desired such advice, and that he should select papers and paints on the spot and leave a "cut-and-dried" plan of decoration to be carried out by the local house-painter. "Half-day or a little more," Mr. Jennings said, "would be amply sufficient time in which to do such work." This sounded very simple, but there was one objection to it—it was not possible to leave a "cut-and-dried" scheme for a house-painter to carry out. The average house-painter could not be trusted to match colours; he had not the necessary knowledge of colours nor the necessary taste. These things were not easily acquired.

Proceeding, the lecturer said:—
 "I should like now to say something of those errors in public taste of which I have had experience. Some, like the white paint fallacy, come from taking house-decorating lightly; but the majority can, I think, best be described as errors against simplicity; they are, too, errors of ignorance. That is to say, if it were understood why the house-decorator wishes to do this and the principles on which he works, many of them would disappear. There are fewer people than is commonly believed with a natural delight in what is vulgar and pretentious. Most, I think, are very ready to admire what is simple and beautiful if they are taught. To understand the aim of the decorator, you must remember that he is picking up a broken tradition. Modern house-decorating was part of the movement of the fifties, which was a protest against the utilitarian ugliness of the two preceding decades—a desire for beautiful things. The utilitarian theory can be seen plainly in all the furniture and decorating of the Early Victorian period. The furniture of that period is ugly, because it is very solid and heavy. It was designed for use, and where ornament was desired it was made a separate thing. It was made not as part of, not even to harmonise with the thing of use, but as a contrast. That was the inevitable result of assuming that a useful thing need only be useful; and so we have side by side with the solid and sombre furniture of the Early Victorian time strange and fantastic ornaments and highly-coloured wax fruits, the extreme of simplicity in design for the useful thing, and the extreme of violence in colour for the ornamental thing."

It is clear, then, that the modern house-decorator, in taking up the broken tradition, as to go back a full century to the Georgian period, and through that to the Queen Anne and Jacobean periods. This is no retrograde movement, for it is towards the most modern period of good English decorative art. It is to take up the tradition where it was broken off. Even less is this movement purely imitative. The decorator can, of course, deal in mere copies of the designs of others, and much work of the sort is done. You will find many copies both of the furniture and the decorations of the XVIIth and XVIIIth century artists. There are even many fraudulent copies of the best modern wallpapers done with small mechanical alterations of the designs to avoid infringement of copyright. It is not for this reason that the chief part and the most delightful

part of a decorator's training is the study of the fine woodwork furniture and designs of the XVIIIth century, but because, like other artists, he must get an instinct for beauty and a standard of beauty by steeping himself in beautiful things, and because he has in the XVIIIth-century work a fine English tradition of decorating in a simple and dignified style, which he must attempt to carry on in the difference circumstances of modern life. In taking up this tradition he is taking up aristocratic ideas, the ideas of great town and country houses, and he uses them and modifies them for middle-class life, to suit smaller houses, and a different manner of living, and an age which, even in its art, depends a very great deal on machinery.

That is the central principle of modern house-decorating—to apply aristocratic ideas to fit middle-class life. I believe that the decorator must study and study, and continually study the fine things of the Georgian, Queen Anne, and Jacobean periods, not only because they are good or because they are English, but because they are good in the right way for us, in a way in which the contemporary French decorative work was not good. They are good in a simpler way; their chief beauty is their perfect proportions. It is for that reason that they are sound models for modern decorators. They are aristocratic, but because of their simplicity they can be adapted to middle-class houses and an easier and less elaborate ceremony of life.

If we keep this aim and idea clear the common faults of taste become at once impossible, because they become at once apparent. The most numerous and most serious faults are, first of all, the many faults which come under the head of imitations. Chief of these is the fault of decorating in set styles; it reduces decorating to a very mean and mechanical business, and the decorator to a mere copyist, but it is encouraged and much practised by the large furnishing firms. And so you will get houses furnished Louis Quatorze or Louis Seize or Queen Anne, without any regard to the fitness of the style, to the size or the shape of the rooms or their uses or the manner of life of their inhabitants. You may even get each room of a house furnished in a separate style.

This is a pathology of taste run mad. It breaks, violently breaks, the first and elementary rule, that all the rooms of a house, like all the things in one room, should show no violent contrast with one another, but be a harmonious whole.

I do not want it to be thought that any English decorator can be altogether indifferent to the ideas or independent of the products of other countries; we get many beautiful things from abroad. No longer ago than in my predecessor's time we had crozier in Spitalfields, but that industry has disappeared, and for silks we have now to go to France; for velvets we go to Germany; and we get many new and fine stuffs, beautiful wall-coverings made of grass fibres, for example, from Japan.

There are many other forms of imitation no less vicious than the copying of set styles: there is the imitation of Nature. Many impatient people are not content that a pattern should be a pattern and no more than a pattern. They are not satisfied with a conventional rose design; they want the illusion of a rose itself. They do not understand that a wallpaper covers a flat surface, and that if a design is no realistic that it seems to stand out from it, if the flowers on it offer themselves to be picked, then the paper suggests something which it is not."

In speaking of the Art Nouveau, the lecturer said:—"Its disciples are as wrong in their ideas as were the Early Victorians. They, too, believe that use and beauty cannot go together; but their products are even worse. The utilitarians did, at least, produce useful things; but the things of the Art Nouveau are neither useful nor beautiful. Use is sacrificed for the sake of a beauty which is not achieved. Art Nouveau throws aside all restraint in its designs, but its central idea is a grotesque shame. It is ashamed when a chair looks like a chair; it professes that it should look like the trunk of a tree. It attempts to disguise everything. It makes balusters like twisted serpents, and electric lights like horseshoes on an axle; it makes everything appear like something else. These imitations are bad enough, but there are others which are still more gross—imitations which attempt to give simply an illusion of costliness."

The manufacturer finds it better business continually to produce new designs, even if they are bad, and continually to encourage the public taste in novelty. Things that are made to satisfy such a standard cannot have, and are not intended to have, any durable worth.

Now all these errors of taste, imitations, and so forth, offend against that principal thing at which a decorator must aim—tranquillity. They are all restless. To be continually struck by the newness and strangeness of a piece of furniture, or to be continually reminded that a design is not what it seems, to look at marble and then remember that it is painted iron—all this is not to feel at home. In a home you aim at something different, at ease and familiarity, and so the things in it must have a lasting worth; they must satisfy more than a momentary fancy; they must be companionable."

Mr. Bullock, in proposing a vote of thanks, said he did not agree with the remarks as to imitating old works. He himself had had to do so, and it becomes a necessity in restoration or when a client demands a copy of some old room. He hoped that wallpapers would be abolished.

Miss Fuller seconded the vote of thanks. Mr. A. H. Belcher said that he had hoped to have heard more of Miss Cohen's methods, and did not agree with all the accusations she had levelled at the heads of architects. Whilst holding no brief for the imitations of mouldings on a flat surface, he instanced a church at Edgware where this method was followed with a pleasing effect. He also was of the opinion that the use of wallpaper was often an abuse.

Dr. Helen Boyle agreed that the house-decorator should educate the public taste. The house-decorator, in her opinion, should not pay too much attention to the client's wishes and should take justifiable risks. Mr. C. G. Boucher said that the less decoration used the better for the building. He was of the opinion that good architecture should rely on form and proportions for its effect. He suggested that Miss Cohen's criticism should be turned rather against the speculative builder than against the responsible architect.

Mr. Bart Tunnard said that he did not agree with Mr. Bullock's justification of reproducing verbatim old rooms. He held that these tended to vulgarise the original. As to the Nouveau Art movement, he did not hold the opinion that we lacked able craftsmen, and instanced some of the furniture shown at the recent Arts and Crafts Exhibition. He said that we were living in an age of our own, and that while the past could not be neglected, it was a mistake to reproduce old work and fit it to modern requirements.

Messrs. Rogers and Allcorn also spoke.

The Chairman, in putting the vote of thanks to the meeting, said that the business of the decorator was to divert the public from the standard of taste thrust at it by the wholesale manufacturer, and remarked that we lived in an age of selection rather than of initiative.

The motion being carried, Miss Cohen replied, and the meeting terminated.

THE LAND INQUIRY.

QUESTIONS were recently put to the Government in both Houses of Parliament relative to the informal inquiry into the tenure of land. The Lord Chancellor, in reply to Lord Halsbury, is reported as having said:—"The inquiry was being made by Mr. Lloyd George. No Minister could divest himself of his official capacity, but, so far as it could be done, the inquiry was unofficial." The Lord Chancellor also said that he had not the least idea who was finding the money. Lord Lansdowne drew attention to the speech delivered by the Chancellor of the Exchequer at Aberdeen in which he was reported to have said he must burst up the land system, thereby apparently anticipating the results of the inquiry for which he is responsible. In the House of Commons Mr. Asquith said that no person engaged in the inquiry had any right to profess to be acting on behalf of the Government.

It may seem open to question Lord Haldane's statement that no Minister can divest himself of his official capacity in the light of the utterances of the Chancellor of the Exchequer. A Minister who is responsible for the annual Budget, according to all precedent, observes a strict reserve beforehand as to his views.

In his Aberdeen speech Mr. Lloyd George said he was accused of undermining credit and ruining trade, especially in connexion with the

* See our issue for November 29, page 651.

Finance Act, 1909-10, but that trade had gone on improving ever since. The Chancellor of the Exchequer has been fortunate in that there has been a cycle of prosperity in the general trade of the country during the past three years which has to some extent mitigated the influences of his 1909 Budget.

With secret inquiries pending and popular promises constantly made in reference to the land, what is the position of those who are seeking to develop land, and those societies, such as building societies, land societies, etc., who have the savings of needy classes invested in land? Is it fair play constantly to depreciate vaguely their securities?

TRADE UNIONS, 1911.

The Board of Trade Labour Gazette in August last published some interesting statistics relating to the membership of all trade unions in the United Kingdom, upon which we commented in our issue of August 30. In the current number of the *Gazette* there is an article on the membership, income, expenditure, and funds of 100 principal unions for the year 1911. The 100 unions have a membership representing 60 per cent. of the membership of all unions. The years 1907-9 showed comparatively small fluctuations in membership, but in 1911 it increased by 347,186, and they now total 1,816,506. The total income is the highest recorded, and amounted to 2,936,754*l.* In the article it is stated that this is due to the increased membership, but that from the same cause both the amount of income per member and the expenditure per member is less than in any of the preceding ten years.

The total funds increased by 434,573*l.*, and the amount of 5,570,690*l.* has only been exceeded in 1907; but in that year they represented 77*s.* 6*d.* per head, whereas in 1911 the amount was 6*s.* 4*d.* per member. The summary of the expenditure during the past ten years is very interesting and instructive. During the ten years the 100 unions have expended 22,946,000*l.*, and of this sum 6,140,000*l.* went in unemployed benefit, 9,543,000*l.* was sick, accident, superannuation, and other benefit, and only 2,455,000*l.*, or 10*7* per cent., of the total amount was expended on dispute pay. Working expenses and miscellaneous items accounted for 4,808,000*l.* We quote these figures because at the present time they seem peculiarly important. Trade unionists are under the impression that a large section of the community is antagonistic nowadays to the unions. This is solely due to the discussion that has been evoked by their seeking political powers and the possible use by the unions of their highly-privileged position under the Trade Disputes Act in their proposed new political sphere. We have always recognised the efficiency and value of trade unions as benefit societies and, in many respects, as trade societies, and the future of trade unions rests largely in their own hands. In their capacity of trade societies on purely trade questions discipline should be maintained, so that their important function of collective bargaining may be exercised. Strikes without notice, contrary to trade union rules, should be vigorously repressed by the union leaders, and agreements when entered into should be adhered to. The strike, and especially the sympathetic strike, should be sparingly used, and never to intimidate the public. On the other hand, political action should be confined to matters connected with trade and employment; general politics should be avoided, and any kind of political dress or compulsion be prohibited by the unions. We venture to submit that if the unions proceed on such lines they have a great future before them.

THE WONDER OF WORK.

Those who went to the Royal Society of Arts on the evening of December 18 had no reason to regret their pilgrimage to the Adelphi, for Mr. Joseph Pennell gave a lecture on "The Pictorial Possibilities of Work" which will be remembered by the audience for a long time; and the lithographs and etchings on the walls, with the lantern views, were as instructive and as attractive as could be desired.

The origin of the lecture was Mr. Pennell's visit to the Panama Canal, but the opportunity was taken to look back on the artistic achievements of the past.

Among the artists chosen by Mr. Pennell to illustrate his subject were Rembrandt, Claude,

Canaletto, Piranesi, Turner, Whistler, Meunier, Ford Madox Brown, Puvion de Chavannes, Menzel, Mr. W. L. Wyllie, Mr. D. Y. Cameron, Mr. Muirhead Bone, Mr. John Lavery, and Mr. Frank Brangwyn. Several of Whistler's etchings were thrown on the screen, with the picture "The Building of New Westminster Bridge," painted in 1862, which was a feature of the Memorial Exhibition of the artist's works held at the New Gallery in 1905.

In the course of his remarks Mr. Pennell said:

"I went to Panama because I believed that, in the making of the greatest work of modern time, I should find the greatest inspiration. The day I landed in Colon I found it. I had seen great cranes at Pittsburgh and Duisburg, but nothing like that which stretched its great arm, with great claws, over the sad, silent swamp of Mount Hope—the *ciénaga* of De Leó—ambition. I had seen in New York, as I sat on the thirtieth story of the Metropolitan Building, a chain come up from below with a man clinging to it. But I had never imagined anything like the group of figures which rose out of Gatun Lock at dinner-time. I had looked into chasms and gulfs, but I never imagined anything so terrific as the gates of Pedro Miguel. I had seen the greatest walls of the oldest cities, but I never imagined anything so imposing as the walls of Miraflores Lock. I had seen the great aqueducts and great arches of the world, but I never imagined anything like the approaches to Gatun and the spring of Pedro Miguel, made by army officers and civil engineers mainly to save material. For there are no architects, no designers, no decorators on the Panama Canal—just engineers and organisers—Goethals, Gaillard, Gorgas, Williamson, Bishop, and more. But the engineers at Panama are great designers, and great work is great decoration."

"Work to-day is the greatest thing in the world, and the artist who best records it will be best remembered. In France, Germany, and Italy the Wonder of Work around us has been made the subject of endless commissions from the State to artists. But records of facts, facts of one's own time, here and in America are never recorded. Go to the Royal Exchange and you will find Wat Tyler, Phoenicians, prehistoric apple-carts, and everything in the history of London that can be made into a painting of the past, and not a single record of the present. Where is the building of the Tower Bridge, the electric light works, the docks, the Blackwall Tunnel, the trams, the Tube, or any of the other works by which this age, this workaday age, has distinguished itself, all of which are worth painting? John Lavery has made, in Glasgow, a decoration out of shipbuilding which is worth the whole wall coverings of the Royal Exchange and the House of Lords put together."

GENERAL NEWS.

Professional Announcement.

After Christmas the offices of Messrs. F. H. Greenaway & J. E. Newberry, architects, will be removed to Parliament Mansions, Victoria-street, Westminster.

Appointment: Calcutta Cathedral.

Mr. Heathcote D. Statham, Mus.Bac., Cantab., eldest son of Mr. H. Heathcote Statham, F.R.I.B.A., has been appointed organist of Calcutta Cathedral.

Cambridge University.

The following four candidates have passed the examination in Preliminary Architectural Studies at Cambridge:—Part II.—Class I.: P. H. Pilditch (Pemb.); Class II. (in alphabetical order): K. M. B. Cross (Cains); D. C. Parsons (Trin.); Class III.: E. N. Clifton (Trin.).

Crystal Palace Engineering School.

The "Wilson Premium" for the best paper read before the Crystal Palace Engineering Society (affiliated to the Society of Engineers Incorporated) during the present session has been awarded by the Council to Mr. J. R. M. Chalton for his paper on "Wireless Telegraphy." Other papers read during the session were:—"The South-Eastern Coalfield," by Mr. B. L. Rignid; "Compressed Air," by Mr. H. M. Jordan; and "Reconstruction of Komati Poort Bridge," by Mr. J. E. Thomas. The premium was presented to Mr. Chalton by Mr. R. Elliott-Cooper, President of the Institution of Civil Engineers, on the

occasion of the 120th distribution of certificates of the School, on the 10th inst., at which he presided.

Coronation of George V. Tapestry.

Messrs. Morris & Co. are weaving at their Merton Abbey Works a large piece of commemorative tapestry whereof the design reproduces that of Mr. Bernard Partridge's "Arming of the King" in the Coronation number of *Punch*; Mr. Partridge has made a coloured replica of his cartoon for use at the loom. The woven piece will be enriched with a wide border of trailed York and Lancaster roses interlaced with badges of the reigning houses during the past seven centuries, from designs by the Rev. E. Doring, who devised the heraldry for the King's Coronation and the Prince of Wales's Investiture at Caernarvon Castle. A scroll at the top is inscribed, "Georgius V. Rex et Imperator armis induitur A.D. X. Kal. Jul. MCMXI."

Property Sales.

The late Sir L. Alma Tadema's house in Grove End-road, St. John's Wood, upon which he expended some 70,000*l.*, was withdrawn from sale after a bid of 30,000*l.*; negotiations are in progress for buying the house and grounds as the headquarters of a learned and artistic society.—Avonholm, Glassford, Lanarkshire, designed by Robert Adam, has just been sold to Mr. R. Halket, of Glasgow.—Swinton House, Berwickshire, just purchased by Captain G. H. Taylor Swinton, of Uppminster Hall, Romford, has vested in that family (until a few years ago) since the 13th century, and there is record of Laith, of Bannburn and Swinton, Seigneur of Northumbria, as being the first individual Scottish subject whose ownership of land can be proved by contemporary and extant documents.—Messrs. Collins & Collins have sold No. 2, Carlton House-terrace, St. James's, for nearly 100,000*l.*; the house was the residence of Lord Liverpool, and latterly of Mrs. Malvina Drummond.—The Island, Waterford, with the Castle (the home of Edward Fitzgerald), built by the Fitzgeralds in the 13th-15th centuries, will be offered for sale, with the works of art and fine old furniture, in the coming season, together with Quenby Hall, near Leicester, a fine example of domestic Jacobean architecture (1610-20), constructed of brick, with the diamond pattern, and having Ketton stone dressings.—Sir Sothern Holland has bought Westwell Manor, Oxon, near Burford, a typical Cotswold house, of stone, and with a stone slab-roof, temp. James I.

Art Sales.

The first part of the sale at the Manzi-Joyant Gallery, Paris, on December 9-11, of the late M. Henri Rouart's collection of old and modern pictures realised 186,274*l.* The collection comprised forty pictures by Corot and fourteen by J. F. Millet, and numerous drawings by them, with examples of Degas, Manet, Fantin-Latour, Troyon, Cézanne, Diaz, Monet, Renoir, Henri Daubier, the caricaturist, and many other modern painters. The lots included Corot's "La Source" (1,480*l.*) and "Villa d'Este à Tivoli" (4,440*l.*)—these were bought for 14*l.* and 160*l.* respectively at the artist's sale in 1875—and his "Les Baigneuses aux Iles Borromées" (8,400*l.*—Knoedler); "Femme en Bleu" (6,480*l.*—Louvre Museum); and "Naples et le Château de l'Euif" (1,180*l.*); Degas's "Les Danseuses à la Barre" (2 ft. 6 in. by 2 ft. 7 in., depicting two ballet-girls at practise, originally sold for 20*l.* (17,400*l.*); "La Répétition des Danses" (8,000*l.*—Knoedler); "Sur la Plage" (3,600*l.*—Sir Hugh Lane); and "L'Enlèvement des Sabines" after Poussin (2,200*l.*); Manet's "Buste de Femme nue" (3,880*l.*); "La Leçon de Musique" (4,800*l.*); and "Sur la Plage" (3,680*l.*); Puvion de Chavannes's "L'Espérance" (2,600*l.*—the Luxembourg Museum); Goya's "Femme Espagnole" (5,680*l.*—Sir Hugh Lane); Fragonard's "Paysage" (2,800*l.*) and "Repos Pendant la Fuite en Egypte" (3,000*l.*). At Christie's was sold for high prices last week some old English silver, the property of Captain J. H. Reynolds, Mr. J. H. H. V. Lane, and others. The lots comprised a James I. silver-gilt steeple cup and cover, embossed and chased, 13½ in. high (1621), nearly 11 oz. in weight (80*l.*—Crichton); a William and Mary monteith, 11½ in. high, at 20*s.* (504*l.*—Crichton); an Elizabethan chalice and paten (1571), 9 in. high, at 400*s.* (268*l.*—Elkington); a James I. beaker, richly engraved, 6½ in. high

(1607), at 640s. (243l. 4s.—Elkington); and a lock-watch by Edward East, London, XVIIth century (147l.—Huggins); with an Irish potatoing, Dublin, of about 1670, at 1670, at 450s. (216l.—Pernann).

Church Building Society.

The Incorporated Church Building Society held its usual monthly meeting on the 19th inst., at the Society's House, 7, Dean's-yard, Westminster Abbey, S.W., the Hon. Sir E. P. Chesiger, K.C.B., in the Chair. Grants of money were made in aid of the following objects, viz.:—Rebuilding the Church of St. Mary Magdalene, Somersell, Somerset, 50l.; and towards enlarging and otherwise improving the accommodation in the churches at Dymchurch, St. Peter and St. Paul, Kent, 40l.; and Plessey Hill, St. Barnabas, Notts, 40l. The following grants were also paid for works completed:—King Cross, St. Paul, Halifax, 250l.; Langley Mill, St. Andrew, Derbyshire, 150l.; Taplow, St. Nicholas, Bucks, 150l.; Colne, Holy Trinity, Lancs, 120l.; Headstone, St. George, Middlesex, 100l.; Gringley-on-the-Hill, St. Peter and St. Paul, Doncaster, 50l.; East Wickham, St. Michael, Welling, Kent, 50l.; Fitzroy-square, St. John, Middlesex, 40l.; Hendon, St. Paul, Sunderland, 30l.; and Rathmell, Holy Trinity, Yorks, 10l. In addition to this the sum of 100l. was paid towards the repairs of five churches from trust funds held by the Society.

City Subway, Cannon-street.

The Corporation of the City have placed with Messrs. Mitchell Brothers, Ltd., of Victoria-street, S.W., a contract for the construction, after designs by Messrs. Basil Mott & Hay, M.M.Inst.C.E., of the subway at the junction of Queen Victoria and Cannon streets. The subway, having a total length of 280 ft., a width of 10 ft., and height of 8 ft., will be planned in the form of a cross, with entrances from the two streets and from beneath Mansion House railway-station. It will be made under timber road-decking, on the "cut-and-cover" system, with brick walls, concrete floor, and steel trough roof; a subway, 12 ft. wide, for mains and lines of various kinds must be lowered at Queen Victoria-street, and other mains and sewers, one of them 4 ft. high, will be diverted horizontally.

Art and Industry.

Mr. Frank Warner, President of the Silk Association of Great Britain and Ireland, recently distributed the prizes at the Macclesfield School of Art. In an address on "Art and Industry" he said that those in control of our educational system seemed bent on stifling all effort, thwarting every scheme, and humiliating to the dust all those who had the temerity to attempt to attach to our industries that touch of art culture of which they stood to-day in such need. They had forced upon them a scheme of examinations which was more academic, extreme, unnecessary, and impossible than anything ever attempted before. The new regulations for examination in industrial design would result in a fiasco, for the simple reason that no industrial student, certainly not one connected with the textile industry, stood a chance of passing unless he studied far beyond the range of subjects that was necessary for his efficiency as a designer. A still more serious upheaval was the threatened abolition of the National Competition hitherto held at South Kensington. The competition had done a great good, not only in stimulating the students, but to the art schools themselves.

BOOKS.

Pitman's Law of Repairs and Dilapidations. By T. Cato Worsfold, M.A., LL.D. (London: Sir Isaac Pitman & Sons, Ltd. Pages xii. and 91. Price 3s. 6d. net.)

This is a very useful little book written in a style which is both clear and concise. The branch of the law with which it deals necessarily affects in some degree persons of all classes either as landlords or as tenants. Many a man at some time or other has found himself in a difficulty and has been perplexed as to what he is or is not liable for as a landlord or as a tenant, and further to what extent in either capacity.

That being so, there was indeed room for a handy book upon this intricate subject, seeing that most of the standard text-books upon it

are too detailed and bulky for use by anyone but a trained lawyer. The author has succeeded in producing a very readable work which sets out in admirable fashion not only the principles embodied in statutes, but also the manifold legal decisions arising therefrom, and the book is quite up to date, for it includes decisions right down to July 31 of this year, which was the last day the courts sat prior to the long vacation. The author is certainly to be congratulated upon having fulfilled the difficult task of compressing into a small compass a very complex branch of our law, while at the same time retaining sufficient details to render his work of service to lawyers as well as to laymen.

The Table of Cases would perhaps have been more useful to the former if full references had there been given against the names of the cases, and it is also customary to enclose dates of cases in square brackets when such dates actually form part of the reference, but these are small matters which in no way detract from the general merit of the work. There is a Table of Statutes and an index.

Water Supply and Drainage Systematised and Simplified. By C. E. HOUSDEEN. With three plates. (London: Longmans, Green, & Co. 1912. Pages 28. 1s. 6d.)

This small volume is a supplement to the author's "The Precise Calculation of Pipe Drain and Sewer Dimensions," but it can be used without reference thereto. It explains in detail the method of determining the sizes of main pipes in a system of water supply, including the investigation of velocities of flow in the pipes and the reduction of excessive pressure, together with the allowances to be made for eventual incrustation. A drainage project is dealt with upon parallel lines.

The outstanding features of the book are two scales for ascertaining the dimensions of pipes and sewers, adopting any desired co-efficient for the state of comparative roughness of the wetted surface. These should be very useful in rapidly arriving at and in checking sizes of pipes.

The Mechanical World Pocket Diary and Year-Book for 1913. A Collection of Useful Engineering Notes, Rules, Tables, and Data. (London: Emmott & Co.; and Tokyo, Osaka & Kyoto: The Maruzen-Kabushiki-Kaisha. Pages 439. 6d. net.)

This issue is in no way inferior to its predecessors, and has some excellent points. We notice, for instance, the clear way in which terms of the class that "every schoolboy knows" are defined; anyone who is often asked for such definitions by beginners knows how difficult it is to lay hands on a small book which will give them clearly; in the present work we find an excellent series under the headings of "Steam and the Steam Engine," "Notes on Heat," "Beams and Girders," and elsewhere.

In addition to the chapter on steam engines of more ordinary types there is an article devoted entirely to steam turbines. The means of production of steam are dealt with in sections on boilers, their design and setting, and the corrosion and incrustation met with in them. The design of the chimney and notes on superheating of steam are added. Gas-producers and gas and oil engines are also treated of, and there are copious notes upon shafting, gearing, bolting, hemp and wire rope driving, chain driving, ball and other bearings, and many useful tables and workshop notes.

The appearance of the name of a Japanese joint stock company as joint publishers of a handbook of this kind is a sign of the times, and we should not be surprised to hear that the work has a good sale in the land of the Rising Sun, for it contains much useful matter, well arranged, well written, and with a good index. It is neatly bound in cloth, and among the many pocket-books of its class we do not remember a better sixpennyworth.

Primer of Scientific Management. By FRANK B. GILBRETH. Pages viii. and 108. (London: Constable. 1912. 4s. net.)

The preface of this book explains that it is intended to supply answers to questions put to the publishers of the *American Magazine* as a result of articles in that periodical upon "The Principles of Scientific Management." This fact is said to be the reason, "in part, at

least, why the book is not a complete treatise on scientific management."

The scientific management referred to seems to have as one of its features a somewhat extreme division of labour and to involve a multiplicity of foremen. Both these may possibly be useful in trades involving very many repetitions of any given operation, but would appear likely to make the life of a mechanic monotonous to the last degree. It is claimed that the system will give the biggest possible day's work and wage with the least possible expenditure of time, and this result would probably have its attractions for many. In some trades a wearisome monotony will in any case prevail, and such trades are probably those whose managers will derive the most useful hints from the book before us. In any case the author approaches his subject with the idea that the welfare of the operative is a matter to be considered equally with that of his employer, and contends that scientific management does this. Any system having a tendency in this direction will command sympathy, but the author's admission that his schemes tend to "keep the worker from being all-round mechanic and instead make him a narrowly trained specialist" does not so well please. For the worker in the higher walks of, say, surgery, specialisation following on a good general training may be almost without drawbacks, but for the manual worker we fear that specialisation can very easily do harm. On the whole we are inclined to think that the full application of the methods advocated by the author is more suitable to America than to this country.

Competition Points for Gas Salesmen. By ARTHUR F. BEZANT. (Published by Walter King, Office of the *Journal of Gas Lighting*. London. 1912. Pages xii. and 212. Price 3s. 6d.)

AN interesting and useful book, frankly endeavouring to make the best possible case for the use of gas in preference to electricity. It is addressed to the gas salesmen with the object of helping him in his duty of selling the product of his employers, whether company or other corporation, by putting him in possession of all the available facts and arguments for gas, and against other means of providing light and heat.

The subject is one of very general importance, there being few town dwellers who are not personally interested in it to some extent, financially or otherwise.

The author deals with it as regards direct cost of installation and maintenance, as well as with reference to efficiency, and discusses the relative merits of gas and electricity as affecting the eyesight of the user, the ventilation of rooms, the purity of the air, the preservation of bookbindings, and other important matters.

The special requirements and conditions of street, factory, shop, and domestic lighting, and those incidental to the lighting of public buildings are all dealt with, and a considerable space is devoted to cooking. Chapters upon Gas versus Electricity for Power Production, upon Fire Risks, Failures of Electric Supplies, and upon miscellaneous points complete the book.

Here and there—as, for instance, in the list of "Fires Reported to Have Been Electrically Produced"—the evidence adduced may be weak, and as to the whole book, we feel a desire for a corresponding volume prepared upon similar lines, but taking the opposite side. Nevertheless, provided the reader remembers the title and object of the book, it is full of instructive points.

The index might with advantage be amplified.

STORY OF THE MAIN DRAINAGE OF LONDON.

The London County Council have issued, at a price of 1s. 6d., a revised edition of the description, with plans and illustrations, drawn up by Sir Maurice Fitzmaurice, C.M.G., in 1909, of the main drainage of London. That system, we may mention, was originally instituted by the late Metropolitan Board of Works, whose first Engineer-in-Chief was Sir J. W. Bazalgette, M.Inst.C.E. The new work was carried out by him for the Board in 1857-74. Up to March, 1909, the London County Council expended more than 11 millions upon the drainage system of London.

ILLUSTRATIONS.

House in Rutland.

THIS is one of two alternative schemes prepared by Mr. H. S. Goodhart Rendel for a site in Rutland. The project has been abandoned. The conditions involved the incorporation of an old house and the irregular arrangement of the plan. The materials would have been those customary in the district—stone walls and roof, and leaded windows. The drawing was shown at the Royal Academy Exhibition this year.

Furze Hill, Willersey.

THIS house has been built in a very elevated position, commanding a wide prospect of the vale of Evesham and the Cotswold Hills, and overlooking the villages of Broadway and Willersey at about an equal distance from each. It is built of local stone in the local manner, and roofed with stone slates.

The house was designed by Mr. J. L. Ball, Director of the Birmingham Municipal School of Architecture, and was built by Messrs. Collins & Godfrey, of Tewkesbury. The heating apparatus, casements, leaded glazing, and lead rain-pipes were supplied by Messrs. Henry Hope & Sons, of Birmingham.

The Architectural Association Schools.

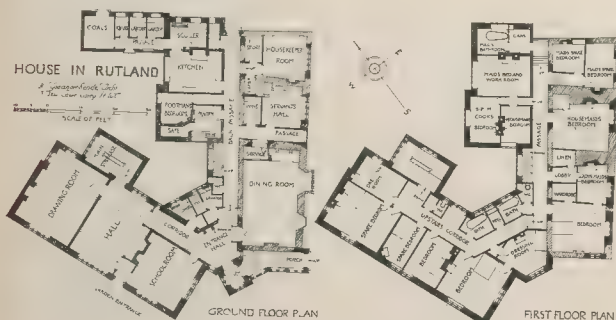

THIS "Study in Ornament" was prepared as a freehand drawing test of the end of the Third Year Evening School at the Architectural Association. The "Detail of a Fountain" and the whole design (p. 779) were shown at the A.A. Exhibition held last July. This design was part of a scheme of lay-out and planning of a library and site, being the principal subject in the Summer Term.

Mr. A. E. Maxwell is the holder of the R.I.B.A. silver medal (Drawings), the subject chosen being Compton Wynyates. Mr. Gerald C. Horsley, F.R.I.B.A., in his criticism of the drawings submitted for the Institute prizes and studentships, referred to these measured drawings and data as "an admirable example of what such a collection should be."

In his first year's course at the A.A. Schools Mr. Maxwell was awarded a special prize for excellence. He was also the winner of the freehand drawing test. His second year design, "A Garden Pavilion," was illustrated in the *Builder*, September 3, 1910. This was a subject set at the completion of the Day School course in the final test, in which Mr. Maxwell was placed first, receiving his Association Certificate with Honours. He then entered the Evening School, working in the daytime with a well-known firm of architects. Mr. Maxwell was born in 1891 in St. Petersburg, and was educated at Bowdon College, Cheshire, supplementing his studies at St. Petersburg, Berlin, and Paris.

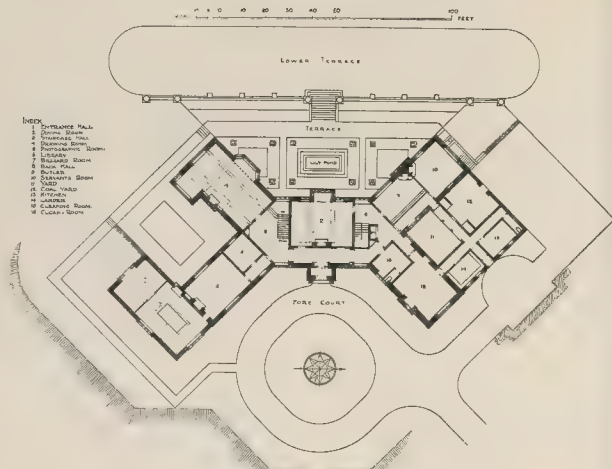

The Church of Santo Spirito, Florence.

THIS church was built by Brunelleschi after the burning of the former church standing on the same site. The scale is considerable,

COMPETITION NEWS.

A list of current Competitions is printed on page 794.

Henry Saxon Snell Prize.

The subject given by the Royal Sanitary Institute in 1912 for the Essay in competition for this prize was "The Ventilating, Lighting, Heating, and Water Supply Appliances and Fittings for an Operating Room for a General Hospital." Ten essays were sent in. The adjudicators for the competition were Mr. Edwin T. Hall, F.R.I.B.A., Dr. Louis C. Parkes, and Mr. A. Saxon Snell, F.R.I.B.A.; and they had the advantage of the criticisms and suggestions made by Sir Frederick Treves, Bart., G.C.V.O., who acted as consulting referee. Acting upon the advice of the adjudicators and of the consulting referee, the Council have decided to divide the prize of fifty guineas, giving one-half the sum to Mr. John Darch, M.R.San.I. (Wandsworth), writing under the motto "Aseptos," and the other half to Mr. H. F. V. Newsome (Manchester) and Mr. John G. Cherry, M.R.San.I. (Manchester), writing jointly under the motto "Magnum Bonum." The adjudicators consider that there are many excellent suggestions in each of these essays, but, on the other hand, there are some which they consider would prove unsatisfactory in practice. A bronze medal of the Institute will be awarded to each of the successful competitors. The adjudicators also commend the essays sent in under the mottoes:—"Science moves but slowly, slowly creeping on from point to point," "Ajax," and "Tout bien ou rien."

Schools, Newcastle-on-Tyne.

The following are the authors of the premiated designs in the competition for the Rye Hill Council School, Newcastle-on-Tyne:—(1) Mr. J. H. Morton, F.R.I.B.A., 57, Westgate-road, Newcastle-upon-Tyne; (2) Messrs. Harrison & Ash, 14, Grey-street, Newcastle-upon-Tyne; (3) Mr. Edwin F. W. Liddle, 12, Eldon-square, Newcastle-upon-Tyne. And in the competition for the Crutchie Park Council School the following have been successful: (1) Messrs. Harrison & Ash, 14, Grey-street, Newcastle-upon-Tyne; (2) Messrs. Wright & Chapman, 38, Grainger-street, Newcastle-upon-Tyne; (3) Mr. W. H. Knowles, 25, Collingwood-street, Newcastle-upon-Tyne. The competitions were open to local architects only.

CORRESPONDENCE.

Fire Protection and the London County Council.

SIR,—Mr. Horace Cubitt's able letter in your issue of the 13th inst. may be divided into four sections. In the first place, he points out that owing to the neglect of the local authorities there are frequently relatively greater fire dangers to be met with in the provinces than in the metropolis, and he suggests that the state of affairs requires remedy.

I fully concur with Mr. Cubitt that in many localities in the provinces the state of affairs is scandalous, and this is often most evident in matters relating to the safety of industrial buildings or stores that cannot be brought under the Factory and Workshop Act. But for reasons best known to themselves many local councils do not even seriously put into force the powers they have in respect to factories and workshops under sect. 14 and 15 under the Factory and Workshop Act of 1901, and there are quite a number of local authorities that have not yet even made the necessary by-laws which they have power to frame under the last-named section. The central authority on factory and workshop matters unfortunately has little or no power over these neglectful local authorities, and the result is that, unless the factory inspector can persuade the building owner to act fairly, the necessary fire precautions on such buildings are most difficult to enforce.

The only remedy against these apathetic local councils that appears feasible is to give the central authority some additional powers for bringing them into line with, say, some proviso that the central authority can, if necessary, take the matter in hand itself at the expense of the local authorities in question.

Regarding the second section of Mr. Cubitt's letter, in which he argues that "it may be generally conceded that the London County Council, in putting their powers in force in a gradual manner, are acting reasonably," I differ entirely. It is unreasonable of the London County Council to allow the many users of the buildings in question who do not happen to be building owners—including the many employees of the latter—to run the unnecessary risk of fire they now have to owing to the delay in enforcing the Building Acts (Amendment) Act of 1905. It is also unreasonable to place so many building owners in such a position as they are in at present where they do not know how when they may be called upon to make structural alterations—may be, just after they have redecorated their premises. It is unreasonable to spread five years' work over a period of five centuries and to take the few (527) individual cases that have been put in order under sect. 9 during the past seven years in the present haphazard fashion.

In the third section Mr. Cubitt apparently desires to argue that matters of fire prevention and matters of escape from fire are not very similar things. Originally fire prevention was purely considered to be a small chapter in the general subject of fire protection dealing with the precautionary measures against the actual outbreak of fire due, for instance, to individual negligence, defects in electric wiring, etc. Gradually the subject grew to what might be termed fire prevention in the wider sense, which included the prevention of the spread of fire and the spread of smoke, and the escape from fire and smoke. To-day the term fire prevention may be said to cover everything relating to building construction and equipment that may prevent the outbreak of fire, prevent the spread of fire, and prevent the loss of life from fire.

As to the fourth section of Mr. Cubitt's letter as to whether the more populous areas of the metropolis are more dangerous from the fire point of view than the less populous ones of the provinces, this is certainly a very debatable subject of wide issues. Without wishing to indicate concurrence with Mr. Cubitt's views, I will gladly agree that the provinces require fully equally that "stirring up" that is at present being applied to the London County Council.

In conclusion, but one additional word to Mr. Cubitt as a former member of the architectural staff of the London County Council, and that is that I wish to emphasise, as I have tried to throughout this correspondence, that whatever may be the failings of the London County Council in its corporate capacity, my strictures in no way reflect in the slightest degree on any

A Design by Mr. A. E. Maxwell. (See Plate for detail.)

member of the Council's Building Act Department. The remarkable efficiency and strenuousness of Mr. Riley and his chief assistants are as well known to me as his tactful handling of delicate or difficult technical cases, and it is only a pity that such a splendid staff should be working for such a sluggish Council.

EDWIN O. SACHS.

Intercepting Traps.

SIR,—If only in the interests of historical accuracy, some comment seems desirable on the reference to German house drainage practice found at page 40 of the Departmental Committee's Report on Intercepting Traps. Mr. Durham's statement favours the assumption that the omission of these appliances originated with one of the English engineers of the Frankfort sewerage system, and that the treatment of house drains in that and other cities constituted, in this respect, a new departure. I find it difficult to reconcile this with my recollection of the facts in regard to Frankfort after an interval of forty-five years.

So far from the absence of intercepting traps being a feature of the Frankfort house drainage regulations, compiled in 1868, these expressly enforced their provision for all liquid wastes

to be installed in a brick chamber at least 3 ft. in diameter and provided with a stoppered central opening—i.e., for cleaning only. Plans of typical house drainage systems, accompanying the regulations, showed in several cases the necessity for two such traps and chambers in order to avoid the passage of fecal matter through an interceptor, it being a cardinal feature of the plan that water-closets and their extended soil pipes should be directly connected with the street sewer.

It is clear, therefore, that the principle of disconnection—that is to say, the provision of a main underground trap in addition to the small seals on each waste-pipe—was a feature of the original Frankfort system. The essential difference between this method and that which has been ruthlessly imposed upon English sanitary boards since 1877 lies in the inclusion of water-closets under the model by-laws—a course which no reader of the present Report can fail to recognise as a grave mistake. The genesis of this latter method can be traced to the outbreak of typhoid in Uppingham School in 1875, and to the subsequent report thereon by an engineer no longer with us. In view of the disclosures of the Departmental Committee in regard to the putrid condition of house sewage discharged into public sewers

Stoic

* * * When referring in a recent "Note" to the demolition of some of the Paris theatres, we spoke of the Cirque Impérial—now known as the Châtelet—having been opened in 1780 by "un égyptien Anglais" named Astley. In the same year his London establishment, in St. George's Fields, was converted into a covered amphitheatre. It was only a timber structure, and was twice burned down. A building with a simple classic front took its place in 1820. Dion Boucault's management did not last long, and the house reverted to its old calling in 1873 under "Lord" George Sarger. Phil Astley died in Paris in 1814. Another of the transatlantic theatres, the old Surrey, for many years a rival to Astley's as a circus, had later as manager, the actor Elliston, who, as we all know, was the subject of one of Elia's Essays.—Ed.

CONSTRUCTION & ENGINEERING REVIEW

Fig. 1. New York Grand Central Station and adjacent Buildings.

NEW YORK GRAND CENTRAL RAILWAY-STATION.

THE New York Central and Hudson River Railroad is the only railway having western connexions for both freight and passenger traffic direct to Manhattan Island. It enters the city over the four tracks of the New York Central, which skirt the east bank of the Hudson River and run over the two-track viaduct from Chatham. The former route was originally the freight line, while the latter was the original passenger line to Albany and the West. The New York Central passenger traffic enters the Grand Central Terminal in conjunction with that of the New York, New Haven, and Hartford Railroad.

History of the Grand Central Station.

The precursor of the present station was built in 1832 by the New York and Harlem Railroad, now a part of the New York Central system, about 3 miles south of the new Grand Central terminus. In 1857 the station was moved to Twenty-sixth-street on the site of the present Madison-square Garden.

This station was shared jointly with the New Haven Railway, but in turn it became too small, and in 1871 the original Grand Central station was built.

In 1900 the station was enlarged by the addition of three stories and an increased number of lines.

It soon became evident, however, that nothing but entire reconstruction would meet the ever-increasing traffic requirements. At the same time it was recognised that the substitution of electricity for steam offered the only cure for the objectionable atmospheric conditions existing in the Park-avenue tunnel at entrance to the Grand Central Station. It was not until 1903 that legislative action was taken directing the complete abandonment

of steam locomotion in Park-avenue within a period of five years.

In the same year the railway company and the city authorities agreed upon radical changes which were possible only with the abandonment of steam traction. From a civic standpoint the most important of these changes, is the depression of the whole terminal area, so as to permit the extension of highways over the tracks from Forty-fifth to Fifty-sixth streets, inclusive, thus joining two sections of the city, hitherto separated by three-quarters of a mile, by an impassable barrier of railway-yards and buildings, and to permit also the continuation of Park-avenue so as to make it, by means of an overhead bridge at Forty-second-street, a continuous north and south thoroughfare.

Design of the New Station.

The design of the new terminus presented a problem of no small magnitude. Twice the railway company had been compelled to move their terminal northwards, and it was very desirable that the strategic position of the station in the heart of the city should be maintained, so that the heavy passenger traffic might continue to be brought into the centre of the city, yet without creating a public nuisance in the high-class residential quarter through which the line runs south of the Harlem River.

Other important considerations were the provision of accommodation for existing car and train requirements, together with probable future increases, and the necessary facilities for mail, express, and baggage traffic, together with arrangements for the cleaning and preparation of equipment for the return journey.

The new scheme provides two levels of tracks,

the lower level being joined to the upper level by four approach tracks, two inward having grades of 3 per cent. and two outward having grades of 2.7 per cent. Under the lower tracks three transverse subways are provided for transfer of mail, baggage, and express traffic, and for piping across the yard.

Above the upper tracks are carried the transverse streets, with one longitudinal avenue in the centre which, at Forty-fifth-street, is diverted to the east and west around the station building, the easterly branch being reserved as a private way for baggage and mail vans and the westerly branch joining Vanderbilt-avenue, together with an elevated roadway next the terminal building, by which vehicular traffic is maintained over Forty-second-street to join the present Park-avenue at Forty-fourth-street.

The buildings comprise (1) the station building proper; (2) a post-office and office building, in which are the premises of the American Express Company; (3) a sub-station for transforming high-voltage alternating current to 660-volt direct current for traction and to low-voltage direct current for operating signals; (4) a heating and lighting plant building of capacity sufficient for all the buildings; (5) an accumulator-house for storage batteries to supply traction and signal current in case of failure of the sub-station or during extreme loads; (6) the Adams Express Building; and (7) the Merchants' and Manufacturers' Exchange Building. The remaining building areas between the proposed street lines will be occupied as soon as satisfactory arrangements can be made, some buildings not mentioned above being already under construction. Fig. 1 is a bird's-eye view of the station and adjacent buildings, and Fig. 2 is a view showing

Fig. 2. New York Grand Central Station : Building Sites over Train-yards.

one of the available building sites over the rain-yard.

The Station Building Proper.

This is appropriately the dominating feature in the Grand Central group of buildings. It extends longitudinally from Forty-second to Forty-fifth streets and transversely from Depew-place to Vanderbilt-avenue, and covers an area measuring 722 ft. long by 301 ft. wide at street level. Below street level the station is 745 ft. long by 455 ft. wide.

In designing this building the architects had in mind an expression of the old terminal idea, which is that of a gateway to the city. Hence the main entrance to the station on Forty-second-street is in the form of a triumphal arch with three openings, each being 33 ft. wide and 60 ft. high. In this building are situated the waiting-rooms, concourses, baggage-rooms, and other facilities for travellers.

The principal hall is the main outward or express concourse. It is 272 ft. long by 120 ft. wide by 125 ft. high, and, as may be gathered from Fig. 3, a dignified simplicity of architectural detail has been preserved, while the interior, finished with Botticino marble, gives a warm and pleasing effect. In the concourse are the ticket offices, information bureaux, parcel-room, baggage checking department, and all the usual conveniences expected by American travellers.

The various offices and rooms are arranged so that the movement of the traveller is a progressive one, the ticket window coming first, the Pullman window next, the baggage office third, and so on in regular sequence. Stairways are obviated by inclined ways along which passengers proceed directly from the concourse to the train platforms, the concourse being slightly higher than the train platforms. The main waiting-room between the concourse and Forty-second-street is another hall of monumental proportions. The suburban concourse is directly beneath the express concourse, and is of the same area, although the ceiling is not so lofty.

One of the unique features of the station is the use of inclined ways instead of stairways, all the levels used by passengers being connected in this manner. Suburban traffic is separated from main line traffic and the incoming from the outgoing traffic, so that all passengers on any one inclined way move in the same direction, thus obviating undesirable congestion.

Fig. 4 is a section in perspective which serves the purpose of illustrating the general arrangement of the station and the means provided for access to and from the streets and the various metropolitan and suburban lines.

The new terminus will have direct sub-surface connexions with the Interboro Subway, the Hudson and Manhattan tubes to Jersey City, the Belmont Tunnel to Long Island, and the Lexington-avenue Subway now under construction. This will establish inter-communication between the New York Central lines and the interurban lines, so that every part of New York shall be in direct touch with the Grand Central Station.

The station for inward traffic is situated on the west side of Vanderbilt-avenue between Forty-third and Forty-fourth streets. Passengers arriving may proceed to an hotel, to the street, to the subways, or to the cabstand without crossing the path of a single outward passenger, thus eliminating a source of confusion which is very evident in most large railway-stations. The arrival station is provided with a waiting-room of ample proportions over the express level tracks, and means of pedestrian communication between the arrival and departure stations are provided by a subway below Vanderbilt-avenue.

Suburban Lines.

This part of the station includes seventeen tracks alongside the platforms, two reserved for baggage, and five additional tracks on the west which will be used for transferring trains from the arrival to the departure side by way of the loop shown. The storage yards are to the north of the station tracks.

The platforms vary from 14.33 ft. to 26 ft. wide, the passenger platform being 4 ft. above rail level, and the baggage platforms 4 ft. 3 in. above the same level.

Express Lines.

The arrangement of the express tracks and platforms is indicated in Fig. 5. There are forty-two tracks at the south end, some of these resting on rock, while those over the suburban lines are supported by a concrete floor carried by steel columns and girders.

There are three transverse subways in the express station, one at Forty-third-street for pipes, mail conveyors, and baggage trucks; one at Forty-fifth-street for baggage trucks, containing quarters also for storage and cleaning, together with a space for pipes; and a pipe subway north of Forty-eighth-street. On the westerly side of the station the three transverse

Fig. 3. New York Grand Central Station : Interior of Concourse.

Fig. 4. New York Grand Central Station : Perspective Section.

ways are connected by a longitudinal pipe way. On the easterly side the pipes are in a gallery above and east of the parking platform and connected with the transverse subways.

The suburban and express platforms are of reinforced concrete, and a general idea of construction may be obtained from the longitudinal and transverse sections in Fig. 6. The steel columns supporting the viaducts are protected by an encasing concrete pier for a distance of 7 ft. above rail level, where adjacent to running tracks, and 5 ft. 6 in. above rail level where adjacent to station or storage track. Above the concrete pier the columns and girders are protected by concrete applied on wire fabric.

Street Viaducts.

Park-avenue and the transverse streets are supported on steel columns, some of which rest on the suburban roof steelwork and some on solid rock, these columns supporting a series of beams which in turn carry the concrete floors. Most of the viaducts carry city and water mains and electric conduits. The viaducts are paved with sheet and block asphalt. A feature of the viaduct design is the re-arrangement of Park-avenue, where separate tracks for mail, baggage, express, and cab traffic negate the vehicular congestion that characterized the old terminus, while the extension of Park-avenue has provided a new north and south thoroughfare of great value to the city, which will pass the heavy vehicular and traffic of Forty-second-street.

Steel Designs.

The steel structure supporting the roof over the suburban lines is designed not only to carry the main yard tracks, but also to support the ends of the cross-street viaducts, Park-avenue extension, and future buildings to the east of Park-avenue, those to the west being supported by independent columns.

The arrangement of the tracks of the suburban and express stations is not identical, the disposition of the columns varies at the two ends; consequently some of the columns carry structures over the main yard are supported by girders in the suburban station roof, a somewhat costly method of procedure rendered necessary by the paramount importance of track lay-out.

The suburban roof, forming the express station flooring, was designed for the following loading on each track—Two 142-ton engines,

followed or preceded by a uniform train load of 4,500 lb. per linear foot, or a special loading of 120,000 lb. equally distributed on two driving axles spaced 7 ft. centre to centre and followed by a uniform train load of 4,500 lb. per linear foot, commencing 5 ft. from the axle.

In designing the column footings the allowable bearing of steel on concrete for the live load was 250 lb. per square inch and for the dead load 500 lb. per square inch.

The building laws of the city of New York were followed in proportioning the structures for the support of loads from the columns intended to carry buildings. The floor loads from these proposed future buildings average about 1,800 lb. per square foot over the area of the suburban roof to be covered, and the average load from building walls is about 45,000 lb. per linear foot of the building wall.

Two types of construction were adopted in the design for the steelwork of the suburban roof, and which may be designated as longitudinal and transverse, corresponding to the direction of the girders forming the direct supports of the express level track. In general, the longitudinal construction has been used to the south of Forty-eighth-street, and the transverse construction to the north of that street.

To the south of Forty-eighth-street the columns in both stations are disposed in transverse lines normal to the axis of the yard, and spaced 20 ft. apart, except at the transverse streets, where the spacing varies to conform with the spacing of the viaduct columns, and their situation relative to the adjacent outer line of the building columns.

The general character of the construction is illustrated by the sections reproduced in Fig. 6.

All the steel construction is protected against fire. In most cases the girders are framed into the column shafts. The columns rest on grillage footings on solid rock, except in a few instances in Park-avenue, where the rock was at such a depth that caisson foundations were necessary.

In most cases where the building columns are supported on the transverse girders it has been necessary to provide twin transverse girders, as the loads to be carried are of such magnitude as to preclude the use of a single girder. Heavy I-beam grillages resting on the tops of the twin girders are used for distribution of the column loads. The maximum bending moment for each of the twin girders is 8,400,000 ft.-lb., the

maximum end shear being 704,000 lb. The greatest load transmitted by one of the columns to the transverse girders is about 1,800,000 lb.

The heavy girders spanning the suburban station have necessitated a considerable roof depth, the distance from the rail level in the express station to the underside of the fire casing on the transverse girders varying from 8 ft. to 10 ft. To the north of Forty-eighth-street the distances between the express and suburban tracks decrease, with a corresponding decrease in the depth of the roof, which is reduced to 4 ft. 6 in. at Fiftieth-street. In this latter type the concrete arches are carried directly by transverse plate girders of 20 ft. to 45 ft. span and spaced from 3 ft. 6 in. to 4 ft. 6 in. apart.

Along the east and west sides of the suburban station the ends of the transverse girders rest on the concrete retaining wall. Continuous longitudinal steel bents, composed of box girders framed into the columns, form the intermediate supports of the transverse beams, the ends of which rest on the top of the longitudinal girders, which are of the box type, having a depth of from 4 ft. to 5 ft. and a maximum span of 20 ft.

The entire suburban station roof is supported on heavy riveted columns of rectangular cross-section built up of plates and angles.

Drainage and Conduits.

The entire area of the terminus, with the exception of the three subways, is drained by gravity by a low-level sewer in Forty-sixth-street, connecting with an outfall into the river. The subways are drained by sumps, from which the water is delivered to the sewer by electrically-operated centrifugal pumps.

The tracks are drained by means of catch basins placed in the ballast or concrete, as the case may be.

A very complete system of hot and cold water, steam, compressed air, and vacuum cleaning pipes has been installed throughout the station and sidings. A complete fire-protection system is installed on both levels with nearly 300 hose reel connections at frequent intervals, and a fire-alarm system is provided with 125 boxes connecting with a central station from which the City Fire Department may be called if required to assist the railway fire brigade.

In addition to having duplicate lighting installations, 10 per cent. of all the lights are on an independent system, so that the station can never be left in total darkness.

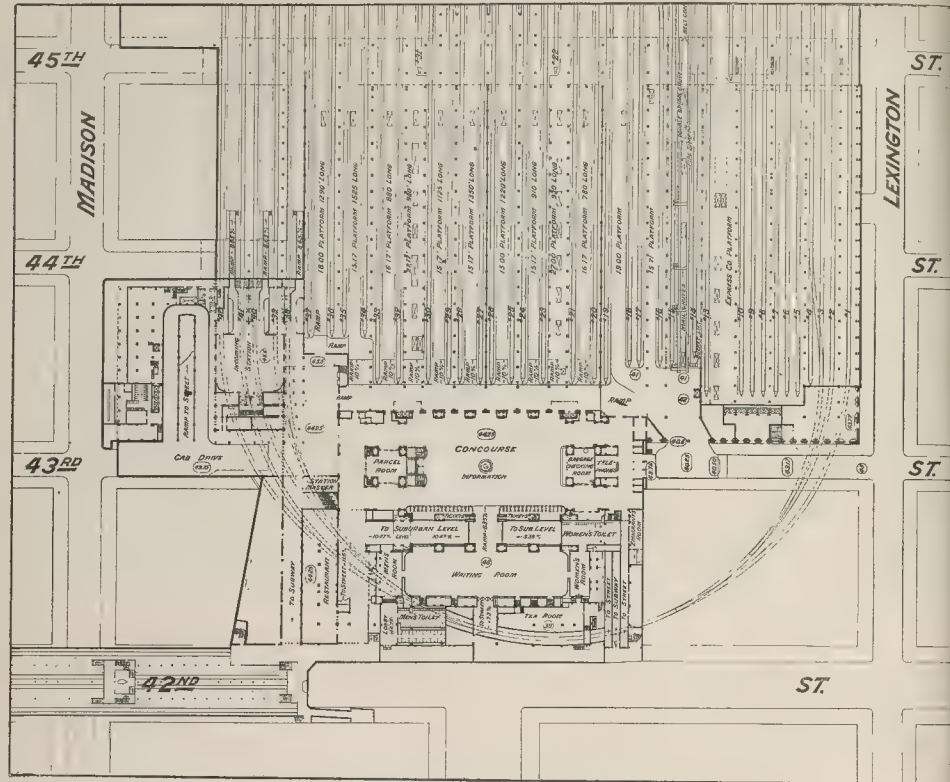

Fig. 5. New York Grand Central Station: Part Plan at Express Line Level.

Execution of the Works.

Before commencement of the works for the improvement of the Grand Central Station in 1903 all trains entered the terminus at Forty-second-street through the four-track masonry tunnel in Park-avenue, the southerly limit of which was at Fifty-sixth-street. Thence the tracks ascended about 17 ft. to Forty-ninth-street in a cutting and entered an open yard, remaining at street level until the station proper was reached. The yard was of irregular area, about two city blocks in width at the widest part by seven city blocks in length, and covered 23 acres of land. The establishment included 11.3 miles of tracks and various buildings used for passenger and freight traffic and other purposes.

To the north of Forty-ninth-street vehicular traffic was maintained on both sides of Park-avenue, the railway lines occupying only the middle of the street. Between Forty-ninth and Forty-second streets the tracks opened out into the terminal yard occupying the full width of Park-avenue. Vehicular traffic was carried across this yard by inclines, with a long-span tross bridge over Forty-eighth-street and a girder bridge over the cutting in Park-avenue between Fifty-first and Fifty-second streets. Foot bridges elevated above the street level and approached by stairs—with the exception of one at the east end of Forty-seventh-street, which had an incline approach—crossed the yard at Forty-sixth, Forty-seventh, and Forty-ninth streets, and the cutting at Fiftieth, Fifty-third, Fifty-fourth, and Fifty-fifth streets.

The conditions as then existing, quite apart from the nuisance caused by steam locomotives, were extremely unsatisfactory, not only for the railway company, but also from the standpoint of civic design.

The reconstruction scheme involved far more than the building of a new station, and included the numerous important operations enumerated below in the order in which they were undertaken.

The removal of all buildings; the rearrangement of the engine tracks at the Forty-seventh-street turntable; the moving of tanks and other conveniences in the rear of the New Haven engine-house; removal of car-cleaners' and supply quarters to the end of the tracks on Forty-fifth-street; transfer of Adams's Express business to Madison-avenue; the removal of milk traffic entirely outside the terminus; the closing of Park-avenue East and Park-avenue West to all but pedestrian traffic; the grading of Park-avenue West down to the level of the present tracks, followed by the laying of two new tracks on the surface prepared to compensate for the removal of the original easterly tracks along Park-avenue, which was used in conjunction with the new roadbed under Park-avenue East, or, in other words, widening the Park-avenue tunnel and throat of the yard between Fifty-sixth and Fifty-seventh streets on opposite sides alternately, and increasing the original four tracks to ten; excavation for the depressed yard between Park-avenue and Lexington-avenue was then made, and retaining walls and new tracks built within the area excavated; the station traffic having been transferred to these new tracks, excavation for the westerly portion of the depressed yard between Park and Madison avenues was commenced and is now under way; the excavation was followed by the construction of retaining walls, steelwork, the laying of tracks for regular service, and construction of the street viaducts for Park-avenue, and for the intersecting streets south of Fifty-seventh-street; the new station was then built, together with some of the buildings between cross streets over the areas occupied by tracks, and the temporary station is to be abandoned shortly.

The preliminary works comprised the removal and replacement of city sewers, gas and water mains, the removal of buildings on the site of the station-yard extension, the removal and rebuilding of some transverse bridges, and the rearrangement of switch and signal plant.

About 25 miles of sewers and pipes were removed or replaced, and about 10 miles of this work was completed before the general excavation was commenced. A new collecting sewer was built in Park-avenue from Forty-ninth to Fifty-fourth streets, intercepting the old sewers under nearly all the intervening streets and delivering their flow to a new 4-ft. 6-in. by 3-ft. sewer, built in tunnel across Park-avenue under the depressed tracks, and connected with the existing Third-avenue sewer. The drainage from other sewers intersecting the yard excavation was provided for by a new sewer from Madison-avenue and Forty-eighth-street to Lexington-avenue and Forty-second-street.

In September, 1903, excavation was commenced on the west side of Park-avenue along the wall of the old tunnel between Fiftieth and Fifty-seventh streets. This excavation was carried down at first only to the bottom of the tunnel, where two new tracks were laid in the excavated area and connected at both ends to the adjacent existing tracks, the construction of the new retaining walls involving the underpinning of adjacent buildings. As the excavation here and on the east side of Park-avenue extended across the entire width of that thoroughfare the foot pavements were supported over the excavation on temporary wooden trestles.

In 1904 work was commenced on the excavation of the east side of Park-avenue from Fiftieth to Fifty-seventh streets, where a trench wide enough for three new tracks was carried down to the final level. This excavation was in rock, dipping so steeply towards the west that it was necessary to build a heavy retaining wall outside and independent of the new tunnel wall, and to provide new footings for most of the buildings.

To provide for cross-overs in the tracks it was necessary to omit some of the columns and to support some of the side roofs in Park-avenue by longitudinal girders and trusses, those between Fifty-sixth and Fifty-seventh streets being 150 ft. long by 10 ft. high.

with six stiff-leg derricks operated by two engines. Screens were hung at the sides from the first platform level to protect passengers on the outer station platforms. The south face was boarded over, forming a false end for the station as soon as the staging had been moved to the south.

The material was prepared and framed together at the Harlem Works of the company, and portions ready for erection were brought into the station and erected at night up to the first floor level, the remainder being erected during the daytime after the members had been delivered and hoisted to the first floor level at night.

As the staging was moved south it was followed up with temporary wooden canopies, thus reducing exposure to a minimum. As soon as the staging had been moved to a new position two roof arches were blocked on it, and the corrugated-iron roofing, glass, skylights, and purlins were removed. The north of the two arches so supported was then cut into eight sections, which were then placed by derricks on the platforms of the staging, all this work being done during the daytime, while the material was loaded at night into wagons, on the passenger tracks under the staging.

The staging was moved by two 15-ton jacks on each platform, each being operated by two men. The work of moving was done in units of 40 ft., and it required at first about five hours and later two hours to move the staging for this distance.

The demolition of the north portal was the most delicate part of the whole operation on account of the necessity for cutting away all connections between the portal and the main roof before the work of demolition could be commenced. To facilitate this operation the north end of the staging was constructed with beams projecting 5 ft. beyond the face. These beams were passed through the window openings, or through openings out in the metal sheathing, and the entire portal was lashed to the staging. Timber troughs were constructed at the various platform levels so as to prevent loose material from falling on the tracks below.

Conclusion.

The new terminus, which has been under construction for several years, is now approaching completion, and represents an undertaking far greater than the mere building of a large railway station.

By depressing the tracks below street level and by the substitution of electric for steam traction a space equal to about twenty city blocks has been reclaimed for the erection of new buildings, all of which are to be designed in harmony with the general architectural scheme.

Thus the Grand Central Station reconstruction will not only be the source of a large revenue that will help to pay interest on the enormous outlay undertaken by the railway company, but will also constitute a great civic improvement in the heart of New York.

The works have been designed and executed under the direction of Mr. G. W. Kittredge, Chief Engineer to the New York Central and Hudson River Railroad Company. The buildings were designed by the associated architectural firms of Messrs Warren & Wetmore and Reed & Stem, and the steelwork was designed by Messrs Balcom & Darrow, civil engineers.

TEST DEFLECTIONS IN REINFORCED CONCRETE.

At the meeting of the Society of Engineers, held on the 2nd inst., Mr. Percy J. Waldram read a paper on "Test Deflections in Reinforced Concrete." The author selected this subject as being one which not only calls for the closer attention of engineers, but which also needs that closer attention without delay, before the proposed London County Council regulations fix a standard of deflection which may or may not be correct, or even safe.

The Relation of Stiffness to Strength.—The stiffness of a beam is no criterion of its strength, unless due regard be paid to the factors of depth and fibre stiffness; but it is not too easy always to appreciate that the fibres of a short deep girder, deflecting under load to, say, $\frac{1}{4}$ in., are possibly being punished much more severely than those of a long shallow girder deflecting, say, 3 in. Still more difficult is it to avoid the drawing of incorrect assumptions from the minute deflections of reinforced concrete

beams, because in their case not only are the formulae for strength very tedious, but the writers of text-books have failed to establish any connexion between them and deflection, and seldom even to show how deflection can be calculated at all.

Small Deflections in Reinforced Concrete Not a Proof of Strength.—When beams of reinforced concrete are tested to, say, one and a half times their working load extremely small deflections are recorded, which are triumphantly quoted as evidence of the enormous strength of the new material, because a steel beam of the same proportions would have deflected very much more under its ordinary working load.

A point which is seldom mentioned, however, is that the deflections are small because the greatest working loads and stresses which we dare to place on reinforced concrete are so very much less than those which we habitually work to in wood or steel.

Reinforced Concrete Weaker than Steel or Fir.—A deflection of, say, $\frac{1}{4}$ in. in an ordinary wood or steel floor beam under a test load might indicate quite a satisfactory factor of safety. The same deflection in a reinforced concrete beam of the same proportions would mean that the structure was on the verge of total collapse.

Reinforced concrete has so many advantages over wood and steel in its great durability, its adaptability, and its simple and monolithic character that there should be no need for its exponents to claim for it the strength of steel or even that of ordinary fir. It is a much weaker material than either, and to pretend to believe otherwise is to court disaster. The safe load on a fir beam can always be trusted to destroy a reinforced concrete beam of the same size unless the latter is heavily reinforced in compression.

It does not require much detailed investigation to appreciate that the fibre stress of 600 lb. per square inch, which is the limit of good concrete in compression in beams, obviously cannot produce deformations comparable with those which result from 11 or 12 cwt. per square inch on timber (quite a light loading) or $7\frac{1}{2}$ tons per square inch on steel.

Of course, concrete beams can be reinforced in compression, but the strength of the concrete surrounding the compressive reinforcement is still the governing factor, and double reinforcement is very uneconomical.

Reinforced concrete has the advantage of being easily formed with fixed ends, encastred edges, and into ribbed floors in which the transverse slabs assist the main beams, and the strength of each part contributes to that of one strong monolithic whole; but even with those advantages the proportions of the parts have to be more generous than would be necessary with wood or steel, and the deflections under test loadings are necessarily far less than we have been accustomed to in those materials.

Deflections of Beams under a Given Stress.—It should be carefully remembered that we can obtain the deflection of a beam of a given depth, span, and material under a given system of loading without troubling about its moment of inertia or its section modulus, or even the amount of the load, provided that we know that the loading is stressing the fibres to a given amount.

The formula expressing this is:—

$$\text{Deflection} = \Delta = \frac{p l^3}{E d}; p \text{ being a constant}$$

varying with the type of beam and the method of loading. For girders of uniform section under distributed load p is $\frac{w}{2}$. The term d is either the depth (in symmetrical sections) or (in unsymmetrical sections) twice the distance between the neutral axis and the layer of fibres stressed to the amount f (in pounds per square inch). E is the elastic modulus of the material.

Conversely, in all beams having the same proportion of depth to span any given proportion of deflection to span under the same system of loading must indicate the same fibre stress in material of the same stiffness, whatever may be the size of the beam, the span, or the load.

Reinforced concrete therefore must, always be expected to show deflections far less than those to which we are accustomed. Long before it deflects to anything like the extent that wood or steel does it would be time for those conducting the test to look to their own safety.

The London County Council Draft Regulations.—The draft regulations of the London

County Council specify certain degrees of deflection which would appear to need careful consideration, and it is hoped that discussion may elicit opinions as to whether they should be altered; and if so to what extent, and upon what lines. It is necessary not to lose sight of the fact that these regulations require the approval of the Local Government Board before they can come into force; and that until they are so approved it is the obvious duty of professional men to endeavour by all available means to bring them to a high state of efficiency. Their scope may be nominally limited to special buildings in London alone, but when once adopted they will most certainly be regarded as a standard, and their conditions will be specified in cases where they have no legal status whatever.

The Act of 1909 which authorises their compilation requires the Council, before applying for their approval by the Local Government Board, to give notice to the Surveyors' Institution, the Institution of Civil Engineers, the Royal Institute of British Architects, and the Concrete Institute. Every member of any of these Institutes can therefore approach his Council or the Local Government Board direct, if it should appear to him to be desirable that any of the 160 clauses should be altered.

The regulations in their present form appear to have been carefully compiled from codes already in existence in Europe and America, where reinforced concrete is far more extensively used than in England. At least one of these codes—that of the French Government—was based upon several years of valuable and exhaustive experimental research. It would therefore scarcely be expected that any serious errors of principle would have been generally adopted, and clauses upon which the foreign codes are unanimous, or are in general agreement, ought apparently to be good enough to adopt.

But precisely the same considerations obtained when other codes were drawn up. The natural desire of the codifying authority to be able to show precedents for its regulations is only too favourable to the perpetuation of errors, which acquire fresh status every time they appear. It would therefore certainly seem to be desirable that the Institutions should do all they can to awaken interest in these regulations and secure the greatest possible volume of criticism from their members; so that even if errors of principle may have crept into other codes they shall not be repeated in the first British code.

Early in the present year the author was consulted with reference to a case where the parties had agreed that the regulations as printed in the Council's minutes should be worked to. This opportunity of applying them to the problems of a somewhat complicated design necessitated a close examination of their provisions, and the result was, to say the least, disquieting.

For instance, the clauses determining the strength of columns—based, like the French code and the R.I.B.A. report, on a mistaken application of Euler's formula*—were unworkable; whilst those relating to deflection would appear to be positively dangerous.

Clause 23 allowed beams of a lesser depth than $\frac{1}{20}$ span provided the calculated deflection was less than $\frac{1}{160}$ span—regardless of the fact that even with absolutely free ends the concrete of a beam $\frac{1}{20}$ of the span in depth deflecting $\frac{1}{160}$ l would be stressed to nearly 700 lb. per square inch. Thus:

$$\Delta = \frac{p l^3}{E d}, \text{ and when } \Delta = \frac{l}{160} \text{ and } d = \frac{l}{20}, \text{ then}$$

$$f = \frac{24 \times E}{5 \times 600 \times 24} = 666 \text{ lb. per square inch.}$$

$$(E = 2,000,000 \text{ lb. per square inch.})$$

Whilst in beams with fixed ends it meant anything up to 3,330 lb. per square inch. As the clause did not specify whether test or working loads were to be calculated for it might have been merely, harmlessly unworkable, especially as there was no method specified for calculating the deflection of T and double reinforced beams.

But Clause 143 specified the test by means of which the District Surveyor should determine whether or not suspected work should be condemned as being a deflection of $\frac{1}{160}$ of the span under the full working load. A short deep beam with fixed ends or a thick square slab with four fixed edges was thus to show precisely the

* Vide Engineering, April 5, 1912.

degree of flexibility as a long shallow with absolutely free ends.

Of course, this was no test at all. No beam of ordinary proportions could ever show such a degree of deflection; it would simply not exist. A beam of only $\frac{1}{16}$ of its span span, even with absolutely free ends, over its section, is necessarily being loaded, when the deflection reaches $\frac{1}{16}$ of its span, to an extent which can only be resisted with a stress of 1,066 lb. per square inch on the concrete. The depth in the foregoing cases should strictly speaking be 2 in.; allowance must be made for the concrete in the span, which, although neglected, lowers the axis, so that 2 in. is generally more than all depth.

The amount of compressive reinforcement can vary any difference, because when that degree of deflection is reached the concrete surrounding the compression rods is receiving a stress under which it is liable to spall off and leave the beam denuded and free to buckle. If the beam is deeper or if the ends were fixed, as they are in the great majority of cases, the specified degree of deflection would be still more im-

possible. No beam, however bad or shaky, could be condemned under the clause so long as it held under test load any less deflection, and the following clause, which stipulates a 25 per cent. increase on the superimposed load, not only gave an implied official approval of a test deflection which would be very dangerous to everybody concerned, it would have effectually defeated its object by preventing the condemnation of any beam or floor which could just stand at one and a quarter times its calculated load without any factor of safety.

These and other points were submitted to the Council of the Surveyors' Institution, who promptly met and considered them and made recommendations which at the time of writing were presumably still under consideration.

Suggested Standard of Deflection Under Test

The author's suggestion made with regard to deflection was that the standard should be $\frac{1}{160}$ of the span on a beam $\frac{1}{16}$ of the span in length under the calculated load, with free and distributed loading; the effect of any points other than those being duly allowed for in each case. This would apparently have been equivalent to about 480 lb. per square inch on the concrete, but would only be reached in the case of beams. Of course, any test which involves only the superimposed load, as stipulated in Clause 144, varies in severity, being at one end on heavy beams and severe on light beams; a 25 per cent. increase on the total calculated load may or not be equivalent to a 25 per cent. increase on the superimposed load, but it is estimated to do so in the average case.

Effect of Ordinary End Fixing Not Yet Fully Mined

It would be obvious that a better standard criterion of deflection could be obtained by direct to the fixed ends customary reinforced concrete beams. But whereas it can predetermine the deflection of reinforced concrete beams with free ends and there are at present actual tests, experimental data lacking as to the actual effect of the ordinary ends of fixing the ends of such beams; it is a point that must be remembered, almost invariably doubly reinforced at the ends to the reverse bending moments over the supports, and are therefore of unequal stiffness, theoretical effect of complete end fixing and uniform section is to reduce the deflection to $\frac{1}{8}$; but to stipulate for a deflection $\frac{1}{160}$ of the span with fixed ends might be right or it might be wrong. We do not know.

Experiments to determine the point would be very expensive or difficult, and there is no authority under the parent Act for the Council to do them. But until the point is determined, it is approximately, it is obviously impossible to base on a basis about which we know practically nothing.

Importance of a Correct Standard.

If the end of stiffness be fixed too high good will be unjustly condemned; if it is too low and dangerous work will receive an undeserved certificate of strength. The minute difference of the deflections makes it all the more necessary to fix the standard with the greatest

THE CONCRETE INSTITUTE.

The twenty-ninth ordinary general meeting of the Concrete Institute took place at the offices on the 12th inst., the President, Mr. E. P. Wells, in the Chair. The discussion on Mr. Theobald's paper on "Experiments on Reinforced Concrete Work" was resumed, and the following took part in the discussion: Messrs. E. P. Wells, J.P.; Frederick Kingston, C. C. Workman, Member of Council, Concrete Institute; Moritz Kahn, Percival M. Fraser, John M. Theobald.

A paper was then read by Mr. W. Lawrence Gadd, F.I.C., M.C.I., on "Action of Acids, Oils and Fats upon Concrete." In the course of his remarks the author said:—

With regard to the mineral acids—*i.e.*, hydrochloric, nitric, and sulphuric acids—there is little to be said. Neither cement nor concrete will withstand the action of these acids, which decompose and dissolve the constituents of cement, even in dilute solution. Even a weak acid, like carbonic acid, has a distinct action upon cement, which, suspended in water, can be practically entirely carbonated by passing a current of carbon dioxide into it.

The action of organic acids, such as lactic and butyric acids, formed by the fermentation of milk or butter; tannic acid, occurring in tanning liquors; tartaric and citric acids, and acetic acid in vinegar or stale beer, is not so marked; but it is very probable that the whole of the series of higher fatty acids will be detrimental to concrete.

In most cases the action of the organic acids is confined to a combination with the calcium hydrate liberated when cement or concrete is gauged with water; but, as the organic lime-salt formed has no cohesive strength, the concrete must be deteriorated to a greater or less extent, depending upon the quantity of the acid and on its combining weight.

The tendency of organic acids to combine with carbonate of lime is much less than with hydrate of lime, and it follows that an acid which would be dangerous in contact with green concrete might be perfectly harmless in contact with old or indurated concrete. Thus, stale beer has a distinctly detrimental action upon new work, but once the concrete has indurated by exposure to air for some time, the acid of sour beer has little action upon it.

One of the commonest forms of acid action to which building material is subjected is that of sulphuric acid, derived by oxidation from the sulphurous gases present in the atmosphere of large towns. This is noticeable on Portland stone, of which many buildings in London are constructed. It appears to be less marked on concrete buildings, possibly for the reason that the surface pores of concrete become closed with a deposit of calcium sulphate, which affords protection from further action of the acid.

Lactic acid is produced by the fermentation of milk, brought about by the micro-organism *Bacterium lactis*, and is a possible acid to come in contact with concrete structures in farm buildings.

Concrete vaults would appear to be suitable for tanning operations, and the possible action of tannic acid becomes of importance. This acid, of which gallo-tannic acid ($C_{14}H_{10}O_8$) may be taken as a type, is again an organic acid which combines with calcium hydrate to form calcium tannate, but as the combining weight of tannic acid is high—sixteen parts by weight combining with only one part of calcium—the probable action is not very serious.

Proposals have of late been made, particularly on the other side of the Atlantic, to incorporate a certain small amount of oil or fat with concrete, with the object of giving the same dustless, waterproof, and other qualities. What we might almost call the natural instinct of the concrete-worker has, however, always led him to avoid oil or grease as far as possible, and he has been right. Whether we accept the crystallisation theory, or the colloidal theory of the setting of cement, the presence of oily matters must interfere with the process of setting, even assuming that the oil has no chemical action with the constituents of the cement. Furthermore, oil does not readily mix with water and has a tendency to collect in globules, which, however small, are a source of weakness to the concrete.

Many oils and fats react chemically with the cement constituents, and in this class must be placed the whole of the oils and fats of animal or vegetable origin.

These substances consist of the glycerides of various fatty acids, such as stearic, palmitic, and oleic acids, although the acids may be present in the free state, as, for instance, in palm oil, which may contain from 50 per cent. to 80 per cent. of free acids calculated as palmitic acid.

The glycerides of the fatty acids, which constitute the neutral oils and fats of animal or vegetable origin, are readily decomposed, or saponified, by certain metals and metallic salts, and by all alkalis, including calcium hydrate, which we know is a constant product in cement or concrete which has been gauged with water. The result of this saponification is the decomposition of the oil with the formation of a metallic or alkaline salt or soap, and the liberation of glycerin.

Thus, tallow is saponified by calcium hydrate, according to the following equation:—

Tristearin (tallow) + calcium hydrate = glycerin + calcium stearate (lime soap).

Calcium stearate is a whitish, friable material, insoluble in, and immiscible with water; whilst the lime soaps of other fatty acids commonly occurring in oils and fats are slimy and sticky substances which, although water repellents, do not, so far as my experiments show, render concrete less permeable to water, and decidedly reduce the tensile and crushing strength.

By this process of saponification, which takes place rapidly under the influence of heat and more slowly in the cold, cement or concrete will certainly be injured by the admixture of any animal or vegetable oil or fat; and if the concrete be green or new, there is some liability of damage being done to it by mere contact, such as might occur from constant drippings of oil upon it.

Mineral oils and greases, which are hydrocarbons, are of a different constitution from that of the animal and vegetable oils, and are incapable of saponification. They have, therefore, no injurious action from this particular cause, although they weaken the strength of concrete for physical or mechanical reasons.

The vegetable and saponifiable oils cottonseed and colza are absolutely destructive to concrete, and that the mineral oils, which are not saponifiable, reduce the strength very materially when mixed in small proportion with the mortar. It will be noticed that the strength at twelve months is less than at six months in the cases of cylinder oil (mineral), lard (animal), and colza oil (vegetable).

When testing samples of cement for tensile strength, which is commonly done now by users, I have observed that many operators use colza oil for the purpose of greasing the briquette moulds. The film of oil which remains, or should remain, on the moulds is, of course, very thin, but colza oil cannot be considered as suitable oil for the purpose, seeing that it has so great an action upon cement. Briquette moulds should be oiled with mineral oil, or a mixture of heavy mineral oil and paraffin.

It is to be noted that these slabs were not intended to be made absolutely water-tight, the object being to obtain a comparison. Leighton Buzzard sand was therefore used, and the results show that under identical conditions sand mortar without any addition of oil was more water-tight than with any of the oils or fats tried. The addition of lard, colza, and cottonseed oils to the extent of less than 2.5 per cent. on the weight of the concrete prevented the slabs from setting properly.

The conclusions I draw from theoretical and experimental data are:—

1. That the addition of oil or fat of any kind to concrete results in a weakening of the strength.
2. That animal and vegetable oils have a direct action on green concrete, and in time will bring about its destruction.
3. That indurated concrete is less liable to be attacked by oils and fats.
4. That oil-mixed concrete is not rendered more waterproof. The least permeable concrete is, in my opinion, a dense mortar in which the aggregate is properly graded to fill the voids.

The following took part in the discussion on this paper:—Messrs. E. P. Wells, J.P.; D. B. Butler, A. Alban, B. Scott, E. W. Vawdrey, B.A., Percival M. Fraser, W. V. Perkins, District Surveyor for Holborn; F. Kingston, G. C. Workman, W. Lawrence Gadd.

HEAT LOSSES FROM STEAM PIPES.

In a paper read by Professor Petavel and Dr. Lander before the British Association this year it was stated that experiments under normal conditions showed the loss of heat from 1 in. uncovered steam pipe to be 3 B.Th.U. per square foot per hour per degree of temperature difference. Of this total 15 per cent. was due to radiation, 4 per cent. to conduction, and 81 per cent. to convection.

It was found that the best insulating materials possessed some thirty times the conductivity of air, so that, were it not for their use in reducing convection, pipe coverings would actually increase instead of diminishing the loss of heat. If the insulation was very tightly packed, its efficiency was low owing to the increase in conductivity, while, on the other hand, if packed too loosely a large proportion of the convection would still continue. For this reason it appeared that for each class of insulation a certain density of packing was best.

For slag wool this was found to be one-fourteenth the actual density of the individual fibres. In that case the loss by conduction through the insulation to the air would be raised from 0.1 to 0.4 B.Th.U. per square foot per degree per hour; the loss by convection would be reduced from 3.2 to 0.1 B.Th.U. per square foot per degree per hour, the net loss being one-seventh of that with bare piping.

With bare pipes the character of the service had a distinct influence on the loss by radiation. With a good machined surface the loss by radiation was reduced from 15 per cent. to about 7 per cent. of the total loss, and if the piping were polished the radiation loss was still further reduced to about 3 per cent. of the total. The loss by convection was not, however, affected in any way, and, as this was the main proportion of the total loss, very little was to be gained by polishing.

Another factor to be considered was the diameter of the piping. With a small radius the conduction loss varied with the diameter of the pipe. It was, however, found that this increased loss by conduction only became important with pipes of less than $\frac{3}{4}$ in. in diameter. For pipes above 4 in. in diameter the loss was found to become nearly constant at 2 B.Th.U. per square foot per degree per hour irrespective of the diameter.

MANUFACTURE OF WATER-PROOF ARTIFICIAL MARBLE TILES.*

FACINGS of artificial marble are now very common, even in buildings of comparatively modest pretensions. The trouble is that durability is sometimes sacrificed to appearance, and the slabs are not only not proof against those accidents which will occur in modern buildings through leaky roofs, bursting water-pipes, overflowing bath-tubs, etc., but even hardly resistant to the careful house-cleaner's wet cloth. In the manufacture of slabs suitable for such uses there are required gypsum (plaster of Paris) and the requisite colouring matters—of course, mineral only; as, for instance, graphite (plumbago, black-lead), chrome-green, English red, iron oxide, red, yellow, and brown ochres, and ultramarine, all of which are unaffected by the gypsum or by each other. A separable frame is made, about 2 in. high, of planed $\frac{1}{2}$ -in. strips, and divided by a cross strip.

For small "tiles," say $4\frac{1}{2}$ in. by $4\frac{1}{2}$ in., there are needed several glass plates about 8 in. to 12 in. square, and the wooden frames are arranged so as to leave spaces of the size of the glass plates.

A solution of paraffin wax is made in benzene, in the proportions of 30 grammes to a litre (about $\frac{1}{2}$ lb. to an American gallon). This solution must be kept in a warm room in a tightly-corked bottle, and requires to be shaken at each time of using. One side of the wooden frame and the glass plate is to be well rubbed with the solution, and then dried thoroughly with a clean cloth.

On the work-table there is laid a mirror, face upwards; on this are laid two strips of wood; on the latter the glass plate and on this the mould. To prevent the glass plate from shifting, rubber rings should be laid between it and the wooden strips.

Next the colours are to be mixed. For

* Translated from an article by Fried. Huth.

green and black veining, chrome-green and graphite are used. Each colour is mixed to stiffness with a little water in a separate saucer. In a large vessel the gypsum and water are mixed to the consistency of thick cream.

The frame is half filled rapidly with the plaster, and at once a brush dipped in the graphite must be thrust through the mass to the glass, on which the pattern is to be traced—a matter of a few seconds only. The veining will be seen by reflection in the mirror below. If they are too thick in any one place, they may be lightened with the brush. If the consistency of the plaster and the colour be right, the two will run together properly. Then the green colour is applied in similar manner. In a few minutes the first layer will be hard enough to permit the frame to be filled to the edge with a mixture of sand and gypsum or sand and cement. If the slab is intended to be specially durable, wire gauze or cloth may be laid on the first layer, before the second is poured in, the ends of the wires being bent upwards. In a short time the frame may be removed to hasten the drying of the tiles. These must remain on the glass plates until thoroughly hard and dry, and care must be taken not to slide them on the plates.

The surface obtained is smooth, but not very highly polished, and is somewhat porous. The pores can be closed by amylocatate colloidum, which improves the polish and makes the tile waterproof. It resists both acids and alkalies, and the surfaces can be washed with water and chamois leather.

When the tiles are dry they should be slightly warmed and thoroughly waterproofed by immersion in a mixture of the above-named colloidum and a third of amylocatate, which will sink in to a depth of about a third of an inch. The tiles are then to be dried in a warm place, and finally painted with undiluted amylocatate colloidum.

Greater hardness may be obtained by adding to the gypsum a small quantity of ground pumice-stone or powdered glass, which gives the tiles a grain without damaging their appearance.

ENGINEERING NOTES.

The Los Angeles Aqueduct.

The great aqueduct now under construction for supplying the city of Los Angeles with water has the unprecedented length of 240 miles, including some 47 miles of tunnels and 193 miles of steel and reinforced concrete pipes. One of the most interesting features of the project is the construction of twenty-two inverted steel siphons for conveying water from the eastern side of the Sierra around the western boundary of the Mojave Desert, beneath the Sierra Madre range, and into the San Fernando Valley. These siphons range in length from 611 to 15,596 ft., and in diameter from 8 ft. 6 in. to 11 ft., the thickness of the metal ranging from $\frac{3}{4}$ in. to $1\frac{1}{2}$ in., according to the pressure. The aggregate length of the steel siphons is 49,576 ft., which, with concrete siphon approaches and siphons composed entirely of reinforced concrete, brings up the length of this class of construction to 63,585 ft. in all. The maximum head varies greatly, the lowest being 50 ft., while that of the siphon crossing the Jawbone Canyon amounts to 850 ft. This siphon will have a total length of 5,093 ft., the pipe ranging from 7 ft. 6 in. to 10 ft. in diameter. The longest siphon is that by which the water will be carried across the upper end of the Antelope Valley on the Sierra Madre range. This siphon at its northern end consists of a concrete pipe 10 ft. in diameter, designed for the head of 75 ft.; 15,596 ft. of steel pipe 10 ft. in diameter, constructed for a head of 200 ft.; and 3,414 ft. of 10 ft. diameter concrete pipe at the southern end, for a head of 75 ft. It is hoped that the aqueduct will be completed during the early months of next year, the total cost of the work being about five millions sterling.

The Young Engineer.

At a meeting of the Junior Institution of Engineers on the 11th inst. the President, Sir A. Trevor Dawson, delivered an address on "Staff Officers in Industrial Works: Their Scientific and Practical Training and Duties," in the course of which he said that the demand now was for well-trained youths having experience of materials, mechanical methods, and men. Experience was a dominant

consideration. This could not be too forcibly emphasised, for young men were at times prone to seek advancement without carefully considering whether that which looked like advancement would conduce to the winning of the experience so invaluable in future work. He was a wise youth who, when he could afford it, accepted experience as part of his remuneration. There was a national need for much more highly-trained engineers—men combining scientific and practical knowledge, and having experience of materials, mechanical methods, and men to serve on the staff of works. The most difficult of all problems which beset the young engineer was the management of men. There were certain occupations in which a man could design and complete his work himself. The painter, the *littérateur*, the musician could labour in solitude, and their products were the fruit of their own brains. But with the staff officer the case was quite different. He had largely to see through other persons' eyes, to hear through their ears, and to act through their hands. The day was not long enough for him to take personal cognisance of everything for which he was responsible. He must act to a great extent through subordinates. When they served him well he got the credit, and when they served him ill he bore the blame. It was therefore of immense importance to him and his firm that he should, in the first place, select his assistants with skill, and, in the second, imbue them with a spirit of loyalty. Nothing conduced more to good service than the knowledge among the rank and file that the chief could take any job out of their hands and do it as well as or better than themselves. Our great technical institutions in the metropolis and provincial cities were not excelled in any country in the world, and it was creditable also that our great City Companies and many private endowments had assisted many less-favoured in the "world's goods" to prosecute their engineering studies at such institutions. Yet the results had proved unsatisfactory, alike from the point of view of the student and the nation. The absence of practical training, of early contact with the workshop, deprived those students in most cases of an indispensable part of their preparation for future industrial work, and interfered with their finding a suitable position after their college course had been completed. Was it too much to expect that, as there was great national need, the State should extend its educational system so as to enable the best youth to enter upon a combined practical and theoretical training for the greatest of manufacturing industries, without requiring great sacrifices on the part of parents who might be unable to support their sons throughout the prolonged period of training?

Bridging the Mersey.

Mr. L. H. CHASE, M.Inst.C.E., lectured on the 18th inst. before the Liverpool Engineering Society on his schemes for bridging the Mersey between Liverpool, Birkenhead, and Seacombe. Instead of making the approaches extend over a distance of 1 mile from each side of the river, Mr. Chase proposes a spiral roadway up which motors and trams would run by their own power to the level of the bridge, some 200 ft. above the high water level of the River Mersey, and thus clear of such vessel as the *Mauveletina*. The spiral roadway was to be built in reinforced concrete, and would look not unlike the Roman Colosseum. The bridge would be of the suspension type and its span of 2,700 ft. would make it the largest span in the world. The main towers would be placed near the Prince's Landing Stage on the Cheshire side, and would be 500 ft. high. The total cost, exclusive of land and legal expenses, was estimated at about £25,000. Mr. Chase also mentioned a new design for dealing with passenger traffic only on a similar bridge.

The Largest Testing Machine in the World.

The 10,000,000-lb. testing machine designed by Mr. Timius Olsen, of Philadelphia, for the Structural Materials Testing Laboratory of the U.S. Geological Survey, at Pittsburg, was shown in operation during the Congress of the International Association for Testing Materials, when a 4-ft. square brick column, 12 ft. high, was tested to destruction under a load of 6,580,000 lb. The machine was designed to test 60-ft. columns vertically, and it can also be applied for testing slabs and beams of large dimensions. As at present erected, however, the machine is not available for testing columns more than 25 ft. in length.

THE BUILDING TRADE.

THE TRADE UNION BILL.—III.

IN our last notice of the proceedings in Committee relating to this Bill we referred to the amendment, which was lost, but the rules provided by Clause 3 should be statutory force so that if they were infringed some remedy might be given to members to secure the observance of the rule. The clause, it stands, affords the minority little protection, as we showed in our article of November 15.

A number of sittings have been occupied with the discussion of the subclauses to this clause. By subclause (a) the funds of a union are only to be applied to such political objects as are approved by a resolution passed on a ballot by the members "by a majority of the members voting." It has always been contended that this subclause does not provide for the real expression of the opinion of the members of a union, and amendments were moved providing (1) that the political objects must be approved by a majority of the members of the union, or (2) that at least two-thirds of the members voting in the United Kingdom must vote on the resolution. Both these amendments were rejected after some considerable discussion. If the political objects to which the funds are to be devoted can be determined as the Bill now stands, by a majority of the members voting, the exemption of those who are unwilling to contribute becomes increasingly important, but all amendments to subclause (c) were negatived, and the clause stands as in the Bill. According to this clause members not wishing to contribute to the political objects are to be placed under no disability, but, as we have shown in our previous articles, if a man is placed under no disability no remedy is open to him. Subclause (2) of Clause 3 defines the political objects. This clause was passed, save that the members of the union were reintroduced into the maintenance of Members of Parliament. These words were in the Bill when it was introduced last year, but were omitted when payment was granted to Members of Parliament. It was suggested that this might not be a permanent condition, as the State payment of Members of Parliament was only granted by a clause in the Budget, and was therefore subject to review at the end of the financial year, thus the words were reintroduced. Clause 4 deals with the ballot which has to be taken in accordance with any rules made by the union for the purpose, and in the Registrar of Friendly Societies shall not approve any rules unless he is satisfied that every member has an equal right of voting, and that the secrecy of the ballot is properly secured. In the motion of the Attorney-General a provision was conditionally inserted that every member should have, "if reasonably possible, fair opportunity of voting."

Clause 5, which requires a circular to be sent to the members of a union on the passing of a resolution adopting political objects, acquainting them with their right to exemption from contribution, was amended on the motion of the Attorney-General, substituting for the circular "notice" to be given, the latter part of the clause being re-drafted. It will be seen at the Bill leaves the Committee (for they have concluded their labours) very much in its original form and, if anything, less favourable to the rights of minorities.

We have shown that the Bill affords no real protection to those who, compelled to join a union in order to obtain work, do not wish to forward the political propaganda selected by a majority; the rules inserted by way of protection are a dead letter since there is no appeal to the Courts or elsewhere, the ballot is satisfactory, and the position of those who defy the union that they decline to contribute to the political objects is very precarious.

The only real concession made in the interest of the dissenting minority in the unions was a promise made by the Attorney-General that he would consider whether the Registrar of Friendly Societies should be empowered to settle disputes between members of a union about small sums. Apart from the effect the Bill may have upon unions and their members, there remains a question of the greatest interest to the public, especially since the recent decision in the House

of Lords in *Vacher's* case (see the *Builder*, November 29 last). The Trades Disputes Act enables a trade union to commit any tort against the public or anyone else without being held liable in any court of law. Is this immunity to be extended to their political powers and activities? Are the public to be placed entirely at the mercy of the unions at election times, with no civil redress for head-smashing, window-smashing, defamation of character, or any other tortious act? A new clause, confining the protection of sect. 4 to the existing powers of trade unions was rejected by the Committee without a division, and the public are to be left without redress.

EDINBURGH, LEITH, AND DISTRICT BUILDING TRADES ASSOCIATION.

IN Ferguson & Forrester's Restaurant, Princes-street, on the 11th inst., the annual dinner of the Edinburgh, Leith, and District Building Trades Association was held. Ex-Ballie Forrest presided.

Mr. Malcolm Stewart, of the Glasgow and West of Scotland Building Trades Council, proposed the toast of the Association.

The Chairman, in reply, said their relations with the employees during the year had been harmonious and cordial. Referring to the Insurance Act, which he characterised as a source of annoyance and irritation all round, the Chairman said that as it had become law it was their duty to make the Act work as smoothly as possible. They had passed through a prolonged depression of trade, and they naturally were asking the reason of the long-continued depression. He personally was convinced that recent legislation had done the greatest part of the damage. No trade had been so heavily hit as theirs. Confidence in heritable property had been destroyed, but he was convinced that they were round the corner. No houses were being built, but the population must be increasing to some extent. There had been a considerable amount of contract work in the city during the year, and with increased trade that work should be more plentiful.

Mr. A. D. Angus proposed "The Corporations of Edinburgh and Leith," and said that builders could not keep in too close touch with those bodies.

Councillor Cameron said a great industry like that which they stood for ought to be directly represented in the Council.

Baillie Pennell, Leith, also replied.

GOVERNMENT CONTRACTS.

The following tenders have been accepted during the past month by the Government Departments named:—*Admiralty, Works Department:* Portland cement for Peterhead Harbour of Refuge Works—Woolldham Cement Company, 35, Great St. Helen's, E.C.; works services: redecoration of end and erection of sewage lift tower at Fort Cumberland, R.M. Barracks, Eastney—Mr. S. Salter, York-street, Southsea; shed for loaded powder trucks, H.M. Dockyard, Chatham—Messrs. West Brothers, Rochester. *War Office:* Works services: alterations to boundary wall, etc., Duke of York's Headquarters, Chelsea—Messrs. Bovis Ltd., Upper Berkeley-street, W.; erection of abattoir, Curragh Camp—Mr. J. Murphy, Ardville, Blackrock-road, Cork; erection of barracks block, Hilsa—South-Western Building and Slean Joinery Company, Ltd., Gosport; erection of officers' quarters, Quebec Barracks, Bordon—Messrs. Martin, Wells, & Co., Ltd., Victoria-road, Aldershot; erection of sanitary annexes to married quarters at Birm.—Mr. J. Hickey, Birm.; erection of sanitary annexes to married quarters at Northampton—Messrs. E. Archer & Sons, Ltd., Northampton; erection of sanitary annexes to married quarters at Paisley—Messrs. J. Paterson & Sons, Ltd., 610, Pollokshaws-road, Glasgow; erection of small arms ammunition store, shelter shed, etc., Rainham Rifle Range—Messrs. Pavitt Brothers, Aveley, Purfleet; installation of electric light, etc., Old College, Sandhurst—Mr. V. G. Middleton, Broadway-chambers, Westminster, S.W.; installation of heating apparatus at New Cavalry Barracks,

Redford—Messrs. E. Doane & Boal, Ltd., 3, Monument-street, E.C.; Old College, Sandhurst—Messrs. E. Doane & Boal, Ltd., 3, Monument-street, E.C.; School of Aviation, Salisbury Plain—Messrs. Strode & Co., 45, Osnaburgh-street, N.W.; overhead conductors and supports for electricity supply, Tidworth and Bulford—British Insulated and Helsby Cables, Ltd., Prescott, Lancs.; provision of gymnasium, forage barn, etc., Horfield Barracks, Bristol—Messrs. E. Walters & Son, St. Andrew's-road, Montpellier, Bristol; repairs and maintenance of War Department buildings at Lichfield—Messrs. T. Lowe & Sons, Curzon-street, Burton-on-Trent; Netley—Mr. H. G. Ross, Station-road, Netley; Purfleet—Messrs. Pavitt Brothers, Aveley, Purfleet; Warrington—Mr. J. P. Booth, 3, Fore-street, Warrington; revision of foul drainage, Sheerness—Messrs. T. Wood & Sons, Ltd., Cruckhill, Swanley; supply and erection of cooking apparatus, Old College, Sandhurst—Falkirk Iron Company, Ltd., Craven House, Kingswood, W.C.; *Crown Agents for the Colonies:* Steel bridge-work—Messrs. J. Butler & Co., Ltd., Stanningley Ironworks, near Leeds; Horsehay Company, Ltd., Tipton, Staffs.; cement—Associated Portland Cement Manufacturers, Ltd., 3, Lloyds-avenue, E.C.; British Portland Cement Manufacturers, Ltd., 4, Lloyds-avenue, E.C.; Messrs. Martin, Earl & Co., Ltd., 139, Queen Victoria-street, E.C.; Wouldham Cement Company, Ltd., 35, Great St. Helen's, E.C.; sanitary pipes—Messrs. George Jennings, Ltd., Lambeth Palace-road, S.E.; *Office of Works:* Builders' work: erection of ballroom, Cairo Consulate—Messrs. Cossena & Biorioti, Cairo; new post-office, Dover—Messrs. Ellis Brothers, New Romney, Kent; erection of Edinburgh Labour Exchange—Messrs. H. Miller & Sons, Millar-place, Edinburgh; extension of Grimsby Telephone Exchange—Mr. P. T. Kettlewell, 60, Trinity-street, Hull; extension of women's cloakroom, Hampton Court Palace—Messrs. Pasterfield & English, 27, High-street, Collier's Wood, S.W.; alterations, Leicester Land Revenue Office—Messrs. H. Herbert & Sons, 33, Millstone-lane, Leicester; erection of new telephone exchange, Purley—Messrs. H. & G. Taylor, Hayes-lane, Reckenhall; alterations, Reading Labour Exchange—Messrs. Alley & Co., 115, Oxford-street, Reading; ordinary works and repairs at Smethwick—Messrs. J. Barnsley & Sons, 102, Ryland street, Birmingham. *General Post Office:* Laying lines of pipes, Edinburgh—Mr. T. Spencer, 13, Cathcart-place, Edinburgh; laying lines of Sykes' ducts, London-Canterbury (sect. 3)—Mr. W. Dobson, Yeaman-lane, Dundee-street, Edinburgh; London-Cventry-Birmingham (sect. 5)—Mr. W. Dobson, Yeaman-lane, Dundee-street, Edinburgh; laying lines of Sykes' ducts and pipes, London-Weybridge-Guildford (sect. 2)—Messrs. Greig & Matthews, 35, Queen Victoria-street, E.C.; Coudson Redhill-London—Messrs. Greig & Matthews, 35, Queen Victoria-street, E.C.; Finchley-Barnet (sect. 2)—Messrs. Greig & Matthews, 35, Queen Victoria-street, E.C.; Dundee—Mr. David Horsburgh, 65, Trades-lane, Dundee; laying lines of ducts, Bishops-gate-street, E.C.—Messrs. Airds, Ltd., 22, Queen Anne's-gate, S.W. *Metropolitan Police:* Erection of a new police-station at South Fulham—Messrs. J. Garlick Ltd., 43, Sloane-street S.W.; erection of a new police-station at Tottenham—Mr. G. R. Rowley, 278, Philip-lane, West Green, Tottenham; general repairs at Metropolitan Police buildings—Messrs. Holand & Hamen, Hyde-street, Bloomsbury, W.C. *Commissioners of Public Works, Ireland:* Building works: erection of Blacklun National School, Co. Kerry—Mr. P. T. Kennedy, Moyderwell, Tralee, Co. Kerry; alterations to mechanical engineering laboratory, Royal College of Science, and erection of new public offices, Upper Merrion street, Dublin—Messrs. McLaughlin & Harvey, Ltd., Dartmouth-road, Dublin; erection of St. Joseph's, Kilsasser National School, Co. Mayo—Mr. W. Killackey, Kilsasser, Co. Mayo; erection of St. Patrick's, Coagh, National School, Co. Tyrone—Messrs. Currie Brothers, Castlecaulfield, Co. Tyrone.

COUNCIL SCHOOL, NEWBOTTLE.

A new Council school has been erected at Newbottle at a cost of about 2,984, from the designs of Mr. Rushworth, the County Architect. The building provides accommodation for 260 boys, and the work was executed by Mr. White, contractor, of Sunderland.

GENERAL BUILDING NEWS.

DRILL HALL, PERTH.

Mr. G. P. K. Young, A.R.I.B.A., is the architect for the new Territorial drill hall which has been erected in Perth. The new buildings have been erected as additions to the old Volunteer drill hall in Tavistreet, and include lecture, recreation, officers', and general rooms. The contractors were:—Masons, Messrs. Beat Brothers, Perth; joiners, Messrs. D. S. & J. Anderson, Perth; plumbers, Messrs. Frew & Co., Perth; plasterer, Mr. D. McNair, Falkirk; slaters, Messrs. J. Buchan & Son, Perth; glaziers, Messrs. J. Coutts & Co., Edinburgh; steelwork, Mr. D. McGregor, Perth; heating, Messrs. Taylor & Fraser, Glasgow; and painter-work, Mr. H. MacKay, Perth.

NEW JETTY AT TILBURY.

The Port of London Authority has accepted the tender of Messrs. Perry & Co., amounting to 105,466*l.*, for constructing a deep-water river-side jetty at Tilbury. The jetty will be 1,000 ft. long and 50 ft. wide, will have railway connections, and be equipped with the most modern type of cranes for the rapid handling of cargo.

NEW HOSPITAL, CLAPHAM.

It is stated that an anonymous gift of 25,000*l.* has been made for hospital purposes in Lorton, including a site at Clapham Common, and it is proposed to erect a hospital for women there at the cost of 25,000*l.*

CHURCH OF THE ANNUNCIATION, W.

The name of the builder of this church, illustrated in our issue of December 13, was given as Mr. F. T. Chisholm, of Kensal Green; this should have been Messrs. Chisholm & Co., of the same address.

TRADE NEWS.

The Cherry Tree Machine Company, Ltd., laundry engineers, Blackburn, inform us that they have in hand, for the Western Hospital of the Metropolitan Asylums Board, the contract for the supply of two new "Manchester" metal-washing machines of 350 shirt capacity each, with elevated back gearings, and cage divided in two compartments: the same contract also includes one of their 100-in. by 24-in. "Manchester" Decoudon ironing machines, with two-speed gearing, automatic safety finger guard, etc.

Ronuk, Ltd., the proprietors of Ronuk sanitary polish, have received a Royal Warrant of Appointment to her Majesty Queen Alexandra.

Under the direction of Mr. George H. Farley, architect, Banbury, the "Boyle" system of ventilation (natural), embracing Boyle's latest patent "air-pump" ventilators and air inlets, has been applied to the Wesleyan Chapel, Gimsbury.

Messrs. E. H. Shortland & Brother, Ltd., of Failsforth, Manchester, have received repeat order to supply their double-fronted patent Manchester stoves with descending smoke flues to the Napier-Hill, New Zealand.

APPLICATIONS UNDER LONDON BUILDING ACTS, 1894 to 1909.

At the last meeting of the London County Council the following applications under the London Building Acts were dealt with. (The names of the applicants are given in parentheses):—

Width of Way.

Finsbury, East.—Buildings upon a site abutting upon Dingley-road and Nelson-passage, Finsbury, with a portion of such building next to Nelson passage upon land not previously built upon and at less than the prescribed distance from the centre of such passage (Messrs. Vets, Sturdy, & Usher for Messrs. T. Wallis & Co., Ltd.).—Refused.

Greenwich.—One-story building on the northern side of Wood Wharf, Greenwich (the London Electric Supply Corporation, Ltd.).—Consent.

Southwark, West.—Erection of a building on the southern side of Friar-street, Southwark (Mr. J. F. Wetherell).—Consent.

Westminster.—Re-erection of No. 69, Catherine-street and No. 6, Wilfred-street, Westminster (Mr. G. J. Cawthorne for Miss J. Beckley).—Consent.

Width of Way and Lines of Frontage.

Paddington, North.—Projecting steps at No. 9, Blomfield-mews, Paddington (Messrs. Norman & Burt).—Consent.

St. George, Hanover-square.—Projecting illuminated sign at No. 5, Mill-street, Hanover-

square (Messrs. Freeman & Co. for the Bodega Company, Ltd.).—Consent.

Width of Way and Construction.

Deptford.—Temporary wood and iron building on land abutting upon Trundley-road. Deptford (Mr. B. Cloke).—Refused.

Kensington, North.—Erection of a temporary steel and iron building on the eastern side of Old Court-place, Kensington (Messrs. J. Barker & Co., Ltd.).—Consent.

Limehouse.—Wood and iron building on the western side of Carr-street, Limehouse, in front of railway arch No. 640 (Messrs. A. Hapson & Co.).—Consent.

Paddington, South.—Temporary wood and iron covered way at the rear of Nos. 40, 42, and 44, Westbourne-grove, Paddington (Mr. W. Hanney).—Consent.

Lines of Frontage and Space at Rear.

Paddington, South.—One-story building at the rear of No. 154, Westbourne-grove, Paddington (Mr. G. A. Sexton for Mr. A. Woollard).—Consent.

Formation of Streets.

Greenwich.—Formation or laying-out of a new street for carriage traffic between Airy-street and South-crescent, Greenwich, in connection with the erection of houses (Mr. J. S. Gilberth for the Governors of the Roan School Foundation).—Consent.

Kensington, North.—Formation or laying out of a new street for carriage traffic to lead from Dalgarno-gardens to Barby-road, Kensington, and a new street to lead from such proposed street to Highlever-road (Messrs. P. & H. W. Carey).—Consent.

Newington, West.—Formation or laying out of a new street for carriage traffic in continuation of Ambergate-street, Kennington (Messrs. Briant & Son).—Refused.

Wandsworth.—Three proposed new streets for carriage traffic upon a site on the eastern side of Valley-road, Streatham (Messrs. P. Anson & Son).—Consent.

Wandsworth.—Retention of barriers across Broadwater-road and Khama-street, Garratt-lane, Tooting (Messrs. Grundy, Izod, & Co.).—Consent.

Wandsworth.—Formation or laying-out of a new street for carriage traffic to lead from Garratt-lane to Steerforth-street, Wandsworth (Mr. J. Wise).—Consent.

PROJECTED NEW BUILDINGS IN THE PROVINCES.*

ABERGAVENNY.—Eisteddfod Pavilion (1,295*l.*); Mr. B. J. Francis, architect, Linden House, Abergavenny; Messrs. Foster & Hill, builders, Abergavenny.

Accrington.—Weaving shed as technical school (2,000*l.*); Mr. H. Littler, architect, 16, Ribblesdale-place, Preston.

Airdrie.—Proposed extension of County Buildings; Mr. James Rennie, County Surveyor, Sandyhill, Shettleston, N.B.

Alloa.—Extensions to bakery, Mar-place (1,500*l.*), for the Alloa Co-operative Society.

Altrincham.—Hospital; Mr. F. B. Dunkerley, architect, 17, St. Anne's-square, Manchester.

Arbroath.—Proposed public baths (7,000*l.*); Mr. P. C. Smith, Surveyor, Burgh Hall, Arbroath.

Ashton-upon-Mersey.—Conveniences, shelter, etc.; Mr. A. Cardingby, builder, Mersey-road, Ashton.

Barnard Castle.—Hall and rifle range; Messrs. Wright & Chapman, architects, 23, Grainger-street, Newcastle; Messrs. Wilson & Sons, builders, 1, Victoria-street, Barnard Castle.

Barnstaple.—Swimming-bath (3,000*l.*); Mr. E. Y. Saunders, Surveyor, Town Hall, Barnstaple.

Bearpark (Durham).—School (3,000*l.*); Messrs. Clark & Moscrop, architects, Feethams, Darlington; Mr. R. Southern, builder, Dipton, Durham.

Benfieldside.—Picture hall (3,000*l.*); Mr. J. Eltringham, architect, Derwent-street, Blackhill.

Berwick.—Proposed remodelling of workhouse (3,900*l.*); Mr. H. R. Peters, Clerk, Guardians' Offices, Berwick.

Bingley.—Theatre (5,000*l.*); Messrs. J. B. Bailey & Son, architects, Scott-street, Keshley.

Bishop Auckland.—Hospital, Tindale-crescent (3,200*l.*); Mr. R. B. Thompson, architect.

* See also our list of Competitions, Contracts etc., on another page.

Market-place, Bishop Auckland.—Messrs. Hope & Son, builders, Coundon, Bishop Auckland. Additions at B. and S. Hospital, Helmington-row (3,000*l.*); Mr. R. B. Thompson, architect, Market-place, Bishop Auckland; Mr. T. Manners, builder, Peel-street, Bishop Auckland.

Blackpool.—School, Devonshire road District; Mr. F. G. Plant, Education Offices, Blackpool. Wesleyan Sunday-schools (2,750*l.*); Messrs. W. E. Potts, Son, & Hennings, architects, Victoria-street, Manchester.

Blackwood.—Hall; Messrs. H. & D. Barclay, architects, 295, St. Vincent-street, Glasgow.

Bolton.—Central hall for Lancs. Miners' Federation (6,000*l.*); Messrs. Bradshaw & Gas, architects, 19, Silverwell-street, Bolton.

Botwell.—Factory for Sandow's Cocoa and Chocolate Company, Ltd., Elephant and Castle, S.E.

Bournemouth.—Additions to printing works for the Richmond-hill Printing Works Company, Ltd.

Bovey Tracey.—Sanatorium, Hawkmoor Estate; Mr. E. H. Harbottle, County Architect, Exeter.

Bridlington.—Residence (1,950*l.*); Messrs. W. J. Walker & Son, builders, Lowgate, Hull.

Brighton.—Proposed alterations to old workhouse and new infirmaries (1,710*l.*); Mr. B. Burfield, Clerk, Guardians' Offices, Brighton.

Bromsgrove.—Proposed children's home; Mr. H. D. Holloway, Clerk, Guardians' Offices, Bromsgrove.

Burnley.—Additions at Town Hall; Mr. G. H. Fieles, Engineer, Town Hall, Burnley. Schools, Padham-lane (8,000*l.*) and Burnley-lane (8,000*l.*); Mr. H. Littler, architect, 16, Ribblesdale-place, Preston.

Burton-on-Trent.—Children's home, near Belvedere-road; Mr. C. F. Chamberlain, Guardians' Offices, Burton.

Bury.—Police courts, stations, etc. Tenterden-street (about 15,000*l.*); Mr. W. H. Schofield, Surveyor, County Offices, Preston.

Byers Green.—School (5,000*l.*); Mr. H. A. Curry, architect, 3, Biggmarket, Newcastle; Mr. T. Douglas, builder, Close House, Bishop Auckland.

Cannock (near Speechhouse).—Proposed 100 houses; Mr. P. Phipps, Rural District Council Offices, West Dean.

Chard.—Isolation hospital; Mr. C. O. Baines, Surveyor, Urban District Council Offices, Taunton.

Church Gresley.—Drill hall for the Derbyshire Territorial Association.

Cimla.—Proposed conversion of infectious diseases hospital into sanatorium; Mr. W. E. Thomas, Surveyor, Rural District Council Offices, Neath.

Clayton le Moors.—Church, Atlas-street; Vicar, St. James's Church, Clayton.

Colwyn Bay.—Additions to Royal Hotel for Messrs. Worthington & Co., Ltd., brewers, Burton-on-Trent. Proposed shelters and conveniences; Mr. W. Jones, Surveyor, Urban District Council Offices, Colwyn Bay.

Cottingham (Hull).—Picture theatre, Hallgate; Mr. J. H. Wright, Hallgate, Cottingham.

Coupar Angus.—Garage, Union-street, for Messrs. C. Gardiner & Co.

Croyde.—Proposed drill hall for the Croyde and Georgeham Territorials.

Denny.—Proposed library; Mr. A. G. Merriles, Surveyor, Town Hall, Denny.

Devonport.—Municipal buildings (70,000*l.*); Mr. J. F. Burns, Surveyor, Town Hall, Devonport.

Dinnington.—Additions to Wesleyan Methodist Church for the Trustees.

Drumblade.—Cookery, laundry, and manual work buildings; Mr. W. L. Duncan, Hall Hill House, Turf.

Dukinfield.—Church school, King-street; Vicar, St. Luke's Church, Dukinfield.

Dundee.—Alterations to premises, West Henderson's Wynd, for Messrs. A. Thomson & Sons, wastepaper merchants.

East Cowes.—Additions to premises, for Messrs. S. E. Saunders & Co., motor-boat builders.

Faith.—Weaving shed for the Spodden Manufacturing Company, Ltd., cotton goods manufacturers, Spodden Mill, Fagit.

Fogginton.—School, between Morrville and Rundlestone-cross; Mr. P. Morris, architect, 1, Richmond-road, Exeter.

Ford.—Tuberculosis pavilion and alterations and additions to isolation hospital (7,978*l.*); Messrs. J. & T. Parker, builders, Commercial-road, Sunderland.

Gee Cross (Hyde).—Additions to works, Wych Fold, for the Werneth Rubber Company, Ltd., indiarubber goods manufacturers, Glasgow. Two houses, Springburn-road, Bishopsbriggs; Mr. W. Nimmo, builder, Netherhall, Bishopsbriggs, Glasgow.

Great Yarmouth.—Plans have been passed for four houses in Victoria-street for Mr. F. P. H. and for four houses in Suffolk road, Weston, for Mr. R. G. Wales.

Griff.—Engine-house (672 $\frac{1}{2}$); Messrs. G. E. W. Wingo, builders, 12, Church-street, Great Yarmouth.

Hatherden.—Ten Houses; Messrs. Boale & sons, builders, 1, London-street, Andover.

Heywood.—Additions at Perseverance Mill the Haywood Cotton Spinning Company, Ltd.

Hindolvestone (Norfolk).—Church (1,590 $\frac{1}{2}$); H. J. Green, architect, 31, Castle-meadow, Norwich.

Horsham.—Two schools, New-street; Architect, West Sussex Education Offices, Horsham.

Hunstanton.—Shelters on esplanade (720 $\frac{1}{2}$); Messrs. F. Southgate, builder, Hunstanton.

Hunstanton.—Mr. J. C. Walker, Surveyor, Town Hall, Hunstanton.

Hyde.—Additions to mill for Messrs. Jacob, Welch & Co., wholesale stationers, Newton Hill, Hyde.

Hyde (Lancs).—Extensions to public baths; Messrs. Hall Construction Company, Ltd., builders, Salford.

Keighley.—Cinematograph theatre; Messrs. B. Bailey & Son, architects, Scott-street, Keighley. Additions to technical institute (2,650 $\frac{1}{2}$); Messrs. W. H. & A. Sugden, architects, Devonshire-buildings, North-street, Keighley; Mr. J. Warton, builders, Ingrow.

Keighley.—Swimming-baths (7,000 $\frac{1}{2}$); Messrs. B. Bailey & Son, architects, Scott-street, Keighley; Messrs. P. Rhodes & Co., builders, Keighley, Leeds.

King's Lynn.—Additions to iron foundry, isebach-road, for the Cooper Boiler Bearing Company. Swimming-baths; Mr. A. Smith, surveyor, Town Hall, King's Lynn.

Kingston-on-Thames.—Congregational church (6,000 $\frac{1}{2}$); Mr. E. Carter, architect, 86, Eden-street, Kingston.

Kirkcaldy.—Enlargement of school (3,550 $\frac{1}{2}$) for the Kirkcaldy School Board.

Leigh (Lancs).—Weaving shed for the Leigh Mill Manufacturing Company, Ltd., cotton goods manufacturers, 226A, Chapel-street, Mill Lane, Messrs. Taylor & Sons, cotton goods manufacturers; Messrs. Bradshaw & Gass, architects, 19, Silver-street, Bolton. Free Methodist Church, Wigan-road (3,000 $\frac{1}{2}$); Mr. H. Dinsley, architect, 12, Cleveland-street, Wigan.

Leith.—United Free Church hall; Mr. G. Craig, architect, 85, Duke-street, Leith.

Lincoln.—Proposed abattoir buildings; Mr. A. MacBrat, Surveyor, Town Hall, Lincoln. Infirmary (20,000 $\frac{1}{2}$); Mr. W. B. Danby, clerk, Guardians' Offices, Lincoln.

Maldon.—Proposed sixteen houses (2,925 $\frac{1}{2}$); Mr. T. R. Swales, Surveyor, Town Hall, Maldon.

Melksham.—Picture theatre (1,990 $\frac{1}{2}$); Messrs. Greenwood & Co., builders, Spa-road, Melksham.

Newcastle-on-Tyne.—Proposed extensions to Northford Technical College (10,000 $\frac{1}{2}$); Mr. C. Coffin, Education Offices, Newcastle.

Newcastle-on-Tyne.—Heaton (3,000 $\frac{1}{2}$); Mr. B. G. Hills, (Lancs) architects, Newcastle.

Newcastle-on-Tyne.—Heaton & Tasker, architects, Trinity-buildings, Newcastle.

Newport (Mon).—Schools for defective children (4,000 $\frac{1}{2}$); Mr. A. Bain, Architect, Newport.

Newtown-on-Ayr.—Refrigerating factory and abattoir (4,000 $\frac{1}{2}$); Mr. P. St. Clair Williams, architect, Sandgate-street, Ayr.

Newtown.—Tuberculosis hospital; Mr. A. G. Parker, Architect, Town Hall, Worcester.

Northwich.—Baths (9,580 $\frac{1}{2}$); Messrs. Rice & sons, builders, 15, Stockwell-road, S.W.

Norfolk.—Alterations and additions to Didgford Hall (25,000 $\frac{1}{2}$); Messrs. Dunn & Richardson, architects, 38, Lincoln's Inn-fields, London, W.C.; Messrs. Holland & Hannen, builders, 5, Inn-road, W.C.

Norwich.—Additions to East Anglian Institute for Blind and Deaf Children (2,175 $\frac{1}{2}$), for the Governors.

Nottingham.—Proposed rebuilding of works, Lancelotti street, for Messrs. M. Perry & Co., Ltd., apron and pinafore manufacturers.

Nuneaton.—Additions to factory, Meadowcroft, for Messrs. Hall & Phillips, hat manufacturers.

Odham.—Proposed almshouses, Broad Oak (6,000 $\frac{1}{2}$); Trustees of the late Miss Sarah Barker, Broad Oak, Odham.

Oskehampton.—Territorial drill hall (2,000 $\frac{1}{2}$); Messrs. Ellis, Son, & Bowden, architects, Dorchester-circus, Exeter.

Ongar.—Alterations at workhouse; Mr. A. Richardson, Clerk, Guardians' Offices, High-gate, Ongar.

Oulton.—Enlargement of school (150 extra seats); Mr. J. Stuart, Architect, County Hall, Kenilford.

Plymouth.—Proposed school; Mr. C. H. Bothamley, Architect, County Education Offices, Weston-super-Mare.

Pontypool.—Theatre and Hippodrome (over 1,000 places) for Mr. G. H. Pitt.

Rainham (Kent).—Cement factory; Mr. P. L. Spoor, Rede-court, near Rochester.

Ramsbottom.—Additions to weaving shed for the Chatterton Weaving Company, Ltd.

Ramsbottom.—Proposed shelter, Italian-gardens, West Cliff; Mr. G. Taylor, Surveyor, Town Hall, Ramsbottom.

Rotherham.—Congregational church, Kimberworth-road (2,600 $\frac{1}{2}$); Mr. J. Totty, architect, 20, Moorgate-street, Rotherham.

Scarborough.—Alterations and additions to school (1,555 $\frac{1}{2}$); Mr. W. Ascoug, Education Offices, Scarborough.

Sedgefield.—Hospital; Mr. J. Stones, Surveyor, Council Offices, Sedgefield.

Skelton-in-Cleveland.—Drill hall; Mr. W. Wardman, architect, High-street, Redcar; Mr. M. France, builder, 3, Balmoral-terrace, Redcar.

Slough.—Additions to factory for Horlick's Malted Milk Company, Ltd., infants' food, etc., manufacturers.

South Molton.—Artisans' dwellings; Mr. E. D. Grove, Surveyor, Town Hall, South Molton.

South Shields.—Picture hall; Messrs. J. H. Morton & Sons, architects, North-eastern Bank-chambers, South Shields.

Stafford.—Proposed sixty houses; Mr. W. Plant, Engineer, Town Hall, Stafford.

Stirling.—Home (2,500 $\frac{1}{2}$); Mr. John Allan, architect, 32, Dumbarton-street, Stirling.

Stockport.—Shelter, bowl-house, and pavilion (785 $\frac{1}{2}$); Messrs. D. Badie & Co., Ltd., builders, North-street, Stockport.

Stoke-on-Trent.—Proposed school for girls; Mr. W. Lincoln Copeland, Education Offices, Stoke.

Stretford.—School, Trafford Park; Mr. H. Little, architect, 16, Ribblesdale-place, Preston.

Sunderland.—Extensions to engineering works for Messrs. Lynn & Co., which manufacturers; Messrs. W. & T. R. Milburn, architects, 20, Fawcett-street, Sunderland. Engineering works foundry, etc.; Messrs. W. & T. R. Milburn, architects, 20, Fawcett-street, Sunderland. Two schools; Mr. H. Read, Education Offices, Sunderland. Pavilion (1,200 $\frac{1}{2}$) and laundry at hospital; Mr. G. T. Brown, architect, 51, Fawcett-street, Sunderland.

Sutton-in-Ashfield.—Fire-station (350 $\frac{1}{2}$); Mr. W. Burnley, Surveyor, Town Hall, Sutton.

Swansea.—Coal exchange, Cambrian-place (22,250 $\frac{1}{2}$); Mr. C. T. Ruthen, architect, Bank-chambers, Heathfield-street, Swansea; Messrs. Billings & Sons, builders, Trafalgar-yard, Glastonmouth-road, Swansea. Additions to Ship Inn, Penryn-quina-road, for the Swansea United Breweries, Ltd., Wassall square, Swansea.

Tarbolton.—School (6,000 $\frac{1}{2}$); Messrs. J. & H. V. Eaglesham, architects, Wellington-chambers, Ayr.

Tiverton.—Houses; Mr. J. Siddals, Surveyor, Town Hall, Tiverton.

Todmorden.—One hundred and eighty-four houses, Rawson Fields Estate, for Mr. George Collett (Chairman of the Hare Spinning Company), Failswoth.

Torquay.—Secondary school; Architect, County Education Offices, Exeter.

Town.—Transmitting-station (60,000 $\frac{1}{2}$) for the Marconi Wireless Telegraph Company, Ltd., Marconi House, Strand, W.C.

Trindon Colliery.—Twenty-six houses; Mr. J. Stones, Surveyor, Rural District Council Offices, Sedgefield.

Troon.—Extensions to clubhouse (500 $\frac{1}{2}$); Mr. A. Black, Surveyor, Town Hall, Troon.

Trowbridge.—New county offices (12,000 $\frac{1}{2}$); Mr. J. E. Powell, Surveyor, County Offices, Trowbridge.

Trowbridge.—Alterations to premises for the Wilts United Dairies, Ltd. (3,750 $\frac{1}{2}$); Messrs. Bigwood & Co., builders, Spa-road, Melksham.

Tynemouth.—Additions at St. Saviour's Church; Mr. A. E. Plummer, architect, 13, Grey-street, Newcastle-on-Tyne.

Wakefield.—Restoration of St. Andrew's Church for the Vicar.

Wallsend.—Sixty-six houses, near Rising Sun Colliery, for the Wallsend and Hebburn Coal Company, Ltd., Exchange-buildings, Newcastle.

Warrington.—Proposed rebuilding of works, Bank Quay, for Messrs. H. D. Pochin & Co., Ltd., chemical manufacturers.

Wellingborough.—Buildings for London County and Midland Bank; Mr. A. Whinney, architect, 8, Old Jewry, E.C.; Messrs. Henson & Son, builders, Wellingborough.

Wellingborough.—Isolation hospital; Messrs. Sharnham & Archer, architects, 32A, Sheep-street, Wellingborough.

Weymouth.—Alterations to bottling store, Lower Bond-street; Messrs. Crickmay & Son, architects, 49, St. Mary's-street, Weymouth.

Weymouth.—Alterations to London Hotel; Mr. S. Jackson, architect, Bridge-chambers, Weymouth.

Wick.—Fish market and offices for the Harbour Trustees (3,000 $\frac{1}{2}$); Mr. G. E. B. Coulcher, Harbour Offices, Wick.

Windsor.—Hospital at Combemere Barracks (10,000 $\frac{1}{2}$); Messrs. G. H. Hunt & Son, builders, Station Works, High Wycombe.

York.—Proposed open-air school and school for defectives, also enlargement of tram depot; Mr. F. W. Spurr, Surveyor, City Hall, York.

FOREIGN AND COLONIAL.

Polytechnic College, South Africa.

H.M. Trade Commissioner reports that, according to information received from the Commissioner of Customs and Excise at Pretoria, the Provincial Administration of the Orange Free State intend shortly to erect in Bloemfontein a Normal and Polytechnic College, at an estimated cost of 22,500.

TRADE CATALOGUES.

The Nautilus Fire Company, Ltd., of 215, Tottenham Court-road, W., forward us the latest illustrated catalogue of their patent "Bush" fire. The governing principle of this fire is simplicity, the component parts consisting of a plain or ornamental frame in cast-iron or other metal, with or without a canopy, a loose front fitted with an ashpan, and a ventilator fitted in the front of the ashpan to regulate combustion. There are no fire-bars, and the fire, in the most distinctive form of the "Bush" fire, rests on an "island" brick entirely surrounded by a cast-iron grating, which supplies air to the outside of the fire without forcing the draught through the heart, thus securing a slow-burning but always cheerful

fire. The fire-brick linings used in conjunction with the grate radiate the heat into the room, and do not allow it to escape up the flue. The "Bush" gas-fire is an entirely new barless pattern, designed with the idea of combining the conveniences of a gas-fire with the cheerfulness of a coal grate. It can be fitted to any grate, and owing to its construction it has the appearance of a coal fire, the specially made fuel giving out a similar glow. Though the fittings are completely hidden, it is only necessary to draw out the fret to expose the burner, which can be taken out for cleaning purposes without dismantling the arrangement, or removed if it be desired to use the grate for a coal fire. Though standardised for the "Bush" fire, it may be readily altered to suit any other grate.

RIVER TRENT PROTECTION WORKS.

The City Corporation of Nottingham has accepted the tender of Messrs. Gibbons & Turner, of Nottingham (licensed contractors for the "Piketty system" of reinforced concrete), for the execution in reinforced concrete of the River Trent Protection Works, in accordance with the plans of Mr. Arthur Brown, M.Inst.C.E., City Engineer. The work is to be carried out on the "Piketty" system of reinforced concrete construction, which has been selected in competition.

Queen Ethelburga's School, Harrogate.

Designed by the late Mr. C. Hodgson Fowler, F.S.A. Erected by Mr. W. H. Wood, F.R.I.B.A.

QUEEN ETHELBURGA'S SCHOOL, HARROGATE.

On September 27 the Bishop of Ripon dedicated a new chapel in connexion with the above school. The plan of the chapel consists of a continuous nave and chancel, with narrow passage aisles to the nave, and a sacristy on the north side of the chancel. A stair turret gives access to the western gallery, where the organ will be placed. The north aisle is connected by a corridor with the school buildings. The walls are built of stone, with green slates on the roof, and the floors throughout are of wood blocks.

The chapel will accommodate 340, and is the gift of Lord Mountgarret. The work has been carried out by Messrs. Bowman & Sons, builders, of Stamford, from the designs of the late Mr. C. Hodgson Fowler, F.S.A., under the supervision of Mr. W. H. Wood, F.R.I.B.A., of Durham, and Newcastle-on-Tyne, his successor.

LAW REPORTS.

OFFICIAL REFEREE'S COURT.
(Before Mr. VEREY.)

Decorative and Electrical Work: Action by Messrs. Hampton.

THE hearing has been concluded of the action by Messrs. Hampton & Sons, Ltd., of Pall Mall East, S.W., against Princess Annie de Lusignan, to recover 162*l.* 5*s.* 11*d.* for decorative and electrical work done in her flat at 11, Wellington-court, Knightsbridge, S.W., last year.

Mr. Frank Mellor, who appeared for Messrs. Hampton, said the Princess's flat was on the fifth floor, the kitchen and domestic offices being on the floor above. Most of the work was in respect of the fifth floor. The defence was, apparently, an allegation that the work was negligently and unskillfully done, and that 100*l.*, which the defendant had tendered, was sufficient payment. Counsel added that from the first Messrs. Hampton had taken up the position that if anything had been defective they should have been allowed to put it right. They had over and over again expressed the wish to remedy any defects, but the defendant had never given them the opportunity. One of the reasons why they had not had that opportunity was that the Princess had apparently got rid of her lease. Eventually, the plaintiffs, through the courtesy of the present occupier, were permitted to inspect the premises.

Mr. John Harvey Coney, building surveyor, in the employ of the plaintiffs, said he had charge of the work. He repudiated the suggestions as to defects in the work. His firm had only used the best materials. Assuming that there were any defects, witness thought a sovereign would put them right.

Witness said that when the defendant took possession she only complained of the wall-paper in the corridor being wrong; but, added witness, she admitted she had changed her mind a great deal. She also spoke about a ceiling.

Mr. R. B. Mann, of the firm of Messrs. John Mann & Sons, quantity surveyors, of Parliament-street, S.W., said he had inspected the work and considered it to be satisfactory.

Mr. T. E. Haydon, for the defendant, submitted that his client, in tendering before the action and bringing into Court 100*l.*, was amply satisfying the requirements. This was, urged Counsel, a case of *quantum meruit*.

Mr. George A. Hall, F.R.I.B.A., of Victoria-street, S.W., said he had examined the work done by the plaintiffs on behalf of the defendant. With reference to the fastenings in the drawing-rooms, they had not been lacquered for a long time, and witness criticised the material of a picture-rail in the oak-room—a knob had fallen out and another was loose. The ordinary precaution of sandpapering had not been observed. Witness said he would not have passed such work in a flat which let at 360*l.*

The dining-room paper was badly hung and trimmed. The joints were not regular, which would have been the case if the paper had not shrunk. In the bedroom the ceiling was badly done, and knots in the woodwork were showing through the paint. In his opinion, there had been lack of supervision.

Mr. Haydon said that Mr. Martin had given evidence that he had measured up the work and put in a tender, assuming that the work was to be executed on the basis set down in the specifications. Mr. Martin said that a fair price would be 107*l.* Mr. Martin had not examined the work for any defects, but he had noticed that it was poorly done, and he considered 90*l.* was an outside price that ought to be paid to the plaintiffs.

Counsel asked Mr. Hall what he had to say. Mr. Hall said if the estimate for 107*l.* had been put before him he would have reduced it.

Mr. Haydon: Having regard to the condition of the work when you saw it, it would be easier to tell the defects than when Mr. Martin inspected the premises?—Yes.

What do you say would be a fair value of the work to the Princess?—I should think 90*l.* absolutely.

That is an outside figure?—Yes.

Cross-examined by Mr. Mellor: I am taking it that, in your opinion, the difference between the estimated work which the Princess has had is a difference between 90*l.* and 107*l.*?—Yes.

Witness added that he had made a thorough examination.

Do you think there is any single defect that you did not notice?—I should be surprised to hear of anything that I have omitted.

Other evidence was given for the defendant, and the Official Referee, giving judgment, said that he thought the correspondence showed that the plaintiffs were ready and willing at all times to put right whatever small defects

there might be, and he thought that a somewhat unreasonable lady had been shown on the part of the lady in not giving the plaintiffs that opportunity. The question he had to decide was whether the work had been substantially completed. He had listened with great interest to the arguments advanced by Counsel for the lady, and to the way he had analysed the evidence. On the other hand his Lordship had had the evidence of Mr. Coney, the plaintiffs' building representative, and that evidence stood uncontradicted. On the whole of the evidence before him he came to the conclusion that the plaintiffs did substantially carry out the contract, that they did the work specified, and, taken on the whole, in a proper manner. He thought, however, that a somewhat deduction should be made for the cost of making good certain little things. For that he would allow 2*l.* 5*s.* 11*d.* Deducting that sum, the plaintiffs were entitled to judgment for 160*l.* and costs.

Mr. Haydon, for the defendant, asked for a stay of execution in case his client desired to appeal.

Mr. Verey: You can take what course you like, but I do not think it is a case in which I ought to do anything.

London Building Law:

Borough Councils and District Surveyors.

AT Tower Bridge Police Court Mr. Cecil Chapman gave his decision on the four summonses taken out by Charles Archibald Daubney, District Surveyor, representing the London County Council, against Mr. Robert John Angel, A.R.I.B.A., Borough Engineer and Surveyor, Bermondsey, for having failed to give building notices in respect of works at Vine-street, Rouel road, Rotherhithe-street, and Bermondsey-street, and for having begun such works without giving notice.

Mr. Chapman said the District Surveyor of Bermondsey had summoned the Borough Surveyor for failing to give him notice under the London Building Act, 1894, before interfering with and replacing the soil under certain houses in the reconstruction of a sewer passing under a block of houses in one place and in close proximity to the sides of houses in another place. "The claim," he said, "is based upon the proposition that anything done to the foundations of a building, within 3 ft. of a building, must be 'work' for which notice is required under sect. 145, subsect. (a), although the interference was only incidental to the execution of other work which had nothing to do with the buildings. The word 'work' in the section which deals with notice to be given is associated with the words 'building or structure,' and it is natural to infer that it must mean work *ejusdem generis* as building or structure. The cases relied upon for the plaintiff—London County Council v. District Surveyor, Inspector, Moran & Sons v. Marsland, and City of Westminster Council v. Watson—do not seem to me to conflict with this view. They show that brick or other work connected with a reservoir comes within the term structure or building, and that a wooden stand erected in a public place for the purpose of sight-seeing is equally a structure. . . . The defendant's case is based upon the contention that work which is not directed to a structure or building is outside the scope of sect. 145, although it may be closely associated with, and even materially affect, a building. In support of this contention, the case of Verner v. Macdonnell is relied upon, in which a solid structure of seats within the Agricultural Hall, for the purpose of accommodating hundreds of people, was held not to require notice to the District Surveyor. In my opinion, the reasoning in that case applies directly to the one before me, and, as I imagine, governed the action of local authorities ever since the London Building Act was in force. If it were otherwise, the construction of sewers or the laying of electric cables, or the carrying out of any other works below the surface of London would have been accompanied by endless notices and fees for District Surveyors. Such demands have never yet been heard of, so far as I know, except in two cases, one of which appears to have been successful and one unsuccessful. In my judgment, it is unnecessary to discuss the extent of interference with the subsoil of the houses in this case, because I hold that whatever was done incidentally to a building in the carrying out of a sewer construction, an entirely different operation, is not a work or structure for which notice to the District Surveyor is necessary. The case, therefore, against the Borough Surveyor will be dismissed, with 12 guineas costs."

On the application of Mr. Pasmore, the magistrate consented to state a case. A summons for fees was adjourned *sine die*.

LONDON COUNCILS.

Barnet.—Mr. F. Cade has lodged plans for the erection of a block of flats at the corner of Bedford-avenue and Barnet-hill.

Bermondsey.—The disused tram-track in Spa-road is to be taken up and the roadway, including certain portions outside the track, is to be repaved with pitchings or wood at an estimated cost of 4,500.

Camberwell.—A scheme has been approved for the erection of a convenience at Goose Green at an estimated cost of 900.

Deptford.—Tenders are to be invited for carrying out (1) the drainage work, (2) the formation of roads, and (3) the demolition of stages, in connexion with the extension of rockley Cemetery. A plan lodged by Mr. F. Varman for the erection of a building abutting upon Hales-street and Stanhope-street, has been passed.

Finchley.—Plans have been passed for Messrs. Edmundsons, Ltd., for the erection of seven shops and houses in Ballards-lane; also for the Up-to-Date Picture Palaces, Ltd., for the adaptation of the skating rink on the north North Road into a cinematograph theatre.

Holborn.—Tenders are to be invited for carrying out alterations to the public mortuary in Goldsmith-street, so as to provide for improved accommodation for the caretaker; private mortuary chamber; a suitable cleansing station, with baths on ground and first floors; and various other improvements to make the building suitable for present and future requirements.

Isle of Dogs.—Plans have been passed for Mr. V. J. Hobbs for the erection of three houses in Bethell-avenue and seven in Emerson-road.

Kensington.—Tenders are invited for making p Wallingford-avenue, Balloil-road, Kingsbridge-road, and the extension of Kelfield-avenue.

Levensham.—A communication has been received from the L.C.C. stating that they have decided to undertake the widening of London-road, Devonshire-road, and Valdmarr-road, Forest Hill, at an estimated cost of 46,500. The Council have acceded to application from Messrs. Jarvis & Richards on behalf of the Catford Estate Company, Ltd., to construct a 6-in. sewer from the boundary of their property to the west side of Catford Bridge. The work is to be undertaken by the Council at the cost of the applicants. Plans have been passed for Mr. J. Hughes and Messrs. W. T. Champion & Sons for the erection of six houses in Downhill-road, and for additions to Nos. 142 and 4, High-street respectively; as have also plans for Mr. A. Henley for alterations to a picture palace opposite Crofton Park Railway station, Brockley-road.

The following have lodged plans with the L.C.C.: Mr. W. Goddard, buildings, Lewis-grove; Mr. F. W. Loasby, buildings, Hither Green-avenue; Mr. G. A. Lansdown, forming and laying out new road.

Tottenham.—Plans have been passed for Mr. J. S. Theobald and Mr. Wm. C. Staljes for additions to the factory, in North-grove, of Messrs. A. Bewick & Co., and for additions to Oceana Laundry, Cornwall-road, respectively.

Wandsworth.—The attention of the Lord Chancellor, H.M. Treasury, and the Office of Works is again to be called to the inadequacy of the building used as the Wandsworth County Court, and to the immediate necessity of a larger building being provided. Tenders are to be invited for paving Otterburn-street, Footing, and part of Salford-road, Stratnam, as new streets. The following plans have been passed:—Mr. A. Harvey, additions to Convent of the Holy Family, High-street, Footing; Messrs. Erwood & Morris, addition to St. Mary's Schools, St. Alphonsus-road, South Clapham; Messrs. Holloway Bros. (London), Ltd., four houses off Kellerton-road, Springfield; Messrs. Jones Bros. (Footing), alterations and additions to Nos. 6 and 8, St. Nicholas-road, Balham; Messrs. J. Arnell & Son, additions and alterations to Southampton House, Roehampton-lane, Putney, W.

Willesden.—The Engineer has been directed to report as to the probability of securing a suitable site for the erection of swimming and slipper baths. The Education Committee has been authorised to proceed with the erection of temporary schools on the "Doecker" principle, to accommodate 400 children, upon the Bridge-road and College-road sites; also to proceed with the erection of a permanent school on the Dudden Hill site to accommodate at the first instance 400 children, with the possibility of enlargement to 1,200, and finally 1,600 if required. To cover the cost of the work application is to be made to the Local Government Board for sanction to borrow 7,755. Electricity mains are to be extended at an estimated cost of 82. The following plans have been passed:—Messrs. Lawrence &

Aitken, additions at Albion Works, Kimberley-road, Willesden-lane; Mr. H. R. Hunter, six houses, Doyle-gardens; Messrs. William Moss & Sons, additions to Workhouses, Acton-lane, for the Guardians; Mr. F. W. Heel, alterations to No. 126, High-road, for Messrs. E. G. Harvey, Ltd.; Mr. T. W. Willard, additions at Edinburgh Biscuit Works, Waxlow-road, for Messrs. McVitie & Price; Messrs. John Belcher, R.A., and J. J. Joass, addition to factory, Waxlow-road, Acton-lane, for the British Luxfer Prism Syndicate. Plans have been lodged by Messrs. T. Marcus Houghton, S. Hathaway, and G. S. Valentin for the erection of a picture theatre at rear of No. 159, High-road, Kilburn; a mission hall in Melville-road, Stonebridge Park, and for extensions to cinema theatre, High-street, Harlesden, respectively.

PATENTS.

APPLICATIONS PUBLISHED.*

23,705 of 1911.—Charles Thomas Lee: Ventilator screens.

26,609 of 1911.—John Willis Cloud: Pipe joint.

28,596 of 1911.—Carl Murer: Machines for moulding plastic substances.

1,920 of 1912.—Richard Henry Annison: Piling, sheeting, and other members for structural work.

4,006 of 1912.—James Holt: Silencing arrangement for water-waste preventers, cisterns, or the like.

4,112 of 1912.—Albert Barnes: Apparatus for closing water supplies to taps and other fittings.

7,624 of 1912.—Frederick James Kellow: Slab walls.

7,995 of 1912.—Joseph Wilkinson Crosby: Moulds for forming blocks of artificial stone, concrete, and the like.

9,168 of 1912.—Franz Kaiser: Doorlock and safety device therefor.

10,521 of 1912.—The British Reinforced Concrete Engineering Company, Ltd., and Andrew William Storey: Stirrups or shear members for use in reinforced concrete structures.

12,114 of 1912.—Logan Willard Mulford: Concrete skylights, vault-lights, and floor-lights.

13,708 of 1912.—Edward Aloysius Tracy: Paving blocks.

15,955 of 1912.—Anton Drexler: Building blocks.

16,264 of 1912.—John William Ewart: Baffles for preventing down draughts in flues.

17,070 of 1912.—Roy Alfred Plumb: Method of rendering cement, mortar, and concrete waterproof.

SELECTED PATENTS.

16,471 of 1911.—James Johnston: Windows. This relates to windows having a pair of sliding sashes balanced one against the other by means of racks 1 on the sashes 10, 11, engaging pinions 4 mounted on the window-frame.

16,471 of 1911.

The pinion 4 is mounted between washers 5 and 8 on a spindle 3, riveted over to form a head 9. A deep draught-rail is also fitted to the sill to enable the upper sash to be opened without admitting air below the lower sash.

16,763 of 1911.—Reichert Manufacturing Company and August Reichert: Moulding concrete floors.

This relates to moulds for casting concrete floors and beams *in situ*, which are supported by T-section or other rails 13, 26, carried by grooved heads 15 on screw-threaded rods 16, adjusted by nuts 18, provided with shoulders 19, to engage the upper ends of pipe lengths

* All these applications are in the stage in which opposition to the grant of Patents upon them can be made.

20. The screws are provided with enlargements 23 at the lower ends, to fit within the pipes, which are centred on feet 21 with bosses 22. The edges of the mould-plates 10 are provided with flanges, which are secured

16,763 of 1911.

together by pivoted clamps 11 and pins 12, and are retained on the T-rails 13 by lugs 17. The corners of the moulds are formed by angle-pieces 24, 25, secured to the adjacent mould-plates by the clamps 11.

List of Competitions, Contracts, etc.

For some Contracts still open, but not included in this List, see previous issues. **Those with an asterisk (*) are advertised in this number;** Competitions, —; Contracts, iv. vi. viii. x.; Public Appointments, —; Auction Sales, xviii. Certain conditions beyond those given in the following information are imposed in some cases, such as: the advertisers do not bind themselves to accept the lowest or any tender; that a fair wages clause shall be observed; that no allowance will be made for tenders; and that deposits are returned on receipt of a bona-fide tender unless stated to the contrary.

The date given at the commencement of each paragraph is the latest date when the tender, or the names of those willing to submit tenders, may be sent in.

* * It must be understood that the following paragraphs are printed as news, and not as advertisements; and that while every endeavour is made to ensure accuracy, we cannot be responsible for errors that may occur.

Competitions.

TO CORRESPONDENTS.

All communications with respect to literary matters should be addressed to "THE BUILDER" (and not to any person by name); those to advertisements and other exclusively commercial matters should be addressed to "THE BUILDER," and not to the Editor. Communications must be authenticated by the name and address of the sender, whether for publication or not. No notice can be taken of anonymous communications. Responsibility of signed articles, letters, and read at meetings rests, of course, with the author. The Editor cannot undertake to return rejected communications, and the Editor cannot be responsible for the loss of photographs, manuscripts, or other documents sent to him, or to left at his office, unless he has specially asked for them. For drawings sent to or left at this office for consideration, the owner's name and address must be given, and a drawing for publication, in given to the Editor, who retains the right to reject any article in type does not necessarily imply its publication. Illustrations of the Fleet Promenade Design in the Architectural Competition will always be for publication by the Editor, whether they are formally asked for or not.

PRICES CURRENT OF MATERIALS.

*Our aim in this list is to give, as far as possible, the average prices of materials, not necessarily the lowest. Quality and quantity obviously affect prices—a fact which should be remembered by those who make use of this information.

BRICKS, &c.		
Per 1000 Alongside, in River.	£ s. d.
